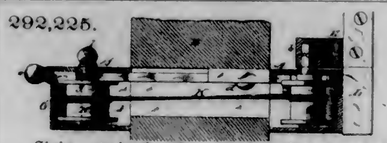
4. In a rail-joint, the chair B, provided with lugs J J, clamping-flange C, extending up to the rail-head, and fitting the side of the rail, and transverse apertures or holes C', in combination with rail ends A, having slots A' near their ends, clamping-bolts D, having threaded ends F and curved ends E, to fit the side of the rails, a nut, G, and means to lock said nut in position when the rails are clamped, substantially as and for the purpose specified.

5. In a rail-joint, the chair B, provided with clamping-flange C, reënforcing band K, lugs J J, and transverse holes C', in combination with rails A, having slots A' in their bottom flanges near their ends, bolts D, having curved ends E, and means to cause the rail to be clamped between said ends E and flange C, substantially as and for the purpose specified.

292,224. PILLOW-SHAM HOLDER. CLARK P. HAWLEY, Johnstown, N.Y. Filed July 12, 1883. (No model.)

Claim.—1. In a holder for pillow-shams and the like, the bar C, having staples or eyes *n*, secured to the same, and a tape, *o*, passed through the staples, the shams being suitably attached to the tape, as and for the purpose set forth.

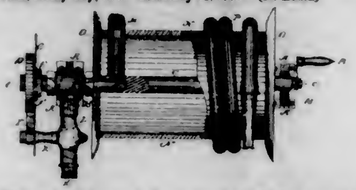
2. In a pillow-sham holder, the brackets G, having spiral spring I, which is extended inward and formed with a hook, *l*, in combination with the adjustable bar C, pivoted in the brackets, and frame B, having extension *b'*, connected with the loop *l*, as set forth.



3. The brackets G, having coil I and eye *k*, in combination with the bar C, journaled in said brackets, a rod, K, attached to the bar C and provided with a hook and operating as described, and frame B, the latter being provided with loop *b* to receive the rod, and extension *b'*, connected to the coil, as set forth.

4. The brackets G, having coil I, formed with a hook, *l*, in combination with the adjustable bar C, provided with plates or castings E, having L-shaped extensions *e*, journaled in the brackets, and the frame B, the latter having extension *b'*, connected with the loop *l*, as set forth.

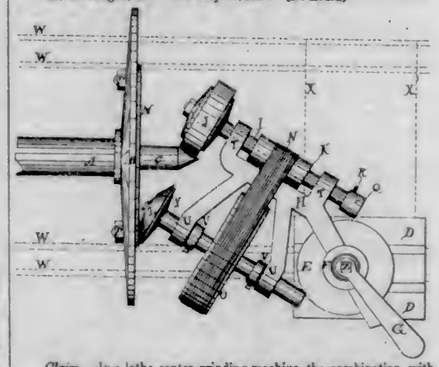
5. The brackets G, having loop F, coil I, and eyes *k*, in combination with the bar C, having plates or castings E, L-shaped extensions *e*, frame B, formed with extensions *b'*, loops *b*, and eyes b^2, connecting with coil I, and the rod K, all arranged and operating for the purpose set forth.



292,225. SHUTTER-WORKER. WILLIAM HAWN, Knoxville, Tenn. Filed Nov. 24, 1883. (No model.)

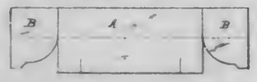
292,226.

Claim.—An interior pulley or sprocket-wheel arranged within a shell or casing and kept in position by a spring or stop, and provided with a crank or lever, in combination with an exterior pulley or sprocket-wheel similarly arranged and provided with an extended axle and notched rim, said pulleys being connected by a suitable band, a slotted sliding bolt provided at its inner end with a handle or knob, and secured at its outer end to the under side of the cover of the exterior shell or casing, and a suitable socketed connecting device adapted to be secured to a shutter, all arranged to operate substantially as and for the purpose specified.



292,226. HOSE-REEL. BENJAMIN HEYWOOD, Brooklyn, N.Y., and JOHN JONES, Jersey City, N.J. Filed May 22, 1883. (No model.)

Claim.—1. In hose-reels, the combination, with the headed toothed segment I, having a yoke, G, pivoted thereto, of a disk, E, having a projection, F, on its circumference, a cog-wheel, D, mounted on the same axis, partially-hollowed shaft C, and valve K, substantially as and for the purpose specified.

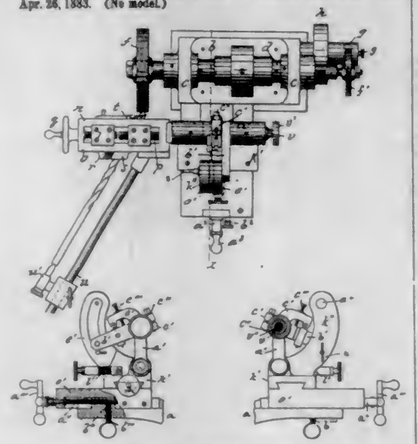


2. In hose-reels, the combination, with the headed toothed segment I, having an elliptical yoke, G, pivoted thereto, disk E, having a projection, F, on its circumference, and cog-wheel D, of valve K, operated as described, pipe L, tube M, and shaft C, partially hollowed, substantially as shown.

292,227. LATHE-CENTER-GRINDING MACHINE. DARIUS HOOGHTON, Skowhegan, Me. Filed May 31, 1883. (No model.)

Claim.—In a lathe-center-grinding machine, the combination, with the face-plate of the lathe, of the plane-faced friction-wheel M, secured thereto, and the friction-wheel L and its shaft, with means for transmitting the motion therefrom to the grinding-wheel, as and for the purpose set forth.

292,228. PAPER BOX. JAMES C. HURD, Springfield, Mass. Filed Aug. 11, 1883. (No model.)



Claim.—1. A paper box the bottom and sides of which consist of a slitted rectangular portion, A, and the ends of portions B, having the flaps *e* and locking-extension *g*.

2. A knockdown paper box consisting of the slitted body portion A, having the end pieces B secured to the sides of the body, and provided with locking-extensions, and having the longitudinal folding lines or creases *c i* through the middle of the body and end pieces, whereby the box may be folded flat for storage, as described.

3. A paper box consisting of a body portion, A, having slits *b*, and the end pieces B, secured to the sides by flaps *e*, and having extensions *g*, provided with tongues *h*, for locking the box, as set forth.

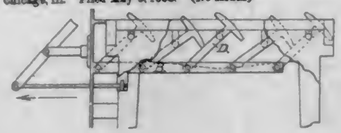
4. A folding box consisting of the body portion A, having the folding lines or creases *a c*, and slits *b*, and the end pieces B secured to the sides by flaps *e*, and having extensions *g*, provided with tongues *h*, and folding-lines *i*, as set forth.

292,229. MACHINE FOR SHARPENING DRILLS. MOSES C. JOHNSON, Hartford, Conn., assignor to William N. Woodruff, same place. Filed Apr. 26, 1883. (No model.)

Claim.—1. In combination, chuck-frame *o*, male jaw *s*, with projecting face, female jaw *z*, with re-entrant angular face, and feed-screw *p*, having at opposite ends right and left hand threads, respectively, the thread feeding the female jaw having one and one-half time the pitch of the other, whereby the center of drills of various diameters as held by said jaws will be parallel to and equidistant from the axis of the gage-rod *u*, all substantially as described.

2. In a drill-grinder, the combination of the chuck *n*, the rock-shaft *v*, bearing the connected arms *b' c'*, frame *a'*, and upright arm *k''*, bearing the cam *c'*, all substantially as described.

3. In combination, the slide *k'*, bearing arm *k''*, the cam *c'*, pivoted to said arm and having at its lower end the segment of a worm-gear, the worm *l'*, and the connected drill-grinding mechanism, all substantially as described.

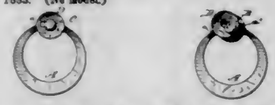


4. In a drill-grinder, in combination, the frame *a'*, the chuck *n*, the shaft *v*, bearing the adjustable arm *c'*, connected with movable arm *b'*, adjustable cam *d'*, pivoted to arm *k''* and slide *k'*, all substantially as described.

5. In a drill-sharpener, the swinging frame *a'*, adjustable cam *d'* with the connecting-arms *b'* and *c'*, in combination with the connected drill-grinding mechanism, all substantially as described.

6. In a drill-grinder, a chuck pivoted to a swinging frame and adapted to hold a drill with its axis below the line of the axis of the pivot, in combination with the drill-grinding mechanism, all substantially as described.

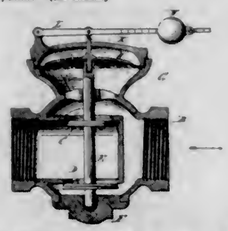
7. In a drill-grinder, a chuck pivoted to a swinging frame and adapted to hold a drill with its axis out of line with the axis of the pivot, in combination with the drill-grinding mechanism, for the purpose set forth.



292,230. SELF-CLEARING FURNACE-GRATE. JAMES C. JONES, Chicago, Ill. Filed May 3, 1883. (No model.)

Claim.—1. A grate composed of a series of rocking bars, a portion of which shall be pivoted in a horizontal plane, while the remaining portion shall be pivoted in another and different plane parallel with the first, substantially as shown and described.

2. A grate composed of a series of bars, a portion of which shall have a differential movement in relation to the other bars of the series, substantially as and for the purpose set forth, whereby some of the bars shall be made to move in the arc of a larger circle than the others.



292,231. KEY-RING. GEORGE W. JOPSON, Meriden, Conn. Filed June 2, 1883. (No model.)

Claim.—1. The improved key-ring formed by a combination of an open ring, A, having at one end a projecting portion or washer, B, attached by a pin having an enlarged oblong portion under its head, and a washer with a key-hole slot, the parts being organized substantially as described.

2. In combination with the open ring hereinbefore described, having an enlarged end which overlaps the adjacent portion of the ring, the pin C, having enlarged portion *e*, and stem *c'*, and washer D, having a key-hole slot, the parts being organized substantially as shown, and for the purpose set forth.

292,232. REGULATOR-VALVE. TIMOTHY J. KELLY, New York, N. Y. Filed Feb. 17, 1883. (No model.)

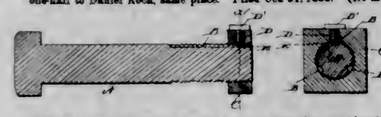
Claim.—The combination, in a regulator-valve, of the diaphragm G, provided with a continuous pressure-plate upon its upper surface, the said plate being connected with a weighted lever by the anti-friction-roller journal M, the valves C and D, the valve D and its valve-seat being greater in diameter than the valve C, the cap F, serving as a guide for the lower end of the stem E, and itself being greater in diameter than either the valve C or D, and the spider-guide located between the valve C and the diaphragm G, thereby insuring the accurate seating of the valves and preventing the lateral movement of the diaphragm, substantially as described.

292,233. FAUCET. JUDSON N. KNAPP, Syracuse, N. Y. Filed Jan. 13, 1883. (No model.)

Claim.—1. The combination, with the faucet A, of the ferrule B and tubular screw C, retaining the ferrule upon the faucet, constructed substantially as described, for the purposes set forth.

2. In a faucet, the combination of the ferrule B, screw C, strainer D, and spring E, when constructed and operating together substantially as described, for the purposes set forth.

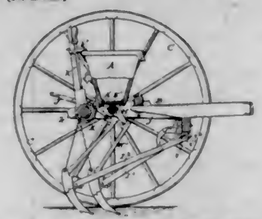
3. In a faucet, the combination of the detachable superimposed metallic head-protector L with the body A of a wooden faucet, attached to each other substantially as and for the purposes set forth.



4. In a faucet, the combination of the band F, encircling the body A, and perforated to receive the key *a*, with the body of the faucet, constructed and operating together substantially as and for the purposes specified.

5. In a faucet, the combination of the band F, bushing H, and key *a* with the body of the faucet, constructed and operating together substantially as and for the purposes specified.

6. In combination with a faucet, the tubular strainer D, provided with means for regulating its protrusion from the faucet-barrel and for maintaining it in an extended position, substantially as and for the purpose set forth.



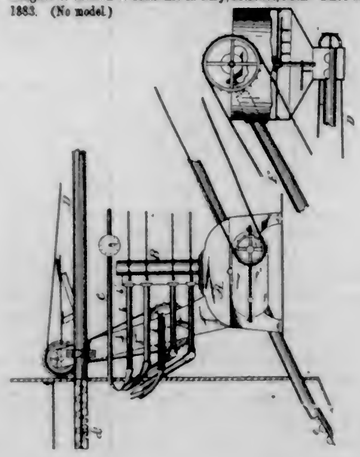
7. In combination with a faucet, the tubular strainer D, provided with a collar on its inner end, and the spring E, substantially as and for the purpose set forth.

292,234. NUT-LOCK. AMBROSE R. KOCH, Fleetwood, Pa., assignor of one-half to Daniel Koch, same place. Filed Oct. 31, 1883. (No model.)

Claim.—As an improvement in nut-locks, the combination of a bolt having one or more shallow longitudinal grooves extending throughout its threaded portion, a nut having a radial screw-threaded opening, and a set-screw seated in the said opening and terminating in a nipple at its inner end, substantially as herein set forth, and for the purpose stated.

292,235. GRAIN-DRILL. HERMANN H. KOELLER, St. Louis, Mo. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a grain-drill, the seed-box bottom proper, made laterally adjustable, and provided with a series of feed-openings, in combination with a series of feed-cups and cylinders, stationary in a lateral direction, for the purpose set forth.



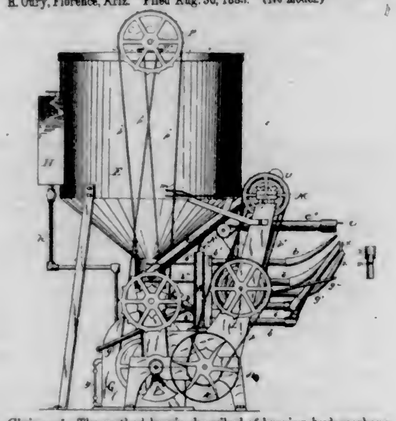
2. In a grain-drill, the combination of the laterally-adjustable seed-box bottom A', feed-cylinders E', and cups or housings E, stationary in a lateral direction, and provided with a projecting rim, *e'*, for the purpose set forth.

3. In a grain-drill, the combination of the adjustable plate B, provided with a cam-slot, *d*, pin or stud *d'* on the seed-box bottom, and locking-nut *d²*, as described, and for the purpose set forth.

4. In a grain-drill, the combination of the fluke-raising drum K, on which is secured a notched ratchet-wheel, *k*, with the lever K', turning loosely around said drum, and provided with a spring locking dog or bar for locking it to said drum, all constructed and arranged as herein described, and for the purpose set forth.

5. In a grain-drill, the combination of the drag-bars I³, curved lever J', engaging pin-projections on said bars, link *j*, and hand-lever J, as described, and for the purpose set forth.

292,236. PROCESS OF MIXING AND CONSUMING HYDROCARBON WITH PULVERIZED EARTH. JULIUS LEEDE, Washington, D. C., assignor of one-half to Granville H. Oury, Florence, Ariz. Filed Aug. 30, 1883. (No model.)



Claim.—1. The process of mixing fine material and liquid carbon for the production of fuel, consisting in conducting a stream of fine material and a stream of hydrocarbon and discharging said materials from their conduits in juxtaposition, and while suspended intermixing the particles of both streams by a separate stream or blast of air, as hereinbefore set forth.

2. The process herein described of mixing fine material and liquid carbon, and simultaneously igniting and consuming the carbon, consisting in conducting a stream of fine material and a stream of hydrocarbon and discharging said materials from their conduits in juxtaposition, and while suspended intermixing the particles of both streams by a separate stream or blast of air, and simultaneously igniting the fuel by a jet-flame, as hereinbefore set forth.

3. In an apparatus for mixing earthy matter and hydrocarbons, and for consuming the carbon therein, the combination of means for feeding the earthy matter, a separate conduit for the liquid carbon, means for producing and separately conducting a blast, and jet for ignition, substantially as set forth.

292,237. APPARATUS FOR FEEDING AND CONSUMING FINE FUEL. JULIUS LEEDE, Washington, D. C., assignor of one-half to Granville H. Oury, Florence, Ariz. Filed Aug. 30, 1883. (No model.)

Claim.—1. The method herein described of burning hydrocarbons, consisting in mixing the same with granular or pulverized material, feeding it to a furnace, and then simultaneously scattering and igniting the same, and thereby consuming it while in suspension, as set forth.

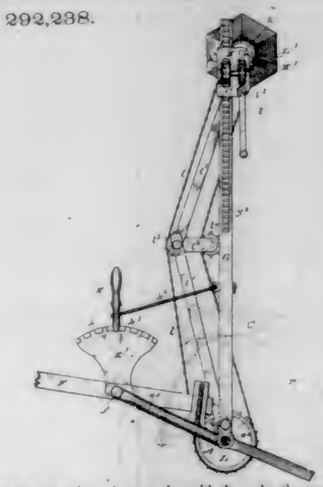
2. The combination, substantially as described, of a carburetor and a blower having a blast through the carburetor to the furnace, to provide gas and pressure for a jet-flame, and a separate blast to the furnace, substantially as and for the purpose described.

3. The combination of the automatic fuel-feeding conveyers working the fuel through conduits into the furnace, the separate blast-pipe for projecting the fuel through the furnace, and the jet-flame adjacent to the nozzle of the conduit and blast, substantially as specified.

4. In a furnace for burning pulverulent fuel, the combination of a series of blast-pipes and means for producing a jet-flame adjacent thereto for igniting the fuel as it issues from the feed-pipe into the fire-chamber, substantially as specified.

5. The combination of a series of adjustable blast-pipes and a series of gates or valves and levers for controlling the direction, quantity, and force of the blast without changing the speed of the blower, substantially as specified.

6. The combination, in a fuel-feeding apparatus, of the inversely-graduated gearing and their connecting chain belts, the serrated clutches, and their operating-levers, whereby the speed of the conveyers and the feed are adjusted with relation to the blower, substantially as specified.



7. The combination of means for changing and regulating the speed of the conveyers with means for regulating the force of the blast without changing the speed of the blower, substantially as specified.

8. The apparatus constructed and operating substantially as described, consisting of the combination of automatic fuel-feeding conveyer, the separate blast-pipes, means for producing a jet-flame, a locomotive having a conceived fire-box, and an automatic conveyer for removing the residuum of the fuel to a reservoir-bin, substantially as specified.

292,238. HARVESTER-REEL. SYLVANUS D. LOCKE, Hoosic Falls, N. Y. Filed Apr. 3, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the two-armed reel-support, the equal racks on said arms, the carriers on each arm, the reel-shaft journaled in said carriers, the equal

292,238.

pinions in each carrier engaging with the racks, the worm-wheels fixed to said pinions, so as to move therewith as integral, the crank-shaft extending transversely across the supporting-frame and journaled in ears from the carriers, and the worms upon said crank-shaft engaging with the worm-wheels, whereby the reel-shaft will be adjusted co-ordinately at each end along the frame by revolving the crank-shaft.

2. The combination, substantially as hereinbefore set forth, of the two-armed reel-supporting frame, the equal racks upon said arms, the carriers traveling upon said arms, the reel-shaft extending transversely across the frame and journaled in said carriers, the equal pinions pivoted in said carriers and engaging with the racks, the rollers or trucks opposing said pinions and holding the racks in engagement therewith, the worm-wheels fixed to said pinions, the crank-shaft journaled in ears from each carrier, and the worms upon said crank-shaft engaging with the worm-wheels.

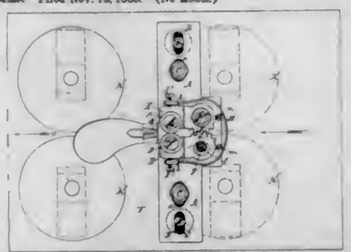
3. The combination, substantially as hereinbefore set forth, of the two-armed reel-supporting frame, the equal racks upon said arms, the carriers traveling upon said arms, the reel-shaft extending transversely across the frame and journaled in said carriers, the equal pinions pivoted in the carriers and engaging with the racks, the worm-wheels fast to said pinions, the crank-shaft journaled in ears from the carriers, and the worms fixed to said shaft between the ears of each carrier.

4. The combination, substantially as hereinbefore set forth, of the two-armed reel-supporting frame, the equal racks upon the outer sides or edges of said arms, back to back, the carriers traveling upon said arms, the reel-shaft extending transversely across the frame and journaled in said carriers, the equal pinions pivoted in said carriers and engaging with the racks, the worm-wheels fixed to said pinions, the worm-shaft extending across the reel-frame and supported in ears from each carrier, the worms fixed to said shaft and each engaging with a section of the corresponding worm-wheel exposed by said ears, and the rollers or trucks pivoted in the carriers to bear against the inner sides or edges of the frame-bars in opposition to the pinions and hold the racks up against said pinions.

5. The combination, substantially as hereinbefore set forth, of the main axle, the single carrying-wheel mounted thereon, the main frame sleeved to said axle prolonged inside of the carrying-wheel, the two-armed reel-support pivoted to said main frame immediately above its bearing upon the axle, the reel-shaft and mechanism for adjusting it in and out along said arms, the sprocket-wheel fixed to the end of the axle outside of the frame, the chain connecting said sprocket-wheel with an opposing sprocket-wheel on the reel-shaft, and the radius-bars pivoted, respectively, to the axle and to the reel-shaft, and pin-jointed to each other at their meeting ends, provided with idle sprocket-pinions or guides for said chain at or in proximity to the pin-joint.

6. The combination, substantially as hereinbefore set forth, of the main axle, the single carrying-wheel mounted thereon, the seat supported from the axle outside of the carrying-wheel, the wide main frame sleeved to the axle prolonged inside of the carrying-wheel, the two-armed reel-support pivoted to said main frame immediately above its bearing upon the axle, the racks upon said arms, the carriers traveling along the arms, and their pinions taken into the racks, the worm-wheels fast to said pinions, the crank-shaft and its worms engaging with said worm-wheels, and the reel-shaft journaled in said carriers, whereby the driver in his seat may adjust the reel up and down by turning the crank-shaft.

7. The combination, substantially as hereinbefore set forth, of the main axle, the single carrying-wheel mounted thereon, the driver's seat supported from the axle outside of the carrying-wheel, the wide main frame sleeved to the extended axle within the carrying-wheel, the two-armed reel-supporting frame pivoted to said main frame immediately above its bearing upon the axle, the racks upon said arms, the carriers and their equal pinions engaging with said racks, the worm-wheel fast to said pinions, the crank-shaft and its worms engaging with said worm-wheels, the reel-shaft journaled in the carriers to be adjusted as they travel along the racks, the sprocket-wheel on the outer end of the axle, and the opposing sprocket-wheel on the reel-shaft, the radius-bars pivoted, respectively, to the main axle and to the reel-shaft and pin-jointed at their meeting ends, and the idle sprocket-pinions or guide-wheels carried by them at said joint or in close proximity thereto, whereby the slack of the chain will be taken up or let out as the reel-shaft is adjusted.



8. The combination, substantially as hereinbefore set forth, of the main axl , the single carrying-wheel mounted thereon, the driver's seat supported from the axle outside of the carrying-wheel, the main frame having two sleeve-connections with said axle prolonged, the two-armed reel-supporting frame pivoted to said main frame immediately above the sleeve-bearing thereof upon the axle, the draft-tongue pivoted in forwardly-extending arms from said frame, the lever pivoted to the draft-tongue at or near its pivotal attachment to the frame, the segment into which such lever latches, and the link-connection with the reel-frame.

9. The combination, substantially as hereinbefore set forth, of the main axle, the carrying-wheel mounted thereon, the driver's seat supported upon the axle outside of the carrying-wheel, the wide main frame having two sleeve-bearings upon the axle prolonged inside of the carrying-wheel, the draft-tongue pivoted in forwardly-extending arms or bars on said frame, the lever pivoted to said draft-tongue, the two-armed reel-supporting frame pivoted to the main frame immediately above the sleeve-bearings of the latter upon the axle, and the forked link connecting the lever on the draft-tongue with each arm of the reel-frame.

10. The combination, substantially as hereinbefore set forth, of the main axle, the carrying-wheel mounted thereon, the driver's seat supported from the axle outside of the carrying-wheel, the wide main frame sleeved upon said axle, the two-armed reel-supporting frame pivoted to said main frame immediately above its bearing upon the axle, the draft-tongue pivoted between forwardly-extending arms from said main frame, the lever pivoted to the draft-tongue by the same pivot-bolt securing the latter, the segment and its rack rising from the front end of one of the frame-bars above said pivot, a dog upon the lever taking into said rack, and a link-connection between the lever and the reel-frame.

11. The combination, substantially as hereinbefore set forth, of the main axle, the carrying-wheel mounted thereon, the driver's seat supported from the axle outside of the carrying-wheel, the wide main frame sleeved to said axle, the two-armed reel-supporting frame pivoted to said main frame immediately above its bearing upon the axle, the equal racks upon said arms, the carriers and their equal pinions engaging with said racks, the worm-wheels, crank-shaft, and worms driving said pinions, the reel-shaft journaled in said carriers, the draft-tongue pivoted between forwardly-extending arms from the main frame, the lever pivoted to the draft-tongue at its joint with the main frame, and the link-connection between said lever and the reel-frame.

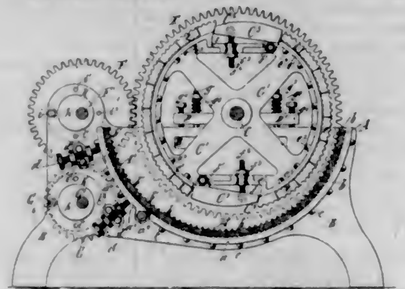
292,239. WORKING RATTAN. GEORGE W. LOMBARD, Westminster, Mass. Filed Nov. 12, 1883. (No model.)

Claim.—1. In a rattan-splitting machine, the combination, with rolls which guide the material to the splitting-cutter, of the guide-supporting arms pivoted for swinging action and connected with each other by intermeshing gear-teeth *e*, formed on arcs of circles coincident with the pivot-centers of said arms, and means for adjusting the relative distance between their axes of motion, substantially as shown and described.

2. The combination, with the swinging arms or blocks geared to each other, and provided with devices for guiding the rattan to the splitting-cutter, of a flat pressure-spring extending around the pivot-heads in C form, with its ends pressing against the outer sides of the blocks, in the manner set forth.

3. The combination, with the swinging blocks or arms, pivoted as at *f*, and toothed together for simultaneous action, and provided with means for guiding a rattan to the splitting-cutter, of the flat metal spring arranged as shown, and provided with adjusting-screws, the points of which enter depressions on the exterior of said arms for retaining and regulating the parts, substantially as set forth.

4. The combination, with the swinging arms E, geared together, and carrying devices for guiding the rattan to the splitting-cutter, of the support-bar A, adapted for vertical and lateral adjustment, upon which said arms are pivoted and supported, as hereinbefore set forth.



5. In a machine for splitting rattan, the combination, with the support-bar A, having the guiding devices mounted thereon, of the screw-threaded studs B, fitted to the bed or frame for upholding said bar, and the clamp-bolts C, substantially as shown and described.

6. The combination of the guide-blocks pivoted for swinging action, and connected with each other for uniform operation by intermeshing gear-teeth, and means for adjusting the axis of their swing movement to compensate for wear in the said gear-teeth.

7. In a guiding device for rattan-splitting machines, an eccentric bushing, F, in combination with the pivot-studs *f*, and guide-blocks E, provided with intermeshing gear-teeth *e*, as and for the purpose set forth.

8. The combination, with the studs *f* and guide-blocks E, of an eccentric bushing, F, of slightly greater height than the thickness of the block, whereby said bushing is adapted to be clamped in position by said stud while the block is free to swing thereon, as set forth.

292,240. MACHINE FOR OBTAINING FIBERS FROM FIBER-BEARING SUBSTANCES. E. LOUIS LOWE, Jr., Brooklyn, N. Y. Filed Nov. 17, 1883. (No model.)

Claim.—1. In a machine for obtaining fibers, a rotary cylinder composed of heads or supports and reversible staves secured to said heads or supports, and having opposite sides or faces grooved or roughened, so that either side or face may be presented for use, substantially as described.

2. In a machine for obtaining fibers, a bed or concave composed of supports and reversible staves secured to said supports, and having opposite sides or faces grooved or roughened, so that either side or face may be presented for use, substantially as described.

3. In a machine for obtaining fibers, a rotary cylinder composed of heads or supports and reversible staves secured to said heads or supports, and having in their opposite sides grooves or projections of different pitch, whereby provision is afforded, by reversing the staves, for operating upon different materials more effectively, substantially as described.

4. In a machine for obtaining fibers, a bed or concave composed of supports and reversible staves secured to said supports, and having in their opposite sides grooves or projections of different pitch, whereby provision is afforded, by reversing the staves, for operating upon different materials more effectively, substantially as described.

5. In a machine for obtaining fibers, the combination of a rotary cylinder and a bed or concave, both having their working-surfaces composed of reversible staves, which are grooved or roughened on opposite sides or faces, so that either side may be presented for use, substantially as described.

6. In a machine for obtaining fibers, the combination, with a bed or concave, of a rotary cylinder consisting of heads or circular supports having formed in their peripheries depressions or recesses, and staves secured to said heads or supports, a movable section or stave arranged in the depressions or recesses of the heads or supports, and forming a pocket or cavity in the cylinder, and devices whereby said section or stave may be adjusted toward and from the center of the cylinder to vary the size of the said pocket or cavity, substantially as described.

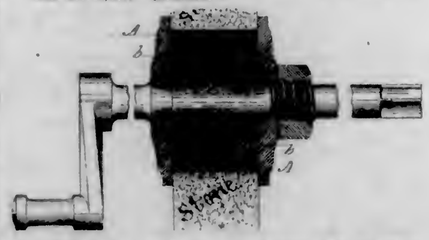
7. In a machine for obtaining fibers, the combination, with a rotary cylinder, of a bed or concave wherein the said cylinder works, extending beneath and upward on each side of the cylinder, and comprising a principal portion, which is fixed and extends beneath the cylinder and upward on the delivery side of the machine, and a hinged portion at the entrance side of the machine, and devices for adjusting said hinged portion toward and from the cylinder, whereby provision is afforded for varying the distance between the cylinder and bed or concave at the entrance, and without moving the principal working portion of the bed or concave, substantially as described.

8. In a machine for obtaining fibers, the combination, with a bed or concave approximately semicircular in form, of a cylinder which is approximately circular in form, working within the bed or concave, and bearings for said cylinder, which are movable horizontally to vary the distance between the bed or concave and cylinder at the entrance and delivery sides of the machine, substantially as described.

9. In a machine for obtaining fibers, the combination of a bed or concave, a cylinder working within the bed or concave, bearings or boxes for the cylinder, which are movable to vary the distance between the bed or concave and the cylinder at the entrance and delivery sides of the machine, a shaft geared to the cylinder and serving to impart motion thereto, and bearings or boxes for said shaft, which are movable, whereby provision is afforded for adjusting said shaft correspondingly to the cylinder, substantially as described.

10. The combination of the bed or concave A, the cylinder, the bearings D, supported by the frame of the machine, and provided with the slotted arms D^2, and bolts g^2, passing through the slotted arms, for securing said boxes in different positions on the frame of the machine, substantially as described.

11. The combination, with the bed or concave A, the cylinder, and the frame B, of the boxes D, provided with the lateral extensions D' and with the arms D^2, the bolts g', having a slotted connection with the frame, the springs g^3, applied to said bolts, the screws g^4, for limiting the downward movement of said boxes, and the bolts g^2, all substantially as described.



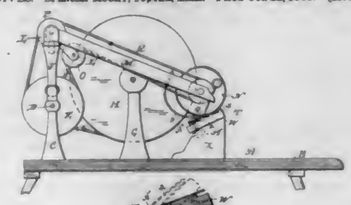
12. The combination of the frame B, the bed or concave A, the cylinder, the boxes D, movable as described, the shaft F', and wheels F E, connecting it with the cylinder, and the eccentric-boxes A, fitted to the frame B, and adapted to be turned therein, substantially as described.

292,241. FLUID-PRESSURE GOVERNOR. WILLIAM LYON, Sheffield, County of York, England. Filed Sept. 15, 1883. (No model.) Patented in England Mar. 27, 1882, No. 1,472.

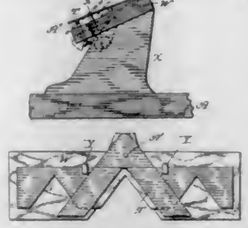
Claim.—The combination, in a governor for regulating the pressure and flow of gas, of a chamber closed at top and supplied with a suitable liquid, a communication between this chamber and the gas-outlet or consumer's pipe by which the pressure of the gas in the latter is brought to bear on a large area of liquid surface within this chamber, a second chamber, open at top, communicating with the first below the lowest level of the liquid, and a float in said second chamber connected with the gas-inlet valve, substantially as hereinbefore described, for the purposes set forth.

292,242. GRINDSTONE. EDWARD R. MASON, Des Moines, Iowa. Filed Nov. 12, 1883. (No model.)

Claim.—1. As a new article of manufacture, a disk for bushing grindstones, having loops or hook-shaped fastening devices projecting from its inside face, that are adapted to be embedded and fastened in cement, for the purpose set forth.



2. The combination of two disks, having loops or hook-shaped fastening devices projecting from their inside faces, with a grindstone by means of cement, in the manner set forth, for the purposes specified.



292,243. CLOTHES-CLAMP. FRANCIS J. MCBRIEN, Brooklyn, N. Y. Filed May 2, 1883. (No model.)

Claim.—As a new article of manufacture, a clamping device consisting of a frame, *a*, having prongs or lips *b b*, and an adjustable screw, *i*, a stationary jaw, *c*, and a movable jaw, *e*, fulcrumed or pivotally connected to said stationary jaw and provided with the cam *f*, by means of which said jaw may be moved toward the clothing and hold the same in place at will, substantially as set forth.

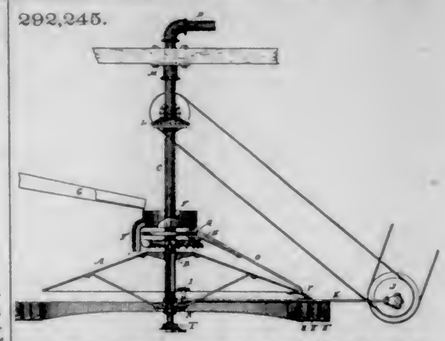
292,244. MACHINE FOR SHARPENING MOWING-MACHINE KNIVES. SPENCER MCCAY, Topeka, Kans. Filed Oct. 22, 1883. (Model.)

Claim.—1. In a machine for grinding mowing-machine knives, the combination of the support C, the part J which is pivoted thereon, and which supports the two guiding-pulleys, with the pivoted part M, which carries the grinding-stone in its outer end, whereby the stone has both a horizontal and vertical movement, substantially as shown.

2. The combination, with the emery-wheel, of an elastic forked guide, which extends upon both sides of the wheel, substantially as described.

3. In a machine for grinding mowing-machine knives, the combination of the movable frame, having the grinding-wheel journaled on its outer end, with the forked guide, which extends upon both sides of the wheel, and the set-screws S, substantially as set forth.

4. The combination of the pivoted table with the guide T, the set-screws A′ A″, and the projections *a* on the under side of the guide, substantially as specified.



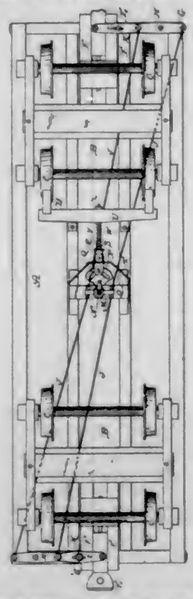
5. The combination of the table, the V-shaped guide, provided with a clamping device, and a set-screw for changing the angle at which the V-shaped guide is held in relation to the knife, substantially as described.

292,245. ORE-CONCENTRATOR. WALTER MCDERMOTT, Orange, N. J. Filed Feb. 26, 1883. (No model.)

Claim.—1. The combination, with a conical table flaring outwardly and downwardly, of the pulp and water distributers, a deflector adjustable as to length, the launders arranged around the outer edge of the table, and mechanism whereby the pulp and water distributers and the deflector are moved in unison, substantially as described.

2. The combination of a conical table, the pulp and water distributers, and the launders with an adjustable deflector revolving around the outer edge of and moving independently of the table, substantially as described.

292,245.



3. The combination, with a central shaft, a feed-box, and water-distributer, of a conical table loosely fitted to move independently of and be supported by said shaft, and mechanism, substantially as described, for revolving the shaft and giving the table a shaking motion independently of the motion of the shaft supporting it, as and for the purposes set forth.

4. The combination, with a central shaft, of the feed-box, water-distributer, deflector, and the conical table, all supported on said central shaft, and the table constructed to be moved independently of said shaft, and mechanism, substantially as described, for giving said shaft, feed-box, water-distributers, and deflector a continuous rotary motion, and the table a shaking motion, substantially as and for the purpose specified.

5. The combination, with the shaft C, of a conical table provided with collars B B′, loosely encircling said shaft, one of said collars having the upper part of the conical table attached thereto, and the other receiving the stays supporting the table, substantially as described.

6. The combination, with the oscillating table A, the shaft C, revolving independently of the table, and constructed and arranged to support and guide it, and mechanism, substantially as described, for revolving the shaft and giving the table a shaking motion independently of the shaft supporting it, as set forth.

292,246. AUTOMATIC CAR-BRAKE. JOHN D. MILLER, Big Sandy, assignor of one-third to Thos. M. Miers, Dallas, Tex. Filed June 11, 1883. (No model.)

Claim.—1. In an automatic car-brake, the combination of the endwise-moving draw-heads, the levers connected thereto, the connecting-rods attached to the levers, a partially-rotating shaft provided with cams, the connecting-rods, springs, and brake-beams, substantially as shown.

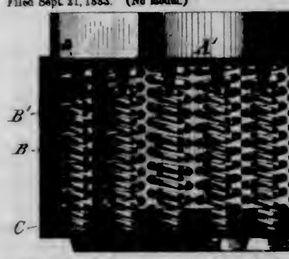
2. The combination of the endwise-moving draw-head, the levers H I, the connecting-rods, and the intermediate mechanism for operating the brake-beams, the lever I being slotted, so that its pivot can be adjusted endwise, substantially as described.

3. The combination, with the partially-rotating shaft provided with cams, and an operating mechanism, of the rods, the springs, and the sleeve, substantially as set forth.

292,247. WALL-PROTECTOR. DANIEL CALDWELL MILLETT, Milwaukee, Wis. Filed Oct. 1, 1883. (No model.)

Claim.—1. A wall-protector having a handle for convenience of manipulation, and provided with drip cups or troughs upon three sides of its surface, as and for the purpose described.

2. A wall-protector having a handle oblique to its surface, and provided with drip cups or troughs arranged, as shown, to catch and retain the drippings from the flat surface.

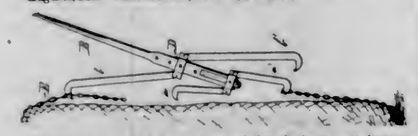


3. A wall-protector having a suitable handle, sharpened edge E, and rounded under edges at the other three sides, as and for the purpose shown.

4. The combination, in a wall-protector, of surface A, sharpened edge E, handle G, oblique to surface A, and drip cups or troughs B C D.

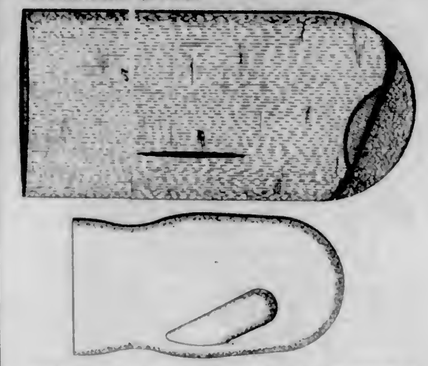
5. The combination, in a wall-protector, of surface A, sharpened edge E, and the edges F F of troughs B D, inclined back from the edge E, so that the wall-protector may be operated close to or under the edges of moldings, &c.

6. The combination, in a wall-protector, of surface A, with opposite curved ends inclined away from each other and toward trough C, so as to make inclined edges F F and inclined gutters or drip-cups B and D, as and for the purposes set forth.



292,248. CAR-SPRING. HARVEY J. MITCHELL, Philadelphia, Pa. Filed Sept. 21, 1883. (No model.)

Claim.—1. A perforated seat-plate adapted to fit and be maintained in position horizontally within a box or casing, said seat-plate having a series of openings each adapted to admit a coiled spring, substantially as set forth.

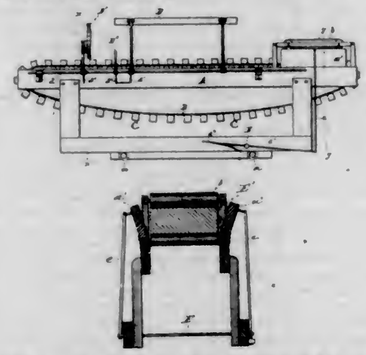


2. The combination of a box or casing, a perforated seat-plate fitting therein, a series of inner coils fitting in the openings of the seat-plate, a series of outer coils resting upon the seat-plate, and a cap-plate resting on said outer coils, substantially as set forth.

292,249. BALE-BAND TIGHTENER. CHARLES CARTER MONTAGUE, Augusta, Ark. Filed June 22, 1883. (No model.)

Claim.—A lever, A, having journaled on its lower end, between arms *f*, securely riveted, one on the lower and the other on the upper side of said lever, roller F, hooks *a a′*, pivoted in the ends *b b* of plates C, and hooks *b b′*, pivoted in the ends of plates D, which plates embrace the lever, and capable of being secured at any one of the holes d^3 in the lever by pin *d*, in combination with link-chain E, substantially as shown and described, and for the purposes set forth.

292,250. MANUFACTURING FELTED MITTENS FROM WOVEN OR KNITTED FABRIC. DEVILLO WASHINGTON NORTHRUP, Utica, N. Y. Filed Mar. 3, 1883. (No model.)



Claim.—1. As a new article of manufacture, a mitten composed of knitted or woven fabric felted or fulled, substantially as set forth.

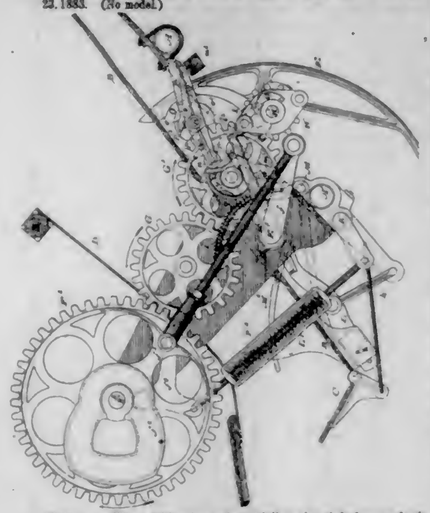
2. A process of making mittens, consisting, essentially, in constructing an exaggerated article from knitted or woven fabric, then fulling the article so constructed, and finally blocking it, if need be, substantially as set forth.

3. A process of making mittens, consisting, essentially, in constructing an exaggerated article from woven or knitted fabric by appropriately cutting and seaming the same, then fulling the article so constructed, and finally blocking it, if need be, substantially as set forth.

292,251. TILE-MACHINE. JAMES W. PENFIELD, Willoughby, Ohio. Filed Feb. 6, 1883. (No model.)

Claim.—1. In a tile-machine, the combination, with the cutter and an endless carrier, of a pivoted gravity-dog adapted to engage the cross-bars of the endless carrier and cause the cutter to be carried along with the endless carrier, substantially as set forth.

2. In a tile-machine, the combination, with the cutter and an endless carrier, of a pivoted gravity-dog adapted to engage the cross-bars of the carrier, and devices connecting the cutter and-dog, whereby the cutter when moved forward will release the dog and cause it to engage the endless carrier and cause the cutter to be carried along with the endless carrier, substantially as set forth.



3. In a tile-machine, the combination, with an endless carrier, of a stop constructed and arranged independent of the carrier and adapted to be adjusted to allow the end of the cut product to come in contact therewith and to carry the cutting device along with the carrier, substantially as set forth.

4. In a tile-machine, the combination, with the endless carriers, of an endless belt for sanding one face, and hinged side pieces for sanding the edges, substantially as set forth.

5. In a tile-machine, metal strips, by means of which the cross-bars are fastened to the endless belt, substantially as shown and described.

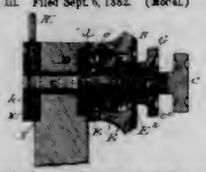
6. The combination, with the cut-off table, of rubber belting with one surface made of canton-flannel or its equivalent with the rough side out, substantially as and for the purpose shown and described.

292,252. GRAIN-BINDER. HENRY E. PRIDMORE, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed May 23, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the binder-arm, and knotter, and cord-holder, of a slack device actuated twice to each binding operation, once to prepare and furnish to the knotter slack cord from the spool-strand, and the second time to prepare and yield slack to the binder-arm as it recedes from the holder.

2. The combination, substantially as hereinbefore set forth, with the binder-arm, knotter, and cord-holder, of a slack device intermediate between said arm and the cord box or spool, and a tension device brought into effective action upon the cord at the moment said slack device is actuated to gather in or store up a slack length.

3. The combination, substantially as hereinbefore set forth, with the slack-lever, of a tension device lying or pressing upon the cord as it passes through said lever, and arranged in such manner that its pressure is increased as the lever rises.



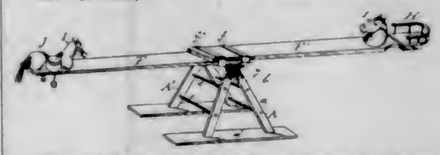
4. The combination, substantially as hereinbefore set forth, of the pivoted slack-lever, the ears formed at the effective end, the cam acting upon its heel end, the independently-pivoted tension-arm resting upon the cord between said ears, and the spring acting upon said tension-arm.

5. The combination, substantially as hereinbefore set forth, of the pivoted slack-lever having perforated ears at its free end, the cam acting upon its heel end, the independently-pivoted tension-arm resting upon the slack-lever between said ears, the spring pressing upon said tension-arm, and means whereby the force of said spring may be adjusted.

6. The combination, substantially as hereinbefore set forth, of the plate bolted to the frame-work, the pivot-pin formed upon said plate, the slack-lever journaled upon said pivot-pin and formed with perforated ears at its effective end, the tension-arm resting upon the slack-lever between said ears, the spring coiled about the pivot-pin and pressing at one end against a shoulder on the tension-arm, and the series of adjusting-pins arranged upon the plate, with any one of which the second end of the spring is adapted to engage to determine its stress.

7. The combination, substantially as hereinbefore set forth, with the pivoted slack-lever, of the cam having the outline shown and described.

292,253. COMBINATION-LOCK. JAMES N. RICE, Chicago, and JOSEPH HUMPHREYS, Austin, Ill. Filed Sept. 6, 1882. (Model.)



Claim.—1. In a lock, the combination of a shell having means for attaching it to a door or other object, tumblers within said shell, having slots and pins which strike each other when the tumblers are turned, a locking-plate to be attached to the object, and having a slot, *d*, a bolt having a bit which may be forced into the slot *d* or drawn into the slot formed by the tumblers, a set-screw for turning the tumblers, and a catch upon the opposite end of the bolt, and adapted to be turned with the latter, substantially as described.

2. In a lock, the combination of a shell having means for attaching it to an object, and having a movable dial on its face, tumblers within said case having pins and slots, and one having a screw-threaded extension, which extends outside of the shell, a nut or screw on said extension for clamping the dial in place and turning the tumblers by means of the screw-threaded tumbler, a locking-plate to be attached to the object, and having a bit-slot, a bolt passing through the tumblers, and having a bit which may be drawn in the tumblers' slots or forced into the slot in the locking-plate, and a catch upon the opposite end of the bolt, and adapted to be turned when the bit is in the tumblers' slots, substantially as described.

3. In a lock, the combination of a shell having means for attaching it to an object, a bolt passing through the shell and having a bit and catch, a series of tumblers, one journaled in the bolt, and having a screw-threaded extension at one end, a slot at the other, and an intermediate pin, and the others journaled upon an extension of the first tumbler, and having slots at one end adapted to register with the slot in the first tumbler, and pins attached to and between the tumblers, and a screw, G, for revolving the thimbles, substantially as described.

4. In a combination-lock, the combination of a tumbler having a screw-threaded extension, c^2, an extension, c^3, a slot, c^1, and a pin, c^5, a second tumbler journaled upon the extension c^3, and having a slot, c^1, and pins c' and c^{10}, a third tumbler journaled upon extension c^2, and having pin c^5 and slot c^1, a screw-nut, G, upon extension c^2, a bolt, C, having a bit, c, which may be drawn into the slots when the latter are made to register, and a catch which may be turned when the bit is in said slots, substantially as and for the purpose set forth.

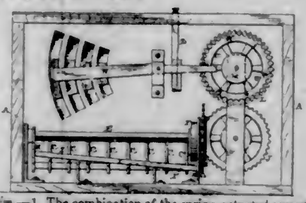
292,254. TEETER. GEORGE W. RICH, Chicago, Ill. Filed June 6, 1883. (No model.)

Claim.—1. In a teeter, the stands A, having inclined posts *a*, that are connected on top by the socketed pivot-castings *b*, substantially as and for the purpose set forth.

2. In a teeter, the planks F F', adjustably coupled by straps or bands *f f'*, secured to the ends of such planks, substantially as and for the purpose set forth.

3. In a teeter, the planks F F', adjustably coupled by straps or bands *f f'*, and one of the planks, F, having secured pivot-plates *g* for bolt *c*, substantially as and for the purpose set forth.

4. A teeter provided with pivotal or reversible seats H, substantially in the manner and for the purpose set forth.



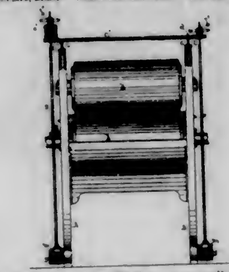
5. In a teeter, the seats H, pivotally secured upon the ends of planks F, each by a pivot-bolt, *h*, substantially as and for the purpose set forth.

6. In a teeter, the combination, with seats H, of handles I, secured upon planks F, substantially as and for the purpose described and shown.

292,255. SALVE. WILLIAM RICHARDSON, Buffalo, Mo. Filed May 21, 1883. (No specimens.)

Claim.—In a salve for the cure of piles, a compound formed of ooze of mullein-leaves, four ounces, (4 oz.;) hog's lard, four ounces, (4 oz.;) gum-camphor, one-half of one ounce, (½ oz.;) laudanum, eighty drops, (80 drops,) substantially as described, and for the purposes set forth.

292,256. ADDING-MACHINE. DAVID MARION RUSH, Louisburg, Mo. Filed July 25, 1883. (Model.)

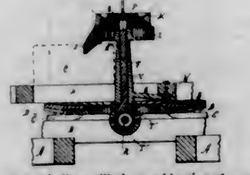


Claim.—1. The combination of the spring-actuated operating-levers C, pivoted at B, the operating-shaft E, and the rod I, set at an angle to the shaft, the lever C being made to bear upon the rod I, in the manner and for the purpose shown.

2. The combination, with the shaft M, having series of wheels provided with studs or projections, of the spring-actuated levers having numbered blocks secured to their ends, the frame having suitable slots through its side to display the figures, and the notched rod Z, for locking the levers in place, substantially as described.

3. The combination, with the shaft M, having a series of wheels which are provided with studs or projections, the spring-actuated levers having the numbered blocks secured to their inner ends, and the frame having suitable slots through its front side to display the figures, substantially as set forth.

292,257. SQUEEZE-ROLL. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Oct. 14, 1882. (No model.)

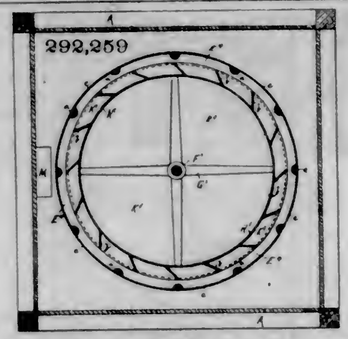


Claim.—1. In combination with the squeeze-rolls B and levers *c c*, the bar *a'*, rods *s e*, and levers *g*, substantially as described.

2. In combination with the roll B, the bar *a'*, provided with depressions *c' c'*, and the levers *c c*, provided with projections *d d*, fitting said depressions, substantially as described.

3. In combination with the levers *c c*, the bar *a'*, the roll B, the conical or egg shaped nuts *b'*, rods *s*, and levers *g*, substantially as described.

292,258. GRINDING-MILL. SILAS C. SCHOFIELD, Freeport, Ill. Filed May 18, 1883. (No model.)



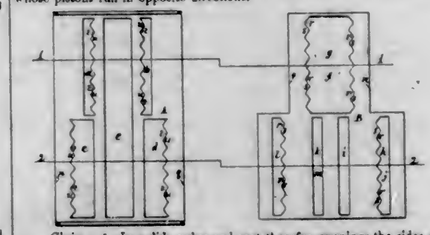
Claim.—1. In a grinding-mill, the combination of a sweep-actuated master-wheel, a hollow central vertical standard above said master-wheel and rigidly attached to it, a grinding-shell rigidly attached to the upper end of said standard, a vertical shaft rotating freely within said standard, a grinding-cone connected with said shaft at its upper end and rotated by and with it, and gearing connecting said master-wheel and vertical shaft, whereby the rotation of the master-wheel rotates the vertical shaft in an opposite direction, substantially as shown and described, and for the purpose set forth.

2. The combination of the master-wheel E, hollow vertical standard F, rigidly attached thereto, shell M, rigidly attached to said standard, shaft V, rotating freely in said standard, cone P, means connecting said cone P and shaft V, and adapted to impart the rotary motion of the shaft to the cone, and at the same time permit rocking motion of the cone, and gearing connecting the master-wheel and vertical shaft, whereby the rotation of the master-wheel produces reverse rotary motion of the shaft, substantially as shown and described, and for the purpose set forth.

3. The combination of the standard F, shell M, rigidly attached thereto, shaft V, rotating freely within said standard, and squared at its upper end, the cone P, provided with a central opening fitting loosely over said squared shaft, and the set-screw W sustaining the weight of said cone, and balancing the same on its point to permit adjustment of the grinding-faces of the cone and shell, substantially as shown and described.

292,259. FLOUR-DRESSING MACHINE. JOSEPH M. SCHUTT, Minneapolis, Minn. Filed May 25, 1883. (No model.)

Claim.—1. In a perpendicular flour-dressing machine, the combination of a slowly-revolving bolting-reel provided with inwardly-inclined rings E' E² E⁴ and vertical internal ribs, *a a*, and a rapidly-revolving beater moving in the same direction as the bolting-reel, and provided with ring-sections H' H² H³, beater-blades *b b*, and horizontal disks K' K² K³, substantially as and for the purpose herein specified.



2. In a perpendicular flour-dressing machine, the combination of the revolving bolting-reel, constructed with the inwardly-inclined rings E' E² E⁴ and vertical ribs *a a*, the beater-shaft, the beater-rings H' H² H³, inclined beater-blades *b b*, and horizontal disks K' K² K³, substantially as and for the purpose herein specified.

292,260. UTILIZING WASTE CALCIUM CHLORIDE AND SULPHATE. CONRAD SEMPER, Philadelphia, Pa. Filed Apr. 23, 1883. (No specimens.)

Claim.—The method of utilizing waste sulphate of calcium produced in the manufacture of acetic acid from acetate of lime, which consists in subjecting said product to a high temperature, as and for the purpose described.

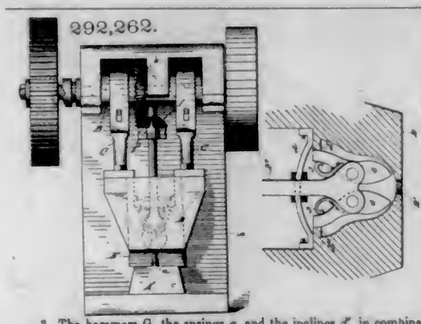
292,261. SLIDE-VALVE. HENRY F. SHAW, Boston, Mass. Filed June 14, 1883. (No model.)

Brief.—The valve supplies and exhausts steam from two cylinders whose pistons run in opposite directions.

Claim.—1. In a slide-valve and seat therefor, openings the sides of which have projections and grooves in their edges or edge faces, whereby one or more passages across the plane of contact of valve and valve-seat are irregular or zigzag in shape, substantially as specified.

2. In combination with the chambers *j* and *m*, openings *h i* and *k l* in the valve, and ports *c*, *d*, and *e* in the seat, said openings and ports being so located with reference to each other that either of the openings *i* and *k* is well over the port *e* when that one of the openings *h* and *l* leading to the same chamber is about to enter upon the corresponding one of the ports *c* and *d*, substantially as shown and specified.

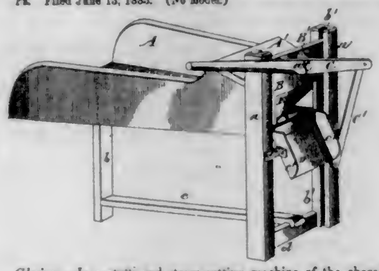
3. A valve consisting of two parts, one of said parts corresponding to a D-valve, and the other of said parts corresponding to a B-valve, the edges of passages and ports presenting projections and grooves, to provide one or more passages across the plane of contact of valve and valve-seat of an irregular or zigzag shape, as set forth.



4. A valve, being a combination of a D-valve and a B-valve, the openings in that part of which that corresponds to a B-valve and the ports in the seat therefor are located in such relation to each other that when the opening leading from either of the two chambers is well over the common exhaust-port in the seat the port leading from the seat to the same chamber in the valve is about to be opened, substantially as and for the purpose set forth.

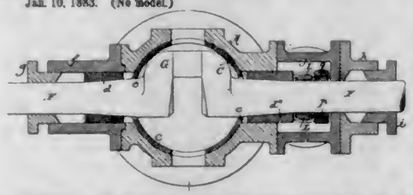
292,262. COMBINED PUNCHING AND FORGING MACHINE. JOHN P. SHEPHERD, Toledo, Ohio. Filed July 3, 1883. (No model.)

Claim.—1. In a combined punching and forging machine, the combination, with a punch and a reciprocating die, of forging mechanism contained within the die, and adapted to forge the surplus metal taken from the opening formed by the punch and die into a thimble around the said opening and integral with the plate, substantially as set forth.



2. The combination, with the reciprocating die D, of the inclosed forging mechanism, substantially as and for the purpose set forth.

292,262.



3. The hammers G, the springs *g*, and the inclines *d'*, in combination with the revolving and reciprocating shaft F, substantially as shown and described.

292,263. STRAW-CUTTER. JOHN N. SLAUGHENHAUP, Chambersburg, Pa. Filed June 13, 1883. (No model.)

Claim.—In a stalk and straw cutting machine of the character hereinbefore described, the combination, with the cutting devices, of the inclined spout D, provided with vertical rest D' and sides *c'*, said spout being secured to the posts *a* in the manner shown.

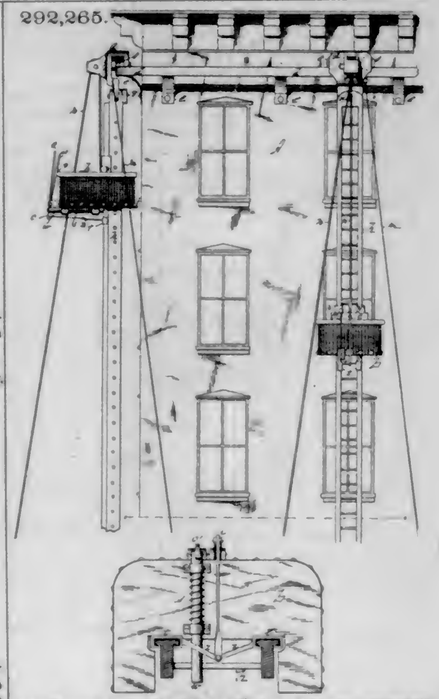
292,264. STEAM-ENGINE. GEO. SMITH, Jr., New York, N. Y. Filed Jan. 10, 1883. (No model.)

Claim.—1. In combination with the inclosed crank-shaft, the piston, and pitman-connection between said shaft and piston, apertures in the upper ends of the piston and the cylinder-head, provided, respectively, with removable lugs or caps *c* and *b*, all substantially as and for the purposes described.

2. In combination with the inclosed crank, the trunk-like extension D, provided with the stud I, and the apertures in said trunk-like extension and in the cylinder-head, provided, as described, with removable plugs *b* and *c*, the hollow pitman H, provided with an oil cup or pouch, *a*, and provided with oil-holes at *l* and *m*, for the purpose of keeping the bearings on crank G and stud I lubricated, all substantially as set forth.

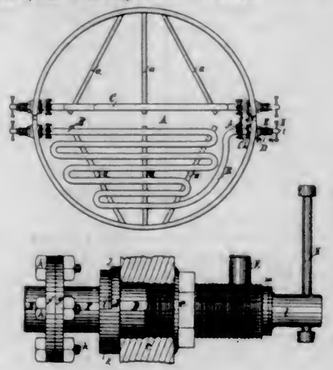
3. In an engine having an inclosed driving-crank, G, a piston, C, the cylindrical shell-like portion of which is all made in one piece, and with two longitudinal slots to permit the movement of the piston about the crank-shaft, and with a lateral slot or opening to permit the insertion of the crank G, all substantially as set forth.

292,265. FIRE-ESCAPE. JOSHUA C. STODDARD, Springfield, Mass. Filed Apr. 26, 1883. (No model.)



Brief.—The hoist is moved up and down up the T side bars of the ladder, and is provided with a bolt operated by a lever, to move it in between the rungs to hold it stationary, and brake-shoes bearing upon the said side bars and operated by a toggle-lever and a connected hand-lever.

Claim.—1. In combination with the projecting track *d*, the roller-head *a*, the ladder *h*, pivoted to said roller-head and having T-shaped bars, the car *b*, having the guides *y y* thereon, and means, substantially as described, for moving said car up and down, substantially as set forth.



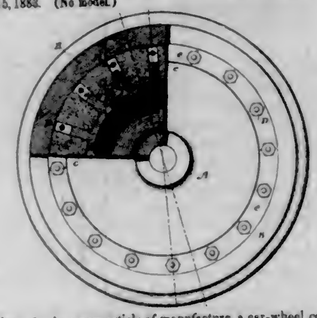
2. The combination, with the ladder *h*, of the car *b*, having the guides *y y* thereon, the lever *c'*, the bolt *w*, and the spring *s*, substantially as set forth.

3. The combination, with the ladder *h*, having T-shaped bars, of the car *b*, having the guides *y y* thereon, the lever *c*, the angle-braces *z z*, and the brake-shoes *l l*, substantially as set forth.

292,265.

292,266. PIPE-COUPLING FOR BEER-KETTLES. HERMAN STRATER, Jr., Boston, Mass. Filed Aug. 20, 1883. (No model.)

Claim.—1. The combination of a pipe secured in the side of a kettle, a coil in said kettle, a piece, F, joined to said coil and forming a nut at the end thereof, and a rod and screw, G, within said pipe, and adapted to screw into said piece F, substantially as and for the purpose set forth.



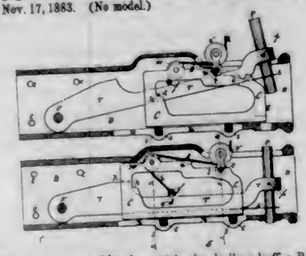
2. The combination of a coil, B, a pipe, D, an intermediate piece, F, a rod and screw, G, and a pipe, E, with a kettle, substantially as and for the purpose set forth.

3. The combination of a coil, B, a kettle, a pipe, D, fixed in the side of the kettle, a flange, *d*, on said pipe, and having extension *k*, an intermediate piece between said coil and said pipe, having a flange, *i*, and forming a nut, as specified, and a screw, G, substantially as and for the purpose set forth.

4. The combination of coil B, intermediate piece, F, packing *j*, pipe D, pipe E, and rod and screw G, with a kettle, substantially as and for the purpose set forth.

5. The combination, in and with a kettle, of a coil, B, an intermediate piece, F, packing *j*, pipe D, rod and screw G, and packing *m*, substantially as specified.

292,267. CAR-WHEEL. THEODORE THOMAS, New York, N. Y. Filed June 15, 1883. (No model.)



Claim.—1. As a new article of manufacture, a car-wheel consisting of a central portion having a series of wedge-shaped peripheral recesses, formed by side plates and by numerous radial cross-arms converging but slightly toward the center, as shown, in combination with a tire portion, and between the two a series of separated and independent blocks of wood, paper, or similar material, seated in the wedge-shaped recesses, as shown, to carry the entire load, substantially as and for the purposes set forth.

2. As a new article of manufacture, a car-wheel consisting of the center portion, A, having side plates, *b* and *c*, and numerous radial arms, *a a*, a series of blocks, C C, of wood, paper, or other suitable material, and a tire portion, B, all suitably connected, substantially as and for the purposes set forth.

3. As a new article of manufacture, a car-wheel consisting of a center portion, A, having side plates, *b* and *c*, and radial arms *a a*, a series of blocks, C C, of wood, paper, or other suitable material, a tire portion, B, having a flange, *e*, and securing-bolts D D, passing through metallic portions of the wheel only, substantially as and for the purposes set forth.

292,268. CAR-COUPLING. WALTER TURNBULL, New Orleans, La. Filed Nov. 17, 1883. (No model.)

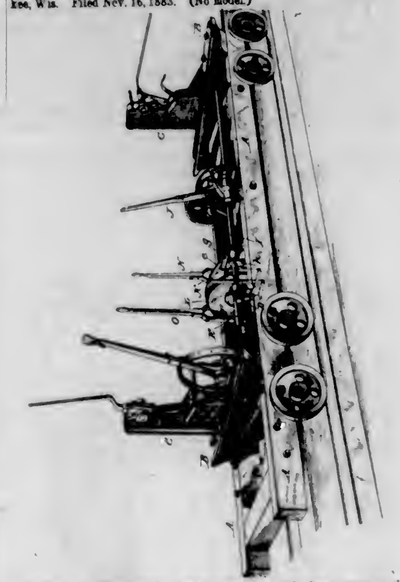
Claim.—1. The combination, with the hollow buffer B, provided with the opening N, the bolts *i i*, with sleeves *e e*, the slots *o o*, and the carriage C, having the shoulders A and *u*, the slot *l*, and carrying the sheave M, and the tongue or lever T, pivoted to buffer B, and provided with the pin *d*, the coupling-pin P, the spring *s*, and the eyebolt *f*, all substantially as described, and for the purpose specified.

2. The combination, with the buffer B and the carriage C, of the bolt *t*, working in slot *o o*, and carrying the sheave *v*, all substantially as set forth.

3. The combination, with the carriage C and the tongue T, of the chain *g*, attached to the eyebolt *f*, passing over sheave M, and under sheave *v*, and up and over sheave *x* to the lever R, and the lever R, pivoted at *y*, and having a handle at each end of same, all substantially as shown.

292,269. COMPOSITION FOR SIZING YARN. JOSEPH WARREN WATTLES, Canton, Mass. Filed June 30, 1883. (No specimens.)

Brief.—The invention relates especially to those described in the United States Letters Patent Nos. 186,435 and 172,216, granted to inventor, one of such patents covering a liquid and the other a dry composition of starch and acetic acid.



Claim.—A yarn sizing or dressing, substantially as described, composed of acetic acid, starch, and grease or oil, mixed or combined essentially as set forth.

292,270. CASE FOR HOLDING PENCILS, &c. HELLMUTH F. WERNER, Milwaukee, Wis. Filed June 18, 1883. (No model.)

Claim.—A device for holding pens, pencils, or other articles or instruments, consisting of the rigid, straight, box-like case A, having the wedge-shaped block D, grooved and fixed in the same, the bands E and F, and pad L, and sliding cover B, with flexible end *b b*, combined and arranged as set forth and described in this specification.

292,271. SAW-MILL SET-WORKS. THEODORE S. WILKIN, Milwaukee, Wis. Filed Nov. 16, 1883. (No model.)

Claim.—1. In a ratchet mechanism for producing rotary motion, the combination of a wheel having ratchet-teeth on its side face, and an oscillatory disk adapted to be moved to and from said side face, and provided with a series of ratchet-teeth to engage with those of the wheel.

2. In a ratchet mechanism for imparting rotary motion, the combination of a wheel having ratchet-teeth on its side face, an oscillatory disk adapted to move to and from said side face, and provided with ratchet-teeth to engage with those of the wheel, and a spring bearing against the disk and serving to hold it in contact with the wheel, whereby the two are caused to lock and move together when the disk is moved in a forward direction, and the disk is permitted to disengage itself from and move back independently of the wheel when operated in a backward direction.

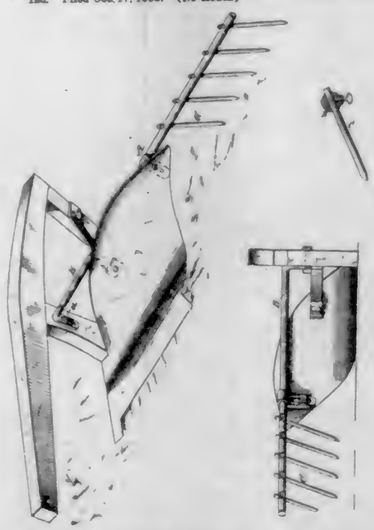
3. In a ratchet mechanism for imparting rotary motion, the combination of a wheel having ratchet-teeth on its side face, a disk adapted and arranged to move to and from said face, and provided with similar teeth, a spring bearing against the disk and serving to urge it into contact with the ratchet-wheel, and a beveled or wedge-shaped bar, arranged, substantially as shown, to enter between the disk and wheel to separate their faces.

4. The herein-described ratchet mechanism for producing rotary motion, consisting of wheel D, having ratchet-teeth on its side faces, disks F F, likewise provided with teeth on their inner faces, springs G, rock-shaft I, having arms *g h*, and links *e f*, connecting the disks with said arms, substantially as shown and described.

5. In combination with shaft E, ratchet-wheel D, having teeth on its side faces, disks F F, mounted loosely upon said shaft and furnished with teeth to engage with those of the ratchet-wheel, means, substan-

tially such as shown and described, for simultaneously moving the disks in reverse directions, springs G, bearing against the disks and serving to press them toward the wheel D, links K, having elongated openings *i* and beveled faces *j*, and encircling the shaft E between the wheel D and disks F, and a hand-lever, N, connected with the links, substantially as set forth.

6. The combination, substantially as shown and described, of shaft E, ratchet-wheel D, secured rigidly upon said shaft, ratchet-disk F, mounted loosely upon the shaft, a hand-lever connected with said disk, collar H, and spring G, bearing at one end against the disk and at the other end against the collar, as and for the purpose explained.

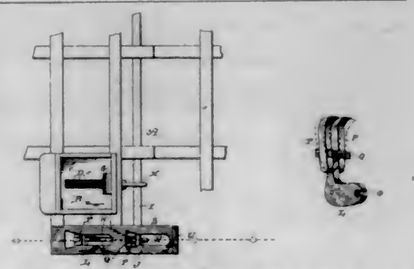


7. The combination, substantially as set forth, of shaft E, ratchet-wheel D, firmly secured thereon, and provided with a hub having a beveled end face, ratchet-disk F, spring G, serving to press the disk against the wheel, and slotted link K, having beveled face *j*, arranged, substantially as shown, to ride upon the beveled end of the hub of the wheel and to separate the disk and wheel.

8. In combination with ratchet-wheel D, having teeth on its side face, and with link or bar K, having beveled face *j*, arranged, substantially as shown, to bear against the hub of the ratchet-wheel, disk F, provided with teeth to engage with those of the wheel, and cut away, substantially as described and shown, to give room for the link or bar K.

9. In combination with a ratchet-wheel having teeth on its side face, and an oscillatory toothed disk adapted to impart rotary motion to said wheel, a brake-band applied to the circumference of the wheel and provided with an operating-lever, substantially as shown and described.

10. In combination with shaft E and ratchet-wheel D, secured thereon, disks F F, springs G G, and collars H, rock-shaft I, provided with arms *g h*, and hand-lever J, links *e f*, connecting the arms *g h* with the disks, brake-band L, and brake-lever O, all substantially as shown.

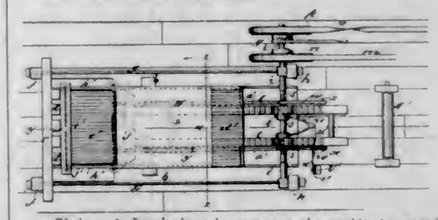


292,272. ATTACHMENT FOR PLOWS. VALENTINE WOOD, Peru, Ind. Filed Oct. 17, 1883. (No model.)

Claim.—In combination with a plow, the harrow attachment constructed substantially as shown and described, and consisting of the rod having oblique tooth sockets or perforations, and bent slotted portion or extremity attached to the plow-standard, the slotted eye-piece, arranged midway upon the rod and adjustably attached to the mold-board, and the harrow-teeth, adjustably secured in the oblique sockets or perforations, whereby the rod and the teeth may be elevated together, or the teeth receive independent vertical adjustment, the latter having both an outward and a backward inclination, as and for the purpose specified.

292,273. CHECK-ROW CORN-PLANTER. ANDERSON WOODWARD, Cameron, assignor of one-half to O. V. Porter, Monmouth, Ill. Filed Oct. 26, 1883. (No model.)

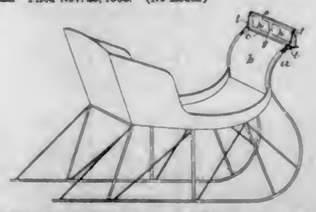
Claim.—1. In a corn-planter, the combination of the operating-shaft, the arms or levers connected thereto, a vertically-moving slide, a pivoted cut-off, the spring for forcing the lower end of the cut-off against the slide, and the seed-conductor, which is connected by a slot with the seed-box, substantially as shown.



2. The combination of the operating-shaft, provided with means for moving the slides, with the levers J L, provided with fingers, and and the slotted slide through which the upper ends of the fingers pass, substantially as described.

3. In a check-row corn-planter, the combination of the operating-levers, provided with fingers for the balls or stops upon the operating rope or chain to catch against, the fingers being adapted to open and let the balls or stops pass freely through after the levers have been moved far enough, substantially as set forth.

4. The combination of the guide, provided with slots which are widest at their rear ends, with the operating-levers provided with fingers, and guides to keep the fingers in a line with each other, the fingers being adapted to open outward, to let the balls or stops pass through when the fingers reach the wide ends of the slots, substantially as specified.

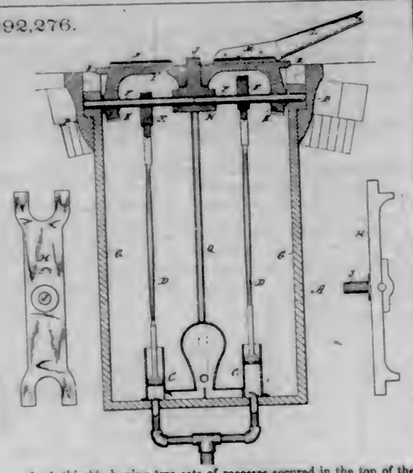


292,274. COTTON-PRESS. JOHN CHAPMAN ALLEN, South Sulphur, Tex. Filed Oct. 10, 1883. (No model.)

Claim.—1. In a horizontal cotton-press, the combination of the staffs *l*, having their upper and lower edges toothed for engaging the driving and withdrawing pinions *t k*, mounted, respectively, on transverse shafts *s i*, provided with driving-pulleys, with the shifting-arms *u*, connecting-rods *u'*, connected with pinions *t k*, and lever *v*, mounted on standard *v'*, equidistant from rods *u'*, whereby the pinions *t k* may be shifted in opposite directions to run the follower backward or forward, as may be desired, substantially as set forth.

2. The books *w*, mounted on shaft *s*, and adapted to automatically engage projections near the outer ends of the staffs *l*, and resist rearward pressure of the cotton, substantially as set forth.

292,275. SLEIGH-DASHER SCREEN. SAML. R. BAILEY, Amesbury, Mass. Filed Nov. 23, 1883. (No model.)



Claim.—The combination, with a sleigh, of a screen formed of thick glass, either transparent of reflective, mounted in a supporting-frame, and secured upon the dasher, substantially as specified.

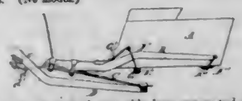
292,276. FIRE-ENGINE. WILLIAM F. BALDWIN, Grayville, Ill. Filed Aug. 28, 1883. (No model.)

Claim.—1. A thimble secured in the top of a cistern and a pump removably hung in said thimble, in combination with a horizontal cover journaled to rotate over the mouth of said thimble, having means for attaching handles to its upper side and means for communicating motion to said pump, as shown and described.

292,276.

2. A thimble having two sets of recesses secured in the top of the cistern, a pump adapted to hang in one set of said recesses, and a cross-bar adapted to rest in the other set of said recesses, in combination with a cover journaled to rotate upon said cross-bar, having sockets on its upper face to receive handles, and gear-teeth on its lower face to communicate with said pump, as shown and described.

3. The thimble B, having recesses *a*, secured in the top of a cistern, in combination with a pump having a frame, G, provided with lugs adapted to rest in said recesses, as shown and described.

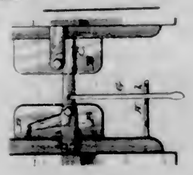


4. The combination, with a thimble permanently fixed in the top of a cistern, said thimble having shouldered recesses in it, of a pump having a frame provided with shoulders or tenons to rest in said recesses, substantially as described, whereby said pump may be suspended in the cistern, or the same pump may be removed intact from the cistern and from the thimble without loosening any binding devices.

5. The combination, with a thimble adapted to rest in the top of a cistern, having recesses *b* in it and a pump suspended by it, of a support, H, adapted to rest in said recesses, said support having the stud J, and a bearing for shafts F, as described.

6. The thimble B, having recesses *a* and *b*, the frame G, supported thereby, a pump supported in said frame, the eccentrics E, operating said pump, the pinions K, the master-wheel I, engaging them, the support H, provided with the stud J and bearings for a shaft, in combination with the two shafts F, journaled in said bearings and in frame G, each of said shafts carrying one of the eccentrics E and one pinion-wheel, K, as shown and described.

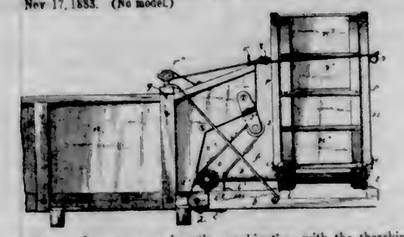
7. The thimble B, having recesses *b* and the bearing R, and the support H, adapted to rest in said recesses, having a stud, J, in combination with the master-wheel I, journaled on said stud, and provided with a peripheral edge adapted to rotate in bearing R, as described.



292,277. ROAD-CART. CHARLES S. BEEBE, Racine, Wis. Filed Aug. 15, 1883. (No model.)

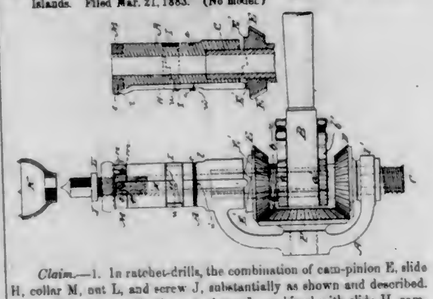
Claim.—1. In a road-cart, side bars supported at their front ends by springs, in combination with the body suspended therefrom by arms that point toward the center of the axle from opposite sides thereof, and rods passing transversely under the body, as set forth.

2. The side bars, supported as described, in combination with the body, arms F F', depending from the side bars on opposite sides of the axle, and pointing toward the center thereof, rods E E', shafts D, and the axle, as set forth.



292,278.

292,278. CAR-COUPLING. CHARLES W. BOND, Toledo, Ohio. Filed Sept. 13, 1883. (No model.)

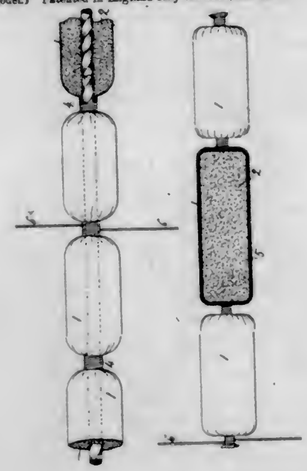


Claim.—The pivoted hook or coupling-link C, provided with the spring D, in combination with the draft-pin E upon the opposite car, substantially as and for the purposes set forth.

292,279. STRAW-STACKER. LEVI BOWERS, Martinsburg, Pa. Filed Nov. 17, 1883. (No model.)

Claim.—In a straw-stacker, the combination, with the thrashing-machine sill, of the removable stacker-sill, the carrier-shaft mounted on the stacker-sill, the miter-gear on its inner end, the transverse shaft at the rear of the machine, a miter-gear mounted thereon near each end, the carrier-frame, and endless slatted carrier, substantially as specified.

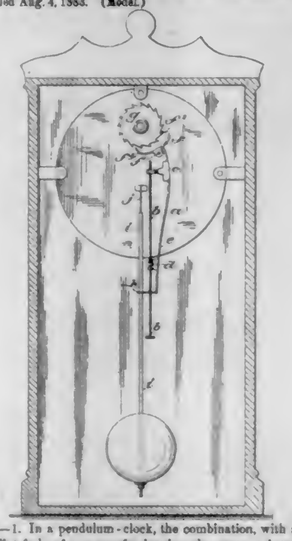
292,280. RATCHET-DRILL. WILLIAM BREDE, Honolulu, Hawaiian Islands. Filed Mar. 21, 1883. (No model.)



Claim.—1. In ratchet-drills, the combination of cam-pinion E, slide H, collar M, nut L, and screw J, substantially as shown and described.

2. In ratchet-drills, the cam-sleeve I, combined with slide H, cam-pinion E, and collar M, substantially as and for the purpose specified.

3. In ratchet-drills, the spring *e*, combined with feed-slide H, having a pin thereon, and cam-pinion E, as and for the purpose specified.

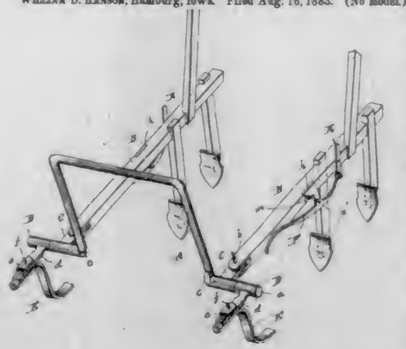


292,281. BUOYANT LIFE-LINE. FRANCIS WENTWORTH BREWSTER, Bloomsbury, County of Middlesex, England. Filed Oct. 15, 1883. (No model.) Patented in England May 10, 1883, No. 2,381.

Claim.—1. A flexible buoyant life-line device, consisting of a series of buoyant sections composed of or filled with any suitable buoyant material, in combination with a flexible center or core about which such sections are flexibly connected, end to end, into a continuous life-line of any desired length.

2. A flexible buoyant life-line device, consisting of a series of buoyant sections composed of or filled with suitable buoyant material and flexibly connected, end to end, in the form of a line or rope capable of being grasped in the hand, substantially as described.

292,282. APPARATUS FOR ADJUSTING THE BEAT OF PENDULUM-CLOCKS. GEORGE H. BROWN and HENRY J. WELTEROTH, Blossburg, Pa. Filed Aug. 4, 1883. (Model.)



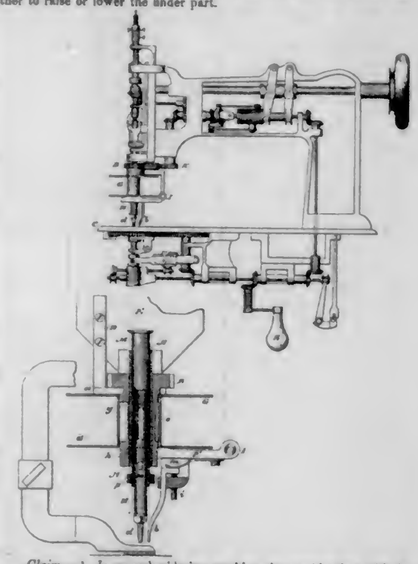
Claim.—1. In a pendulum-clock, the combination, with an elastic verge or pallet fork, of a screw for bowing the same, substantially as and for the purpose set forth.

2. A pendulum-clock constructed with a verge or pallet fork, *a*, fitted with bearings *c d* and screw-rod *b*, the verge or pallet being pivoted at *f'* to be engaged by the escapement-wheel *g*, and the verge-arm being connected at *h* with the pendulum-rod *i*, substantially as shown and described.

3. In pendulum-clocks, the verge or pallet fork *a*, constructed with bearings *c d*, a screw-rod, *b*, and an eye, *h*, substantially as shown and described.

4. In pendulum-clocks, the verge or pallet fork *a*, having a bearing *c*, formed of part *c'*, fixed to arm *e*, and a pivoted nut, *c²*, a bearing, *d*, fixed to arm *e*, and the adjusting screw-rod *b*, held rigidly lengthwise in the bearing *d*, and adjustable in the bearing *c* for deflecting the verge or pallet fork, substantially as shown and described.

292,283. TONGUELESS CULTIVATOR. JOHN B. CHRISTIAN and WILLIAM D. HANSON, Hamburg, Iowa. Filed Aug. 16, 1883. (No model.)



Claim.—1. The combination, in a cultivator, of the arched axle A, of the couplings C, pivoted to the spindles of the axle, and provided with stops *e*, adapted to abut against the vertical portions of the axle, the plow-beams pivoted to said couplings, and the sleeves D, fastened to the spindles of the axle, and serving to hold the couplings in place and as attachments for the shoes E, substantially as specified.

2. The combination, with the plow-beams and plows, of the fulcrum-plate *h*, its stop *m*, the pivoted shoe F, and the catch *k*, the whole arranged to operate substantially as specified.

292,284. EMBROIDERING-MACHINE. EMIL CORNELY, Paris, France. Filed June 30, 1883. (No model.)

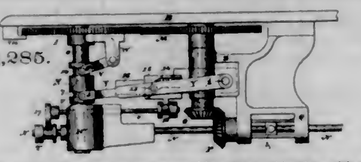
Brief.—The two machines shown in patents of same party, dated August 15, 1882, Nos. 262,742 and 262,743, are combined in this device to produce a machine to wind a thread around groups of threads consisting of the several threads brought into position simultaneously in producing the stitches in the several rows of chain-stitches. The nipple-tube is composed of two or more parts adapted to slide one within the other to raise or lower the under part.

Claim.—1. In an embroidering-machine, the combination, with devices for forming several parallel rows of stitches, of mechanism, as indicated, for winding a thread around the group of threads composing the several rows of stitches, substantially as described.

2. In an embroidering-machine, the combination, with devices for forming several rows of stitches, of a spool encircling the nipple-tube, a thread-carrier, and means for rotating the spool and thread-carrier around the needles, substantially as described.

3. The combination, with the operative elements of an organized sewing and embroidering machine, as set forth, of the nipple-tube, composed of detachable parts, which slide one within the other, and fastening means for securing the parts in their working position, substantially as described.

4. The combination, with the nipple-tube, formed in two parts, detachably connected together, of a spool surrounding said nipple-tube and carrying the thread to be wound around the needle-thread, substantially as described.



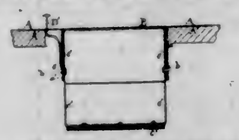
5. The combination of the two-part nipple-tube, the wheel B, turning freely around said tube, the spool encircling the hub of said wheel, and the thread-carrier and thread-guides connected and turning with said wheel, substantially as described.

6. In the art of sewing and embroidering fabric, the improvement consisting in forming several parallel rows of stitches and simultaneously with such formation winding an embroidering-thread around the group of sewing-threads, substantially as described.

292,285. EMBROIDERING-MACHINE. EMIL CORNELY, Paris, France. Filed June 30, 1883. (No model.) Patented in France May 23, 1882, No. 149,127, and in England May 25, 1882.

Brief.—Improvement upon the construction embraced in Letters Patent No. 262,743, dated August 15, 1882, granted to same party.

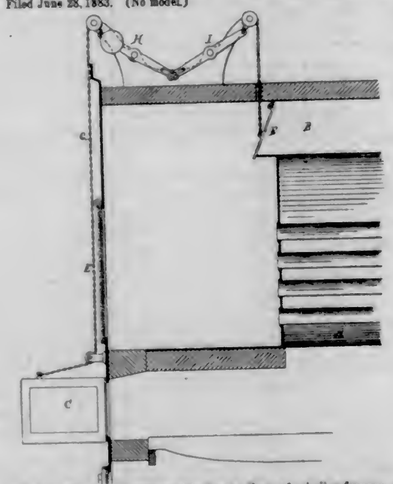
292,285.



Claim.—1. In an embroidering-machine, the combination, with the sleeve for operating the blades that supply thread to the needles, of the lever connected with said sleeve and reciprocating the same, the sliding block having a cam-groove, the stud on said lever entering said groove, and mechanism, as specified, for reciprocating said sliding block, substantially as described.

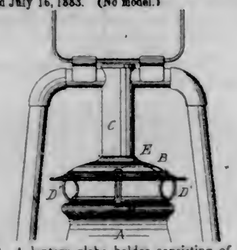
2. In an embroidering-machine, the combination of the blades, the sleeve connected therewith, as set forth, the lever for operating said sleeve, the sliding block having a cam-groove, the stud on said lever entering said groove, and the rod *v*, having a groove which receives a tooth of said block, and provided with a projection which engages collars on the horizontal rod N, substantially as described.

3. The combination of the lever and connections as specified, for communicating motion to the blades, the sliding block having a cam-groove, and the eccentric pin or roller carried by said lever and entering said groove, with means for operating said pin, whereby the stroke of said blades, and consequently the amount of thread supplied, may be regulated, substantially as described.



292,286. SPITTOON. JOSIAH J. DEAL, Wilmot, Ohio, assignor of two-thirds to William M. Johnston, same place. Filed Sept. 15, 1883. (No model.)

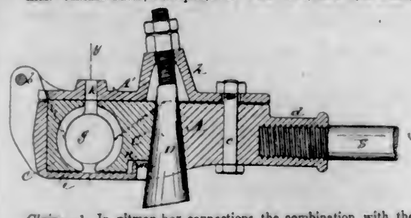
Claim.—1. A spittoon having a counter-weight attached to one edge, whereby the bowl, after having been tilted up by its lever for use, is automatically turned down again to be emptied, and the covering-plate made to cover the orifice in the floor, substantially as and for the purpose described.



2. The combination of the lever D, connecting-rod *d*, and revolving bowl C, having a covering-plate, B, and frame A, having ears *a' a'*, substantially as and for the purpose described.

292,287. DRAFT-REGULATOR. JAMES DEMPSEY, Lewiston, Me. Filed June 28, 1883. (No model.)

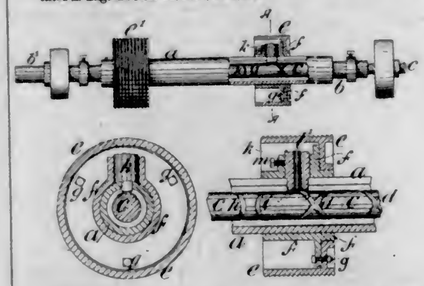
Claim.—The combination, with the fire-door of a boiler-furnace, of a chain attached to the fire-door, weighted lever H, mounted above the furnace, lever I, connected to lever H, as described, a chain leading to the damper, and the inclined damper, the chains being connected to the levers in the manner and for the purpose set forth.



292,288. LANTERN-GLOBE HOLDER. FREDERICK DIETZ, New York, N. Y. Filed July 16, 1883. (No model.)

Claim.—1. A lantern-globe holder consisting of a ring provided with coils at each side, as set forth, said coils being attached to the cap or bell above the globe, substantially as shown and described.

2. In a lantern-globe holder of the character herein specified, ring D, having coils D' at each side thereof, attached to the under side of cap or bell B, located above the globe, a thumb-piece, E, projecting from the ring, substantially as shown and described.

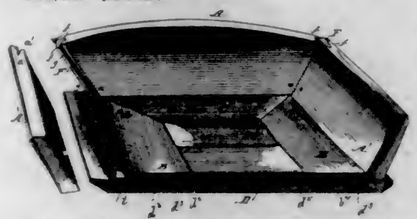


292,289. PITMAN-BOX CONNECTION FOR MOWERS AND REAPERS. CHARLES DIXON, Woodsport, N. Y. Filed Oct. 5, 1883. (No model.)

Claim.—1. In pitman-box connections, the combination, with the frame or head part A, having its chamber *e* constructed with interior tapering sides, the half-boxes C C' of which have sloping sides *i i*, and are constructed to stop short of the bottom of said chamber, the connection B, the adjusting or tightening-up key D, and the hinged lid A', provided with a tightening bolt or fastening, and arranged to bear down on the half box or boxes, to hold it or them in place, essentially as described.

2. In pitman-box connections, the combination, with the pin or ball B and its half-boxes C C', the one C' of which is constructed with a step, *n*, of the adjusting-key D, for the one half-box C', and the frame or head part A, constructed to form a chamber, *e*, having an opening in one of its sides and at its forward end, and formed with raised lips *l m* at such parts, whereby the base portion of said chamber is made to form a receptacle for oil to lubricate the pin or ball, substantially as specified.

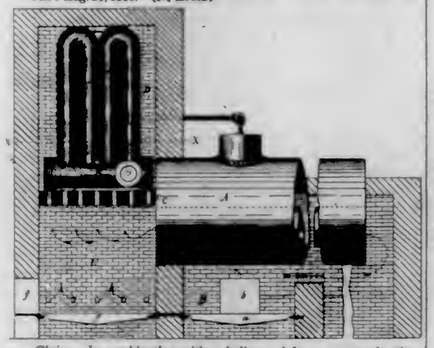
292,290. GRINDING APPARATUS. JOSEPH S. DRONSFIELD, Oldham, County of Lancaster, England. Filed Sept. 18, 1883. (No model.) Patented in England June 22, 1883, No. 3,108.



Claim.—1. In a card-grinding device, the combination of a hollow shaft and a screw-shaft having two separate sets of screw-threads, with shunting-grooves near the center and near the opposite ends, and two grinders each having a fork adapted to traverse one of said sets of screw-threads, all substantially as set forth.

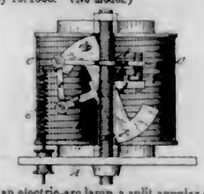
2. In a card-grinding device, the combination of two or more grinders and forks therefor with a rotating screw-shaft, having a corresponding number of sets of right and left hand screw-threads, and shunting-grooves at the ends of each set, substantially as described.

3. The combination of the screw-shaft and block *f* with the fork-holder *k*, adapted to an opening in said block large enough for the withdrawal of the fork the latter having its shank adapted to swivel in the said holder, substantially as specified.



292,291. CARRIAGE-SEAT. WALTON A. EDDY, Randolph, N.Y. Filed Oct. 9, 1883. (No model.)

Claim.—1. A vehicle-seat in which the joining edges of the back and side pieces are grooved and channeled to receive the flanges and ribs of an angle-iron for securing said side and back pieces together, substantially in the manner and for the purpose set forth.

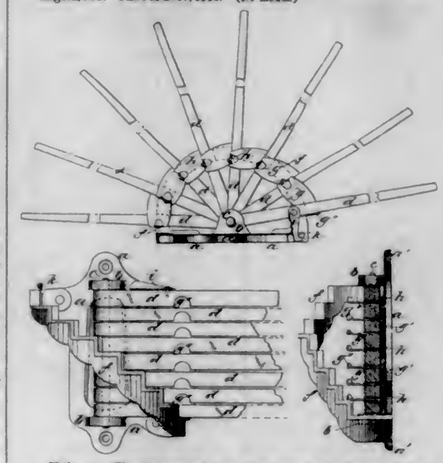


2. An angle-iron, F, having the flanges *f* and rib *f'*, adapted to enter suitable grooves in the joining edges of the back and side pieces of a vehicle-seat, whereby said pieces are held securely together, substantially in the manner and for the purpose set forth.

292,292. SUPERHEATER. H. WILLIAM ELLICOTT, Baltimore, Md. Filed Aug. 21, 1883. (No model.)

Claim.—In combination with a boiler and furnace, a combustion-chamber to which the products of imperfect combustion are introduced, and in which they are combined with other elements to assist in their thorough consumption, a heating-chamber separated from the combustion-chamber by a perforate partition, and a steam-receptacle located in the said heating-chamber and connected by a steam-pipe to the steam-space of the boiler, substantially as specified.

292,293. ELECTRIC-ARC LAMP. FREDERICK K. FITCH, New York, N.Y. Filed May 16, 1883. (No model.)



Claim.—1. In an electric-arc lamp, a split annular clutch, *f*, adapted to normally grip and lift the carbon rod when tilted, in combination with suitable means adapted to spread the split clutch and release said rod, substantially as described.

2. In an electric-arc lamp, the combination, with a split annular clutch, adapted by tilting to grip and lift the carbon rod, of an electro-magnetic device in the arc-circuit operating to elevate said clutch, and an electro-magnetic device in a derived circuit around the arc operating to spread the clutch and release the carbon rod, substantially as described.

3. In an electric-arc lamp, the combination of the rod B, clutch *f*, link *e*, arm *d*, oscillating armature D, and spring *c*, substantially as described.

4. In an electric-arc lamp, the combination, with the clutch *f*, adapted to grip and lift the carbon rod, and having forks *i*, of the derivation-magnet K, armature L, shaft *m*, finger *n*, having forks *o*, cam *p*, having lever *q*, and spring *r*, substantially as described.

292,294. TOWEL-RACK AND CLOTHES-BAR. JOHN T. FOSTER, Arlington, N.J. Filed MAR. 17, 1883. (No model.)

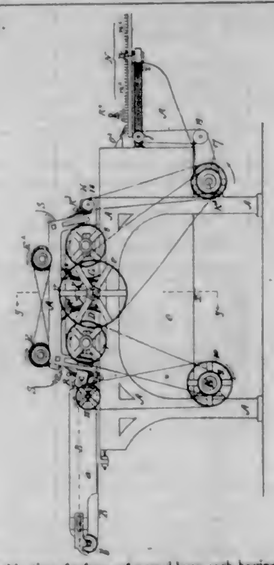
Claim.—1. The combination, with a base-plate, *a*, of the bars *d*, pivoted thereon, the semicircular stepped rim *f*, and the chain of links *g g*, constructed and applied to the bars *d* substantially as described, whereby they perform the double function of moving the bars and protecting them from wear, as and for the purpose set forth.

2. In a towel-rack, substantially as shown, and in combination with the base-plate *a*, the pivot-pin *c*, step part *f*, and overlying bars *d*, the series of links *g*, secured to the bars *d* and having the projections g^2, *h*, and *g'*, the said links being attached to the bars, as described, so as to intervene between the bars and the steps, the hook *i*, and stud *k*, all arranged and adapted to serve as and for the purposes set forth.

292,295. MACHINE FOR CLEANING WOOL. AUGUSTE FRATEUR, Antwerp, Belgium. Filed Jan. 29, 1883. (No model.) Patented in Belgium July 21, 1882, No. 58,538, Nov. 24, 1882, No. 59,653, and Mar. 28, 1883, No. 60,892; in France July 24, 1882, No. 150,219; in England Aug. 2, 1882, No. 3,675; in Germany Sept. 6, 1882, No. 21,582; in Austria-Hungary Sept. 18, 1882, No. 41,904 and No. 19,122; in Italy Nov. 30, 1882, No. 14,349; in Victoria Jan. 11, 1883, No. 3,478; in Spain Apr. 13, 1883; in Cape of Good Hope May 22, 1883, No. 243; in South Australia May 26, 1883, No. 360; in Natal May 29, 1883, No. 5,024; in Queensland Aug. 13, 1883, No. 526, and in New South Wales Aug. 14, 1883.

Brief.—The wool is presented to the action of the first toothed cylinder, and by a jet of water forced down between the teeth thereof, the burrs, &c., being impaled thereon, from which they are knocked by a doffer. After being acted upon by other cylinders, the wool is thrown into a tank of water and floated off onto a spiked frame, and by water-jets forced down among the spikes and carried off by drawing-rollers.

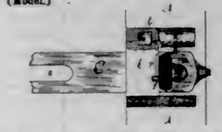
Claim.—1. Two toothed cylinders and mechanism for rotating the same with their teeth in contact, in combination with a water-pipe adjacent to the point of junction of the two cylinders, and adapted to project a stream of water at that point to assist in the transfer of the fibers from the teeth of one cylinder to those of the other, all substantially as set forth.



2. The combination of a frame having projecting teeth, and devices for feeding wool or other fibers thereto, with a pipe adapted to project a stream of water onto the teeth in a direction opposite to that in which they point, whereby the lumps in the wool will be spiked on the teeth and the fibers forced down between the teeth, all substantially as described.

3. The combination of feed-rolls and a toothed cylinder, D, with a pipe, R, adapted to force a stream of water onto the cylinder D against the points of its teeth, a doffer-cylinder, and mechanism for operating the cylinders and rolls, substantially as specified.

4. The combination of feed-rolls and a toothed cylinder, D, with a slotted pipe, R, a doffer-cylinder, E, a pipe, R', a roll or drum to take off the fibers from the cylinder D, and mechanism for operating the cylinders and rolls, substantially as described.



5. The combination of a frame of spaced bars, each having projecting teeth, with a pipe adapted to throw streams of water against the points of said teeth, as set forth.

292,295.

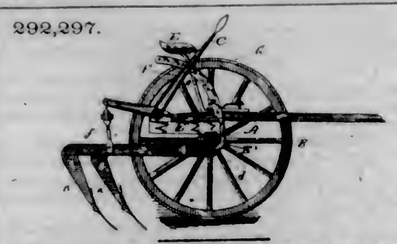
6. The combination of a frame of spaced bars, each having projecting teeth, and a pipe adapted to throw streams of water against the points of said teeth, with devices for feeding wool or other fibers onto said frame, and rollers *i*, and mechanism for operating the same, to withdraw the fibers from between the bars, substantially as described.

292,296. SEAL-LOCK. ROBERT FREW, Pittsburg, Pa. Filed Aug. 11, 1883. (Model.)

Claim.—1. In combination with a hasp and front plate, the latter having a T-head or equivalent device engaging with the hasp and guides for holding the seal, a concealed catch in said plate, and a frangible seal fitting in said guides and held by said concealed catch, substantially as and for the purposes set forth.

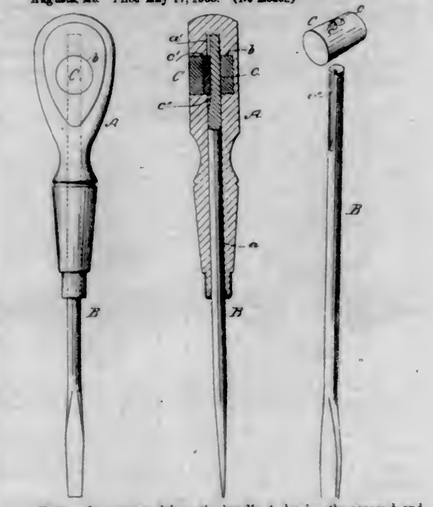
2. In seal-locks, the combination, with the hasp, of the lock-plate having the rotating T-head *e*, engaging with the hasp, guides *h h'*, extending from the edge of the plate to the T-head, and suitable catch, *l*, and the frangible seal *k*, sliding within said guides, fitting against said T-head and held by said catch, substantially as and for the purposes set forth.

3. In seal-locks, the combination, with the hasp, of the lock-plate having the rotating T-head *e*, engaging with the hasp, and provided with the guides *h h'*, extending from the edge of the plate to the T-head, stop *f*, and suitable catch, *l*, and the frangible seal *k*, sliding within said guides, fitting against said T-head, and held by said catch, substantially as and for the purposes set forth.



4. In combination with the hasp having the elongated slot *c*, the lock-plate provided with a suitable catch and having the boss or staple *d* corresponding thereto, and provided with the stop *f* on the face thereof, the rotating T-head *e*, working through said plate, and the frangible seal *k*, adapted to engage with said catch and fit against said T-head, substantially as and for the purposes set forth.

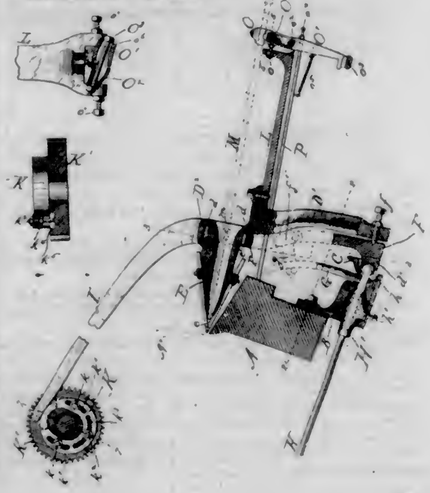
292,297. GRAPE AND ORCHARD CULTIVATOR. WM. FROHLING, Sr., San Jose, Cal. Filed Sept. 22, 1883. (No model.)



Claim.—1. In a grape and orchard cultivator, the beams D, brackets E^2, cross-bar C', and rod or cylindrical bar *d*, in combination with the shovel-beams D^2, jointed to hub-sleeves D^3, and frame E', substantially as shown, and for the purpose described.

2. The combination of the shovel-beams D^2, jointed to the hub-sleeves D^3, with the shovel-beams D, secured to frame E' by brackets E^2, connecting-bars C', and rod *d*, substantially as shown, and for the purpose described.

292,297.



292,298. SCREW-DRIVER. GEORGE E. GAY and JOHN H. PARSONS, Augusta, Me. Filed May 17, 1883. (No model.)

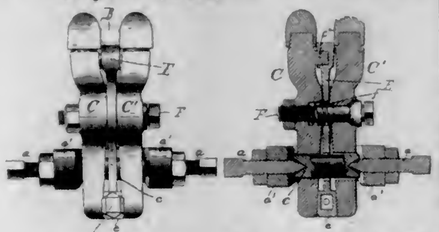
Claim.—In a screw-driver, the handle A, having the recess *b* and axial hole *a*, reaching past its recess, as at *a'*, said extended portion *a'* being made smaller than the hole *a*, in combination with the blade B, having the longitudinal groove *c''* in its shank, plug C, having an aperture, *c*, and key *c'*, substantially as and for the purpose set forth.

292,299. NAIL-PLATE FEEDER. JOHN C. GOULD, Chicago, Ill. Filed Mar. 23, 1883. (No model.)

Claim.—1. In a nail-plate feeder, the combination, with the gripping-levers, one of which is provided with the wedging-surface a^3, of the diagonal bolt O^2, substantially as specified.

2. In a nail-plate feeder, the plate-feeding devices, consisting of the levers united at their lower ends, one of them being pivoted and the other being secured to a stationary point, the diagonal bolt, the wedging-surface a^3, and the stop-rod P, substantially as specified.

3. The combination, with the gripping-levers, of the gripping-surfaced thimbles O, secured thereon by friction, substantially as specified.



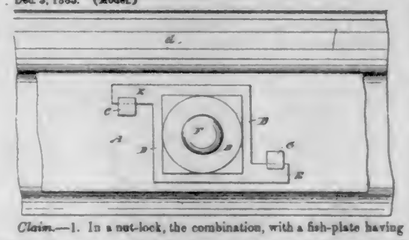
4. The combination of the eccentric, the lever resting thereon without being attached thereto, and the pivoted barrel-support to which said lever is attached, substantially as specified.

5. The combination of the eccentric, the lever resting thereon without being attached thereto, and the pivoted barrel-support, to which said lever is attached by an adjustable attachment, substantially as specified.

6. The combination, with the vibrating segment and its operating devices, of the oscillating rod by which said devices are actuated when said rod is provided with a detachable head, substantially as set forth.

7. The combination, with the lever whereby the feeder is oscillated to and from the knives, of the adjustable eccentric whereby said lever is operated, substantially as specified.

292,300. NAIL-PLATE FEEDER. JOHN C. GOULD, Chicago, Ill. Filed Aug. 3, 1883. (No model.)



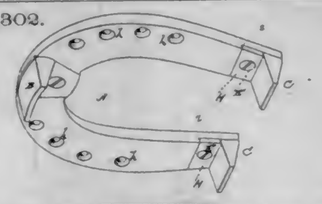
Claim.—1. The combination, with the grippers, of the intermediate wedge-piece and the stop-rod actuating said wedge-piece, substantially as specified.

2. The combination, with the grippers, of the intermediate piece having a wedge for spreading the lower ends of the grippers, and a spring, *f* for spreading the upper ends of the grippers, substantially as specified.

3. The combination, with the grippers, of the intermediate piece, E, for opening and closing the grippers and forming a support for the plate-rod, substantially as specified.

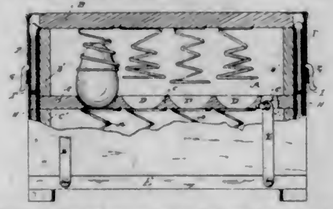
292,301. NUT-LOCK. JOHN W. HALEY, North Hartland, Vt. Filed Dec. 3, 1883. (Model.)

Claim.—1. In a nut-lock, the combination, with a fish-plate having lugs C on its outer surface, of the frame or nut-check D, having lugs E at opposite corners, the said lugs being adapted to catch on the lugs C, substantially as herein shown and described.



2. In a nut-lock, the combination, with the fish-plate A, having hook-lugs C, of the frame or nut-check D, having diagonally-opposite lugs E, substantially as herein shown and described.

3. In a nut-lock, the frame or nut-check D, provided with lugs E at diagonally-opposite points, substantially as herein shown and described.



292,302. HORSESHOE. ALBERT E. HALL, Quincy, Minn. Filed June 28, 1883. (No model.)

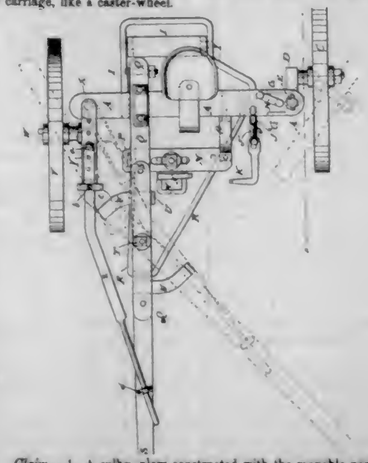
Claim.—A horseshoe having its under face recessed at its end and toe portions, and provided at each portion with two threaded perforations, in combination with the calks having threaded studs to engage the outer perforation of each recessed portion, the perforated locking-plates adapted to fit, respectively, the interspaces of the recesses, one end engaging the shoulders *x* of the shoe and the other the inner sides of the calks, and securing-screws, substantially as specified.

292,302.

292,303. EGG-CARRIER. RICHARD HUNTER HARRIS, Petersburg, Va. Filed Aug. 2, 1883. (Model.)

Claim.—1. In egg-carriers, a rigid hollowed base, in combination with a yielding egg-encircling surface projecting from the roof of each tier, for the purpose specified.

2. In egg-carriers, the combination, with a perforated rigid hollowed base, of a spiral yielding surface concentric with the axis of the former, substantially as herein described.



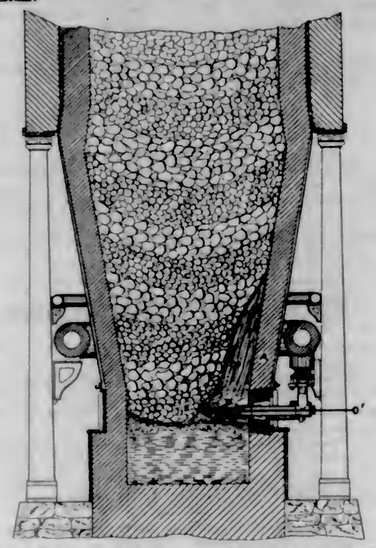
3. In egg-carriers, the combination, with rigid hollowed bases D D, having perforations D′ D′, of spiral springs A A, projecting from roof B, concentric with the axis of the base and that of the egg inserted between them, for the purpose herein set forth.

4. In egg-carriers, the combination, with the roof B, floor C, and the walls B′ B′ C′ C′, composing the respective tiers, of the rods H H, adapted to guide and sustain them in position, pins I I, and pivoted braces K K, substantially as shown and described.

5. In egg-carriers, the combination, with the roof B, from which project springs A A, and perforated hollowed bases D D, forming an unyielding support for the eggs, of rods H H, adapted to guide and connect the independent tiers, having buttons G G inserted therein, and hasps F F, projecting from the roof of the upper tier, whereby a secure fastening is obtained and the independent tiers virtually made a unit, for the purpose herein fully set forth.

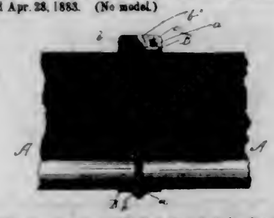
292,304. SULKY-PLOW. THOMAS TROUNDALE HARRISON, Aubrey, Kans. Filed Oct. 22, 1883. (No model.)

Brief.—A jointed tongue connected by a lever with the swiveled post of the furrow-wheel. Turning the tongue turns the wheel. The land-wheel is also swiveled and left free to adapt itself to the motion of the carriage, like a caster-wheel.



Claim.—1. A sulky-plow constructed with the movable part S of the tongue connected with the furrow-wheel by a lever, Z, adjustably secured to a crank-arm, Y, which is attached to or forms part of the swiveled rod X, in combination with the furrow-wheel V, directly operated by said rod X, substantially as set forth.

2. In a sulky-plow, the combination, with the movable part S of the tongue, and the crank-arm Y of the rod carrying the crank-axle of the furrow-wheel, of the lever Z and the eyebolt *d*, substantially as herein shown and described, whereby the lateral movement of the said movable part of the tongue is made to turn the said furrow-wheel laterally, as set forth.

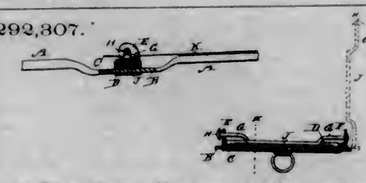


3. The movable portion S of the tongue, in combination with the stop-bars U, attached to the stationary part Q of the tongue, whereby lateral movement of the part S is prevented in one direction and limited in the opposite direction, substantially as set forth.

292,305. METHOD OF PREVENTING CHILLING OF BLAST-FURNACES. JOHN M. HARTMAN, Philadelphia, Pa. Filed Oct. 17, 1883. (No model.)

Claim.—The hereinbefore-described method of preventing the chilling of blast-furnaces through the formation of cinder shells, and of restoring the blast-circulation therein by exploding a torpedo at a point opposite to the tuyere and in juxtaposition to the cinder shell, and immediately forcing the blast through the fissures formed by such explosion.

292,306. JOINT FOR AIR-PIPES. BENJAMIN R. HAWLEY, Chicago, Ill. Filed Apr. 28, 1883. (No model.)

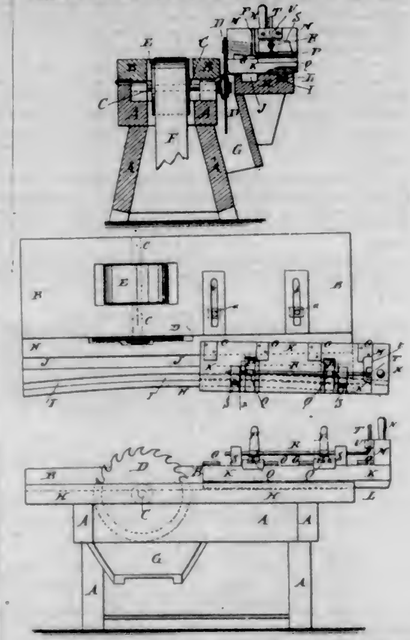


Claim.—The combination, with the pipes A A, having the diagonal flanges *a*, meeting at their outer edges, of the rigid clamping-ring provided with a tightening device, room being left between the base of the ring and the pipe to permit tightening of the ring and lengthening of the pipe, substantially as and for the purpose set forth.

292,307. CLAMP FOR SHEET-HOLDERS. ALFRED P. HAYDEN and FRANKIE PICKUP, Brooklyn, N. Y. Filed Mar. 16, 1883. (No model.)

Claim.—1. A sheet-holding clamp consisting of a longitudinally-grooved plate or strip provided at one end with a hinged jaw, and a hook at the other end, combined with a wire, G, having a bent part, J, fitting in the groove of the plate or strip, substantially as described, and for the purpose set forth.

292,307.



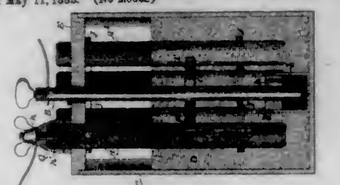
2. The combination, with two covers, united by a back, of the longitudinally-grooved strip or plate C, attached to the inner surface of the back, the hook E at one end of the strip, the hinged jaw F at the other end of the strip, and the wire G, attached to the hinged jaw F, substantially as herein shown and described, and for the purpose set forth.

292,308. RETAINER FOR NECKTIES. HENRY HEATH, New York, N. Y., assignor to Fisk, Clark & Flagg, same place. Filed Nov. 12, 1883. (No model.)

Claim.—A necktie-retainer constructed substantially as herein described, and consisting of a stiffening-piece, as A, a bit of wire, as B, doubled upon itself in the middle and formed into an eye, a device, as E, led through the eye to secure the wire upon one side of the stiffening-piece, and projecting ends, as *e e*, extending from the eye to the edge of the stiffening-piece on the one side thereof, and bent over said edge to constitute diverging arms upon the opposite side, adapted to embrace a collar-button, substantially as set forth.

292,309. STAVE AND SHINGLE SAWING MACHINE. WILLIAM JACKSON HENDERSON, Naylor, Ga. Filed May 5, 1883. (No model.)

Claim.—1. A stave and shingle machine constructed substantially as herein shown and described, and consisting of the frame, the table and the saw, the carriage-table provided with a curved groove and a straight groove, and the carriage provided with the inclined supporting-blocks, the adjustable knees, and the rod having rigid arms, as set forth.



2. In a stave and shingle machine, the combination, with the frame A, of the carriage-table H, provided with a curved groove, I, and a straight groove, J, substantially as herein shown and described, to adapt the said table to receive and guide the carriage, as set forth.

3. In a stave and shingle machine, the combination, with the frame

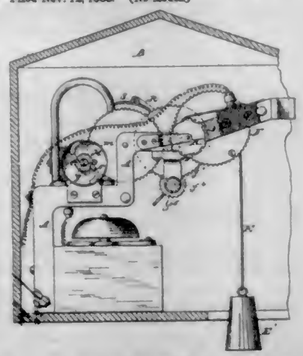
A and the carriage-table H, having curved groove I, of the carriage K, having head-block M and handle N, the inclined supporting-blocks O, the adjustable knees P, and the rod R, having rigid arms Q and T, substantially as herein shown and described, whereby the staves will be supported and carried to and past the saw in proper position, as set forth.

4. In a stave and shingle machine, the combination, with the table B, having grooves *b*, of the gage-bar Z, the bolts *a*, and the gage-screw *c*, substantially as herein shown and described, whereby the shingle-block can be adjusted upon the carriage to give shingles of any desired thickness and taper, as set forth.

292,310. ELECTRIC BATTERY. IDA C. HEMMER, New York, N. Y. Filed May 11, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with a series of separate carbon plates or rods, of a carbon ring or plate in contact with each of said rods, and a zinc electrode extending through said ring or plate.

2. The combination, substantially as hereinbefore set forth, of a series of carbon rods or plates constituting a battery element, a separate ring or plate of the same material electrically connecting said rods or plates at a point below the surface of the exciting-fluid, and a non-conducting jar-cover forming a support for said rods or plates.



3. The combination, substantially as hereinbefore set forth, of an annular series of carbon rods constituting a battery element, a carbon ring supported within said series and in electrical contact with each of said rods, a zinc electrode extending through said carbon ring, and a mercury-reservoir attached to the extremity of said zinc electrode.

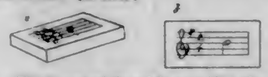
4. The combination, substantially as hereinbefore set forth, of an annular series of carbon rods constituting a battery element, a jar-cover forming a support for said rods, a carbon ring beneath the surface of the exciting-fluid, electrically connecting said rods, a conducting thimble or cap united with the upper extremity of one of said rods, and means, substantially such as described, for securing an electric conductor to said thimble.

5. The combination, substantially as hereinbefore set forth, of a zinc electrode, a non-conducting mercury-reservoir having a perforated cover, which serves both to connect said reservoir with the lower extremity of said electrode and to permit a gradual escape of the mercury contained therein.

6. The combination, substantially as hereinbefore set forth, of the carbon rods A' A^2, &c., the carbon plate or ring *a*, the electrode B, the cup *b*, and the cover *b'*.

292,311. MAGNETO-ELECTRICAL ALARM. JOSEPH R. H. HINTON, Baltimore, Md., assignor to the Viaduct Manufacturing Company of Maryland. Filed Nov. 12, 1883. (No model.)

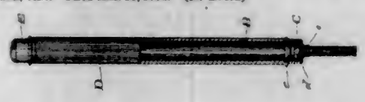
Claim.—1. The combination, with the train of gearing operating the signaling device, of a brake arranged for application to one of the wheels of such train, and adapted to be thrown into frictional contact therewith by the insertion of the winding-key, substantially as shown and described.



2. The combination, with the train having the barrel-shaft projecting and adapted to receive a key, of the pivoted bent lever having an arm, R, carrying a brake arranged for application to one of the wheels of the train, and an arm, R', arranged adjacent to the projecting key-receiving portion of the winding-shaft, and in such position as to be moved by the key for applying the brake, substantially as shown.

3. The combination, with the winding-barrel and its shaft, of the auxiliary ratchet-wheel *u* and the pivoted pawl *u'*, provided with a thumb-piece, substantially as described, and for the purpose set forth.

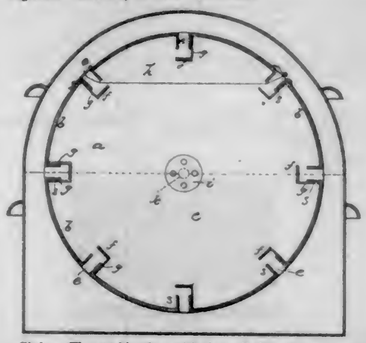
4. The combination, with the actuating-weight and the train, of the shaft f^5, carrying the pinion f^9, meshing with one of the wheels of said train, and provided with a thumb-piece by which it may be turned, whereby an initial movement is given to the train, overcoming its inertia, and supplementing the action of the weight, substantially as described.



5. The combination, with the train of gearing, the key-winding shaft, and the brake-lever arranged with respect thereto, as described, of the key-supporting device affixed to the box-door in juxtaposition to the winding-shaft, whereby the brake is automatically released upon opening the door, substantially as shown and described.

292,312. MUSICAL GAME. WILLIAM L. HOFER, Manhattan, Kans. Filed Dec. 15, 1883. (No model.)

Claim.—The game consisting of the movable cards or pieces *a b c*, printed or marked with notes and rests of music, varying in quantity, and adapted to serve as implements of play, substantially as specified.

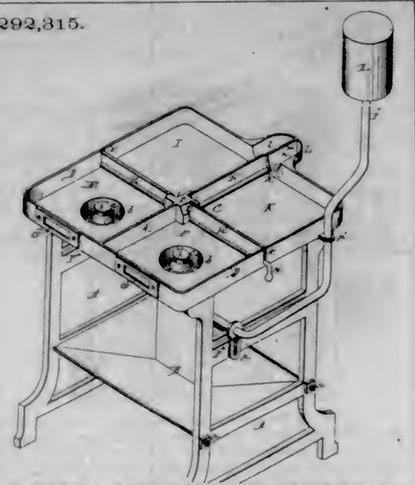


292,313. LEAD-HOLDER FOR PENCILS. JOHN HOLLAND, Cincinnati, Ohio. Filed Mar. 18, 1882. (No model.)

Claim.—1. As a new article of manufacture, a lead-tube for pencils consisting, substantially, as before set forth, of a tube provided at one end with internal or female threads and two or more longitudinal slots to form threaded fingers.

2. The combination, with the lead-tube provided at one end with internal threads and two or more longitudinal slots, of a clamping-sleeve adapted to be adjusted upon the slotted end of the tube to press the threaded fingers upon a lead, substantially as described.

292,314. WASHING-MACHINE. JOSEPH HOLLINGSWORTH, Jonesborough, Ind. Filed July 12, 1883. (No model.)

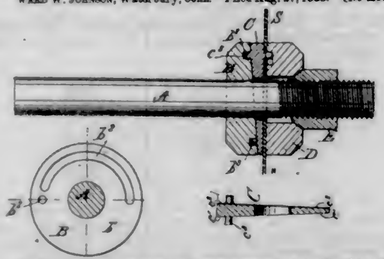


Claim.—The combination, with the cylinder of a washing-machine constructed as described, and provided with the transverse openings *e*, the walls *s* of which extend within the cylinder, of the bars *f*, connected at each end to the cylinder-heads, and with the said extensions by means of the brace-arms *g*, to hold the bars at a distance from the inner edges of the extensions, whereby a free passage is allowed for the water and steam, and the clothes prevented from closing the said openings during operation.

292,315. VAPOR-STOVE. EGBERT C. HOPKINS, Rockford, Ill. Filed Aug. 25, 1883. (No model.)

Claim.—1. In a two-plate vapor-stove, the combination, with the plates, of a division-wall for separating the burners, and movable dampers arranged substantially as set forth, whereby each half of the stove may be heated by a separate burner, and the heat conveyed from said burner to the rear compartment of the other half of the stove.

292,315.



2. The combination, in a two-plate vapor-stove, of a center fitted with journal-bearings, and a radial vertical division connecting the center with the outer rim separating the burners, substantially as and for the purpose set forth.

3. The combination, in a vapor-stove fitted with dampers or valves capable of use to separate the openings into separate and independent chambers, of a top plate provided with a pipe-collar fitted with valves or dampers communicating with the independent burner-chambers, substantially as set forth.

4. The combination, with the supply-pipe and with the supporting-frame, of adjustable bearings supporting said supply-pipe on the supporting-frame, and made adjustable thereon, substantially as and for the purpose set forth.

292,316. MANDREL ATTACHMENT FOR CIRCULAR SAWS. EDWARD W. JOHNSON, Waterbury, Conn. Filed Aug. 27, 1883. (No model.)

Claim.—1. In a saw-mandrel attachment, the combination of the fixed oblique-faced collar having the semicircular recess in its face, with the washer, having one face at an oblique angle, and its other face at a right angle, to its axis, said washer also having a pin to engage with the said recess, substantially as and for the purpose set forth.

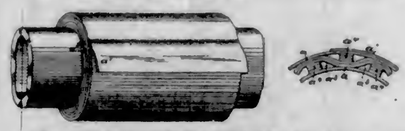
2. In a saw-mandrel attachment, the combination of the fixed oblique-faced collar having the same circular and round recesses in its face, with the washer having one face at a right angle, and its other face at an oblique angle, to its axis, said washer having a pin, substantially as and for the purpose set forth.

3. In a saw-mandrel attachment, the combination of the fixed oblique-faced collar having the same circular and round recesses in its face, with the washer having one face at a right angle, and its other face at an oblique angle, to its axis, said washer having a pin, the countersunk washer D, and the convexed nut E, substantially as and for the purpose set forth.

292,317. ELECTRIC DISTRESS-SIGNAL. THOMAS B. JOSEPH, Alpena, Mich., assignor of one-third to William H. Patten, Philadelphia, Pa. Filed July 19, 1883. (No model.)

Claim.—1. In a distress-signaling apparatus, the combination of the balloon A, having guy-rope H, the lamps C, supported on said rope, and adapted to be adjusted thereon, and the battery G, located and held in the bottom of the balloon, and connected with said lamps by conductors, substantially as described.

292,317.



2. In a distress-signaling apparatus, the combination of the balloon having guy-rope, the lamps adjustably supported on said rope and connected with battery G, and the octagonal reflector B, located exteriorly to said battery at the bottom of the balloon, substantially as set forth.

3. In a distress-signaling device, the combination of the balloon A, having guy-rope, the lamps C thereon, clamps E, for adjusting the same, and sleeve D, adapted to be adjusted on said rope, which rope is designed to be paid out from below, substantially as and for the purpose described.

4. In a distress-signaling apparatus, the balloon A, having guy-rope H, and provided with a reflector, B, at its bottom or lower end, substantially as described.

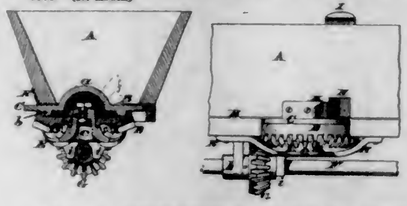
5. In a marine distress-signaling apparatus, the combination of the balloon A, the battery G, located beneath said balloon, the guy-rope H, having lamps C, retained thereon by clamps E, and sleeve D, substantially as and for the purpose described.

292,318. NON-CONDUCTING COVERING. GEORGE KELLY, Chicago, Ill., assignor to the Kelly Scroll Section Manufacturing Company, same place. Filed May 22, 1883. (No model.)

Claim.—1. A non-conducting covering for pipes, &c., composed of layers of paper, &c., folded upon themselves in the flat, and then bent to the required shape, substantially as described.

2. A non-conducting covering for pipes, &c., composed of layers of paper, &c., folded upon themselves in the flat, then bent to the required shape, and provided with an over-lap, *a'*, as described, and for the purpose set forth.

3. A non-conducting covering composed of layers of paper, &c., in combination with longitudinal strips *a'*, arranged, as described, to form dead-air spaces.



292,319. BURIAL-CASKET. WORTH KILPATRICK, Connellsville, and OSMOND M. JOHNSTON, Brownsville, Pa. Filed Feb. 17, 1883. (No model.)

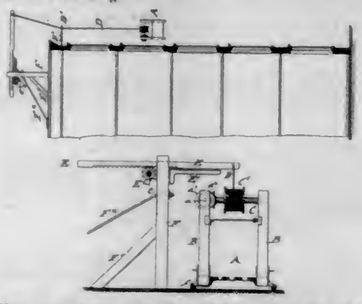
Claim.—1. A burial-casket made of terra-cotta, having secured thereto a wooden bottom provided with suitable lifting or carrying means, substantially as described.

2. A burial-casket made of terra-cotta and formed with a series of vertical ribs, and having attached thereto a wooden bottom provided with suitable handles or lifting means, substantially as described.

292,320. FERTILIZER-SOWER. EMANUEL M. KISSELL, Springfield, Ohio, assignor of one-half to P. P. Mast & Co., same place. Filed Jan. 6, 1883. (No model.)

Claim.—1. In the feed mechanism of fertilizers, the combination, with the hopper, of horizontally-rotating feed-disks made of glass, substantially as described.

2. In the feed mechanism of fertilizers, the combination, with the hopper, of horizontally-rotating glass feed-disks projecting through openings in the hopper, substantially as described.



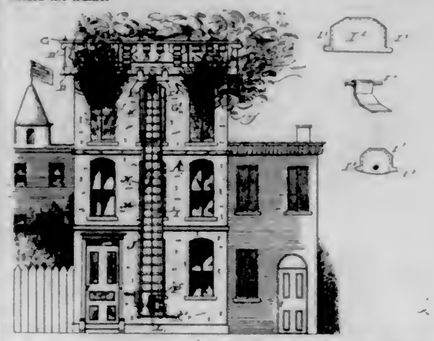
3. In the feed mechanism of fertilizers, the combination, with the horizontally-rotating glass feed-disks projecting through openings in the hopper, of discharge-openings regulated by vertically-moving gates or slides, and stationary scrapers for removing and directing the flow of the fertilizer from the disks, substantially as described.

4. In the feed mechanism of fertilizers, the combination, with the horizontally-rotating glass feed-disks, of immediately subjacent supporting and actuating gears, said disks and gears being locked together by means of lugs or dowels, substantially as and for the purpose specified.

5. The bracket E, provided with a bearing for the gear D, and with a journal for the through-shaft or axle, in combination with the rotating glass feed-disk, the gear D, pinion G, and through-shaft F, the parts being constructed and relatively arranged in the manner and for the purpose specified.

292,321. SCAFFOLD AND FIRE-ESCAPE. JOSEF KLEIN, New York, N. Y. Filed Nov. 9, 1883. (No model.)

Brief.—The cage or scaffold is provided with winding-drums at its ends, actuated by shaft and gears, and is suspended from the ends of rack-bars moved and guided forward and backward in standards secured to the roof of the building.



Claim.—1. The combination of a scaffold provided with winding-drums at its ends, means for actuating the same, suspension-ropes applied to said drums, horizontal rack-bars to which the upper ends of the suspension-ropes are attached, standards secured to the roof of the building for supporting and guiding the rack-bars, and means for moving the rack-bars and scaffold forward and backward, substantially as and for the purpose set forth.

2. The combination of a scaffold provided with winding-drums at its ends, means for operating said drums, suspension-ropes applied to said drums, hook-eyes for the ropes, applied by guide-sleeves to fixed rods below the cornice, horizontal rack-bars to which the upper ends of the suspension-ropes are attached, upright posts secured rigidly to the roof, for supporting and guiding the rack-bars, and means for moving the rack-bars and scaffold forward or back, substantially as specified.

292,322. FIRE-ESCAPE. CYRUS A. KNAUER, Pottstown, Pa. Filed May 23, 1883. (No model.)

Brief.—The traveler, which is moved upon the reverse T-rail track, is provided with two wheels on one side of the track and one central one on the other side. A trough-shaped metal frame, re-enforced at its edges and provided with ladder-rungs, is suspended from the traveler. An endless rope runs over a sheave at the top and a drum at the bottom of and within the frame.

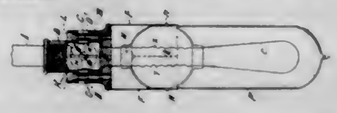
Claim.—1. The combination of the reverse T-rail track, suitably suspended and supported, with the three-wheeled truck and its dependent ladder, said ladder provided with a top sheave and bottom drum, friction-brake, and wheel, with an endless rope provided with a loop, all arranged, constructed, and operated as and for the purpose described.

2. A fire-escape traversing ladder-truck constructed, as shown, with two wheels on one side of the frame and one intermediate wheel on the opposite side, having a central suspension ladder bolt, G, provided with a forked end, G^2, and sheave H, in combination with the reverse T-rail track D and the ladder I, and with drum L and brake P by rope M, substantially as and for the purpose set forth.

3. A fire-escape ladder, I, of metal, of a dish form in section, as shown in Fig. 6, having an iron-rod re-enforce, I^2, and provided with non-conducting rungs J, secured in place by rods J', with a drum, L, at its lower end, and brake and wheel P on shaft K, cranks K', and endless rope M N, in combination with suspension-bolt G, truck E, wheels F, and track D, substantially as shown, and for the purpose specified.

4. In combination with a fire-escape ladder transferable by truck upon a track, as described, a drum and brake-wheel with brake-shaft and cranks, endless rope and loop within reach of an operator upon the ground, whereby a weight may be drawn from the interior of the building and let down upon the level of the street, substantially as and for the purpose set forth.

292,323. HASP-LOCK. EDGAR KNIGHT, Bridgeport, Conn., assignor to Solomon P. Stoddard, Trustee, New York, N. Y. Filed Aug. 30, 1883. (Model.)

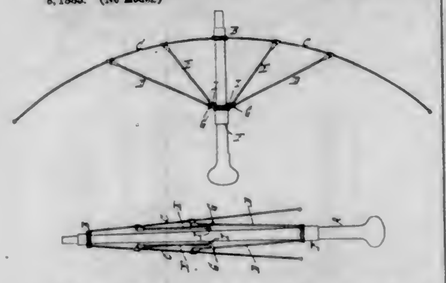


Claim.—1. In a hasp-lock, the hasp A, carrying the lock-case B, and rearwardly recessed at C to receive the head of the screw or bolt D, and provided with a plate, E, having orifice *e*, to retain the head of said screw or bolt in said recess, as and for the purpose specified.

2. In a hasp-lock, the hasp A, rearwardly recessed at B to receive the lock mechanism, rearwardly recessed at C to receive the head of the screw or bolt D, and provided with a plate, E, having orifice *e* to retain the bolt-head in said recess, and also rearwardly recessed at F to receive and inclose the staple G, all as and for the purpose specified.

3. In a hasp-lock, the hasp A, rearwardly recessed at C to receive the head of screw D, and provided with a plate, E, having orifice *e* to retain said screw-head in said recess, and the slot *c* in the forward wall of said recess, as and for the purpose specified.

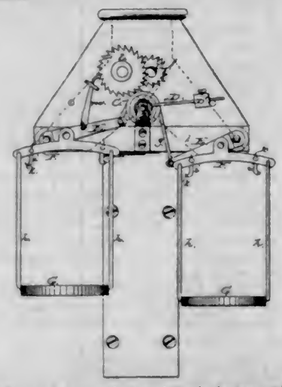
292,324. INCANDESCENT ELECTRIC LAMP. EDWD. R. KNOWLES, Brooklyn, N. Y., and FRANK E. IDELL, Hoboken, N. J., assignors to the Consolidated Electric Light Company, of New York. Filed Sept. 6, 1882. (No model.)



Claim.—1. In an incandescent electric lamp, the combination of the illuminating-chamber P, provided with projections or teats, the socket F, having perforations N N, an insulating base, E, and pins C C', connected to the electrodes of said lamp, substantially as described, for the purpose specified.

2. In an incandescent electric lamp, the combination of an illuminating-chamber, P, a socket, F, provided with screw-pins C C', having notches V and V', and a support, B, containing a switch, H G, and provided with clamps D and D', substantially as described, for the purpose specified.

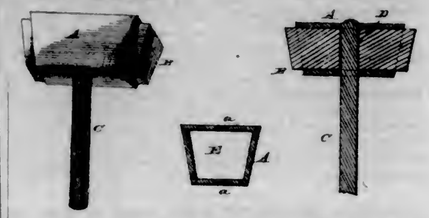
3. In the circuit of an incandescent electric lamp, the combination of a switch-piece, S, and lamp-clamps R, the two coacting to prevent the lamp from being removed until the circuit is turned off.



292,325. UMBRELLA-FRAME. CHARLES D. LATHROP, Newark, N. J., assignor to himself and Sarah Binsland, Mount Vernon, N. Y. Filed Nov. 8, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the ribs, the runner, the main stretchers, having the ends jointed to the ribs and runner, respectively, and the supplemental stretchers, having one end jointed to the ribs at a point above the main stretchers, and the other end constructed to engage the main stretchers.

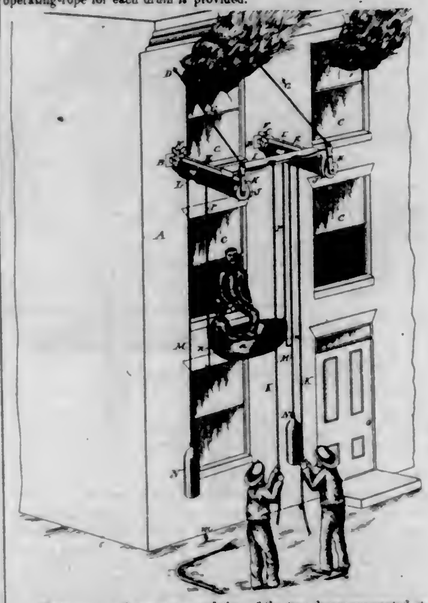
2. The combination, substantially as hereinbefore described, of the ribs, the runner, the main stretchers having the ends jointed to the ribs and runner, respectively, and the supplemental stretchers, having one end jointed to the ribs and the other end constructed with an eye or loop to engage the main stretchers, and with a shoulder to support the supplemental stretchers on the runner.



292,326. COMBINED GRAIN SCALE, BAGGER, AND REGISTER. CHARLES J. LEACH and ALLEN OLDS, Hartford, Mich. Filed June 13, 1883. (No model.)

Claim.—1. In a combined grain scale, bagger, and register, the hopper A, divided into two conducting-chutes by the central partition, *a*, and provided with the transverse rod *b*, carrying the valve or cut-off *c*, platforms G, attached to the frame F, arms E, pulley C, provided with arm D and weight D', and the registering devices *l* and *m*, all arranged and combined substantially as and for the purpose specified.

2. The hopper A, constructed as described, and provided with the registering-wheels *l*, transverse rod *b*, valve *c*, and pulley C, having arm D and weight D', in combination with the arms E, cord *g*, frame F, provided with the bag-holding rods *i*, and platforms G, substantially as and for the purpose specified.



292,327. MALLET. EDWARD LEMERY, Plattsburg, N. Y. Filed May 18, 1883. (No model.)

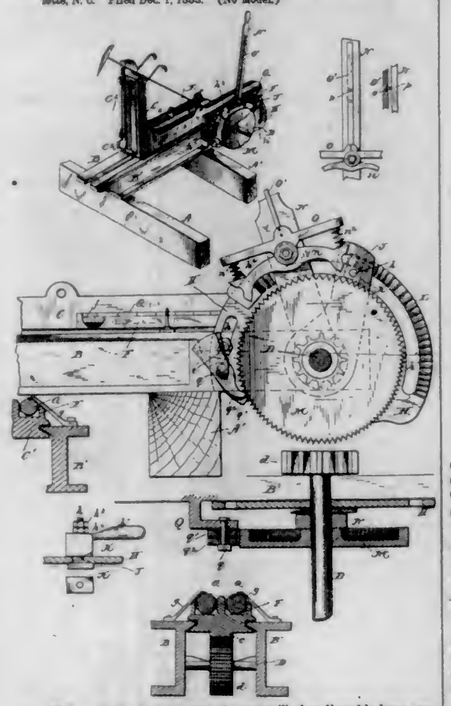
Claim.—The combination, in a wooden and metallic mallet, of a wrought or cast metallic case or shell with a close fitting wooden block projecting in and through such case or shell, the inserted handle of which forms the key, substantially as described and set forth.

292,328. FIRE-ESCAPE. NICHOLAS LEONARDS, Harvard, Ill. Filed May 24, 1883. (No model.)

Brief.—A fire-escape in which two drums are journaled in brackets and at right angles to the wall of the building, each drum having two ropes wound thereon in opposite directions, one having a counterbalance-weight, and the other the car secured to their free ends. A brake and operating-rope for each drum is provided.

Claim.—1. A fire-escape consisting of the two drums supported at right angles to the wall of a building, as set forth, the two ropes wound upon each of said drums in opposite directions, the free end of one rope upon each drum bearing a counterbalancing-weight, and the ends of the other ropes engaging with a basket or car, the movements of said cars being regulated by two independent brakes, substantially as shown and described.

2. In a fire-escape of the character herein specified, the arms E, secured to eyes B and bearing pieces H at their outer extremities, rods G, passing from pieces H to eyes D, and cross-bar I, the whole arranged substantially as shown and described.



3. In a fire-escape, the two drums L, supported at right angles to the wall of a building, ropes M and P, car *a*, and the two brakes J, operated by means of ropes K, the whole combined and arranged to operate substantially as shown and described.

292,329. MANUFACTURE OF PORTLAND CEMENT. ROBERT W. LESLEY and JAMES M. WILLCOX, Philadelphia, Pa. Filed Dec. 21, 1883. (No specimens.)

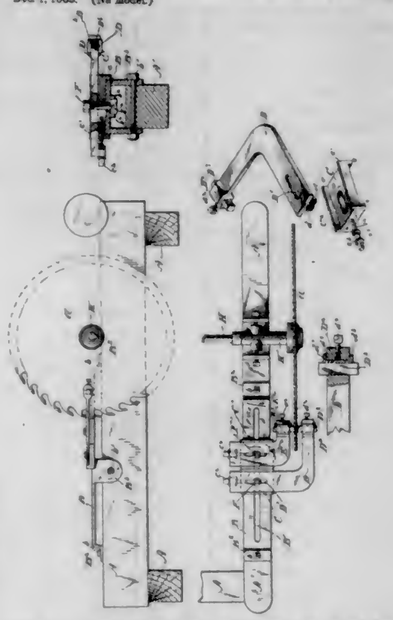
Claim.—1. The hereinbefore-described improvement in the art of manufacturing Portland cement, consisting in dampening only the pulverulent cement-making material, so that it shall still remain essentially powder, as contradistinguished from paste, and then molding said dampened powder into balls or lumps by hard pressure between rotating surfaces, substantially as and for the purposes hereinbefore set forth.

2. The process of manufacturing Portland cement, consisting in reducing the cement-making material to powdered condition, dampening the same to such an extent only that it shall remain essentially powder, as contradistinguished from paste, molding said dampened powder into balls or lumps by hard pressure, and subsequently calcining said balls or lumps and reducing them to powder, substantially as and for the purposes hereinbefore set forth.

292,330. SAW-MILL SET-WORKS. WALTER J. F. LIDDELL, Charlotte, N. C. Filed Dec. 1, 1883. (No model.)

Claim.—1. In the set-works of a saw-mill, the adjustable knee provided with the grooved extension of its flange or base, in combination with the supplemental knee secured to and adjustable in said grooved flange, and means for adjusting the same, substantially as described.

2. The adjustable knee provided with a receptacle for an indicator-rule, in combination with an indicator secured to and moving with said knee, and a stationary pointer, arranged and operating substantially as described.



3. The adjustable knee provided upon each side of its longitudinal rib with a pocket for the reception of indicator-rules, in combination with the interchangeable polygonal indicator-rules, substantially as described.

4. The slotted segment-plate H, adjustable around the pinion-shaft as a center, and provided with the fixed stop, in combination with the adjustable stop, also pivoted upon and adjustable around the pinion-shaft as a center, and the cam-faced block or lever for clamping said adjustable stop to the slotted segment H, substantially as described.

5. The plate or segment H, provided with the fixed stops h^3, slot h', and toothed segment-rack I, in combination with the adjustable stop J, pivoted upon the pinion-shaft, and having teeth engaging said rack, and means for clamping said stop to said plate or segment, substantially as described.

6. The combination, with the lever for effecting the adjustment of the head-block or knee, of the centrally-pivoted double pawl and the cross-head supporting said pawl in operative position, both pivoted to said lever, the socketed spring-arm rigidly secured to said cross-head for adjusting it, and the pin or spur on the lever for gaging the throw of said spring-arm and holding it at the desired adjustment, all substantially as described.

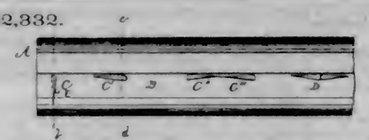
292,331. SAW-GUIDE. WALTER J. F. LIDDELL, Charlotte, N. C. Filed Dec. 1, 1883. (No model.)

Claim.—1. In a saw-guide, the slotted guide plate or rail B, secured to the frame in which the saw is mounted, upon one side thereof, and provided with the sliding independently-adjustable seat-blocks C and C′, in combination with the slotted arms D and E, adjustably secured to said seat-blocks, for the purpose and substantially as described.

2. In a saw-guide, the flanged seat-blocks C and C′, sliding and adjustable independently of each other upon the slotted guide plate or rail B, upon one side of the saw, in combination with the angular guide-arms D and E, adjustably secured upon said independently-adjustable seat-blocks, and means, substantially as described, for adjusting said guide-arms upon said flanged seats, substantially as described.

3. In a saw-guide, the guide-arms D and E, adjustable upon and in combination with the seat-blocks C and C′, independently adjustable upon the guide-plate B, secured to the frame, upon one side of the saw, whereby one of said arms, D, may be removed beyond the cut of the saw by sliding the seat-block C upon rail B, and the saw detached without adjustment of arm E, substantially as described.

4. In a saw-guide, the angular arms D and E, adjustable in the manner and by the means substantially as shown and described, and provided at their outer ends with slotted enlargements D^2 E^2, in combination with bearing-blocks D^2 E^2, located in said slotted enlargements, and held in place by the flanged plates d^2 and screws d^3, whereby the said blocks D^2 may be adjusted laterally in their slots to accommodate the saw, substantially as described.



5. In a saw-guide, the angular guide-arms D E, provided with pendent ears *d d* and slots D′, in combination with the adjustable flanged seat C and C′, slotted at C^2, and provided with the screw c^3, having the collars c^2 c^2, and the bolts F F′, all arranged and operating in the manner and for the purpose substantially as described.

6. In a saw-guide, the slotted elevated guide-plate B, secured to the frame, and provided with the pendent flanges b^2 b^2, in combination with the slotted seat-blocks C and C′, provided with flanges *c c′ c′*, the slotted guide-arms D and E, and through-bolts F and F′, passing through the slots in the said arms, seat-blocks, and guide-rail, all for the purpose and substantially as described.

292,332. CURTAIN-STICK. HENRY LOSDELL, Troy, N. Y. Filed Oct. 23, 1883. (No model.)

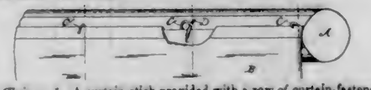
Claim.—1. A curtain-stick provided with a row of projecting fasteners ranged longitudinally of said stick, and bent to project tangentially from said stick, substantially as and for the purposes set forth.

292,332.

2. A curtain-stick provided with a row of fasteners ranged longitudinally of said stick, and having angular projections adapted to swing from a right angular into a parallel line of direction relatively to the general line of direction of the stick, substantially as described, and for the purposes set forth.

3. A curtain-stick provided with a row of double-pointed fasteners ranged longitudinally of said stick, having the points projecting therefrom, and the double points adapted to pierce a curtain together and afterward be separated and bent down upon the curtain, substantially as and for the purposes set forth.

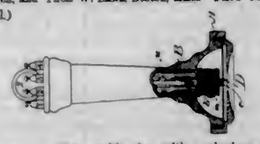
292,333. CURTAIN-STICK. HENRY LOSDELL, Troy, N. Y. Filed Oct. 23, 1883. (No model.)



Claim.—1. A curtain-stick provided with a row of curtain-fasteners extending longitudinally of said stick, said fasteners having pointed ends concealed within said stick, and adapted to be driven through said stick into a position to project therefrom, substantially as described, and for the purposes set forth.

2. A sectional curtain-stick, one of the sections or parts of which is provided with a row of curtain-fasteners extending longitudinally of said stick, said fasteners having pointed ends concealed within said section or part, and adapted to be driven through said part into a position to project therefrom, substantially as described, and for the purposes set forth.

3. A curtain-stick composed of two or more sections, and provided in one section with pointed curtain-fasteners, in combination with a curtain, and with a plurality of rings adapted to fit upon said stick, and provided with an opening on one side of each ring to contain the curtain, substantially as described, and for the purposes set forth.



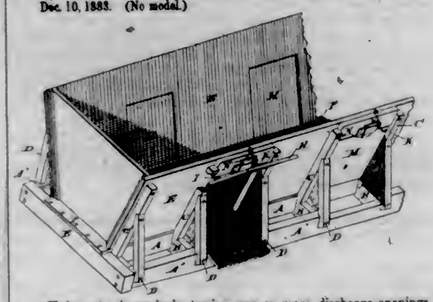
292,334. CURTAIN-STICK. HENRY LOSDELL, Troy, N. Y. Filed Nov. 22, 1883. (No model.)

Claim.—1. A curtain-stick provided with a row of curtain-fasteners ranged longitudinally of the stick, said fasteners having pointed hooks adapted to pierce and secure the curtain upon the stick, substantially as described, and for the purposes set forth.

2. A hook-headed tack, in combination with a transversely-slotted curtain-stick and curtain, substantially as described, and for the purposes set forth.

292,335. MAGNETO-ELECTRIC TELEPHONE. THOS. D. LOCKWOOD, Malden, and THOS. W. LANE, Boston, Mass. Filed July 28, 1883. (No model.)

Claim.—1. The combination, with a telephone comprising a permanent magnet and two coils or bobbins placed on the same pole of the magnet, of a battery included in circuit with one of said coils or bobbins, so as to increase the magnetism of said magnet, the other coil or bobbin being included in the telephone circuit or line, substantially as described.



2. The telephone having the two coils or bobbins, or two sets of coils or bobbins, placed on the same pole-piece or pole-pieces of the permanent magnet, in combination with an exciting-circuit including a battery and one coil or bobbin, or one set of coils or bobbins, so that the current intensifies and maintains the magnetism of the magnet, and the telephone circuit or line including the other coil or set of coils, substantially as described.

3. A telephone comprising, in combination with the diaphragm, permanent magnet with one or more pole-pieces, and a bobbin at the end of each pole-piece, a second bobbin placed on each pole-piece inside the first-named bobbin, between it and the end of the body of the magnet, substantially as described.

4. The combination, with a telephone having a magnet and two bobbins or coils, one included in circuit with a battery, so as to intensify and maintain the magnetism, and the other in the telephone-circuit, of a key for opening said battery-circuit when the telephone is not in use, and closing it when the instrument is to be used, substantially as described.

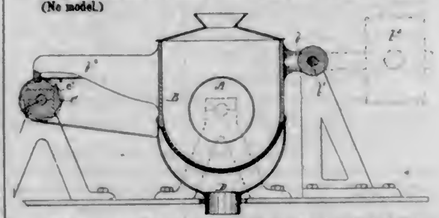
5. The combination, with a transmitter and its battery, of a telephone comprising a magnet with two coils or sets of coils, one included in the circuit of said battery, and the other in the telephone-circuit, and a switch for opening the battery-circuit when the instruments are not in use, substantially as described.

292,336. COAL-CAR. JOHN D. MADEIRA, Chillicothe, Ohio. Filed Dec. 10, 1883. (No model.)

Claim.—1. A car-body having one or more discharge-openings, each of which has hinged, respectively, to its upper and under edges, two overlapping shutters, of which the inner shutter is held by the outer one when closed, and of which the outer shutter becomes, when open, the floor of a discharge-chute, substantially as set forth.

2. In a railway-car for transporting coal and like materials, and having one or more discharge-openings, two overlapping shutters at each opening, of which the inner shutter is hinged by its upper edge to the top of the opening, so as to be capable of closing it, and of which the outer shutter is hinged to the bottom of the opening, and is combined with external side wings to form an extension-platform or discharge-chute, substantially as set forth.

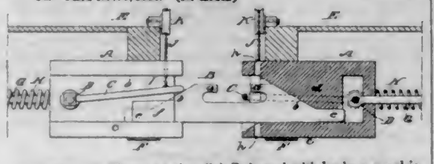
292,337. GRATE-BAR. JOHN MAHLER, San Francisco, Cal. Filed Mar. 29, 1883. (No model.)



Claim.—1. The fixed grate-bar composed of the parallel plates a^3, provided with tongues c^3 on their opposite sides, beveled downward and inward to the plates, and arranged in staggered position, substantially as shown and described.

2. The combination, in a fixed grate-bar, of the plates a^3, tongues c^3, beveled downward and inward to the plates, and arranged in staggered position at opposite sides of the plates a^3, and the parallel-edged spacing-blocks b^3, substantially as shown and described.

3. The combination, in a fixed grate-bar, of the tapering plates a^3, each having a recess along its upper edge, tongues c^3, beveled downward and inward to the plates, and arranged in staggered position at opposite sides of the plates, and parallel-edged spacing-blocks b^3, substantially as shown and described.

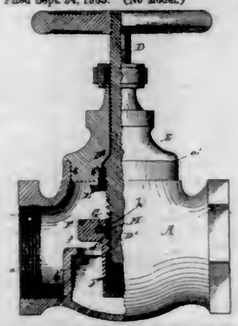


292,338. ATTRITION-MILL. GUSTAVUS B. MAYNADIER, Bolton, Mass., assignor of one-half to William H. Cilley, same place. Filed June 14, 1883. (No model.)

Claim.—In a mill of the character hereinbefore described, the combination of the rotary chambered heads with a hopper communicating with the chambers of the heads, having its bottom reticulated or sieve-

like and arranged to receive a shaking or vibratory motion, and means for imparting such motion, substantially as and for the purpose set forth.

292,339. CAR-COUPLING. CASSIUS MCARTHUR, South Shenango, Pa. Filed Nov. 3, 1883. (No model.)



Claim.—1. The connecting-link B, formed with hooks *a a* and inclined portions *b b*, in combination with the draw-heads A A, provided with the bails C C, substantially as and for the purposes set forth.

2. The connecting-link B, formed with the flat ends *c*, in combination with the draw-heads A, formed with the stops *d*, under which the ends *c* are adapted to pass, substantially as and for the purposes set forth.

3. The connecting-link B, formed with the flat ends *c*, in combination with the draw-heads A, formed with the stops *d* and with the blocks *f*, and the bail C, substantially as and for the purpose set forth.

4. The combination of the connecting-link B, having the oppositely-projecting hooks *a a*, the inclines *b b*, and the flat ends *c c*, with the draw-heads A, having the inclined stops *d*, and the bails C, pivoted to said draw-heads, substantially as and for the purpose set forth.

292,340. GLOBE-VALVE. ELMER ELLSWORTH MCCANNON, Barnhart's Mills, Pa. Filed Sept. 24, 1883. (No model.)

Claim.—1. The shell A, having outlet and inlet openings, and guides C C, located above the valve-seat, in combination with a screw-spindle attached to the shell, and a valve, F, provided with a transverse slot, in which is placed a guide-plate, H, which is recessed at its ends, so as to embrace the guides C C, substantially as shown, and for the purpose set forth.

2. The shell A, having a central valve-seat, and side guides, C C, formed thereon, and means for holding the stem, said stem being provided with a screw-threaded end, in combination with a valve, F, having a screw-threaded portion, *f'*, and transverse slot G, for the reception of a guide-plate, H, with recessed end, the parts being organized substantially as shown, and for the purpose set forth.

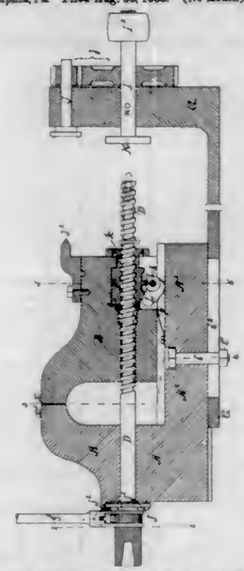
292,341. PURIFICATION OF COAL-GAS. JAMES T. MCDOUGALL, No. 32 Granville Park, Blackheath, County of Kent, England. Filed Mar. 21, 1883. (No specimens.) Patented in England Feb. 23, 1883, No. 995.

Claim.—1. The improvement in gas purification, consisting in precipitating hydrated oxide of iron from a salt of iron with lime or the carbonate thereof, exposing to air and drying the precipitate, and so converting it into a light and porous dry red powder of hydrated peroxide of iron, and subjecting the gas to be purified to the action of such powder, substantially as described.

2. The improvement in gas purification, consisting in subjecting the gas to be purified to the action of precipitated hydrated peroxide of iron in the form of light and porous dry red powder obtained in the manner and by the means described.

3. The method of preparing a material for use in gas purification by saturating or impregnating sawdust, tanners' refuse, or other light porous organic material with a soluble salt of iron, and then decomposing the said salt with an alkaline reagent, so as to deposit iron oxide in the pores thereof, substantially as described.

4. The mixture of sawdust, tanners' refuse, or other light porous organic material impregnated with iron oxide deposited in the pores thereof, with a purifying agent—such as hydrated peroxide of iron—substantially as described.



5. The mixture of sawdust, tanners' refuse, or other light porous organic material impregnated with iron oxide, and in a dry state, with the light and porous dry powder of hydrated peroxide of iron, hereinbefore described, as a new material or composition.

6. The method of preparing burned spent oxide or analogous burned spent composition of iron and sulphur for gas purification, by neutralizing the acidity thereof with lime, excess of the latter being avoided, substantially as described.

7. The mixture of the neutralized burned spent oxide with freshly-prepared hydrated peroxide of iron, substantially as described.

8. The mixture of the burned spent oxide neutralized with lime, the sawdust, or its equivalent, impregnated with iron oxide, and the light and porous dry powder of hydrated peroxide of iron, substantially as described.

292,342. COMPOUND VISE AND LATHE. JAMES R. MCMILLAN, Philadelphia, Pa. Filed Aug. 20, 1883. (No model.)

Claim.—1. The combination of the stocks A and B of a vise, the nut F, and means for locking and releasing the same, and the screw-spindle D, adapted to the nut, and constructed at the end for the reception of a tool, as set forth.

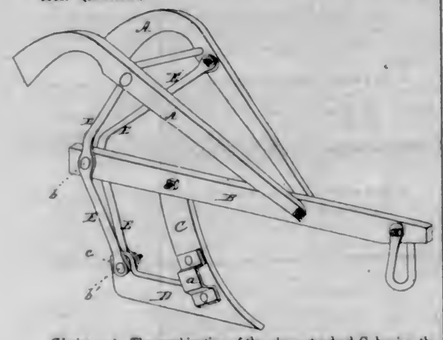
2. The combination of the stocks of the vise, the screw-spindle D, constructed for the reception of a tool, the nut F, means for retaining and releasing the same, and the adjustable frame G, having a spindle, I, as set forth.

3. The combination of the stocks A and B of the vise, the screw-spindle D, constructed for the reception of a tool, the nut F, and means for locking and releasing the same, said nut having a projecting portion, *k*, through which retaining friction may be applied to the nut, as set forth.

4. The combination of the stock B of the vise and its stud J' with the adjustable frame G, having a spindle, J, and means for rotating the same, as set forth.

5. The combination of the stock B of the vise, its nut F, and means for locking and releasing the same, the stock A, the spindle D, and means for locking said spindle longitudinally to or releasing it from the stock A, as set forth.

6. The combination of the spindle D and its ratchet-wheel *g* with the lever *g'*, the pawl *g²*, and the shaft *h*, with its locking-cam *h'*, as set forth.

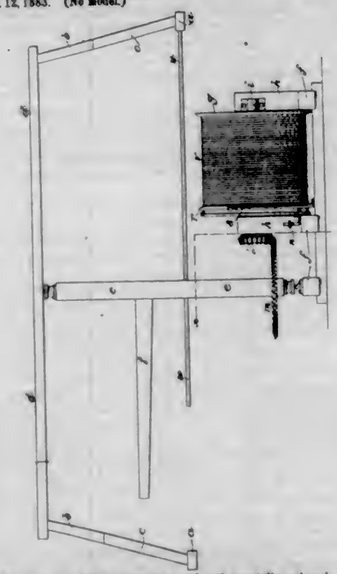


7. The combination of the stock A and its arm A', the sliding stock B, the screw-spindle D, the cam-lever L, hung to the stock B and bearing on the arm A', and the nut F, having a slight play in the stock B, and arranged to act upon the lever L, as set forth.

8. The combination of the stock A and its arm A', the sliding stock B, the screw-spindle D, the cam-lever L, the nut F, and the spring-ring *s*, as set forth.

9. The combination of the stock A and its arm A', the sliding stock B, the screw-spindle D, the cam-lever L, the nut F, and the set-screws *t*, as set forth.

10. The combination of the screw-spindle D, having a slot therein, the sleeve P, having a spline, *w*, and the clamping-nut S, as set forth.



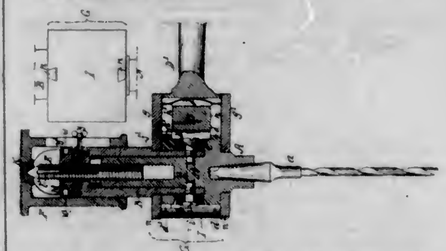
292,343. PLOW. JAMES T. MILLER, Thomasville, Ga. Filed Dec. 12, 1883. (No model.)

Claim.—1. The combination of the plow-standard C, having the heel D, with the bent braces E E, the beam B, and the handles A, the said braces being bolted to the plow-heel, the beam, and to the handles, in the manner shown and described.

2. The combination, with the beam and the handles, of the plow-standard having its heel D terminating in an upward extension, *c*, and the bent braces E E, bolted to the opposite sides of said heel-extension, the opposite sides of the beam, and to the handles, as shown and described.

292,344. HOISTING APPARATUS. PRETHROE J. MITCHELL, Dragoon Summit, Ariz., assignor of one-half to Samuel H. Ecklen, same place. Filed Nov. 12, 1883. (No model.)

Claim.—1. A hoisting apparatus made substantially as herein shown and described, consisting of a rope-drum and horse-power, combined and operated as set forth.



2. The arrangement of the geared end of the drum-shaft within a movable journal-box, substantially as herein shown and described, whereby the geared pinion of the drum is adapted to be thrown in or out of gear with the horse-power driving-wheel, as set forth.

3. In a hoisting apparatus, the combination, with the rope-drum, of a foot-lever for moving the drum-pinion out of gear, and a hand-brake for controlling the motion of the drum, substantially as shown and described.

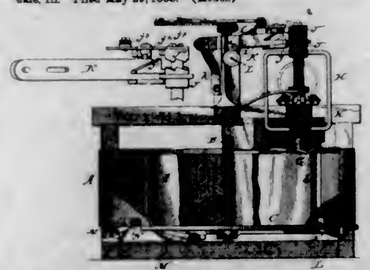
4. The combination, with the main shaft and gear *l m* and the vertically-adjustable drum-shaft bearing *k*, of the lever *n*, substantially as shown and described.

5. The combination, with the drum *g*, its shaft *j*, movable bearing *k*, and lever *n*, of the friction-brake *r s*, substantially as shown and described.

292,345. RATCHET-DRILL. WM. MORTS, Philadelphia, Pa. Filed Aug. 13, 1883. (No model.)

Claim.—1. The combination of the drill-spindle having a groove, *i'*, and bevel-wheel *e*, the loose bevel-wheel *f*, the pinions *b*, and the sleeve B, having pins *i*, adapted to the groove *i'*, and carrying the pinions *b*, as set forth.

2. The combination of the drill-spindle and driving-gear therefor, as described, with a pawl-carrying frame, G, comprising the block D, plates *g g'*, and casing I, as set forth.



3. The combination of the drill-spindle and means for rotating the same, the sleeve B, longitudinally confined to said spindle, the cap F, circumferentially confined to the sleeve, the feed-screw E, and the ring M, connected to the feed-screw so as to turn therewith, and longitudinally confined to the sleeve B, as set forth.

4. The combination of the drill-spindle A, the sleeve B, means for preventing the latter from turning with the spindle, the feed-screw E, and the ring M, turning with the screw confined longitudinally to the sleeve and held thereto circumferentially by a friction-clamp, as set forth.

5. The combination of the drill-spindle A, the sleeve B, having a slot, *v'*, the feed-screw E, ring M, and the cap F, having a set-screw, *v*, adapted to the slot *v'*, as set forth.

6. The combination of the drill-spindle A, the sleeve B, the feed-screw E, and the cap F, having a bearing-plug, K, as set forth.

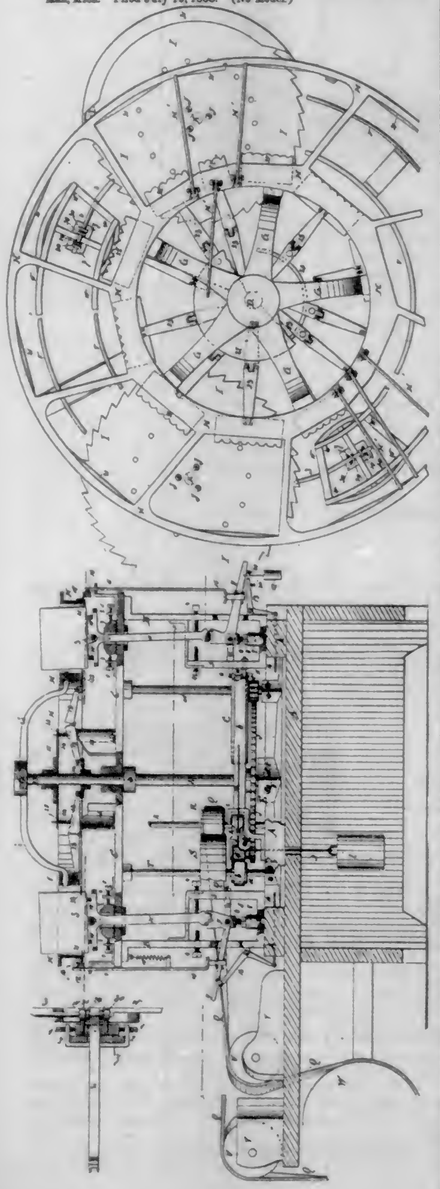
292,346. GRAIN-MEASURING MACHINE. JOSEPH NAFZIGER, Hopedale, Ill. Filed May 29, 1883. (Model.)

Claim.—1. In a measuring-machine, the compartment-measure A and board C, in combination with means, substantially as described, for intermittently revolving the measure and intermittently reciprocating the board, as and for the purposes described.

2. The wheel G and clutch J, adapted to be raised on the shaft F by the grain in the measure, in combination with the clutch-lever D', connecting-rod E, arm D, shaft B, measure A, and board or disk C, substantially as and for the purposes set forth.

3. The clutch-lever D', formed with the cams *j'* and *j⁴*, in combination with the lever K, clutch J, the bar K, and wheel G, the lever being notched and provided with cams, and the clutch formed with the rim *j*, substantially as and for the purposes set forth.

4. The continuously-revolving shaft F, in combination with the wheel G and clutch J, adapted to slide on the shaft, for imparting intermittent rotary motion to the clutch-arm D' for operating the measure A and board C, substantially as described.



5. The combination, with the intermittently-revolving arm D',

formed with the cams j^3 and j^4, of the lever K and register I, substantially as and for the purposes set forth.

6. The intermittently-revolving measure A, formed with the studs N N, in combination with the stops M M' and rotary reciprocating board C, provided with the pawl L, substantially as and for the purposes set forth.

7. The rotary reciprocating board C, provided with the pawl L, and placed under the measure A, in combination with the said measure and the stops M M', substantially as and for the purposes set forth.

292,347. SHINGLE-SAWING MACHINE. PATRICK O'CONNOR, Tallman, Mich. Filed July 19, 1883. (No model.)

Claim.—1. In a rotary shingle-machine, the rotary frame H, formed of two annular rings connected by inclined bars dividing the same into block-compartments, substantially as herein shown and described, whereby provision is made for presenting the blocks squarely to saws, as set forth.

2. In a rotary shingle-machine, the combination, with the rotary frame H, divided into compartments by inclined bars, of the hinged bars H', for subdividing said compartments, substantially as herein shown and described.

3. In a rotary shingle-machine, the combination, with the frame C, the shaft D, the block-holding frame H, provided with the stationary dogs 21, and attached to said shaft, and means for operating the said shaft, of the jointed and spring-pressed bars 23, hinged to supports attached to the shaft, the dogs 22, on the free ends of the said bars, and the cam-plates 25, secured to the frame, substantially as herein shown and described.

4. In a rotary shingle-machine, the combination, with the frame C, shaft D, the block-holding frame H, the hinged and jointed bars 23, carrying dogs 22 on their free ends, and the cam-plates 25, of the plate 27, secured to the shaft D, the pins 28, secured to jointed bars and passing through apertures in the said plate, and the springs 26, surrounding the pins, substantially as herein shown and described.

5. In a rotary shingle-machind, the combination, with the frame C, the track *v*, and the rotary frame H, of the tables *w*, having their top bars curved to form a continuation of the track *v*, the standards *x*, to which the tables are attached, and the elbow-levers *y*, pivoted to adjustable supports, substantially as herein shown and described.

6. In a rotary shingle-machine, the combination, with the frame C, the track *v*, and the tilting tables *w*, having their top bars curved to form a continuation of the track, of the arms 3, projecting from the front parts of the tables, and having their upper surfaces flush with the tables, substantially as herein shown and described.

7. In a rotary shingle-machine, the combination, with the standard *x*, carrying a table at its upper ends, of the foot 7, resting on the base-frame, the screw 6, entering the foot and provided with the jam-nut 8, and the elbow-lever *y*, pivoted to the head of the said screw and supporting the standard *x*, substantially as herein shown and described.

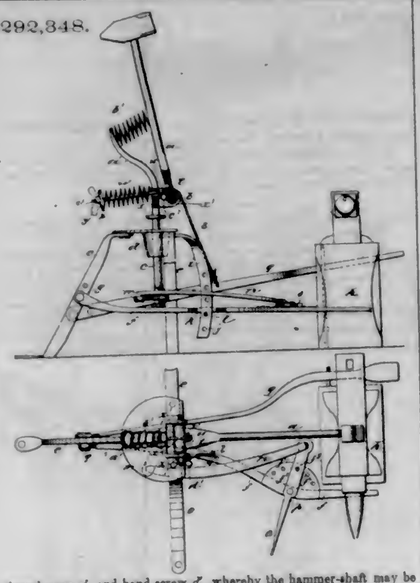
8. In a rotary shingle-machine, the combination, with the upright 5, the screw 6, and the elbow-lever *y*, pivoted to said screw and carrying a table-standard, of the bar 9, pivoted to the screw, the screw-bolt 10, pivoted to the outer end of the bar 9, and the eyebolt 11, connected to the screw-bolt 10 and adjustably secured to the upright 5, substantially as herein shown and described.

9. In a rotary shingle-machine, the combination, with the post B, the upright 5, the table-standard *x*, and the elbow-lever *y*, supporting said standard, of the set-screws 4, the bar 9, pivoted to the support of the said elbow-lever, the screw-bolt 10, pivoted to the end of the bar 9, and the eyebolt 11, adjustably secured to the upright 5, substantially as herein shown and described.

10. In a rotary shingle-machine, the combination, with the standard *x* and the table *w*, having its central bar recessed, of the apertured adjustable bearing-block *z*, the arm 3, provided with collars 29, and the eyebolts 30, projecting into the apertures of the bearing-blocks, substantially as herein shown and described.

11. In a rotary shingle-machine, the combination, with the standards *x*, carrying the tables *w* at their upper ends, and the elbow-lever *y*, in which the said standards are stepped, of the elbow-levers 13, connecting-rod 14, and treadle, substantially as herein shown and described.

12. In a rotary shingle-machine, the combination, with the block-carrying frame H, provided with the sectional flange 17, and the elbow-levers *y*, carrying the table-supporting standards *x*, of the bars 15, connected with the elbow-levers *y*, and provided with the rollers 16 at their upper ends, the weight 12, and spring 18, substantially as herein shown and described.



13. In a rotary shingle-machine, the combination, with the block-carrying frame H, provided with the sectional flange 17, and the elbow-levers *y*, carrying the table-supports *x*, of the bars 15, secured to the elbow-levers and carrying rollers 16 at their upper ends, the weight 12, spring 18, elbow-levers 13, and the treadles 20 20', substantially as herein shown and described.

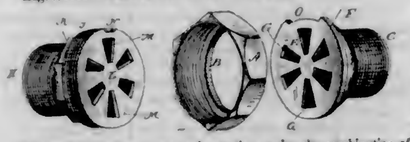
14. In a rotary shingle-machine, the combination, with the saws I, means for operating them, and the block-holding frame H, operated from the saw-driving mechanism by the belt *b* and intermediate mechanism, of the elbow-lever A, provided with the roller *g*, the cord *j*, attached to the end of lever A and provided with the weight *l*, the connecting-rod *m*, and shaft *o*, provided with arms *n p*, substantially as herein shown and described, whereby provision is made for stopping and starting the block-holding frame without affecting the movement of the saws, as set forth.

292,348. FOOT-POWER HAMMER. JOEL L. PAINTER, Bellevue, Ohio. Filed Aug. 3, 1883. (Model.)

Claim.—1. The combination, with the hammer-staff *a*, having pivot *b*, of a hammer-shaft, *c*, carrying a head, *x*, provided with horizontally-

292,348.

slotted arms *x'*, and hand-screw *d'*, whereby the hammer-shaft may be brought forward more or less, as described.



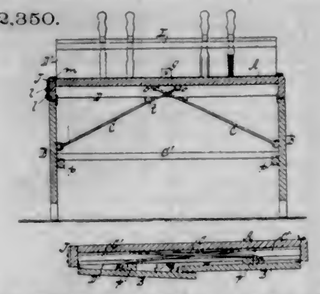
2. The combination of the hammer-shaft *c* with the lever *f*, provided with a step for said hammer-shaft, and pivoted at its rear end to stand *e*, and a perforated arm, *i*, passing through said lever in front of its step, and a connecting-pin, *l*, whereby the hammer-shaft may be adjusted vertically, substantially as set forth.

3. In a foot-power-hammer mechanism for vertically and horizontally adjusting the hammer-shaft, consisting of a lever, *f*, pivoted to the rear under side of the frame, and provided with a step for the hammer-shaft *c*, and having at its forward end a pivoted adjustable lever, *o*, to which is pivoted a connecting-rod, *n*, extending rearward, and pivoted to an arm, *m*, rigidly secured to the lower part of the hammer-shaft above its step, a perforated arm passing through said lever *f*, and a pin, *l*, substantially as set forth.

4. The combination, with the hammer-shaft *c*, having arm *m*, of the connecting-rod *n*, lever *o*, pin f^2, and plate *f'*, having holes f^3, whereby the hammer may be adjusted in the arc of a circle, as described.

5. The combination of the treadle *q*, strap *s*, hammer-staff having slot *t*, the rod *v*, the shaft *c*, having slotted extension *c'*, and the spring *w*, whereby the hammer may be actuated on its downward and upward movement, as described.

292,349. SERVICE-COCK. WALTER S. PAYNE, Titusville, Pa. Filed Aug. 9, 1882. Renewed Dec. 20, 1883. (No model.)

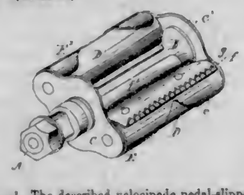


Claim.—As an improvement in service-cocks, the combination of the ring A, having flange B, pipe C, having bulb D, closed by a radially-slotted plate, E, having flange F, provided with notch O, and the pipe H, having exteriorly-threaded enlarged portion or chamber I, seat K, and radially-slotted plate L, having stud N, all arranged and operating substantially as described, for the purpose set forth.

292,350. TOY WORK-BENCH. ADOLF PFAENDLER, Brooklyn, N. Y. Filed July 26, 1883. (No model.)

Claim.—1. A work-bench consisting of a top, A, having along its rear edge a sunken tool-chest, D, provided with a movable lid, D', the hinged end legs, B, and a brace for holding the legs in position for use, substantially as described.

2. A work-bench, A, having hinged legs B, a sunken tool-chest, D, along the rear edge, a recess, *m*, at one end, an adjustable stop, J, having a bent end adapted to said recess, and a brace for holding the legs in position for use, substantially as described.



292,350.

3. A work-bench consisting of the top A, having legs B, and provided along its rear edge with a sunken tool-chest, D, a hinged lid, D', having openings *f* to receive tools, and a pivoted foot, *g*, adapted to rest on the bottom of the tool-chest, substantially as described.

4. A work-bench consisting of the top A, having along one edge the sunken tool-chest D, provided with a hinged lid, D', the legs B, pivotally connected with the top beneath the bottom of the sunken tool-chest, and a brace for maintaining the legs in position for use, substantially as described.

292,351. VELOCIPEDE-PEDAL. ANDREW J. PHILBRICK, Salem, Mass., assignor to the Pope Manufacturing Company, Hartford, Conn. Filed Nov. 19, 1883. (No model.)

Claim.—1. The described velocipede pedal-slipper, consisting of a curved metallic plate with one or more branches, *e*, and a stop, *e'*, and combined with a stop, *f'*, and a raised toothed edge, *f*, essentially as herein set forth.

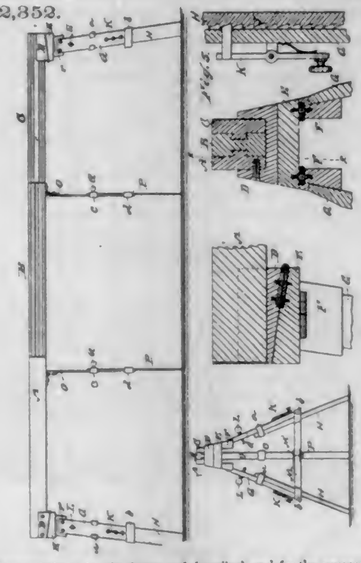
2. As an improvement in velocipede pedal-slippers adapted for attachment to a single bar, and having a curved plate bearing a toothed edge for the sole and a stop to rest against the barrel, a secondary stop, *f'*, combined therewith, and adapted to operate essentially as set forth

3. Constructed and adapted to operate as a pedal-slipper, the combination of two plates, E and F, one formed to hold a pedal-bar and the other formed to receive the sole of the rider's shoe, and both conformed so as to form a holding device between the rubber bar and the barrel of the pedal to prevent the slipper from turning, essentially as set forth.

292,352. COMBINED EXTENSION SAW-HORSE AND SCAFFOLD. JOHN W. PHILLIPS, Oakdale, Nebr. Filed Dec. 20, 1882. (No model.)

Brief.—An extensible top piece is provided with a saddle at each end, to which is hinged a head-block having diverging hinged extension-legs. The latter are held apart by a folding brace hinged at the center and pivoted at the ends. The legs are held extended by a spring-catch on one section engaging a rack on the other. The top piece is provided with intermediate extensible supports hinged thereto.

Claim.—1. In a saw-horse, the combination, with an extensible top piece, of a hinged head-block and extensible legs hinged to said head-block, substantially as herein shown and described.



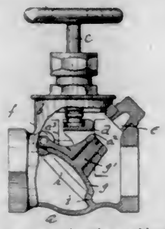
2. In a saw-horse, the combination, with the saddles adapted to receive the top piece, of head-blocks hinged to said saddles and legs hinged to the head-blocks, substantially as herein shown and described.

3. In a saw-horse, the combination, with the top piece consisting of the strips A C, provided with dovetailed tongues, and the strip B, provided with grooves, of the recessed and beveled saddles D, the beveled and hinged head-block E, and the hinged legs G, substantially as herein shown and described.

4. In saw-horses, the combination, with an extensible top piece, of the saddle D, attached to the ends of the same, the head-block E, pivoted to the saddle D, and the legs G, attached to socket-blocks F, pivoted to the saddle D, substantially as herein shown and described, and for the purpose set forth.

5. In saw-horses, the combination, with an extensible top piece, of the saddle D, attached to the ends of the same, the head-block E, pivoted to the saddle D, the legs G, attached to the socket-blocks F, pivoted to the saddle D, and of the folding braces M, pivoted to the legs

292,352.



G, substantially as herein shown and described, and for the purpose set forth.

6. In a saw-horse, the combination, with the top piece, of the hinged legs G, the extension-legs H, provided with the racks J, the latches K on the legs G, and of the screws L, substantially as herein shown and described, and for the purpose set forth.

7. In saw-horses, the combination, with an extensible top piece, of extensible legs attached to head-blocks at the ends of the top piece, and of extensible legs between the ends of the top piece, substantially as herein shown and described, and for the purpose set forth.

8. In saw-horses, the combination, with an extensible top piece, of extensible legs hinged to head-blocks at the ends of the same, and of intermediate extensible legs hinged to the extensible top piece, substantially as herein shown and described, and for the purpose set forth.

292,353. STEAM-VALVE. RUFUS N. PRATT, Hartford, Conn., assignor to the Pratt & Cady Company, same place. Filed Nov. 30, 1882. (No model.)

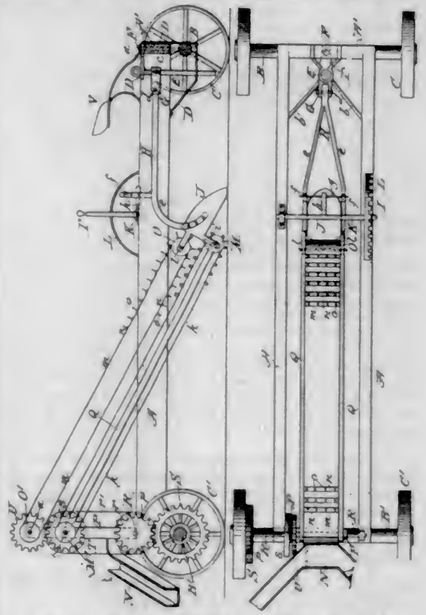
Claim.—1. In a steam-valve, in combination, body *a*, having branches *b* and *c* and inclined valve-seat *i*, hinged flap *f*, bearing a rotary disk, *g*, and a carrier-block, *d*, provided with front and rear bearings, and reciprocated between guides by means of spindle *e*, all substantially as described.

2. In a steam-valve, a carrier-block having bearing-surfaces adapted to work between guides within the valve-body, and also an inclined bearing, forming with the front bearing a wedge between the valve-body and the hinged flap, all substantially as described.

292,354. SHUTTER-WORKER. RONELLO F. PRATT, Everett, Mass. Filed Aug. 31, 1883. (No model.)

Claim.—1. A device for operating outside blinds or shutters from the inside of a room, the same consisting of a sleeve and inclosed spindle passing through the wall or frame of a house, said sleeve and spindle being each provided with a toothed segment at their outer ends, in combination with two separate toothed bars, each operating a pinion and bar

292,354.



in connection with the blinds, whereby one or both blinds may be separately operated, as desired, substantially as set forth.

2. The combination, with the handles D' E', of the locking device consisting of the slotted plate *a*, the screw *d*, and thumb-nut *a*, substantially as and for the purpose set forth.

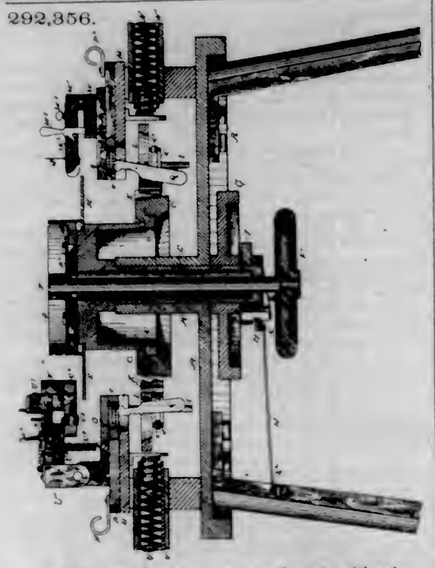
292,355. DITCHING-MACHINE. GEORGE W. RAYMOND, Seneca, Ill. Filed Sept. 18, 1883. (No model.)

Brief.—A shaft for gear and belt wheels transmitting motion from riding-wheels to carrier-belt and adjunctive scraper-belt forms a pivot for a frame supporting the upper ends of such belts and their side beams. The plow or scoop carrying the lower belt-rollers has a bifurcated beam with rods connected by a cross-rod to an arm on a rock-shaft with hand-lever and locking-arc. Such beam is connected at front to a "knuckle" adjustable on a draft-pin passing through a metal frame on the front axle.

Claim.—1. In a ditching-machine, the combination, with the adjustable plow J, having bifurcated beam H, of the conveyers *k m*, adjustable knuckle G, and draft-pin E, substantially as described.

2. In a ditching-machine, the combination, with the adjustable plow J, of the conveyers *m k*, side bars, Q Q, pulley-frame P, swiveled on the shaft R, and suitable connecting and operating mechanism, substantially as described.

3. In a ditching-machine, the combination, with the frame A A' and frame-work D, of the draft-pin E, knuckle-piece G, plow-beam H, having arms *e e* and uprights *f f*, rod *g*, arm *h*, secured to said rod and to rock-shaft K, lever I, ratchet-arc L, plow J, conveyers *k m*, pulleys O O' and M M', pulley-frame P, dump N, gears U T, pulleys *s r*, belt *r'*, pinion *p*, and driving-gear S, substantially as shown and described.



292,356. HAT-MANUFACTURING MACHINE. CHARLES H. REID, Danbury, Conn. Filed May 1, 1883. (No model.)

Claim.—1. In a hat-machine, the rotating clamp and former, constructed as described, in combination with the clutch, as set forth.

2. The driving-shaft carrying the former, in combination with the collar and spring-actuated clutch-pin.

3. A driving-pulley capable of rotating loosely on the driving-shaft, a rigid collar forming a guideway for a clutch-pin, and an enlargement on the driving-shaft in which the clutch-pin slides, in combination with

292,356.

a wedge which, when moved forward, rides on the surface of the enlargement until the clutch-pin comes round, when it engages a shoulder thereon and forces it down out of engagement with the driving-pulley, so that the machine can only be stopped in the position in which the clutch-pin is engaged by the wedge.

4. In a hat-machine, the driving-shaft carrying the former, pulley, and the collar, in combination with the clutch-pin and the wedge.

5. In a hat-machine, the collar, clutch-pin, and the wedge, in combination with the bell-crank lever and the connecting-rod.

6. The bracket and the wedge pivoted thereto, in combination with the central shaft and spring pivoted thereto, the clutch-pin, collar, and the wedge.

7. The rotating clamp and former, in combination with the trimmer, substantially as described.

8. The rotating clamp and the former, in combination with the driving-pulley, clutch, and the trimmer.

9. The rotating clamp and former, constructed as described, in combination with an ironer.

10. The rotating clamp and the former, in combination with the driving-pulley, clutch, and the ironer.

11. The iron, in combination with standards having beveled edges, which serve as stops or rests when the iron is turned back out of use.

12. The iron-supporting standards and tool-carrier, in combination with adjusting-plate, sliding block, steerer, and adjustable head.

13. The rotating clamp and former, in combination with the ironer and the ironing-cloth.

14. In a hat-machine, the ironing-cloth having its edge supported by a wire, and attached to a metallic yoke which covers the body of the hat.

15. The yoke and ironing-cloth, in combination with the adjusting-plate and jointed standard, whereby the ironing-cloth may be thrown back out of the way when not in use.

16. The rotating clamp and the former, in combination with the curler, substantially as described.

17. The rotating clamp and the former, in combination with the driving-pulley, clutch, and the curler, substantially as described.

18. The adjusting-plate and tool-carrier, in combination with the supporting-plate and the curling-block.

19. The adjusting-plate and tool-carrier, in combination with the supporting-plate, the curling-block, and the turner secured thereto by a spring.

20. The supporting-plate having a central slot, the sliding cap-plate, and the block secured thereto, in combination with the curling-block.

21. The slotted supporting-plate, cap-plate, and block, in combination with the curling-block, the turner, and the guard.

22. The adjustable guard, curling-block, and supporting-plate, in combination with a holding-spring, for the purpose set forth.

23. The curling-block and supporting-plate, in combination with pivoted standards and the tool-carrier, whereby the operative parts may be thrown out of the way when not in use.

24. The supporting-plate and the operating parts carried thereby, in combination with the tool-carrier, the adjusting-plate, and the sliding block.

25. The supporting-plate and the operating parts carried thereby, in combination with the tool-carrier, the adjusting-plate, the sliding block, the steerer, and the head.

26. The curler, as described, in combination with the tool-carrier, the adjusting-plate, the sliding block, the steerer, the adjustable head carrying the shoe, and the former.

27. The curler, as described, in combination with the tool-carrier, the adjusting-plate, the sliding block, the steerer, the adjustable head, and bearing-points, for the purposes set forth.

28. The tool-carrier, constructed as described, in combination with the supporting-plate, and a curling-block provided with a heating-chamber, for the purpose set forth.

29. The supporting-plate, in combination with the sliding plate, the link, and the lever, for the purpose set forth.

30. The operating-lever pivoted to the supporting-plate, in combination with the sliding plate, and a link connecting the sliding plate with the lever, and pivoted thereto at one side of its center of motion, so that when the lever is turned to its forward position the sliding plate is carried with it and is locked in such forward position.

31. The rotating clamp and the former, in combination with the planer, substantially as described.

32. The rotating clamp and the former, in combination with the driving-pulley, clutch, and the planer, substantially as described.

33. The tool-carrier, in combination with the standard and the planer-arm, substantially as described.

34. The planer-arm, in combination with the finger and the knife, for the purpose set forth.

35. The knife and adjustable finger, in combination with the hinged planer-arm and the latch.

36. In a planer for trimming hat-brims, the adjustable curved finger, adapted to pass under the curl of the brim and to act as a guard to the knife.

37. The planer, constructed as described, in combination with the tool-carrier, the adjusting-plate, and the sliding block.

38. The planer-arm and operating parts carried thereby, in combination with the tool-carrier, the adjusting-plate, the sliding block, the steerer, and the head.

39. The planer, as described, in combination with the tool-carrier, the adjusting-plate, the sliding block, the steerer, the adjustable head carrying the shoe, and the former.

40. The planer, as described, in combination with the tool-carrier, the adjusting-plate, the sliding block, the steerer, the adjustable head, and bearing-points.

41. In a hat-machine, the combination, with a rotating clamp and former, of a non-rotating curler and a planer, for the purposes set forth.

42. In a hat-machine, the combination, with a rotating clamp and former, of a non-rotating ironer and a curler, for the purposes set forth.

43. In a hat-machine, the combination of an ironer, a curler, and a planer with a rotating clamp and former, for the purposes set forth.

44. In a hat-machine, the combination, with a rotating clamp and a former, of a series of non-rotating tools adapted to act upon the hat.

45. In a hat-machine, the combination, with a clamp and former, of a trimmer, an ironer, a curler, and a planer, whereby the hat, after blocking, is made ready for shaping and finishing.

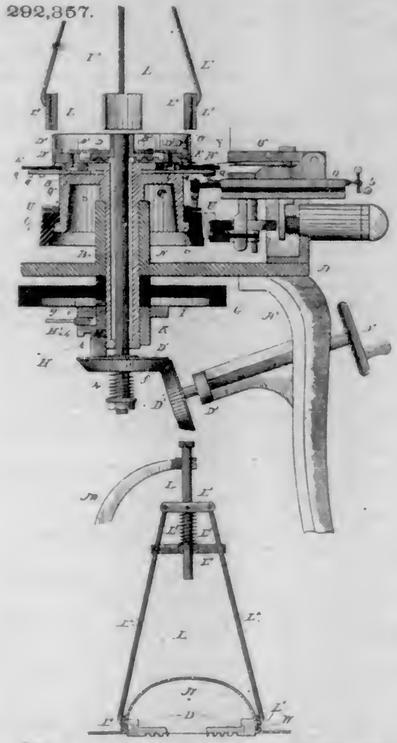
46. The circular bed-plate and supporting-sleeve, in combination with the clamp and former, and a series of tools placed around the former and adapted to act upon a hat-brim.

47. The process of trimming and curling hats, which consists in imparting to the hat a rotary motion, and then subjecting it to the successive action of trimming and curling tools.

48. The process of trimming and curling hats, which consists in imparting to the hat a rotary motion, and then subjecting it to the successive action of trimming, ironing, and curling tools.

49. The process of trimming, curling, and planing hats, which consists in imparting to the hat a rotary motion and subjecting it to the action of a series of non-rotating tools.

292,357. HAT TRIMMING AND CURLING MACHINE. CHARLES H. REID, Danbury, Conn. Filed Sept. 19, 1883. (No model.)



Brief.—Improvement on Application No. 93,604, filed May 1, 1883.

Claim.—1. The central shaft, a gear capable of vertical movement on said shaft, and a spring acting to force the gear upward, in combination with the clutch-pin and driving-pulley, whereby motion is imparted to the hollow shaft and parts carried thereby.

2. The central shaft, a gear moving thereon, and a spring, in combination with the driving-pulley, the clutch-pin, and a wedge which acts when in operative position to withdraw the clutch-pin and stop the rotation of the hollow shaft.

3. The combination, with the clutch, the driving-pulley, and the central shaft, of a spring-actuated operating-wheel, which slides on said shaft.

292,357.

4. The hollow shaft, the driving-pulley loosely mounted thereon, and a spring-operated clutch-pin acting to connect said pulley and shaft, in combination with a wedge adapted to act on a shoulder on the clutch-pin, and having a lug or stop which engages the clutch-pin and stops the machine.

5. Gear D^2, journaled in bearings attached to the frame-work, in combination with a sliding gear upon the central shaft, and means for forcing said gear down into engagement with gear D^2, whereby the central shaft may be rotated to operate the clutch.

6. The central shaft, sliding gear, spring A, and gear D^2, having hand-wheel D^4, for convenience in operating, in combination with the clutch-pin and the wedge, substantially as described.

7. In a hat-machine, clamp D, operated as described, in combination with clamp L, acting upon the outside of the hat.

8. In a hat-machine, clamp D, in combination with a supplemental clamp carried by a swinging standard, substantially as described, and for the purpose set forth.

9. In a hat-machine, rod L' and arms L^2, in combination with band L^4, having a cross-piece, and spring L^3, all combined and operating as described.

10. The spring-operated arms having curved pieces L^5, in combination with a standard and clamp, D.

11. The carrier-plate, a sliding bar connected to one of the clamp-arms, and means for connecting the sliding bar with the carrier-plate, whereby movement of the clamp-arm is imparted to the carrier-plate, for the purpose set forth.

12. Bar Q, connected to one of the clamp-arms, and having beveled lugs Q^1, which engage screw-threaded rod R, in combination with an internally-screw-threaded sleeve engaging rod R, said sleeve being held against longitudinal movement in the carrier-plate, whereby rotation of the sleeve adjusts said plate to the desired position.

13. The carrier-plate having recess P^1, groove P^2, and shoulder P^3, and rod S, having sleeve S^1 and collar S^2, in combination with rod R, having spline R^2, and means for connecting said rod to one of the clamp-arms.

14. Rod T, having a spring-arm, in combination with the sliding plate, the tool-carrier, and a key, for the purpose set forth.

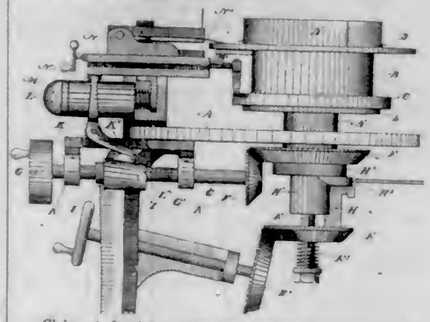
15. The sliding plate having recess O^2 and slot O^4, and rod T, having spring-arm T' and groove T^2, in combination with recess U' and key T^3.

16. The sliding plate, rod T, and spring-arm T', in combination with the carrier-plate, parts Q, R, and S, and key T^3.

17. The carrier-plate, an internally-threaded rotating sleeve held against longitudinal movement, and a threaded rod engaging said sleeve and connected to the clamp, whereby the carrier-plate may be adjusted by rotating the sleeve, and when adjusted conforms to the movements of the clamp.

18. The clamp and the carrier-plate, in combination with means for adjusting the carrier-plate and for connecting it with the clamp.

19. Clamp D, the carrier-plate, and means for adjusting the carrier-plate and connecting it with the clamp, in combination with rod T, having a spring-arm, and a key, substantially as described.



20. In a hat-machine, the combination, with a rotating platform upon which the hat-brim rests, of a spring-plate for holding the brim out flat.

21. The combination, with the platform and clamp D, of a plate secured to the knife-carrier, said plate being widest at its outer edge and curved to conform to the hat, and having straight sides inclined backward toward the knife-carrier, and bent down to press on the brim, whereby the brim is constantly pressed outward, and doubling is prevented.

22. In a hat-machine, a shaft carrying a loose pulley and a clutch, in combination with a wedge adapted to act upon the clutch, and having a lug which stops the machine instantly, substantially as described.

292,358. MACHINE FOR CURLING AND FINISHING HAT-BRIMS. CHARLES H. REED, Danbury, Conn. Filed Nov. 30, 1883. (No model.)

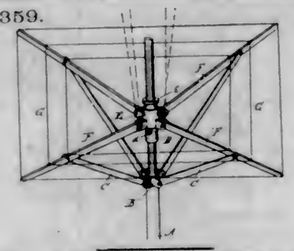
Brief.—Improvement on Application, Serial No. 106,778, of September 19, 1883, by same inventor.

Claim.—1. In a hat-machine, the clamp and mechanism for imparting rotation thereto, in combination with the sliding plate, a pivoted lever engaging therewith, and a cam adapted to actuate said lever, whereby the desired shape is given to the hat-brim.

2. The sliding plate, the clamp, and the clutch, in combination with a pivoted lever for actuating the sliding plate, a driving-shaft carrying a cam which moves the lever, and gears through which rotation is imparted to the clamp.

3. In a hat-machine of the class described, shaft G, carrying a belt-pulley, a cam, and a beveled gear, and a pivoted lever bearing on the cam, in combination with a sliding plate which carries the tool and is actuated by the lever, and a rotating clamp to which motion is imparted by the beveled gear.

4. In a hat-machine driving-shaft, cam I, and lever L, in combination with the sliding plate having grooved projection N', and adapted to carry the operating-tools.



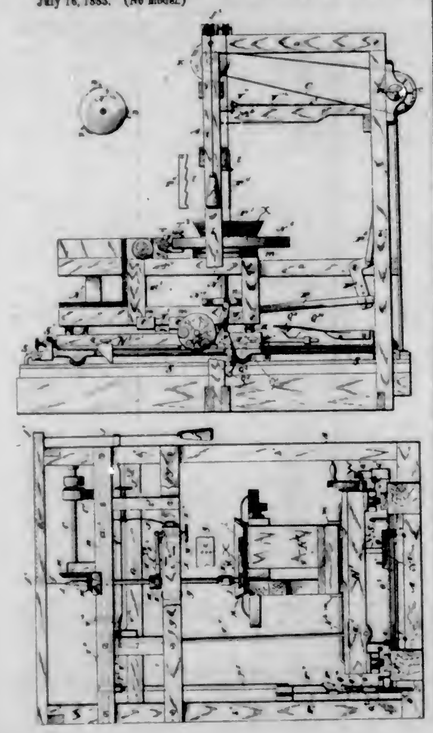
5. The sliding plate, lever L, gears E', E^2, F, and F', in combination with the clamp-collars H' H^2, spring E^3, and clutch-pin H, as described, and for the purpose set forth.

6. In a hat-machine, the driving-shaft carrying a cam of suitable contour to give form to the hat-brim, a pivoted lever bearing on said cam and imparting the necessary reciprocatory motion to the tool-carrying plate, in combination with a rotating clamp which carries the hat, and mechanism for connecting it with the driving-shaft.

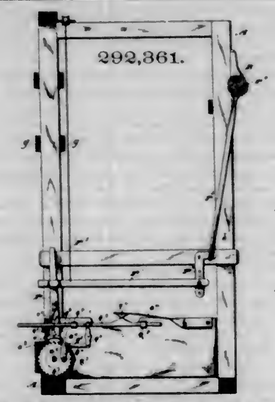
292,359. CLOTHES-REEL. WILLIAM H. RICHMOND, Mount Pleasant, Mich. Filed Aug. 3, 1883. (No model.)

Claim.—In a clothes-drying reel, the combination of the post A, provided with a shoulder, the hubs B E, provided with ears, braces C, sleeve D, provided with set-screw *d*, and the flange *c*, and arms F, the parts being constructed, combined, and arranged and operating as and for the purposes set forth.

292,359.



292,360. HARNESS-SADDLE. ALONZO C. RICKEY, Boone, Iowa, and EDWIN D. MYERS, Wooster, Ohio. Filed Apr. 30, 1883. (No model.)



Claim.—1. The yoke A, formed at its ends with eyes *a* and cross-bars *b*, in combination with the bottom plate, D, having a recess for the reception of the cross-bar *b* and upwardly-projecting lugs *d*, and the top plate, F, provided with the locking-tongue *f*, and adapted to be secured in place, substantially as and for the purpose set forth.

2. The bottom plates, D, provided at their upper ends with recesses *c* and lugs *d*, whereby the yoke may be held in place and secured against lateral or sidewise motion, substantially as hereinbefore set forth.

292,361. MACHINE FOR DRESSING STONE. HENRY A. RIPE, Tim berville, Va., assignor of one-half to Peter S. Fahrney, same place. Filed July 16, 1883. (No model.)

292,361.

Claim.—1. In a machine for dressing stone, the combination, with a grinding-disk and a supporting-table, of a trough for holding abrading material mounted upon said table, and arranged to receive the slab or stone to be operated upon by the grinding-disk.

2. The combination, with an adjustable shaft, a grinding-disk removably secured to the lower end thereof, and connections for adjusting said shaft, substantially as described, of a carriage arranged to move under said disk, and a table arranged to move laterally upon said carriage, and carrying a trough to receive abrading material and to receive the grinding-disk, substantially as and for the purpose set forth.

3. The combination, with devices for cutting or dressing stone, of a table consisting of a step for large blocks of stone, a clamp for holding small pieces, and a rotary or supplemental table.

4. The combination, with a grinding-disk, of a carriage, a table arranged to move laterally upon said carriage, a supplementary rotary carriage, mechanism for moving the carriage and for moving the table, and mechanism for reversing the movement of the carriage and of the table.

5. The combination of a stone-supporting table, a vertical shaft carrying a grinding-disk, devices mounted upon a movable bearing for adjusting said shaft, and a weight and cord for holding said shaft and disk elevated above the table, substantially as set forth.

6. The combination, with a stone-supporting table, a vertical rotary shaft carrying a grinding-disk, an adjustable collar, secured to said shaft above the disk, and connections mounted upon a movable bearing and arranged to engage with the collar for the purpose of adjusting the shaft, substantially as described.

7. The combination, with a stone-supporting table and a vertical shaft carrying a grinding-disk, of a movable bearing for supporting said shaft, and attachments for limiting the movements of said bearing.

8. The combination, with a vertical shaft, having a fixed and a movable bearing, of a spring bearing at one end against the movable bearing and secured at its opposite end to the machine-frame, a pin or bolt for limiting the movement of said bearing, a grinding-disk secured to said vertical shaft, and a table for supporting the stone to be acted upon by said disk, substantially as herein specified.

9. The combination, with a lever carrying a double pawl, a ratchet-wheel acted upon by said pawl, a spring for holding the pawl into engagement with the ratchet-wheel, and a shaft carrying a pinion, of a carriage provided with a rack arranged to engage with said pinion, and mechanism for reversing the position of the pawl.

10. The combination, with a shaft, a pinion and a ratchet-wheel secured on said shaft, and a carriage having a rack-bar with which the pinion engages, of a lever pivoted to the shaft, a pawl secured to said lever, and mechanism for regulating the speed of the carriage.

11. The combination, with a shaft, a pinion and a ratchet-wheel secured to said shaft, and a carriage having a rack-bar with which the pinion engages, of a lever pivoted to the shaft, a pawl pivoted to the lever, a pitman one end of which is adjustably secured to said lever, devices for imparting motion to the pitman, and a cord and notched plate for holding the adjustable end of the pitman in position.

12. The combination, with a shaft, a pinion and ratchet-wheel secured to said shaft, and a carriage having a rack-bar engaged by said pinion, of a lever pivoted to the shaft, a spring-actuated pawl secured to the lever, a bell-crank, a driving-shaft carrying an eccentric, a pitman connecting said bell-crank with said eccentric, an adjustable pitman connecting the pivoted lever with the bell-crank, and a cord and notched plate for adjusting the said adjustable pitman.

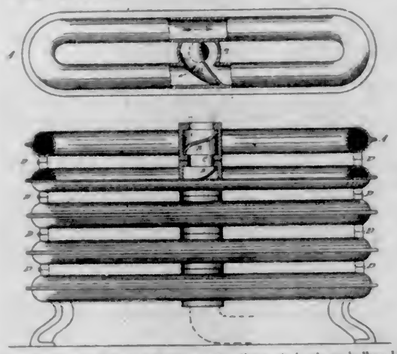
13. The combination, with a lever carrying a double pawl, a ratchet-wheel, a spring for holding the pawl in engagement with said ratchet-wheel, and a shaft carrying a pinion, of a carriage provided with a rack

4.

arranged to engage with said pinion, and a trip-bar carrying adjustable stops, an arm mounted upon said shaft and arranged to engage with said stops, and mechanism connected with said bar for reversing the movements of said carriage.

14. The combination, with a carriage provided with adjustable stops and a rack-bar secured to said carriage, of a shaft, a pinion and a ratchet-wheel secured to said shaft, a lever pivoted to the shaft, the double pawl pivoted to the lever, the spring secured to the lever for holding the pawl in engagement with the ratchet-wheel, the trip-bar, and the sliding rod indirectly connected to the trip-bar, and provided with depending fingers adapted to engage the pawl for the purpose of changing the direction of movement of the carriage.

15. The combination, with the carriage, shaft, pinion, ratchet-wheel, lever, and pawl, of the trip-bar, the sliding rod having depending fingers for engagement with the pawl, and the spring for steadying the sliding rod, substantially as set forth.



16. The combination, with a rotary grinding-disk, and an angular shaft carrying two wheels movably arranged thereon, of a main carriage carrying a rack-bar arranged to be engaged by one of said wheels, a carriage arranged to rest movably upon said main carriage and carrying a rotary table, and a shaft depending from said table and carrying a wheel arranged to engage with the other wheel upon the said angular shaft, substantially as and for the purpose set forth.

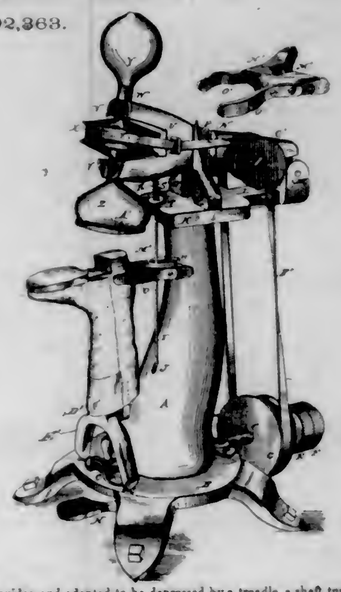
17. The combination, with the carriage, of the table movable laterally on the carriage, the supplementary table, and the clamp having a screw-bolt by which it is secured to the supplementary table, and also a screw-bolt to engage the table proper, substantially as set forth.

18. The combination, with the rotary table, connections for operating the same, and a vertical shaft depending therefrom, of the trip mechanism, the lever U, and the lever U', all of said parts being combined and arranged to operate as described.

19. The combination with the carriage and table, of the screw-shaft, a movable spur-wheel thereon, a worm-wheel journaled to the carriage, and arranged to engage the spur-wheel and turn the screw-shaft, a shaft constructed, as described, for operating the worm-wheel, a vertical shaft having a bevel-wheel thereon, the drive-shaft having two bevel-wheels thereon, and a lever for moving the upper end of the vertical shaft, whereby the wheel thereon is caused to mesh with one of the wheels on the drive-shaft, substantially as set forth.

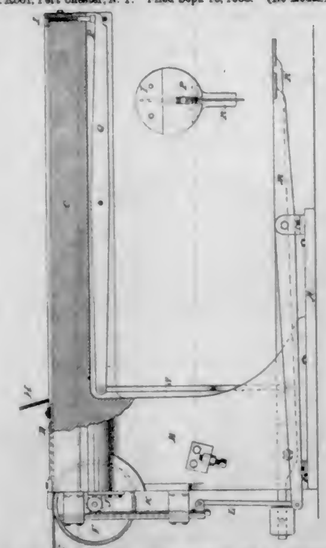
292,362. RADIATOR. LOUIS C. RODIER, Detroit, Mich. Filed Oct. 1, 1883. (No model.)

Claim.—1. A hollow link-shaped radiator, A, having a hollow hub at its longitudinal and transverse center, within which and one leg of the radiator is placed a diaphragm, dividing them into two compartments, substantially as described.



2. Two or more radiators, A, having hollow hubs at their longitudinal and transverse centers, constructed substantially as described, each of which is provided with a central hub and a diaphragm, and adapted to be secured together by a nipple, C, entirely inclosed by said hubs, substantially as specified.

292,363. MACHINE FOR FILING SHOE-HEELS. HENRY F. ROONEY, Randolph, Mass. Filed Nov. 14, 1883. (No model.)



Claim.—1. The combination of an adjustable hinged shoe-jack, a clamp consisting of an inner block and two forwardly-projecting inwardly-curved springs, and a grinding-disk adapted to be brought down to turn in a horizontal plane, as and for the purpose shown and set forth.

2. The combination of an upright frame, a shoe-jack hinged at its lower end to the lower end of the frame, a clamp secured near the upper end of the frame, an arm hinged at one end upon the upper end of the frame, forming a bifurcated arbor at its outer end, swinging between vertical guides, and adapted to be depressed by a treadle, a shaft turning in vertical bearings in the arbor, having a bell-shaped grinding-block at its lower end, a weight at its upper end, and a pulley at its middle, and a belt passing over said pulley, over suitable guide-pulleys, and over a drive-pulley, as and for the purpose shown and set forth.

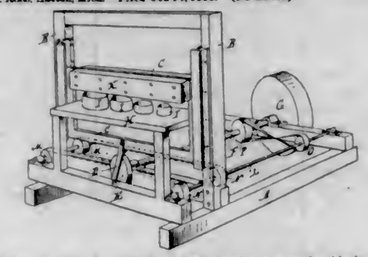
292,363.

292,364. MACHINE FOR RIVETING SHEET-METAL PIPE. JOHN B. ROOT, Port Chester, N. Y. Filed Sept. 10, 1883. (No model.)

Claim.—1. In a pipe-riveting machine, the combination of a riveting-mandrel with a sliding rivet-carrier contained therein, and adapted to reciprocate from one end thereof to the other or riveting end, for the purpose set forth.

2. In a pipe-riveting machine, the combination of a riveting-mandrel with a sliding rivet-carrying rack contained therein, and gearing for reciprocating such rack, as and for the purpose set forth.

3. In a pipe-riveting machine, the combination of a riveting-mandrel, a longitudinally-moving rivet-carrier contained therein, and a yielding catch arranged to retain the rivets as the carrier returns from its forward movement, for the purpose set forth.



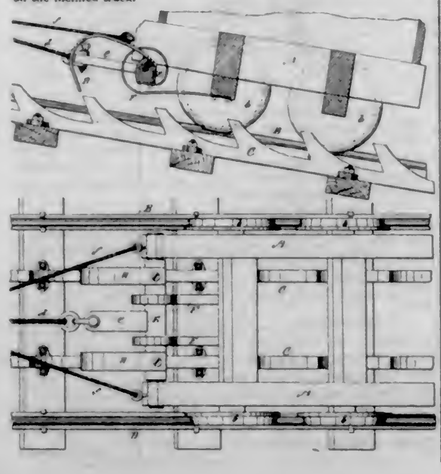
4. In a pipe-riveting machine, the combination of a riveting-mandrel, a rivet-carrier arranged to convey the rivets to the riveting end of the mandrel, and a reciprocating plunger arranged to insert the rivets in the blank, as set forth.

5. The combination, in a pipe-riveting machine, of a riveting-mandrel, a rivet-feeding device located without the position of the blank operated upon, and a rivet-carrier reciprocating in the mandrel, and adapted to carry the rivets from the rivet-feeding device to the riveting end of the mandrel, substantially as set forth.

6. The combination, in the machine herein described, of the mandrel, the rivet-carrier and its reciprocating gear, the connecting-rack and pitman, and the operating-treadle, substantially as set forth.

7. The combination, in the machine herein described, of the mandrel, the rivet-inserting plunger, its reciprocating levers, and the operating-treadle, substantially as and for the purpose set forth.

292,365. MACHINE FOR FORMING PAVING-BLOCKS. DONALD G. RAES, Hatton, Mich. Filed Oct. 16, 1883. (No model.)



Claim.—1. In a machine for sizing and trimming paving-blocks, a series of dies or circular cutters having an opening at the bottom as large as at the cutting-edge, stationarily secured in a bed-plate, in combination with a reciprocating gate or plunger, substantially as and for the purposes described.

2. In a machine for sizing or trimming paving-blocks, the combination of the following parts: a series of dies or ring-cutters, a gate or plunger reciprocating in the axis of the ring-cutters, and suitable belts for carrying off the finished paving-blocks and the débris, all arranged and combined substantially as and for the purposes described.

3. The combination of the frame A, standards B B, gate C, provided with a re-enforced head, K, ring-cutters I, bed-plate H, crank E, pitman D, main drive-shaft F, and driver G, all combined and operating substantially as described.

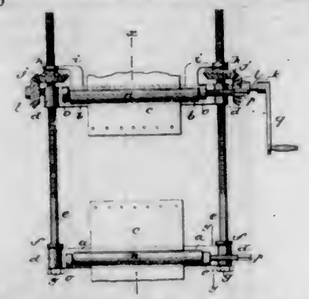
292,366. CAR FOR INCLINES IN MINES. JOHN ROSQUIST, Park City, Utah. Filed Aug. 31, 1883. (No model.)

Brief.—A spring-actuated rotating shaft on the car connected with the draft device has one or more pawls adapted to engage a rack on the inclined track.

Claim.—1. In cars for ascending and descending inclines in mines, the combination, with the car, its inclined track, and one or more locking-racks on said track, of an automatic pawl attachment to the car, connected with and controlled by the rope or appliance by which the car is raised or lowered, substantially as specified, and whereby in case of said rope or appliance giving way the car will be stopped at any portion of or different points in the length of the track, as herein set forth.

2. In cars for ascending and descending inclines in mines, the combination, with the draft devices or connections between the car and the rope or appliance by which the car is raised or lowered, and with one or more locking-racks on the car-track, of a rocking beam or shaft carried by the car, and connected with the draft devices, one or more pawls controlled by said beam, and means for throwing the pawl or pawls into engagement with the rack or racks upon the car being liberated from the rope or appliance by which it is raised or lowered, essentially as described.

3. The combination of the car A, the rails B B of the inclined track, one or more locking-racks, C, on said track, the rocking beam or shaft E, one or more pawls, D, carried by said shaft, a spring or springs, F, for rocking the shaft to throw the pawl or pawls into engagement with the rack or racks, and the tongue e and draft-connection d, for holding the pawl or pawls out of lock with the rack or racks, essentially as and for the purposes herein set forth.



292,367. CAP FOR BOTTLE-STOPPERS. EDWARD SACHS, Dayton, Ohio, assignor to Sachs, Prudon & Co., same place. Filed Dec. 14, 1883. (No model.)

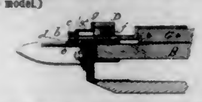
Claim.—1. A cap for bottle-stoppers, made of metal or other suitable material, provided with a central perforation, for the purposes hereinbefore described.

2. The combination of the bottle with the centrally-perforated metallic cap *a*, stopper, and holding-wires, substantially as and for the purposes hereinbefore set forth.

292,368. BELT-TIGHTENER. FRANK SAGER, Pittsburg, Pa., assignor of one-third to Charles Holmes, same place. Filed June 15, 1883. (No model.)

Claim.—In a belt-tightener of that class employing screw-threaded shafts and clamping-rolls, the combination therewith of a fixed and a movable cross-bar having eyes, one at each end, forming bearings for the said shafts, the latter having collars and nuts at the ends of said eyes, and working in screw-threaded bevel-toothed nuts, operated by beveled cog-wheels, a shaft, and a crank or handle, essentially as shown and described, and for purpose set forth.

292,369. SAW-ENVELOPE. FREDERICK SCHLICHTNER, East New York, N. Y. Filed Nov. 13, 1883. (No model.)



Claim.—1. A saw-envelope made, substantially as herein shown and described, with a fastening-strap detachable at one or both ends, for securing the envelope in place upon the saw, and provided with an aperture to display the figure indicating the number of teeth to the inch in the saw, as set forth.

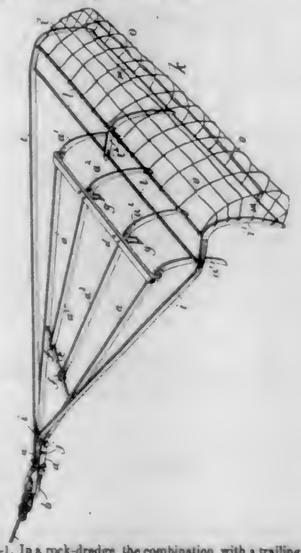
2. The combination, with a saw-envelope, A, of the fastening-strap C, provided at one or both ends with a cross-head, E, to engage with slits F in the said envelope, substantially as herein shown and described, whereby the said envelope will be held securely in place and can be readily detached, as set forth.

3. A saw-envelope provided with an aperture, G, for displaying the figure indicating the number of teeth to an inch in the saw, as set forth.

292,370. CUTTING APPARATUS FOR HARVESTERS. GEORGE H. SCHULTE and CHARLES MARTINCOURT, Milwaukee, Wis., assignors to the Deering Harvesting Machine Company, (Limited,) same place. Filed Oct. 4, 1883. (No model.)

Claim.—1. In a harvester, the combination of the platform, the apron stretcher-bar provided with a horizontal slot, the cutter-bar, the angle-iron shield secured to said cutter-bar, the keeper, also secured to said cutter-bar, the central sway-bar passing through the slot in the stretcher-bar and engaging said keeper, and the flanged shield overlapping said angle-iron shield and covering said slot, as and for the purpose set forth.

2. In a harvester, the cutter-bar *e*, having the angle-iron shield *d* and keeper *c*, in combination with the bar B, sway-bar C, and pivot *a*, substantially as and for the purpose set forth.



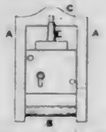
3. In a harvester, the cutter-bar *e*, having the angle-iron shield *d* and keeper *c*, in combination with the sway-bar C, the front stretcher-bar, D, having the slot *f*, and the upper shield, *g*, substantially as and for the purpose set forth.

4. In a harvester, the combination of the finger-bar, the sickle, the removable clamps having slots, and the bolts passing through said slots for securing said clamps in place, substantially as set forth.

5. In a harvester, the sickle-clamps I, having slots *i*, in combination with the bolts I' and nuts *i'*, substantially as and for the purpose set forth.

292,371. ROCK-DREDGE. ISAAC DU BOSE SEABROOK, St. Helena Island, S. C. Filed May 23, 1883. (No model.)

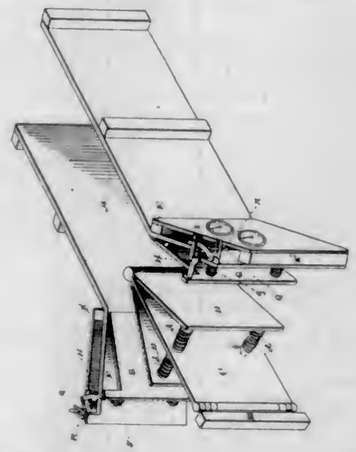
Brief.—Two forwardly-connected diverging bars with ends curved to form teeth are also connected by cross-bars, on one of which are pivoted other curved-end bars, which may play in loops on the other cross-bar. Pivoted between the bars is a triangular frame (formed of two curved-end bars connected by cross-bars, which also carry a connecting and curved-end bar,) carrying a wire-net basket.



Claim.—1. In a rock-dredge, the combination, with a trailing basket or gatherer and drag rope or chain, of the breaker having shackled side toothed bars and intermediate independently-movable toothed bars, adapted to have vertical movement, substantially as and for the purpose set forth.

2. The breaker, made with diverging tooth-bars *a a'*, connected suitably to a draft-clevis or shackle at the front, and by a rear transverse bar, *d*, having clips or loops *g*, through which pass the intermediate teeth, a^2, which connect pivotally with cross-bar *a* of bar *a*, substantially as shown and described.

3. The gatherer, constructed with frame-bars *i* i^2 i^3, cross-rods *l*, flexible wire rope *m*, and intermeshing cords or wires *o*, substantially as shown and described.

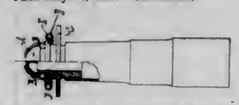


4. The combination, in a rock-dredge, of the breaker consisting of toothed bars *a a'*, connected to draft-shackle *b* and to each other by bars *d e*, as *d* bars *e* carrying pivotally and between collars *f* the forward ends of the intermediate tooth-bars, a^2 a^3, which work in loops *g*, and a trailing basket or gatherer, pivoted to bars *a* at *j*, and formed of end-curved bars *i*, bars i^2, top cross bar or bars, *l*, and flexible wire rope *m*, and the intermeshing cords or chains *o*, said breaker and gatherer being connected to the drag-rope *c* and to each other, to afford free vertical and lateral play of the breaker and gatherer, substantially as shown and described.

292,372. LOCKING BUCKLE. WILLIAM ARTHUR SHAW, Nottingham, England. Filed Oct. 16, 1883. (Model.) Patented in England Jan. 6, 1883, No. 81.

Claim.—The combination, with the buckle-frame, of the lock-case D, swiveled to swing within the frame, and having at its outer end a longitudinally-sliding rigid bolt, E, capable of being advanced to constitute the tongue of the buckle, and also serve to immovably secure the lock-case in the frame, substantially as described.

292,373. SHEEP-ENUMERATOR. HENRY A. SHIPP, Fresno City, assignor of one-half to William Perkins Hall, Dublin, Cal. Filed June 5, 1882. (Model.)



Claim.—1. The corral-chute A and the dodge-gate C, swinging to close said chute upon each side, in combination with the swinging spring-flaps G G, hinged upon each side of the chute, indicating devices, and means for transmitting the yielding of the said flaps to said indicating devices to record the number of passing animals, all arranged and operating substantially as herein described.

2. The corral-chute A and the dodge-gate C, swinging to close said chute upon each side, in combination with the swinging jamb-flaps D D, with strong springs *d d*, the swinging lever-flaps G G, with their lighter springs *g g*, indicating devices, and means for transmitting the yielding of the lever-flaps G G to said indicating devices to record the number of passing animals, all arranged and operating substantially as herein described.

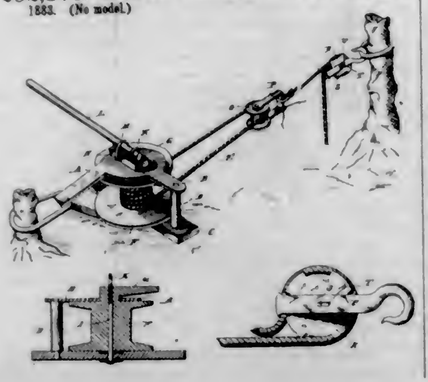
3. The corral-chute A and the dodge-gate C, operating as shown, in combination with the swinging spring jamb-flaps D D, the swinging spring lever-flaps G G, the indicating devices, consisting of the boxes I, with their ratchets *j*, pinions *k*, gears L and N, hands *m* and *o*, dials M and O, and the means for transmitting the motion of the lever-flaps G G to said indicators, consisting of the forked pins H, with their spring-buffers A, elbow-levers R, with their forked ends, levers Q, and their pawls, consisting of the legs *q'*, said pawls engaging with the ratchets *j*, all arranged and operating substantially as and for the purpose herein described.

292,374. TIP FOR ELECTRIC GAS-BURNERS. ADOLPH T. SMITH, New York, N. Y. Filed July 26, 1883. (No model.)

Claim.—A tip for electric gas-burners, made of a non-conducting material, provided with an electrode or electrodes, and also provided with a guard-flange at a point below the electrodes, substantially as and for the purpose described.

292,375. ROAD-SCRAPER. LYMAN SMITH, Malta, Ill. Filed July 2, 1883. (No model.)

Brief.—Bars secured to the scraper and converging forwardly are flexibly secured to the tongue forward of its attachment to the axle. Lifting-chains run from these bars over pulleys in standards on the axle to pivoted levers with locking-arcs. To limit the tilt up of the tongue under the weight of the scraper, which lies behind the axle, a bar carrying a caster-wheel is pivoted to the axle at back and has side braces thereto, permitting the tongue to tilt until a rearward-projecting beam carrying the seat rests on the upper face of the caster-wheel beam.

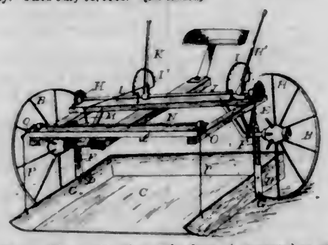


Claim.—1. The combination, with a supporting-frame mounted upon two wheels and projecting forward of the same, a scraper, D, located at the rear of the supporting-wheels, and means for lifting said scraper, of a rearwardly-projecting bar, H, flexibly secured to the frame, a caster-wheel, J, mounted upon said bar, and means (as G) upon the frame constructed to engage the said bar, whereby the upward movement of the front end of the frame is limited, substantially as and for the purposes set forth.

2. The combination, with a supporting-frame mounted upon two wheels, a scraper, D, located at the rear of said wheels, and means for lifting said scraper, of a rearwardly-projecting pivoted bar, H, a caster-wheel, J, upon said bar, a seat, F, and a rearwardly-projecting seat-arm, G, secured at its front end to the said frame, substantially as described.

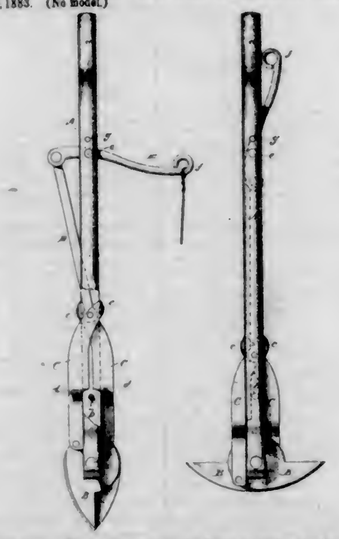
3. The combination, with the beam A, the tongue C, rigidly attached thereto, and the supporting-wheels B, of the pivoted caster-beam H and braces A', attached to said bar, and pivotally connected to the beam A, substantially as and for the purpose set forth.

4. The combination, with the beam A, the tongue C, rigidly attached thereto, and with the supporting-wheels B, of a scraper, D, beams E, rigidly attached to the scraper and flexibly connected to the tongue, standards K upon the beam A, provided with pulleys *k*, levers L, pivoted to the tongue and provided with detents constructed to engage notched segments upon said standards, and chains *l*, attached to said beams and levers and passing over the said pulleys, substantially as and for the purpose set forth.



292,376. WINDLASS. WILLIAM SMITH, Tomah, Wis. Filed June 26, 1883. (No model.)

Claim.—1. The combination, in a windlass, of the frame and its base, a drum having an upward and outward extension, a bolt which turns and passes through said drum, having an eye in which fits the end of the operating-lever, and a link or strap that slides on the lever, as and for the purposes herein set forth.



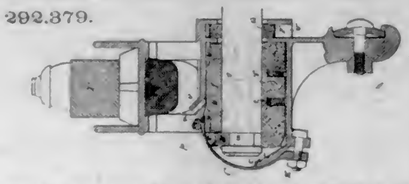
2. In combination with the windlass, as constructed and described, and attachments, a slack pulley, substantially as and for the purposes set forth.

292,377. CLOVER-SEED HARVESTER. HENRY H. SPEARS, Paris, Ky. Filed July 13, 1883. (No model.)

Claim.—The combination of the frame A, mounted on wheels, the cross-shaft J, provided with a sprocket-wheel on each end, the suspension-chains, the slotted guides, the body C, the lever H', rigid on shaft J, the lever K, loose on said shaft, rock-shaft N, its rod-connection with loose lever K, and the suspension-rods P, all constructed and adapted to operate substantially as described.

292,378. HAY-FORK. HENRY STAHL, Cherry Mills, Pa. Filed Aug. 16, 1883. (No model.)

Claim.—1. The combination of the frame or casing A, the prongs B, pivoted thereto, the lever E, also pivoted thereto, the side bars, C, provided with ears *c*, and the center bar, D, pivotally connected to said lever and said side bars, substantially as and for the purpose set forth.



2. The combination of the casing A, rivet *b*, stop *g*, lever E, prongs B, the laterally-bent side bars, C, pivoted to said prongs, and having the narrow lower portions, and the inwardly-curved upper portions terminating in ears *c*, and the center bar, D, pivoted to said lever and said side bars, all arranged and operating substantially as and for the purpose described.

292,379. CAR-AXLE BOX. JOHN STEPHENSON, New York, N. Y. Filed Apr. 21, 1883. (No model.)

Claim.—1. A car-axle-box shell having its front wall bulged outward from each side, and with a front opening provided with a cap curved or bent inward at each side, substantially as set forth.

2. A car-axle-box shell with grooves in its side walls to receive the key check-plate of the necked axle, and with the box-cap to over-

292,379.

shoot the check-plate and bearing-block at an angle relative to the said plate and block, substantially as set forth.

3. An axle-box shell having a curved front end, and provided with a cover plate or cap hinged at the upper end to the box and curved so as to bend its bearing under the action of the clamping-bolt, substantially as described.

4. An axle-box provided with grooves for a key check-plate adapted to a grooved axle, adapted to receive a bearing having a basin at the upper side, and a curved cap arranged to deflect the oil into the basin, substantially as set forth.

5. A car-axle box provided with a cap, the upper part of which extends over the check-plate, and the lower part of the cap passes down outside of front wall, the cap having a ledge or lip at its inner side covering the upper edge of the front wall, as and for the purposes described.

6. The combination of the box and cap extended at an angle over the end of the axle, and provided with a curved lip, *p*, and a flange, *e*, substantially as set forth.

292,380. CONNECTING-ROD. GEO. B. STEVENSON, Upper Sandusky, Ohio. Filed June 11, 1883. (No model.)

Claim.—The combination, with the strap of a pitman or connecting rod, of the adjustable nut N, having the inclined bearing and vertical cylindriform offset R, strengthening the nut in its narrow portion, the wedge-form slide K, having the vertical cylindriform recess *t* and inclined bearing-face, and the adjusting-screw passing through the nut, wedge-form slide, and strap, all adapted to operate substantially as specified.

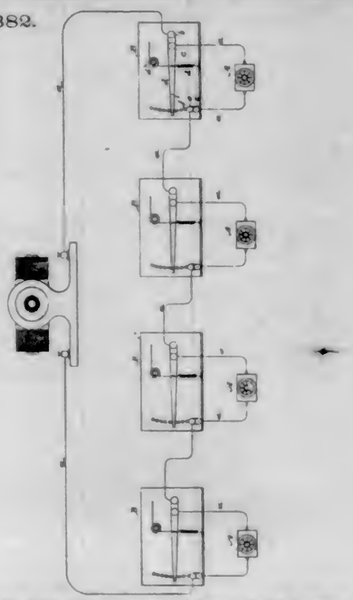
292,381. SYRINGE. GEORGE ABNER STILES, West Gardner, assignor to Warren Hill, Boston, Mass. Filed Sept. 13, 1883. (Model.)

Brief.—A distending cage of open bars fits over any ordinary syringe-tube and is clamped thereto by a spring.

Claim.—1. An attachment for syringes, consisting of a skeleton frame for distending the vagina, provided with a suitable seat for the nozzle of the syringe, and a spring for clamping it thereto.

2. An attachment for syringes, consisting of a skeleton frame formed in two or more longitudinal sections, and having its base end or extremity formed of a series of segmental bars which are arranged in circular form and in such manner as to form an open channel for discharged fluid.

3. An attachment for syringes, consisting of a skeleton frame formed of two or more longitudinal sections, a series of cross bars or stays connecting or uniting said sections, and a suitable spring, the said stays forming bearings or seats for the syringe-nozzle, and the spring acting as a locking or securing device for the nozzle.

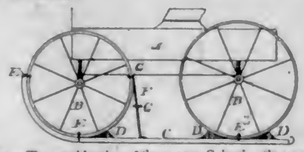


292,382. REGULATOR FOR ELECTRIC MOTORS. LEVI W. STOCKWELL, Cleveland, Ohio. Filed Sept. 21, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of an electric circuit, a series of electric motors placed therein, a variable resistance placed in a shunt around each motor, and consisting of a series of resistances and a switch connected with the main line on one side of the motor which traverses them, and a contact, also, in the path of said switch connected with the line on the other side of the motor, for short-circuiting the motor out of the line.

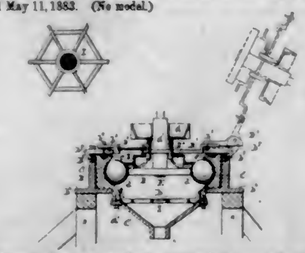
2. The combination, substantially as set forth, of an electric circuit, a series of electrically-connected resistance-bars gradually decreasing in cross-section, their contacts, a switch-finger connected with the line, which sweeps all of said contacts, so as to include one or all in the circuit, and a contact also in the path of the switch-finger, through which the circuit may be completed to cut out all of the resistances.

3. The combination, substantially as set forth, of the face-plate or



292,382.

supporting-board of the adjustable resistance, the resistance-bar, supporting-brackets mounted on the under face thereof, the carbon resistance-bars mounted in said brackets, the circuit-connections, the contacts of the resistance-bars which project through the face-plate, and the switch-finger which sweeps said contacts, so as to include one or all in the circuit.



4. The combination, substantially as set forth, of an electric circuit, an electric motor placed therein, an adjustable resistance placed in a shunt around said motor, the switch-finger of said adjustable resistance, which is automatically normally held into position to short-circuit the motor out of the main circuit, and means for moving said switch-finger to throw the resistance into the shunt-circuit and cause more or less of the current to pass through the motor.

292,383. VEHICLE-RUNNER. WILLIAM HENRY STRAYER, North Manchester, and WILLIAM HENRY PLANCK, Logansport, Ind. Filed Apr. 20, 1883. (No model.)

Claim.—The combination of the runner C, having the curved shoes D, the clips E E', and the brace-rod F, having thereon the step G, with the vehicle-wheels, substantially as herein set forth.

292,384. ORE-PULVERIZER. JEROME B. SWEETLAND, Pontiac, Mich. Filed May 11, 1883. (No model.)

Claim.—1. In an ore-pulverizer, a casing provided with upright beveled projections on its inner face, in combination with a detachable

concave ring fitted within the casing, and provided with upright beveled strips on its outer surface, and adapted to engage with the beveled strips on the inner face of the casing, whereby the connection between the two parts may be tightened and loosened, substantially as described.

2. In an ore-pulverizer, the combination, with a casing, of detachable concave ring resting on the bottom of the casing, and provided with a downwardly-projecting base extending through an opening in the bottom of the casing, and a hopper attached to the lower edge of the ring below the bottom of the casing, substantially as described.

3. In an ore-pulverizer, the combination of the casing, the concave ring having a base extended through the casing, the hopper attached to the bottom of the concave ring, and the screen fitted against the inner face of the extended base of the ring and provided with an upwardly-extending beveled circumferential rim, substantially as described.

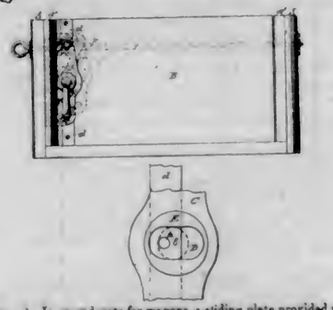
4. In an ore-pulverizer, the combination of a casing provided with beveled projections on its inner face, a concave ring provided with a groove in its top face to receive a packing, and with beveled strips on its outer surface to engage with the projections on the casing, as described, and a removable top fitting over the ring and casing and against the packing in the ring to hold the latter in place, substantially as described.

5. In an ore-pulverizer, the combination of a casing, a rotary web provided with loose balls at its periphery, and a casing, D', fitted over the web and adapted to direct the ore through suitable channels to the periphery of the web, substantially as described.

6. In an ore-pulverizer, the combination of a casing, an interior concave ring, an annular plate secured upon the upper surface of said casing and ring, and a hinged cover secured upon said plate, substantially as described.

7. In an ore-pulverizer, the combination of the casing, the annular plate fitting over the same, the cover hinged to the plate, and the packing between the plate and cover, substantially as described.

8. In an ore-pulverizer, the combination of the casing, a hinged cover thereto, a shaft passing through the cover, and the web secured to the lower end of the shaft, substantially as described.

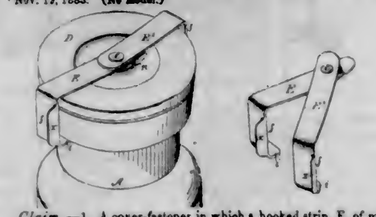


9. In an ore-pulverizer, the combination of a casing, a distributing-hopper divided into compartments and provided with channels communicating with the casing, a feed-hopper, a vibrating apron divided into compartments communicating with said hopper and the compartments of the distributing-hopper, and a cam-shaft for vibrating the hopper, substantially as described.

10. In an ore-pulverizer, the combination of a casing having a concave face with a shorter curve at the upper portion than at the lower portion thereof, and a rotating web carrying loose balls at its periphery next to the concavity of the ring, substantially as described.

11. In an ore-pulverizer, an interior concave ring provided with upright beveled strips on its outer surface, and grooves for packing on its edges, substantially as described.

12. In an ore-pulverizer, the combination of a casing, a ring within the same, having a concave face with a shorter curve at the upper portion than at the lower portion thereof, a rotating web carrying loose balls at its periphery, and adjusting-pins set in the web opposite to the balls, substantially as described.

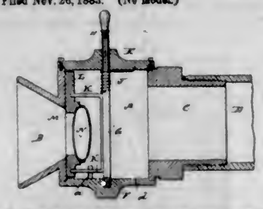


292,385. WAGON END-GATE. HANS P. SWENSEN, Racine, Wis., assignor to Mitchell, Lewis & Co., same place. Filed Oct. 22, 1883. (No model.)

Claim.—1. In an end-gate for wagons, a sliding plate provided with two inclined slots, through which project bolts from said gate, and having between same a horizontal slot, in which works the circular base of a handle that is eccentrically pivoted in said gate, whereby as said gate is inserted between the posts it is maintained therein by said sliding plate, as set forth.

2. In an end-gate for wagons, the sliding plate C, having inclined slots *c c*, intermediate slot, D, in combination with the bolts *c' c'* and handle-plate E, having circular base *e* and eccentric pivoting-leg A, substantially as shown and described, and for the purpose set forth.

292,386. FASTENING FOR FRUIT-JAR CAPS, &c. C. ALBERT TATUM, New York, N. Y., assignor to himself and Francis M. Underhill, same place, James Whitall, Robert P. Smith, Charles Roberts, and William H. Nicholson, Philadelphia, Pa., and John Mickle, Millville, N. J. Filed Nov. 19, 1883. (No model.)



Claim.—1. A cover-fastener in which a hooked strip, E, of metal, having an arm, *s*, is combined with and loosely pivoted to a hooked strip, E', the arm *s* and strip E' being constructed to act on each other, as described, when the strips are turned outward on the pivot-pin, all substantially as set forth.

2. The combination of the upper end of the jar having a shoulder, *m*, and the cover D, having a central recess, with the strips E E', each having a hooked end to underlap the shoulder, and loosely connected together by a pivot-pin, the head of which is adapted to the recess of the cover, substantially as specified.

3. The combination of the top of the jar and cover with the two hooked strips loosely pivoted together and having lips *x*, as described.

292,387. SPEAKING-TUBE MOUTH-PIECE. WILLIAM THOMAS, Pittston, Pa. Filed Nov. 26, 1883. (No model.)

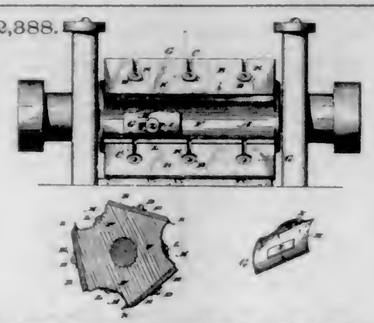
Claim.—1. A speaking-tube mouth-piece consisting of a cylindrical casing provided with a central shaft or spindle carrying a swinging piece, in which the whistle is fastened, substantially as herein shown and described.

2. In a speaking-tube mouth-piece, the combination, with a cylindrical casing, of a central spindle provided with arms, a piece held loosely on the arms, and of a whistle held in the said piece, substantially as herein shown and described.

3. In a speaking-tube mouth-piece, the combination, with a cylindrical casing, of a swinging piece loosely secured to a central shaft, and carrying a whistle, which swinging piece has its outer surface rounded to fit closely against the inner surface of the casing, substantially as herein shown and described.

4. In a speaking-tube mouth-piece, the combination, with a cylindrical casing, A, of the shaft or spindle G, journaled in the top and bottom plates, and having arms K at right angles to it, the spring J, the piece L, held on the arms, and the whistle N, held in the piece L, substantially as herein shown and described.

5. In a speaking-tube mouth-piece, the combination, with the cylindrical casing A, of the shaft G, journaled in the top and bottom plates, the spring J, the arms K on shaft G, and at right angles thereto, the whistle N, held in the piece L, and of the check-studs *a b*, substantially as herein shown and described.



292,388. CUTTER-HEAD. WILTON TRUEG, Cairo, Ill. Filed Dec. 12, 1883. (Model.)

Claim.—1. In combination with the planer, the beading or molding attachment attached to said planer in front of a cutter thereof, and supported near its operative end, which projects beyond the edge of the cutter, by the under face of said cutter, substantially as shown and described.

2. In combination with the cutter of a planer, a beading or molding attachment fastened upon the surface of the planer in front of the cutter, and at its operative end bent up, so as to rest against the under face of the latter and be supported thereby, substantially as and for the purpose described.

3. In combination with a planer, a beading attachment adjustably fastened upon the planer in front of a knife, and at its operative end supported by the under face of the knife, substantially as and for the purpose set forth.

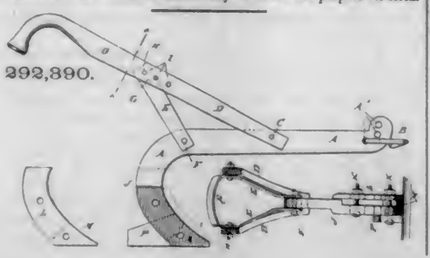
292,388.

4. In combination with the planer-cylinder, the beading attachment adjustably fastened to the cylinder in front of one of the knives by means of a set-screw passing through a slot in its attaching portion, and supported at or near its operative end by the knife, substantially as shown and described.

5. In combination with the cylinder, concaved or provided with longitudinal grooves between the knives, the beading attachment adjustably fastened within one of said grooves, and at its operative end bent up, so as to bear against and be supported by the under face of the knife on the rear side of the groove, substantially as and for the purpose set forth.

6. In combination with the grooved cylinder carrying the cutter-knives, the beading or molding attachment having its main or attaching portion bent to fit the concavity of the groove, and provided with the slot extending parallel to the axis of the cylinder, and the set-screw extending through such slot into the cylinder-body, substantially as and for the purpose set forth.

292,389. COMBINED CANE AND BURGLAR-ALARM. JOHN B. VAN ZANDT, New York, N. Y. Filed Nov. 19, 1883. (No model.)



Claim.—1. In a combined cane and burglar-alarm, the combination of the cane with the collar C, thimble *c*, and screw *d*, all substantially as described.

2. The combination of the cane having collar, as described, and the screw-nut located in said collar, with the thimble *c* and screw *d*, said thimble being formed at its upper end for the reception of the screw-head, substantially as set forth.

3. In a combined cane and burglar-alarm, the cane having handle constructed substantially as described, and having ferrule provided with holes in its side, in combination with the means whereby the cane is suspended, as set forth.

4. An attachment for canes, umbrellas, and the like, composed of the collar, the screw-nut located therein, the thimble *c*, and screw *d*, all constructed and combined substantially as and for the purpose set forth.

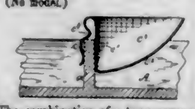
292,390.

292,390. PLOW. SIMEON ASBERRY WARE, Danburg, Ga. Filed Oct. 12, 1883. (No model.)

Claim.—In a plow, the beam A, having the offset J cast in one piece therewith, and the plate L, having the projection M cast therewith, the projection M resting against one side of the beam A, and the plate L resting against the offset J and bolted to the beam A, in combination with the plow G and bolt N, fastened between the plate L and beam A, substantially as shown and described, and for the purpose set forth.

292,391. CLAMP FOR CABINET-MAKERS. JOHN WILLIAM WEBER, Chicago, Ill. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination, with the beam of a clamp, of a stationary bracket secured to one end thereof, an opposing movable bracket upon the beam, a block connected loosely with the beam so as to have free vertical and lateral movement, and a cam pivotally mounted in the stationary bracket and constructed to bear upon the said movable block, substantially as described.



2. The combination, with the clamp-beam A, provided with a stationary bracket at one end and a metal plate having a series of notches, *a*, of a movable bracket, C, opposed to the stationary bracket, a movable pawl-plate, C^3, provided with teeth adapted to engage with the said notches, and links pivotally connected at their ends with the said bracket and pawl-plate, substantially as described.

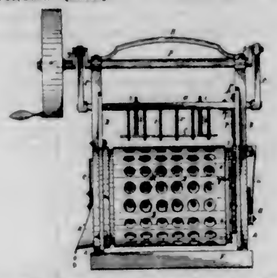
3. The combination, with the beam A of a clamp provided with a stationary bracket at one end, of a notched metal plate, A', secured to the beam, a movable bracket, C, opposed to the stationary bracket, a pawl-block, C^3, constructed to engage the notched plate, said pawl-block and bracket being arranged upon opposite sides of the beam, and links C', connected with the pawl-block and bracket, substantially as described.

4. The combination, with the beam of a clamp, a stationary bracket secured to one end thereof, and an opposing movable bracket, of a cam mounted in said stationary bracket provided with a suitable ratchet and lever, a pawl constructed to engage the ratchet, and means for releasing the pawl constructed to operate from the top of the beam, substantially as described.

5. The combination, with the beam A of a clamp provided with a stationary slotted bracket, B, at one end, and an opposing movable bracket, of the lever D, having a head, D^2, pivotally connected with the stationary bracket and constructed with an eccentric portion, D', and a notched concentric portion, *d'*, a self-acting pawl, E, constructed to engage the notches *d'*, and means for releasing the pawl from engagement with the notches, substantially as described.

292,392. SUPPLEMENTARY CELL FOR TYPE-CASES. PHILIP W. WILEY, Raleigh, N. C., assignor to Golding & Co., Boston, Mass. Filed Sept. 5, 1883. (No model.)

Claim.—1. The combination of a type-case and a supplementary cell provided with a spring, substantially as shown and described.



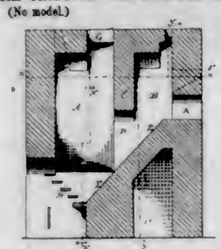
2. A supplementary cell for type-cases, consisting of a removable compartment provided with means, substantially as shown and described, for attaching the same to a single compartment of a case, substantially as and for the purpose set forth.

3. A supplementary cell provided with an integral spring bent below the upper edge of the cell, to form a stop, substantially as shown and described.

4. A supplementary cell provided with the curved bottom, upright back, and integral spring, substantially as shown and described.

5. The blank for type-cells, comprising the integral bottom c^2, sides c^3, back *c'*, and spring *c*, substantially as shown and described.

292,393. CHERRY-PITTER. JOHN WILLIAMS, Kalamazoo, Mich. Filed Sept. 19, 1882. (Model.)

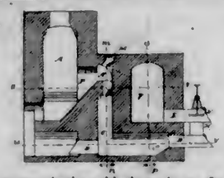


Claim.—1. The combination of the frame having the flanged disk, the revoluble cylinder having the notches and ratchet-wheel at one end, the other end having bearings in said disk, the cylinder-revolving pawl, the spring-metal locking-pawl provided with the studs, and the slotted spring-metal unlocking-bar, substantially as described and shown.

2. In a cherry-pitter, the combination of the frame, the revoluble shaft, punch-supporting bar, the pivoted arms connecting said shaft and bar, the revoluble cylinder having the notches and ratchet at one end, the flanged disk forming bearings to said cylinder at the other end, the slotted unlocking spring-bar, secured at its upper end to the punch-supporting bar, the spring locking-pawl having the studs, and the pawl for revolving the cylinder, all adapted to operate substantially as set forth.

3. The combination, with a revoluble cylinder provided with fruit-pockets having the beveled sides, of a fruit-spout located at the side of said cylinder, whereby the pockets act as scoops in filling them with fruit, substantially as described.

292,394. GAS-PRODUCER. JOHN ZELLWEGER, Chicago, Ill. Filed Dec. 28, 1882. (No model.)



Claim.—1. In a gas-producer, the combination of a front fuel-chamber, a rear gas-chamber of the same or nearly the same width as the fuel-chamber, an inclined floor common to both chambers, and a partition-wall depending from the cap of the producer and terminating above said floor, so as to form a wide gas-outlet between the floor and the partition-wall, and the front wall of the fuel-chamber having its air-inlet openings located on a lower plane than the top of the gas-port between the fuel and gas chambers, substantially as and for the purpose herein set forth.

2. In a gas-producer having a front fuel-chamber, rear gas-chamber, inclined floor common to both chambers, and depending partition-wall provided with a bottom gas-port, the rear or outer wall of the gas-chamber having a stoke-hole arranged above the inclined floor of the fuel and gas chambers, substantially as and for the purpose set forth.

292,395. GAS-PRODUCER. JOHN ZELLWEGER, Chicago, Ill. Filed July 31, 1883. (No model.)

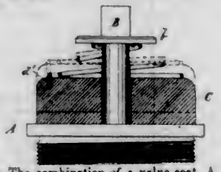
Claim.—1. In a gas-producer, the combination, with the producer-chamber and main gas-flue, of an intermediate soot-chamber arranged in rear of the producer-chamber and below the gas-discharge flue or flues of the latter, and made larger in cross-section than said flue or flues, and provided with an opening or openings for cleaning the same, and with

292,395.

a bottom outlet communicating with the main gas-flue, substantially as herein set forth.

2. In a gas-producer, the combination, with the producer-chamber A, discharge-flues B, and main gas-flue F, of the intermediate soot-chamber, C, made larger in cross-section than said discharge-flues B, and located below the latter and provided with a horizontal bottom extension, C', communicating with the main gas-flue, substantially as and for the purpose set forth.

3. A gas-producer having a soot-chamber, C, below and in the rear of the producer-chamber A, with opening D and horizontal extension C', substantially as and for the purpose set forth.



4. A gas-producer having a producer-chamber and a soot-chamber, with proper flue connecting the same, and an opening, D, into the soot-chamber beneath the hearth or grate of the producer-chamber, substantially as and for the purpose set forth.

5. In a gas-producer, the combination, with the soot-chamber and main gas-flue, of a connecting-chamber, H, extending outside of the brick-work of the producer and containing a gas-valve, substantially as and for the purpose set forth.

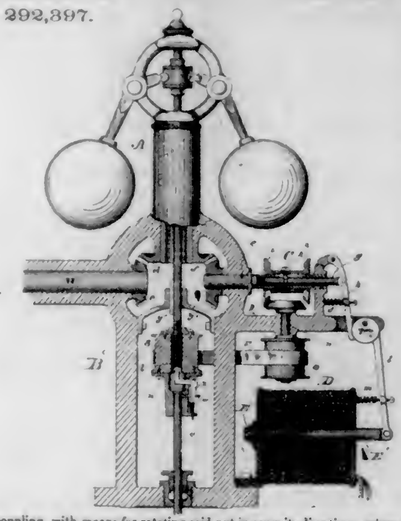
6. A gas-producer having a producer-chamber, and a soot-chamber in the rear of the producer-chamber, and one or more openings, G, through which access can be had both to the producer-chamber and soot-chamber, substantially as and for the purpose set forth.

7. The combination of the inverted-funnel-shaped cap I, having a central opening and a loosely-seated ball-valve, K, with a gas-producer, having an opening for receiving said cap, and a flue located thereunder, as and for the purpose stated.

292,396. PUMP-VALVE. CHRISTOPHER AHRENS, Cincinnati, Ohio, assignor to the Ahrens Manufacturing Company, same place. Filed June 2, 1883. (No model.)

Claim.—The combination of a valve-seat, A, having the central spindle, B, provided with the stationary collar *b*, and the valve C, arranged to rise and fall on the spindle, with the spring D, composed of the successive coils *d*, of uniformly-diminishing diameter from the base, the extremity of the lower coil having the projection *d'* entering an aperture in the valve, and the two upper coils wound one within the other around the spindle, to occupy the same horizontal plane and bear against the collar, substantially as described.

292,397. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. EDWARD H. AMET, La Grange, assignor of one-half to Herbert A. Streeter, Chicago, Ill. Filed Apr. 14, 1883. (No model.)



Claim.—1. In a system for generating and applying an electric current, the combination of a motor for driving a dynamo-electric machine, a solenoid actuated by the current produced, a shaft adapted to be constantly rotated, and having a sliding double-cone gear mounted thereon, a second shaft having a traveling nut thereon, which is connected with said motor, and means, substantially as shown and described, whereby the motion of the core of the solenoid is conveyed to the double-cone gear, and its motion is conveyed to the said nut to rotate it in either direction, substantially as and for the purposes set forth.

2. In an electric current-regulating system, a screw-threaded shaft connected with a motor by suitable means, including a traveling nut on said shaft, in combination with a solenoid the core of which is connected with means for moving said nut in opposite directions, substantially as specified.

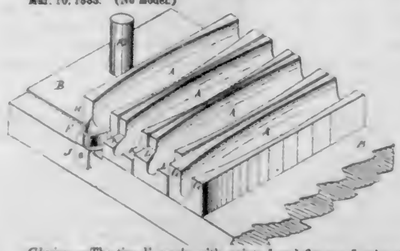
3. In mechanism for controlling a motor for a dynamo-electric machine, a motor-governor comprising a screw-threaded shaft and a nut fitted thereon, in combination with a sliding double-cone gear suitably connected with means for rotating said nut in opposite directions and with a solenoid, substantially as and for the purpose set forth.

4. The combination of a solenoid with a centrifugal governor having a screw-threaded stem, a nut carrying a pulley, and a valve-stem

292,397.

coupling, with means for rotating said nut in opposite directions, substantially as specified.

5. The combination of a solenoid with a centrifugal governor having a screw-threaded stem, a nut carrying a pulley, and a valve-stem coupling, with means for automatically uncoupling the valve-stem, substantially as specified.



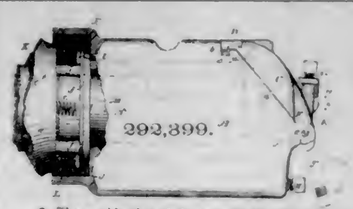
6. The combination of a centrifugal governor, a positively-driven shaft continuously connected therewith, and carrying a sliding double-cone gear connected with the core of a solenoid, with a second shaft carrying a single-cone gear and connected with a climbing nut connecting the governor-stem to the valve-stem of a motor, substantially as specified.

7. The combination of the solenoid D, cam *i*, lever *h*, rod *g*, shaft *e*, and gear C, with shaft *n*, cone-gear *p*, pulleys *o o*, screw-threaded governor-stem *t*, coupling *u*, and valve-stem *v*, substantially as shown and described.

8. The combination of the solenoid D, gears C *p*, pulleys *o o*, stems *t v*, coupling *u*, wedge *x*, and key *w*, substantially as shown and described.

9. The combination of the solenoid D, having the adjustable ping E, with the lever *l*, spring *m*, cam *i*, lever *h*, spring *j*, and rod *g*, substantially as shown and described.

292,398. CIGAR-MOLD. RENSEN APPLEBY, New York, N. Y. Filed Mar. 10, 1883. (No model.)



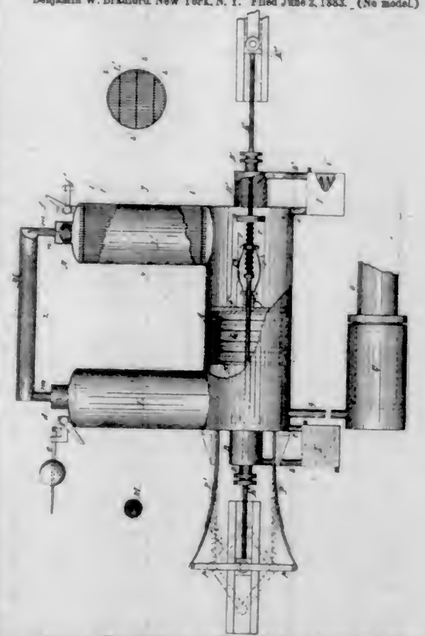
Claim.—The tips F, made with points I and flanges J, whereby they may be rigidly secured to the molds, as and for the purpose specified.

292,399. CAR-AXLE BOX. WILLIAM S. G. BAKER, Baltimore, Md. Filed Sept. 21, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the box, the hinged lid, the locking-shoulder thereon, the hinge-pin carried by the box, the slotted bearings in the lid through which the pin extends, and means carried by the box for holding the lid in its locked position.

2. The combination of the box, the lid hinged thereto, the locking-shoulder on the lid, the hinge-pin carried by the box, and the slotted bearings in the lid through which the pin extends, and which permit the lid to have a slight vertical movement to disengage the locking-shoulder, and then an outwardly-swinging movement to open the box, substantially as set forth.

3. The combination of the box, the lid hinged thereto, the slotted bearings in the lid, the swinging frame mounted on the box, and means carried by the frame for holding the lid in position, substantially as specified.



4. The combination of the box, the vertically-sliding lid, the locking-shoulder thereon, the frame mounted on the box, and means carried by the frame for holding the lid in its locked position, substantially as described.

5. The combination, substantially as set forth, of the box, the lid hinged thereto, the set-screw, and its frame mounted on the box for holding the lid in position.

6. The combination of the box, the wheel, the dowel-sockets therein, the washer interposed between the wheel and the box, and the dowels formed on the washer, which fit into the sockets in the wheel, substantially as and for the purpose specified.

7. The combination of the box, the wheel, the dowel-sockets therein, the washer, the dowels formed thereon, which fit into the sockets in the wheel, and the springs which are attached to the washer and bear against the face of the wheel to hold the washer in position, substantially as set forth.

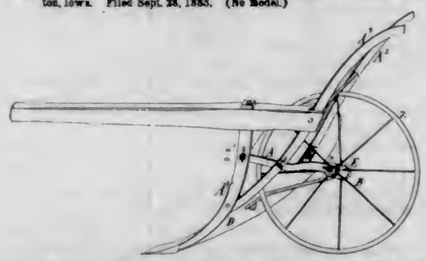
292,400. HOT-AIR ENGINE. JAMES S. BALDWIN, Newark, N. J., assignor of twenty-one twenty-fifths to Samuel A. Farrand, same place, and Benjamin W. Bradford, New York, N. Y. Filed June 2, 1883. (No model.)

Claim.—1. The cylinder for holding a fluid, and means for heating the fluid in one end of the cylinder and cooling it in the other, in combination with the vertical chambers, connected by the regenerator, and a bellows separating the hot from the cold fluid, and means for operating said bellows, whereby the fluid can be alternately raised and lowered in the vertical chambers, and the air or gas caused to rise or fall in tension as it comes in contact with a hot or cold surface, substantially as shown and described.

2. The cylinder A, for holding a liquid, provided with means for heating the liquid in one end of the cylinder and cooling it in the other, in combination with the vertical chambers L L', filled with metal plates

l, and connected by the regenerator, said cylinder A having the bellows G, and means for operating the same, substantially as and for the purpose shown and described.

3. The vertical chambers L L', having the plates *l*, and connected by the regenerator M, filled with metal plates, and having the float-valves N, in combination with the cylinder A, having the bellows G, and means for operating the same, substantially as and for the purpose shown and described.

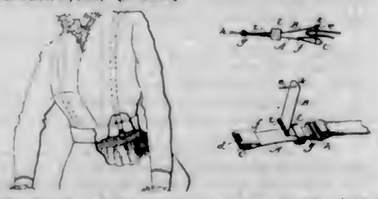


4. The vertical chambers L L', opening into the cylinder A, said cylinder A having the extensions B B' and hot and cold coil boxes I I', connected with the extensions and cylinder, in combination with the piston-rod E, carrying the disks or piston-heads *a a'*, and the plate F', attached to the bellows, and means for operating said piston-rod, substantially as shown and described.

5. The cylinder A and piston-rod E, carrying the plate F', and means for operating said piston-rod, in combination with the springs P P' and rods *p*, substantially as and for the purpose shown and described.

6. The cylinder A and piston-rod E, carrying the sliding collar F and plate F', and disks *a a'*, in combination with the sliding collar *r*, springs *r' r²*, and stationary collar *r³*, substantially as and for the purpose shown and described.

7. The vertical chambers L L', connected by the regenerator M, the cylinder A, having extensions B B', bellows G, piston-rod E, carrying the plate F' and disks *a a'*, and means for operating the piston-rod, in combination with the cylinder O, having the plunger O', and means for forcing the plunger back when the pressure of the air or gas is reduced or removed, substantially as and for the purpose shown and described.

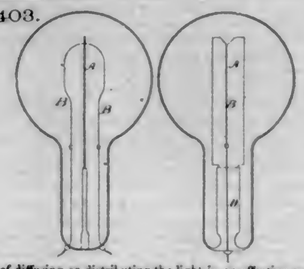


292,401. WHEEL-LANDSIDE PLOW. NATHANIEL S. BARGER, Hampton, Iowa. Filed Sept. 28, 1883. (No model.)

Claim.—1. The combination, with a walking-plow provided with handles A^2 A^3 and a standard, A', of the large oblique wheel-landside B, forming a rolling landside-support, the axle of which is in rear of the mold-board, and is supported at one end by the described attachment-arm A, fastened adjustably to the plow standard or beam and handle A^2, and at the other end by the described attachment-arm C, adjustably fastened to the mold-board and handle A^3, substantially as and for the purpose described.

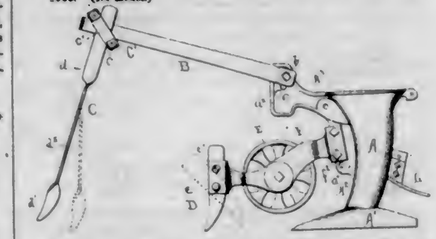
2. The combination, with a plow, of an oblique wheel-landside having a rim which in cross-section is circular instead of beveled, substantially as and for the purpose described.

292,402. SKIRT-SUPPORTER. GEORGE M. BARRY, Boston, Mass. Filed Nov. 23, 1883. (No model.)



Claim.—A clasp or garment-supporter comprising two jaws attached to a loop or analogous device, one of said jaws being provided with the hinged portion and bearing the penetrating-point, and the other having its end doubled upon itself and provided with an aperture to receive the point, the jaws adapted to be locked by a slide.

292,403. REFLECTOR FOR INCANDESCENT LAMPS. JOSEPH S. BERNAN, London, England. Filed Apr. 23, 1883. (No model.) Patented in England July 11, 1882, No. 3,279, and in France Jan. 9, 1883.



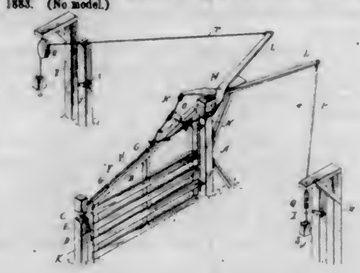
Claim.—In incandescent electric lamps, the combination, with the incandescing filament or filaments, of a reflector situated inside the lamp-bulb and between the limbs of the carbon filament or filaments, for the

292,403.

purpose of diffusing or distributing the light in an effective manner, substantially as hereinbefore described, and illustrated in the accompanying drawings.

292,404. CULTIVATOR-TOOTH. JOS. P. BRADFORD, Weston, Mich., assignor of one-half to Andrew J. Walters, same place. Filed July 9, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the tooth having a rib, A^2, projected forward therefrom and perforated with a series of holes, *a*, the bracket having its rear end provided with slot *f'*, slipped over the rib A^2, and suitable fastening-bolts, the said bracket having a suitable colter secured to its forward end, and a gage-wheel journaled in rear of said colter, as and for the purposes set forth.



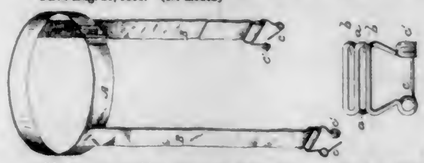
2. The combination, with the tooth A and gage-wheel E, arranged in advance of and supported on bracket F, projected forward from said tooth, of a gage or depth-regulating device, arranged and operating in rear of the tooth, substantially as and for the purposes set forth.

3. The combination of the tooth, the bracket projected forward therefrom in approximately a horizontal position, and provided with a suitable gage-wheel midway its ends, and the colter D, pivotally secured to the bracket by bolt *e*, and held to the bracket above said pivot by a fragile pin, *e'*, all arranged and operating substantially as and for the purposes set forth.

4. The combination, substantially as hereinbefore described, of the tooth A, having forward rib or flange, A^2, the bracket F, having colter D and wheel E, the bar B, extended forward from said tooth, and the spring-colter C, held adjustably to the bar B, with the lower end of its point *d'* working in a plane above the point of colter D, as and for the purposes specified.

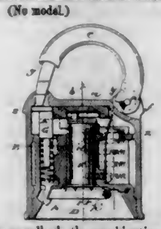
5. The combination, substantially as hereinbefore described and shown, of the drill-tooth, the spreader-plate arranged within and at the base of same, the bracket F, removably secured to and projected forward from the tooth, the colter D, and gage-wheel E, supported on said bracket, and the coverer and gage-plate G, arranged in rear of the tooth, as and for the purposes specified.

292,405. GATE. WALLACE BRUCE, Elk Grove, Cal. Filed July 19, 1883. (No model.)



Claim.—1. The combination of the hinge-post, a gate hinged thereto so as to swing in either direction, an evener pivoted on top of the gate, the cross-levers pivoted on the top of the hinge-post by the single pivot-pin, pull-cords connected to the operating ends of the cross-levers, and chains extending from the other ends of the levers to the ends of the evener, substantially as and for the purpose set forth.

2. The combination of the hinge-post, the gate hinged thereto so as to swing in either direction, the spring-latch secured to the free end of the gate, the evener centrally pivoted on top the gate, a sliding rod connected with the end of the latch, chains connecting the other end of this rod with the ends of the evener, the cross-levers fulcrumed on top of the hinge-post and connected each with one end of the evener, and means for operating the levers, substantially as and for the purpose set forth.



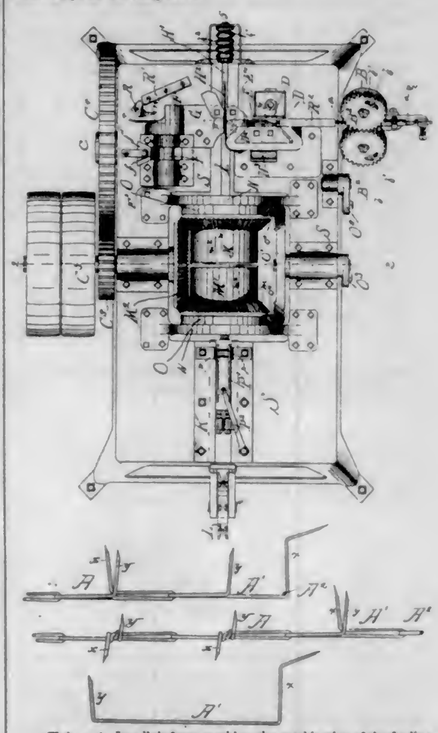
3. The combination of the hinge-post, the latch-posts arranged at the sides and in front of the latter, the gate hinged to the hinge-post, the spring latch-rod secured on the free end of the gate, the evener centrally pivoted on top of the gate, the sliding rod connected to the free end of the latch-rod, chains connecting the operating-rod with the ends of the evener, the cross-levers pivoted on top of the hinge-post by the single pivot-pin, the chains connecting the end of these levers with the ends of the evener, and the weighted pull-cords extending from the long ends of the cross-levers, substantially as and for the purpose set forth.

292,406. STOCKING-SUPPORTER. GEORGE N. BUCK, Mattoon, Ill. Filed Aug. 23, 1883. (No model.)

Claim.—A stocking-supporter attachment consisting of a single wire bent back and forth upon itself to form a series of separate parallel loops, as an elastic strap-adjuster, and terminating in a spring-pin and eye or keeper, by which to attach it to a stocking, substantially as shown and described.

292,407. SEAL-PADLOCK. SAMUEL G. CABELL, Washington, D. C., assignor to Charles Pelham and Flora B. Cabell, both of same place. Filed May 22, 1882. (No model.)

Claim.—1. In a padlock, the combination of a recessed case or body and a seal-holding device, the case or body extending below and embracing said device, as and for the purpose described.



2. In combination with the hasp and the sliding bolt E, provided with the hook or dog *a*, the hub or barrel F, provided with locking pins or tumblers, and a stud, *b*, adapted to co-operate with the hook *a*, as shown and described, whereby the bolt is permitted to remain in its unlocked position until the hasp has been closed, but locked rigidly after being moved forward.

3. In a padlock, the combination of the swinging hasp, the main locking-bolt E, a seal-holder, means for holding said seal-holder in a closed position, and a sliding bolt, G, adapted to serve the twofold purpose of preventing the unlocking of the seal-holder and of holding the main bolt in an unlocked position, said bolt G arranged to be operated by the hasp of the lock.

4. In a padlock having the locking mechanism in one compartment and an alarm mechanism in another compartment of the lock-case, the combination of the hasp-locking bolt provided with an alarm-operating arm extending through the separating-diaphragm, with the alarm mechanism, substantially as specified.

292,408. MACHINE FOR MAKING BARB-LINK FENCING. FRANK P. CADY, Chicago, Ill., assignor, by mesne assignments, to the Cambria Iron Company, of Pennsylvania. Filed July 18, 1883. (Model.)

Brief.—A single wire is fed to the machine. A link-blank is severed and its ends bent to the form shown in Fig. 15. This link is then doubled on itself near the center by a hook reciprocating at right angles to the line in which the wire is fed in. The same movement of the hook bends down the rear end of the preceding link. Another link-blank is fed in across the last blank in the angle formed by the bent end of the last blank, and the operations repeated. The link-blank, with its ends in close proximity, is fed forward through two coiling-heads revolving in opposite directions, which coil each barb-point about the body of the link. Clamps arranged in the coiling-mandrels clamp the link close to the points while the points are being coiled.

Claim.—1. In a link-fence machine, the combination of the feeding and severing mechanisms with bending devices for bending the ends of the blank to form the barbs and for forming the link, substantially as specified.

2. In a barb-fence machine, the combination of wire feeding and severing devices and blank-bending devices, substantially such as described, with devices for coiling the ends of the link, essentially as set forth.

3. In a barb-fence machine, the combination of wire feeding and severing devices and blank-bending devices with devices for coiling the ends of the link and devices for clamping the link at each side of the coiling devices, substantially as specified.

4. In a barb-fence machine, the combination of two coiling-heads revolving in different directions, in combination with mandrels supporting the same and slotted longitudinally to permit the passage of the outstanding link-points, substantially as specified.

5. In a barb-fence machine, the combination, with coiling devices, of the clamping devices for holding the link at each side of the coiling-point, substantially as specified.

6. The combination, with the coiling devices, of feeding devices engaging with the cable at the rear of said coilers, and other feeding devices engaging with the cable in front of said coilers, said feeding devices being connected together so as to move unitedly, substantially as specified.

7. The combination, in a barb-chain-cable machine, of a feed device in advance of the coiling devices, the hook H, in the rear of the coiling devices, and the yoke-slide carrying both the feed device and the hook, substantially as specified.

8. In a barb-fence machine, the combination of devices for feeding and severing the wire and for bending the ends of the blank with a bending device moving at right angles to the line of the blank, substantially as specified.

9. In a machine for making link-fence, the combination of the following instrumentalities, viz: wire-feeding devices, wire-severing devices, benders for bending both ends of the severed blank, guides or holders for holding the blank while said benders are operating, a bending device moving at right angles to said feeding devices, and guides at the side of the line of motion of the last-mentioned bender, substantially as specified.

10. The combination of wire-feeding devices, a support for the wire, a feeding device moving at right angles to the line of said first-mentioned feed devices, and a groove in said support under and in line with said last-mentioned feeding device, whereby the incoming wire is caused to pass over the link already partly formed, substantially as specified.

11. The combination of the moving bender F, the guide and plate G, and the reciprocating hook H, whereby one-half of the blank is bent into form ready for coiling, substantially as specified.

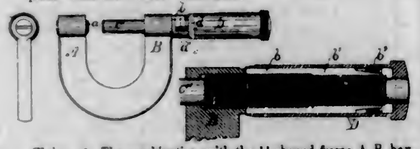
12. The combination of the moving bender E, the guide E', the reciprocating hook H, and resisting-points at each side of said hook, whereby one of the halves of the link is shaped ready for the coiling, substantially as specified.

13. In a machine for making link-fence, the combination of moving benders E and F with guides E' and G, substantially as specified.

14. The reciprocating hook H, in combination with the yielding guides J J, substantially as set forth.

15. In a barb-fence machine, the guide G, having the beveled overhanging vertical surface, in combination with the moving bender F, substantially as specified.

16. The guide G, constructed, as shown, to impart a double bend to the link, in combination with a moving bender, substantially as shown.



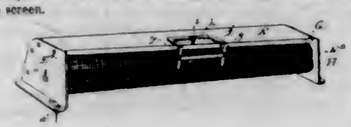
17. In a barb-fence machine, the combination, with the spooler and mechanism for feeding the cable thereto, of an intermittently-acting stop engaging with the cable, substantially as specified.

18. The combination, with the clamping-hooks at the sides of the coiling-point, of the adjustable lever and the intervening devices, whereby the amount of throw of said hooks is permitted to be regulated, substantially as specified.

19. In a barb-chain-cable machine, the combination, with the hook H, reciprocating and pivoted as specified, of a trip device for raising said hook at the end of its return movement, substantially as and for the purpose set forth.

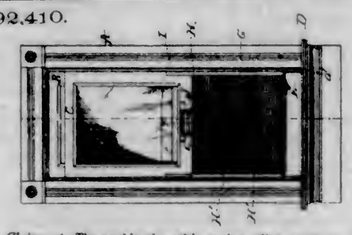
20. In a machine for making link-fencing, the combination, with the devices for bending the blank into link shape for coiling, and the coiling devices, of the guide H^2, for keeping the points of the link from crossing, substantially as specified.

292,409. MICROMETER-CALIPERS. CYRIS CARLETON, Providence, R. I., assignor to the Brown & Sharpe Manufacturing Company, same place. Filed Dec. 17, 1883. (No model.)



Claim.—1. The combination, with the U-shaped frame A B, having extension *b* integral therewith, longitudinally slitted and tapered at the end, as described, of the compressing-thimble b^2 on the tapered end of said extension, and the micrometer-screw C, passing longitudinally through said extension, substantially as described.

2. A micrometer-calipers consisting of a U-shaped frame and a slitted extension, provided with a nut at its end, formed in one piece, a micrometer-screw provided with a plain cylindrical arbor, and a clamping-ring constructed to regulate the bearing of the nut on the screw, as described.



3. The combination, with the U-shaped frame A B, having extension *b* integral therewith, said extension longitudinally slitted and tapered at the end, as described, of the compressing-thimble b^2 on the end of said extension, the micrometer-screw passing through the extension, and the sleeve D, attached to the micrometer-screw and extending over the extension, substantially as described.

292,410. WINDOW-SCREEN. ALFRED L. CLARK, Dubuque, Iowa. Filed June 12, 1883. (No model.)

Brief.—A spring-roller window-screen placed in a box upon a window-sill. The screen is provided with an automatic attachment for attaching it to the window-sash. Metallic rods or strips placed at intervals, extending from side to side and running in guides, prevent any sagging in the screen.

292,410.

Claim.—1. The combination, with a spring-roller, of a window-screen adapted to be automatically attached to the window-sash by means of a catch secured to the free end of said screen, and engaging with projections upon the lower bar of said sash when the latter is raised or lowered, substantially as and for the purpose set forth.

2. The combination, with the catch constructed and attached to the window-screen and its casing, as described, of the lower window-sash, C, provided with the pins *k k* and inclines *k' k'*, substantially as and for the purpose set forth.

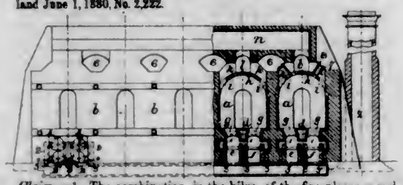
3. The combination, with a spring-roller and a window-screen wound thereon, of a box for inclosing and supporting the same, said box consisting of the top and front pieces, E E', and end pieces, E^3, bent at their lower ends to form flanges *a*, substantially as described, whereby, with the aid of pins or other suitable means, said box, with its inclosures, is adapted to be removably attached to the window-sill, as set forth.

4. The combination of spring-roller F, window-screen G, wound on said roller, window-sash C, and bars H H', as and for the purpose set forth.

5. The combination of spring-roller F, window-screen G, window-sash C, bars H H', and metal guides I, consisting each of the strips *f f'*, arranged as described and shown.

292,411. FIRE-ESCAPE. ALFRED L. CLARK, Dubuque, Iowa. Filed June 12, 1883. (No model.)

Brief.—Grooved end eyes are arranged at both ends of the device to guide the rope and produce additional friction.



Claim.—In a friction fire-escape, and in combination with the rope D, the block A, having grooved end eyes, and consisting of two plates, *a a*, provided with an intermediate central and cylindrical stud, C, and two intermediate end studs, B B, semicircular in form, and having grooved peripheries, whereby an even tension is given that portion of the rope passing through the block, substantially as set forth.

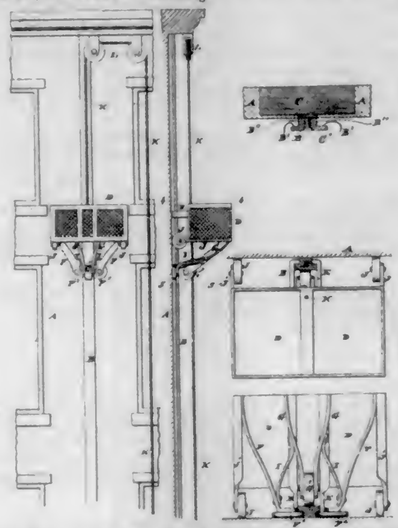
292,412. BOOK-MARK AND PENCIL-HOLDER. EDWARD T. COWELL, New Bedford, Mass. Filed Nov. 13, 1883. (No model.)

Claim.—A book-mark and pencil-holder consisting of two spring-impelled jaws hinged or pivoted together, and each provided with a finger-piece at one side of their hinge or pivot to swing said jaws on such hinge or pivot, one of the finger-pieces being bent into a tubular pencil-holder having a longitudinal free edge, substantially as described.

292,413. KILN. JACOB PEARSON CRAMP, Finedon, County of Northampton, England. Filed May 1, 1883. (No model.) Patented in England June 1, 1880, No. 2,222.

Claim.—1. The combination, in the kiln, of the fire-places *e* and *f* and the openings *g* in the floor *d* with the openings *i* in the roof *h*, the passages *k k*, the longitudinal flue *l* above the roof, and the transverse

flue *n* above the flue *l*, communicating with all the kilns, substantially as set forth and shown.



2. The combination of the passages *k k* and the longitudinal flue *l* above the roof with the openings 6, the covers 7, and the stops or plates 8, by which the communication between the kiln *a* and the flues *l* and *n* can be cut off and regulated, substantially as set forth and shown.

3. The combination, in the kilns, of the openings 1 1 1 1 in the sides of the fire-places *e* and *f*, the longitudinal chambers 2 2 2 2, the descending passages 3 3 3 3, the dampers 4, the transverse lower flue, 5, and the doors A B, substantially as set forth and shown, and for the purposes specified.

4. In combination with the kilns *a* and the fire-places *e* and *f*, the openings *o*, transverse flue *p*, dampers *r*, openings *s*, dampers *t*, and flue *v*, by which communication with the chimney *z* may be made directly from each fire-place, or through any or all of the other fire-places and kilns, substantially as set forth and specified.

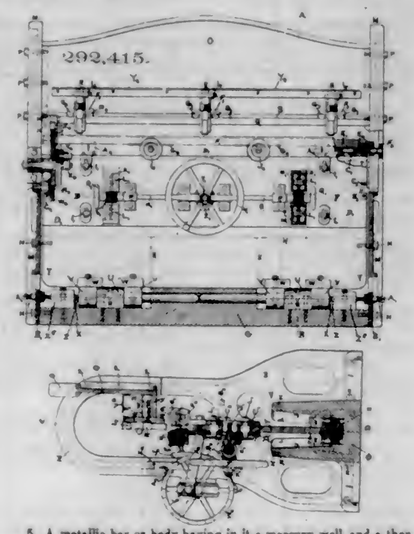
292,414. FIRE-ESCAPE. AUGUSTUS S. CURRIER, Hillsborough, Ill., assignor of two-thirds to John T. Maddux and George W. Paisley, same place. Filed Apr. 19, 1883. (No model.)

Brief.—The T-rail is made fast to the building by plates placed in the wall and having projections inserted in openings in the rail and riveted therein. The car is provided with arms which embrace the flanges, and arms carrying rollers which run on the face of the rail, the web of the rail, and the face of the building.

Claim.—1. In a fire-escape, the combination of T-rail B, secured to the structure, box D, having arms E, engaging the rear sides, B', of the rail, lower arms, G, having roller G', running on the head of the rail, arms F, having rollers F', running on the web B'' of the rail behind the head, and a suitable hoisting-rope, as set forth.

2. In a fire-escape, the single rail or track B, made fast to the building by plates C, having necks or projections C', which are inserted in openings of the rail and riveted therein, in combination with the box D, connected to the rail so as to be moved vertically thereon, substantially as set forth.

292,415. COMPARATOR. SAMUEL DARLING, Providence, R. I. Filed Mar. 1, 1883. (No model.)



Claim.—1. For testing measures of length, a comparator having, in combination with microscopes, separate tables or supports for said measures fixed to a swinging frame, substantially as described.

2. A comparator having, in combination with a table or tables, microscopes and a beam supporting the microscopes, a tracer, and head-rest, said beam being held by its ends and elevated above the tables, leaving the space under it open for the moving back and forth of the tables under said beam and the admission of light, substantially as described.

3. A comparator having, in combination, a table adjustable longitudinally, a metal bar, M_1, stops O_1 and Q_1 to limit its motion, and two or more microscopes, substantially as described.

4. A comparator having, in combination, microscopes, table F_1, and means for adjusting said table longitudinally, including lever L_1 and stop-rest M_1, substantially as described.

292,415.

5. A metallic bar or body having in it a mercury-well, and a thermometer embedded in said well, substantially as described, and for the purpose set forth.

6. For comparing measures of length, a comparator having a table or support for the articles to be compared, said table having in it a mercury-well, and a thermometer embedded in the well, substantially as described, and for the purpose set forth.

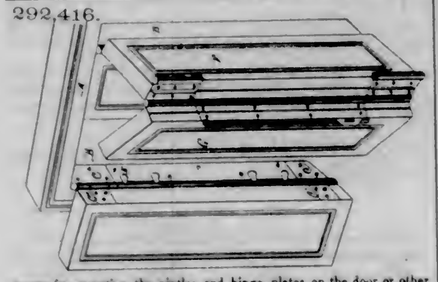
7. For comparing measures of length, a comparator having, in combination, a table or support for the measures, one or more microscopes, a guide or slide, S, running nearly parallel with the table, a vertical guide, 8, and a transverse guide or slide, 7, by means of which the microscopes can be moved parallel, transversely, and vertically to the table, for the purpose of adjusting the cross-hairs of the microscopes to the lines of the measures.

8. The method of comparing lineal end-measure with lineal line-measure, which is as follows: first, bringing into end contact with a fixed bar a movable bar having traced thereon a fine line; second, adjusting the cross-hairs of a microscope to this line; third, substituting for the movable bar a line-measure, and adjusting one of the lines thereon, to coincide with the microscope cross-hairs; fourth, adjusting the cross-hairs of a second microscope to the other line of the line-measure; fifth, substituting for the line-measure an end-measure, abutting it against the fixed bar; sixth, abutting the movable bar against the end of the end-measure; seventh, observing the line on the movable bar through the second microscope, and noting the amount of divergence, if any, of the line from the cross-hairs of the microscope.

9. The following method of comparing lineal end-measure with lineal line-measure: first, abutting the line-measure against a fixed bar; second, adjusting a microscope to that line of the line-measure which is farthest from the fixed bar; third, inserting between the fixed bar and the line-measure an end-measure; fourth, observing through the microscope that line on the line-measure which is nearest to the fixed-bar, and noting the divergence, if any, of the line from the cross-hairs of the microscope.

10. For comparing end-measure with line-measure, a comparator having, in combination, a table or support for the measures, two or more microscopes, and two abutting bars, substantially as described.

11. For comparing end-measure with line-measure, a comparator having, in combination, a table or support for the articles to be compared, one or more microscopes, and two abutting bars, one of the abutting bars to be provided with the line-measure, substantially as described.

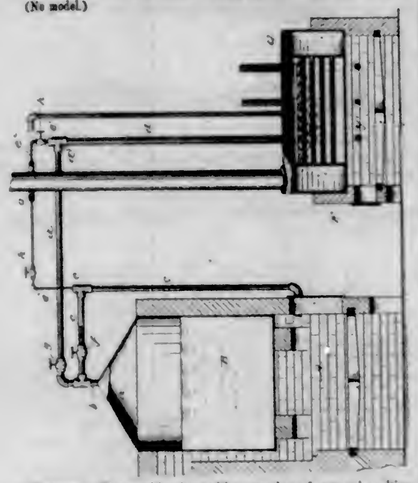


12. For comparing end-measure with line-measure, a comparator having a table or support for the measures, two abutting bars and one or more detective microscopes, substantially as described, and for the purpose set forth.

13. A comparator having, in combination, one or more tables or supports for the articles to be compared, one or more microscopes, and a head-rest, substantially as described, and for the purpose set forth.

292,416. HINGE. JOSEPH DRUMM, San Francisco, Cal. Filed Dec. 30, 1881. (Model.)

Claim.—1. A hinge consisting of a center-plate, H, having cylindrical tubes I I' on its sides, provided with vertically-sliding pintles, and



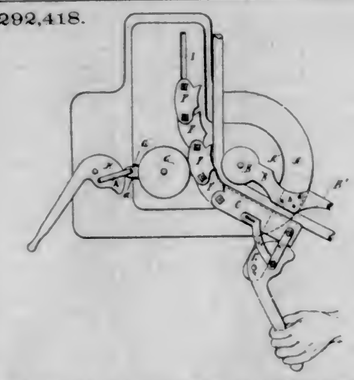
292,416.

means for operating the pintles and hinge-plates on the door or other part, provided with engaging means for the pintles, whereby the pintles may be caused to engage or disengage the hinge-plates on the door or other part with the tubes I or I', as set forth.

2. In a hinge, the combination of the two parts thereof, each having a hollow cylinder and a sliding pintle in the cylinder of one part, adapted to be engaged with the cylinder of the other part, said pintle having a spring, *a*, to keep the pintle in the position in which it is set, and a projection, J, extending outside of the cylinder, for operating the pintle, substantially as set forth.

292,417. APPARATUS FOR REFINING ASPHALTUM FOR PAVING, &c. EDWARD J. DE SMEDT, Washington, D. C. Filed Dec. 28, 1883. (No model.)

Claim.—1. The combination, with a number of covered melting-kettles and furnaces for heating the same, of the separate special furnace F, the steam-boiler G, heated by the same, conduit *d*, leading from each kettle to the furnace F, and the ejector *d'*, drawing its supply of steam from said boiler and acting to exhaust the fumes and gases from the kettle through said pipe *d* into furnace F, as and for the purposes hereinbefore set forth.



2. The combination of the covered kettles B, furnaces A, special furnace F, boiler G, pipes *d c*, ejectors *d' e*, connected with and taking their steam from boiler G, and valves or cocks for controlling the steam-supply, and for directing the abducted fumes or gas into either pipes *d* or *c* at will, the whole arranged and adapted to operate as and for the purposes hereinbefore set forth.

292,418. PIPE-BENDING MACHINE. EDWD. DEVINE, Detroit, Mich. Filed Aug. 3, 1883. (No model.)

Claim.—1. The combination of a frame or table, the annular former-head B', constructed with a grooved edge, a clamp, C, provided with means whereby it may be reciprocated, a series of links secured to said clamp, and a disk, G, provided with means whereby it may be reciprocated, the construction being such that the clamp may be forced against the annular former-head, and carried with said former-head as it is rotated, substantially as described.

2. In a pipe-bending machine, the clamp C, provided with a series of links, F, the inner edges of which are constructed on the arc of a circle, and grooved for the reception of the pipe, said links pivotally connected to each other and with the clamp, substantially as described.

292,418.

3. A pipe-bending machine, consisting in the combination of a frame or table, the former-head B', constructed with an annular grooved edge and pivoted to the table, said head provided with a lever-arm, a suitable clamp, a track rigidly secured at one end to the lever-arm, mechanism for reciprocating said clamp upon said track, a series of links pivotally connected with each other and with the clamp, the inner edges of said links constructed on the arc of a circle, and grooved for the reception of the pipe, and a pivoted disk, said disk provided with mechanism whereby it may be reciprocated, substantially as described.

4. A pipe-bending machine, consisting of a suitable frame or table, provided with a raised bed, A', a former-head, B', pivotally connected thereto and constructed with an annular grooved edge, and adapted to be rotated, a clamp, C, adapted to hold the pipe against the former-head, mechanism for reciprocating said clamp and for holding it firmly against the former-head, said clamp provided with a series of links pivotally connected with each other and with the clamp, the inner edges of said links constructed upon the arc of a circle, the construction being such that as the former-head is rotated the clamp with the series of links pivoted thereto will be carried with the former-head and be successively engaged with the pipe to bend it over the former-head, substantially as described.

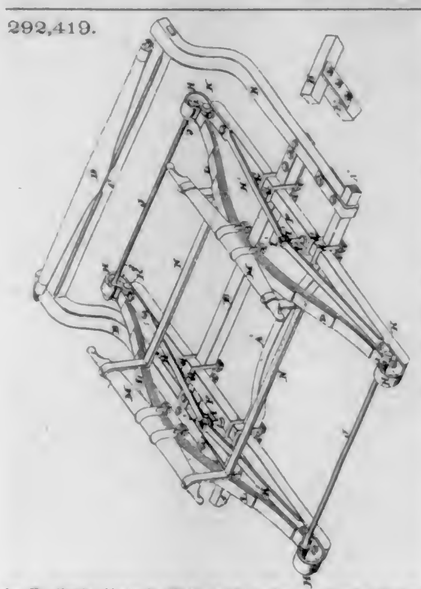
5. A pipe-bending machine, consisting of a suitable table or frame, a former-head pivoted thereto, and having a lever-arm, a track firmly secured at one end to said arm, a clamp provided with a cam-lever connected therewith, and adapted to be reciprocated upon said track, said clamp provided with a series of links pivotally connected together and to said clamp, and in connection therewith a rotary disk provided with a cam-lever suitably connected thereto and adapted to be reciprocated upon the bed of the table, substantially as described.

6. A pipe-bending machine, consisting of a suitable bed or table, a former-head, B', pivotally connected thereto, and provided with a lever-arm, a clamp provided with a series of links pivotally connected together and to said clamp, mechanism for reciprocating said clamp, a disk, means for reciprocating the disk upon the bed of the frame or table, said bed provided with a groove, I, the links having one or more guide-pins, *f*, adapted to travel in said groove, the construction being such that when the former-head is rotated the clamp and the links connected thereto will be carried with said former-head, and when the latter is retracted the guide-pins in said groove will throw said links out of engagement with the former-head, substantially as described.

7. The combination of an annular former-head, a clamp disconnected from the former-head but adapted to receive between it and the former the article to be bent, a pliable former, composed of pivoted links having a pivotal connection with the clamp, and means for reciprocating the clamp and revolving the same, to carry the pliable former around the article being bent, substantially as described.

292,419. CARRIAGE-SPRING. GEORGE E. DOLTON, St. Louis, Mo., assignor to Caroline C. Nitzsche, same place. Filed Aug. 7, 1883. (No model.)

Claim.—1. A frame or body support consisting of sills F and side springs, L_1, connected to the adjustable sills and to the body.



2. The combination of sills F, goose-necks H, and springs L_1, connected to the body.

3. The combination, in a body-supporting frame for vehicles, of springs L_1, connected to the body at or near their middle, and connected at the ends to sills F, substantially as set forth.

4. A body-supporting frame composed of sills F and springs connected together and made longitudinally adjustable upon the axle and shaft or pole frame.

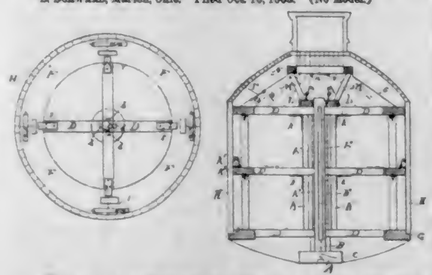
5. The combination, in a two-wheeled vehicle, of the axle A', cross-

292,419.

bar E, adjusting-blocks Q, sills F, and side springs connected to the sills and to the body.

6. The sills F, connected with the springs by goose-necks at the ends, and having truss or brace H', substantially as described and shown.

7. The combination of sills F and truss or brace H', adjusting post and nuts I I', goose-necks H, and springs connected to the goose-necks and to the body.



8. The combination of sills F, goose-necks H, equalizers J, and springs L, forming a body-supporting frame for vehicles.

9. The combination, in a two-wheeled vehicle, of the side bars or shafts, B, cross-bar E, axle A', sills F, goose-necks H, and springs L, connected to the goose-necks and to the body of the vehicle.

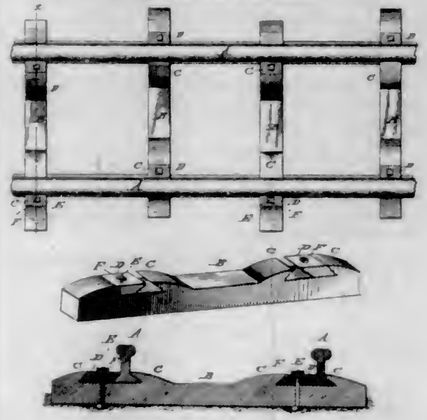
10. The combination of the side bars or shafts, B, cross-bar E, axle A', sills F, secured to said cross-bar and axle, trusses H' I I', goose-necks H, equalizers J, springs L, secured to the body in any suitable manner.

11. The combination of side bars or shafts, B, cross-bar E, axle A', sills F, secured to said cross-bar and axle, goose-necks H, trusses H I I', equalizers J, springs L, spring-bars M, and hangers N, extending transversely from one spring-bar to the other.

292,420. CONSTRUCTION OF CISTERNS FROM CONCRETE. WM. B. DORWARD, Marion, Ohio. Filed Oct. 10, 1883. (No model.)

Claim.—1. A combination, in a cistern, of a concrete composed of cement, sand, and broken stone with an adjustable curb and adjustable braces, substantially as shown and described, and for the purpose set forth.

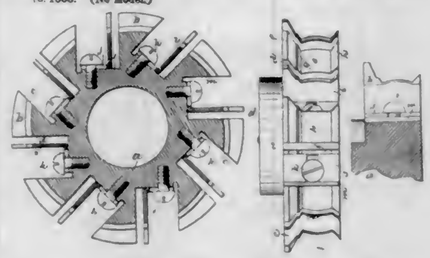
2. The central post, B, resting upon and mortised in the circular block, and provided with the ribs upon each side thereof, in combination with the curb-braces and curbs, substantially as described.



3. The circular block surrounding the upper part of the post and resting upon the curb-braces, and connected with the larger ring at the sewer-neck by means of short arms, as shown, and arched ribs connected with the larger ring at the mouth of the sewer-neck and curb-braces, all arranged as specified.

4. The outer or circular arranged arch, connected to the upper ends of the series of staves, in combination with the flanged curbs connected to the braces, substantially as herein shown and described.

5. A cistern constructed of a concrete composed of cement, sand, and broken stone, the said concrete being held in position until hardened by movable curbs and braces having suitable adjusting means, substantially as shown and described, and for the purpose set forth.



292,421. RAILWAY-TIE. JAS. J. DU BOIS, Springtown, N. Y. Filed Aug. 28, 1883. (No model.)

Brief.—The locking-blocks are made reversible.

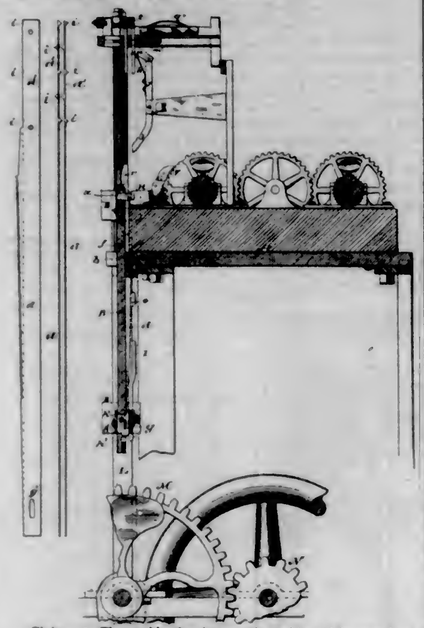
Claim.—The combination of the tie B, provided with the rail-chairs C, the reversible rhomboidal locking-blocks D, and means by which the said blocks are secured in their operative position, as set forth.

292,422. CUTTER-HEAD. JOHN R. EMERY, Lynn, Mass. Filed Nov. 10, 1883. (No model.)

Claim.—1. In combination with a rotary cutter, *a*, subdivided into teeth *b*, a removable guard secured between the respective teeth and projecting outward, so as to gage the depth and extent of cut of the teeth, substantially as specified.

2. In combination with cutter *a*, subdivided into teeth *b*, a guard, *i*, formed to be secured to the base of the slot between the teeth, and extending outward to serve as a peripheral guard to control the cut of said teeth, substantially as specified.

3. In combination with rotary cutter *a*, subdivided by teeth *b*, molded upon their periphery, the counterpart of the desired form of the sole-edge, a guard, *i*, secured between the teeth and projecting outward to form a peripheral guard, to determine the cut of the respective teeth, and formed at such projecting end to correspond with the peripheral form of the teeth, substantially as specified.



4. In combination with cutter *a*, subdivided by teeth *b*, a guard, *i*, secured by screws *k*, and having a slotted base whereby said guard may be adjusted relatively to the front and rear faces of the adjacent teeth, substantially as specified.

5. In a rotary cutter, and in combination with a removable guard, *i*, the front line, *c*, and rear line, *d*, of the teeth, formed at right angles, or nearly so, with the base *l* of the slots between the teeth.

6. In a rotary cutter subdivided into teeth, a peripheral guard, *i*, formed of brass or an analogous alloy, and arranged between the teeth, to control the cut thereof, substantially as specified.

292,423. MACHINE FOR MAKING AND STICKING MATCH-SPLINTS. GUSTAV A. FAAS, Lawrence, Kans., assignor of one-fourth to Arthur P. Usher, same place. Filed Aug. 22, 1883. (No model.)

Brief.—The match-splints are cut from the block by saws which have laterally-projecting spurs on their sides. The saws are set in a frame which is closed against their backs, forming channels within which each match-stick is supported by a support of its own size during the downstroke of the cutter. Upon the upstroke the match-stick is lifted, being held between a spring and the lateral cutter-spurs, and it is inserted between the bars of a spring-tray which is automatically and intermittently fed over the top of the cutter-frame.

Claim.—1. The combination, in a match-machine, of the cross-head B, having a gang of vertical saws, and plates arranged in line above them, having lateral spur-cutters *i* projecting from each side thereof, with a table-bed, *a*, having face divisions *b* and a cross-slit, *c*, and means, substantially such as described, carried at the top of said cross-head, for holding the produced splints against the said spur-cutters in position to be delivered, as described.

2. The combination, in a match-machine, of the cross-head B, having a gang of saws, and vertical plates arranged above them, having lateral spur-cutters, with a table-bed, *a*, having face divisions *b* and a cross-slit, *c*, substantially as described, for the purpose specified.

3. The combination, in a machine for producing match-splints, of a cross-head, B, having a gang of vertical saws, and plates arranged in line above them, having spur-cutters *i* projecting from each side thereof, a table-bed, *a*, having face divisions *b* and a cross-slit, *c*, and means, substantially such as described, carried by said cross-head, for holding the produced splints in position between the cutter-plates to be delivered, with a removable horizontally-moving dipping-frame adapted to seize and hold the splints, and a guideway open at both ends, adapted to receive, guide, and deliver the filled dipping-frame, substantially as set forth.

4. In a match-machine, the vertically-reciprocating cross-head B, constructed with a recessed face having vertical parallel grooves *e*, and provided with splint-cutting mechanism consisting of a gang of saws, *d*, suitably stretched and supported in said grooves, and plates forming a continuation of the saw-blades, having laterally-projecting spur-cutters *i* arranged within the spaces between the plates, above said saws, combined with a table-bed, *a*, having face divisions *b* and a cross-slit, *c*, substantially as described, for the purpose specified.

5. The combination, in a machine for producing match-splints, of a dipping-frame composed of an open rectangular frame having slotted side bars, *k*, a series of shouldered clamping-bars, *l*, fitted within the slotted side bars, and the springs *m'*, with the vertically-operating cross-head having a gang of saws, and plates arranged in line above them, having spur-cutters projecting from each side thereof, with means, substantially such as described, carried by said cross-head, for holding the splints in position to be delivered to said dipping-frame, and means, substantially such as described, for operating said clamping-bars and for feeding said dipping-frame in position to receive the splints.

6. The combination, with mechanism, substantially such as described, for feeding the wood, of the vertically-reciprocating cross-head B, having the gang of saws, and lateral spur-cutters arranged above them, and the table-bed *a*, having divisions *b*, corresponding with the spaces between the saws, and a cross-slit, *c*, substantially as described, for the purpose specified.

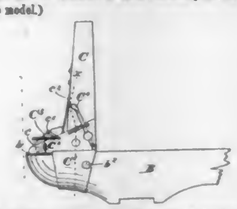
7. The combination, with mechanism, substantially such as described, for feeding the wood, the vertically-reciprocating cross-head B, having the gang of saws, and the lateral spur-cutters arranged above them, and the divided table-bed *a*, having the cross-slit *c*, of a dipping-frame of seizing-bars arranged above the cross-head, means, substantially as described, for opening and closing said bars to receive and hold the splints, and means, substantially as described, for advancing the dipping-frame to receive the splints from the cross-head.

8. In combination with the vertically-reciprocating cross-head B, having the saws *d*, and the lateral spur-cutters *i*, arranged as described, and the divided table-bed *a*, of the horizontal removable dipping-frame having clamping-bars *l*, adapted to be opened for receiving and holding the match-splints, the slotted guideway l^4, the feeding-bar J, having a spring-actuated pawl, *n*, adapted to engage with the toothed ends *m* of said bars *l*, and means, substantially such as described, carried by said cross-head, for actuating said feeding-bar, whereby the said dipping-frame is moved over said cross-head, for the purpose described.

9. The combination, in a machine for producing match-splints, of the cross-head B, having the splint cutting and holding mechanism, substantially as described, of a removable horizontally-moving dipping-frame having seizing and clamping bars *l* arranged therein, and an open guideway for said dipping-frame, with the pivoted feeding-bar J, having a spring-actuated pawl, *n*, adapted to feed said frame, the spring-pawl *q*, adapted to engage with the seizing and clamping bars *l* for holding said frame, and means carried by said cross-head for operating the feeding-bar to move the dipping-frame, substantially as described, for the purpose specified.

10. The combination, in a match-machine, of the cross-head B, having the splint cutting and holding mechanism, substantially as described, with a seizing dipping-frame composed of separate toothed bars *l*, arranged to be fed over said cross-head, and means, substantially such as described, for operating the toothed seizing-bars of said dipping-frame, and for feeding it, consisting of the pivoted bar J, having the spring-actuated pawl *n*, the spring-actuated holding-pawl *q*, both said pawls acting upon the seizing parts, the tappet-arms *o p*, pivoted cams *r r*, and catches *u u*, carried by the cross-head, and the fixed inclined or curved projections *t t*, and trip-arms *w*, all constructed and arranged for operation substantially as described, for the purpose specified.

11. The combination, in a match-machine, of a horizontally-moving dipping-frame adapted to seize or grasp the splints in vertical position on its under side, with a vertically-reciprocating cross-head provided with saws, laterally-projecting spur-cutters, holding-plates for the splints, arranged on the face of the cross-head, and a spring or springs, *x*, arranged at the top of the cross-head, adapted to bear upon the projecting ends of the splints and press them against the inner sides of the spur-cutters *i*, to hold the splints in position for presentation to the seizing or grasping parts of the dipping-frame, substantially as described.



12. The combination, with intermittent feed mechanism for the splint-wood, and a table-bed, *a*, having face divisions *b* and cross-slit *c*, of a vertically-reciprocating cross-head, B, provided with saws *d*, arranged with their cutting-edges oblique to a vertical line, and having plates arranged above the saw-blades in lines coincident with them, formed with spur-cutters *i*, arranged to project laterally within the spaces between said plates in a vertical plane back of the cutting-edges of the saw-blades, substantially as described, for the purpose specified.

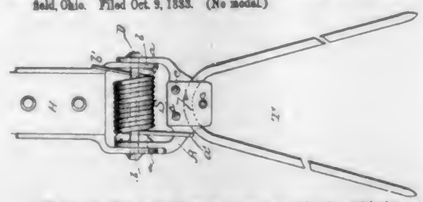
13. The cutting mechanism of a match-machine, consisting of a vertically-reciprocating cross-head or saw-frame, B, having a recessed back formed with parallel slits or grooves *e*, a gang of saws, *d*, secured within said grooves, spur-cutters *i*, arranged to project laterally within the spaces between the saw-blades, above the teeth thereof, and in a vertical plane back of the cutting-edges of said teeth, and means, substantially such as described, whereby the said saw-blades are removably secured within said grooves to the closed back of the cross-head, the said spaces between the saw-blades being open at the top and at the bottom, and the splints held between said cutter-plates in positions to be drawn out at their upper ends.

14. For operation in a match-machine constructed substantially as herein set forth, a reciprocating cutter consisting of two or more saw-blades having saw-teeth standing obliquely to a vertical line, and having one or more spur-cutters projecting from the opposite sides of each blade in vertical planes back of the vertical plane of the cutting-edges of the saw-teeth, and their points lapping in their vertical path between the blades, in combination with a suitable bed or support for the wood, having openings adapted to receive the saw-blades and the said spur-cutters after severing the splints, substantially as described.

15. The machine substantially hereinbefore set forth for making match-splints, comprising an intermittently-operating feed mechanism, a vertically-reciprocating cross-head, B, having a gang of saws, *d*, lateral sper-cutters *i*, and holding-plates for the splints, arranged above the saws, a horizontally-moving dipping-frame provided with means for seizing the splints, and a table-bed, *a*, having face divisions *b* and a cross-slit, *c*, and the holding-springs *z* for the splints, the several parts being constructed and arranged for operation substantially as described, for the purpose specified.

292,424. WAGON-BOLSTER. NELSON FAUSET, Pittsburgh, assignor of one-half to Richard R. Miles, Indianapolis, Ind. Filed Nov. 5, 1883. (No model.)

Claim.—1. The combination, with a wagon-bolster, of a standard, provided on its lower end with a clip, said clip adapted to encircle the end of the bolster, and provided with bearings on its top side for a latch, said latch pivoted in said bearings, and adapted to engage with a notch in the top face of the bolster, whereby the standard is secured in position, substantially as set forth.



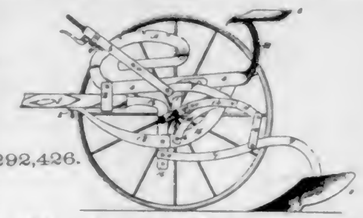
2. The combination, in a wagon, of the bolster B, the standard C, said standard being provided with a clip, C′, the top ends of which extend back and form stays C^2 for said standard, and a latch, C^3, pivoted between the ends of said stays, and adapted to engage with a notch in the top of said bolster, and hold said standard in position, substantially as set forth.

3. In a wagon, the combination of the bolster B, having a notch, *b′*, in its top face near the end, standard C, clip C′, secured to the lower end of said standard, and adapted to encircle said bolster, its top ends being formed into stays C^2, a latch, C^3, pivoted between the ends of said stays, and adapted to engage with the notch *b′* in the bolster, and a locking device, *c′*, hinged or pivoted in the sides of said stays, and adapted to turn down over the end of said latch and lock it in position, substantially as set forth.

4. The combination, in a wagon, of the bolster B, the standard C, provided with a clip, C′, the top ends of which are extended out and formed into stays C^2, a latch, C^3, pivoted between said stays, and adapted to engage with a notch in the end of the bolster, a locking device, *c′*, adapted to lock said latch in position, and a spring, c^2, adapted to bear against the end of said latch, thereby holding it tightly in place, substantially as set forth.

5. The combination in a wagon, of the bolster B, standard C, provided on its lower end with a clip, C′, which is adapted to encircle the end of said bolster, and a lever, C^4, pivoted to the side of said standard, its lower end adapted to bear against the wagon-body, whereby said standard may be easily started from its position on said bolster, substantially as set forth.

292,425. FORK FOR HAY-TEDDERS. JACOB R. FRY, Jr., Springfield, Ohio. Filed Oct. 9, 1883. (No model.)

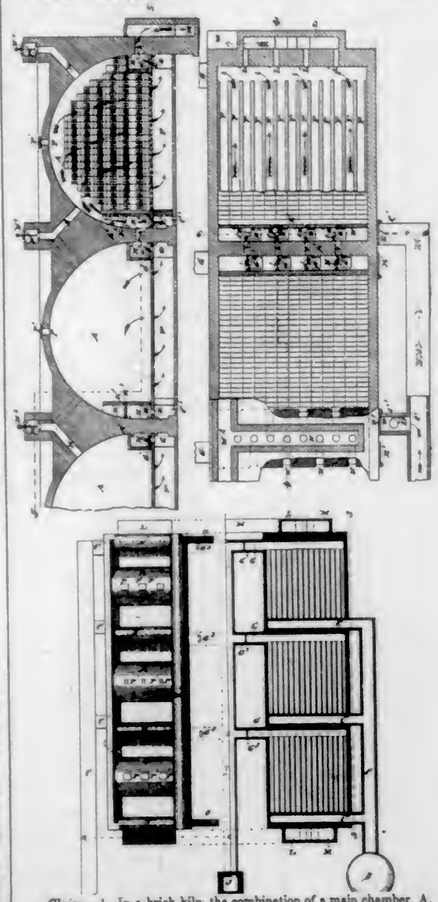


Claim.—1. In a fork for hay-tedders, the combination, with the arm provided with the hinge portion B, having lugs *b*, and the hinge portion A, having lugs *a*, alternating with the lugs *b*, of the spiral spring S, having oppositely-extended ends *a′ b′*, and the bolt D, passed through the aligned lugs and the spring S, substantially as specified.

2. In a fork for hay-tedders, the combination, with the tines T, made of a single piece of material bent as shown and described, of the recessed hinge portion A, the clamping-plate *p*, and the three bolts *c c c*, arranged in triangular form, two above and one below the bend of the tine-piece, substantially as specified.

292,426. SULKY-PLOW. JESSE L. FORBY, Nashville, Ill., assignor of one-half to John Y. Nelson, same place. Filed Nov. 2, 1883. (No model.)

Brief.—The system of lever-connections raises the plow and lowers the wheel-crank at one movement of the lever.



292,426.

Claim.—1. In combination with the plow-beam of a sulky-plow, frame 4, catch-bar A, seat-standard B, lever-bar 5, link-levers 7 11 10 12 14, and crank-axle arm 13, substantially as set forth.

2. In a sulky-plow, in combination with a lever fulcrumed to a catch-bar frame, link-levers 7 11 10 12 14, crank-axle arm 13, plow-beam 9, and pole-shank 16, whereby the crank-axle is shifted and the plow raised or lowered, substantially as set forth and described.

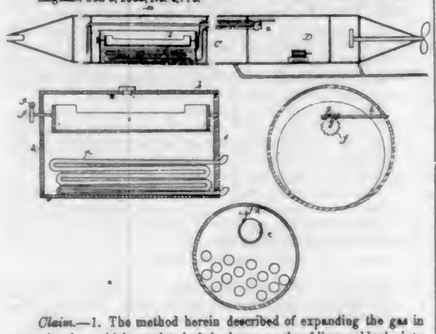
3. In a sulky-plow, the combination of frame 4, consisting of catch-bar A and seat-standard B, lever-bar 5, link-levers 7 11 10 12 14, crank-axle arm 13, braces 15 18, tongue-socket 3, and pole-shank 16, arranged and combined substantially as and for the purposes set forth.

292,427. BRICK-KILN. WILLIS N. GRAVES, St. Louis, Mo., assignor of one-half to the Hydraulic Press Brick Company, same place. Filed Jan. 30, 1883. (No model.)

Claim.—1. In a brick-kiln, the combination of a main chamber, A, having side walls and a perforated floor, a gas-flue on one side of the chamber, beneath the floor, a bridge-wall on one side of the chamber, above the floor, forming a combustion-chamber, E, in communication with the flue and directing the products of combustion to the top of the main chamber, and valves to control the supply of gas to the combustion-chamber, as set forth.

2. In a brick-kiln, the combination of a main chamber, A, having side walls and a perforated floor, a main gas-flue, C, branch flue C′ on one side of the chamber, beneath the floor, diaphragm D between the flues, having opening D′ and valve D^2, and bridge-wall K on one side of the main chamber, above the floor, forming combustion-chamber E over the branch flue, as set forth.

3. In a brick-kiln, the combination, with the main chamber having open floor, of the distributing-flues F and the lower flue, G, beneath the floor, upper flue, H, above the floor, having openings to the lower flue beneath, and the pier-walls, having openings A^2 to connect another main chamber with the upper flue, as set forth.



4. In a brick-kiln, the combination, with a main chamber having an open floor in communication with distributing-flues, of the gas-flue on one side, beneath the floor, a combustion-chamber above the gas-flue and floor, a lower flue on the other side in communication with the distributing-flues, and an upper flue above the floor, and lower flue, having suitable outlet, as set forth.

5. In a brick-kiln, the combination, with two main chambers, A A, of the pier-wall A′, formed with longitudinal flue N′ at top, connected with the main chambers by passages N, controlled by suitable valves, as set forth.

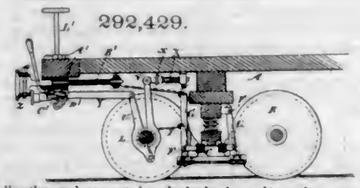
6. In a brick-kiln, the combination, with a series of main chambers divided by pier-walls A′, each having a flue, N′, at top, and passages N, connecting the adjoining main chambers with the flue, of the main flue connecting the top flues, as set forth.

7. In a brick-kiln, the flues O, connecting the main flues, in combination with the top flues of series of main chambers, as set forth.

292,428. MEANS FOR HEATING AND CONTROLLING GASES FOR MOTORS. GEORGE E. HAIGHT, Milford, and WILLIAM H. WOOD, Hartford, Conn., and WILLIAM E. WINSOR, New York, N. Y., assignors to John N. H. Patrick, New York, N. Y. Filed Aug. 31, 1883. (No model.) Patented in France Sept. 25, 1883; in Belgium Sept. 25, 1883; in Germany Sept. 26, 1883; in Spain Sept. 28, 1883; in Italy Sept. 29, 1883, No. 15,925, and in England Oct. 3, 1883, No. 4,776.

Claim.—1. The method herein described of expanding the gas in a supply-pipe, which consists in bringing a supply of lime suddenly into contact with a body of chemicals of the character described, said chemicals being in contact with the feed-pipe leading to the engine, as set forth.

2. The combination of the expansion-chamber, the pipes therein, and the lime-chamber, arranged as described, so that the lime-chamber may suddenly dump its contents into the expansion-chamber, as set forth.



3. The combination of the flask, a pipe leading to the engine, an expansion-cylinder, through which said pipe passes, and a throttle-valve arranged between the flask or reservoir and the expansion-cylinder.

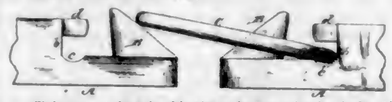
4. The combination, with the reversible lime-chamber, of the cover secured thereto, and devices, substantially as described, for tearing off the cover when the chamber is reversed.

5. The combination of the cylinder *b*, having pipes therein, as described, the lime-chamber *c*, having a cover, devices for removing said cover, and the worm-gear and shaft leading to the exterior of the boat, for reversing the lime-chamber, as set forth.

292,429. CAR-BRAKE. GEORGE M. HATHAWAY, New York, N. Y., assignor of one-half to Charles C. Keeler, same place. Filed Aug. 9, 1883. (No model.)

Claim.—1. The combination, with the axle of a car, of a loose head mounted thereon, and provided with pivoted jaws or clamps adapted to embrace a fixed wheel on the axle, and suitable mechanism for operating said clamps, the head being provided with a collar movable in only one direction, and connected to the brake-beam levers by means of a chain, whereby the brakes may be automatically operated, substantially as specified.

292,429.



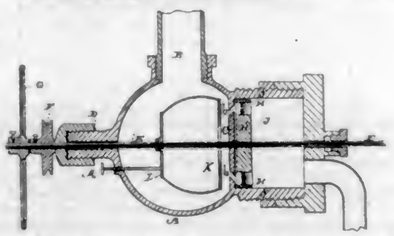
2. The combination, with the axle of a car, of the loose head, the loose collar mounted thereon, the chain and brake-levers, the pivoted levers embracing the clamps, forwardly-extending slotted lever, and the operating-lever and sliding draw-head, arranged to operate substantially in the manner specified.

3. The combination, with the axle of the car and the fixed wheel thereon, of the loose head and the pivoted clamps, the springs by which they are pressed apart normally, and the clamping-levers and their operating mechanism, the whole arranged and adapted to operate substantially as set forth.

4. The combination, with the clamp pivoted to the loose head mounted on the axle of the car, of the pivoted embracing-levers, the spring-bar to which one of said levers is secured, the slotted lever pivoted to one of said levers, the operating-lever working in a slot in the same, and the sliding draw-head adapted to operate the levers to automatically brake the wheels, substantially as specified.

5. The combination, with the bar to which one of the clamping-levers is attached, and the clamping-levers, of the spiral spring and adjusting-nut, whereby the tension of the spring is regulated, substantially as specified.

292,430. CAR-COUPLING. MARSHALL HAYDEN, New Milford, Pa. Filed Dec. 4, 1883. (No model.)



Claim.—1. A draw-head having at its forward end an inclined hook or horn with horizontal edges on each side for supporting the link in a horizontal position before or after coupling, and provided at the rear with a vertical abutment having a forward-projecting lug, *d*, rigid therewith, said lug being adapted to hold the link from vertical displacement when the link is in a horizontal position, and from lateral displacement when it is in a raised position, substantially as described.

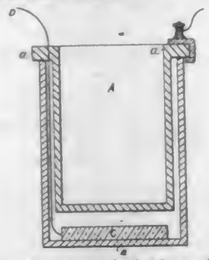
2. A draw-head having at its forward end a rearwardly-inclined hook or horn with horizontal ledges on each side, and provided at the rear with a vertical abutment carrying a forward-projecting lug that overhangs a transverse groove at the base of said abutment, in combination with a coupling-link, substantially as described.

3. The draw-head A, provided at its end with a rearwardly-inclined hook or horn, B, the rear face of which is rounded and inclined back slightly from a vertical line, with horizontal ledges *a a* on each side, the rear portion of said draw-head being formed with a vertical abutment, *b*, having at the top a forward-projecting lug, *d*, that overhangs a transverse groove, *c*, at the base of said abutment, substantially as described.

292,431. WATER-WHEEL. ROBERT HEWSON, San Francisco, Cal., assignor to the Globe Manufacturing Company, same place. Filed Apr. 30, 1883. (No model.)

Claim.—1. The case A, with its inlet-pipe B, and having the flat diaphragm C, with the inclined water-discharge tubes or openings *b* made through it, in combination with a wheel consisting of the outer and inner rims, H H′, having a single series of buckets between them, with front parts, *a*, and rear parts, *d*, substantially as herein described.

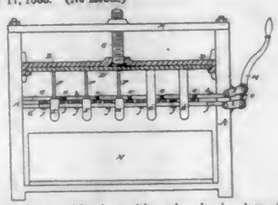
2. In a water-wheel, a case having an inlet-pipe, through which water is admitted under pressure, and the inclined discharge tubes or openings *b*, in combination with a wheel mounted upon a horizontal shaft, so as to revolve within the case, and having the portion *a* of the buckets constructed so as to be driven by the impact or momentum of the water, while the portion *d* is inclined or reactionary, substantially as herein described.



3. The combination, in a water-wheel, of a case adapted to receive water under pressure, a flat diaphragm upon one side, with inclined or angular discharge-openings around its periphery, a water-wheel having buckets corresponding with these openings formed of front and rear plates, and revolving in close proximity to the outside of the diaphragm, and a gate within the case, with mechanism to move it to or from the diaphragm and discharge-openings, substantially as herein described.

292,432. AUTOMATIC FIRE-EXTINGUISHER. CARL L. HORACK, Brooklyn, N. Y., assignor to the Providence Steam and Gas-Pipe Company, Providence, R. I. Filed May 9, 1881. (Model.)

Claim.—A distributer for fire-extinguishers, consisting, substantially as before set forth, of a bent section of pipe perforated upon its outer curved side, in combination with a cap constructed to closely fit the perforated portion of the distributer and be secured thereon by fusible solder.

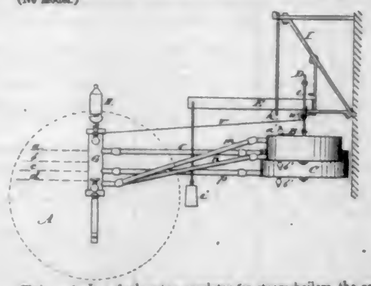


292,433. GALVANIC BATTERY. THOMAS JAMES HOWELL, London, County of Surrey, England. Filed Oct. 2, 1883. (No model.) Patented in England Dec. 30, 1882, No. 6,226.

Claim.—1. A galvanic battery having for one element a carbon pot suspended within an inclosing-vessel, and containing dilute nitrohuoric acid, and for the other element a zinc plate adapted to be laid below the carbon pot, within said vessel, and in a solution of dilute sulphuric acid.

2. A galvanic battery having for one element a carbon pot, A, supported from the top of the inclosing-jar B by an annular flange or lip, *a*, and containing dilute nitrofluoric acid, and for the other element a zinc plate, C, adapted to be laid below the carbon pot, within said inclosing-jar, and in a solution of dilute sulphuric acid, as set forth.

292,434. CAPSULE-MACHINE. FREDERICK A. HUBEL, Detroit, Mich. Filed July 17, 1883. (No model.)



Claim.—1. The combination, with a plate having laterally-movable capsule-mold pins secured thereto, of a rigid inelastic clamp or jaw adapted to strip a capsule from a pin, and means for opening and closing the same, substantially as described.

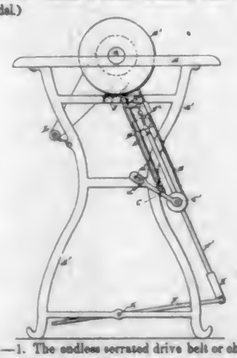
2. A plate for carrying capsule-mold pins, having said pins fastened thereto by spring-wires, substantially as shown and described.

3. In a capsule-pulling machine, the inelastic jaws J H, adapted to strip a capsule from a pin, and means for moving the said jaws, substantially as described.

4. In a capsule-pulling machine, the combination of a plate carrying one or more yielding mold-pins, having thereon an annular groove and rigid inelastic jaws having recesses therein adapted to be closed upon said pin or pins, substantially as shown and described.

292,435. FEED-WATER REGULATOR AND ALARM. PATRICK BROWN and CHARLES W. JOHNSTON, Philadelphia, Pa. Filed July 3, 1883. (No model.)

Claim.—1. In a feed-water regulator for steam-boilers, the combination, with mechanism for opening and shutting off the supply of feed-water to the boiler, of unequally-preponderating water cylinders or vessels on opposite ends or arms of a rocking beam, and flexibly-jointed pipes connecting the upper and lower portions of said cylinders or vessels with the steam and water space of the boiler at different altitudes, substantially as specified.



2. In a combined feed-water regulator and low-water alarm for steam-boilers, the combination, with mechanism for opening and shutting off the supply of feed-water to the boiler, and with a steam whistle or alarm and connections for operating it, of unequally-preponderating water cylinders or vessels on opposite sides or arms of a rocking beam, flexibly-jointed pipes connecting the upper and lower portions of said cylinders or vessels with the steam and water space of the boiler at different altitudes, and a weighted rocking beam, on the one arm of which the beam carrying said cylinders or vessels has its fulcrum, essentially as and for the purposes herein set forth.

3. The combination, with the steam and water receptacle G, arranged to connect with the steam and water spaces of a boiler, of the flexibly-jointed pipes *m n o p*, the unequally-preponderating water cylinders or vessels B C, the beam D, with connections on opposite sides of its fulcrum for carrying said cylinders or vessels, the weighted beam E, having a fixed fulcrum, A, and supporting on its lighter end or arm the beam D, and mechanism or devices connected with said beams D and E, for opening and shutting off the supply of feed-water to the boiler and for operating a whistle or alarm, substantially as specified.

4. The bracket I and attached fulcrum *h*, in combination with the weighted beam E, the beam D, arranged to rock on said beam E, and the unequally-preponderating water cylinders or vessels B C, attached to the beam D, for operation in connection with a steam-boiler, essentially as and for the purposes described.

5. The rest *g* on the weighted beam E, having a fixed fulcrum, in combination with the rocking beam D, mounted on said beam E, and the unequally-preponderating water cylinders or vessels B C, essentially as and for the purposes herein described.

292,436. OPERATING MECHANISM FOR SEWING-MACHINES, LATHES, &c. PIERRE F. JOSTE, Cincinnati, Ohio. Filed Feb. 6, 1883. (No model.)

Claim.—1. The endless serrated drive belt or chain, in combination with the pitman provided with clutch mechanism, substantially as hereinbefore set forth, for engaging said serrated drive-chain, and for causing the upward and downward movements of the pitman to move the chain in one direction, substantially as and for the purposes described.

2. The endless serrated drive belt or chain, engaging the projections of a wheel, as *b*, and at the other end against a bearing, as C', in combination with the pitman provided with clutch mechanism, substantially as hereinbefore set forth, for engaging said serrated drive-chain, and for causing the upward and downward movements of the pitman to move the chain in one direction, substantially as and for the purposes described.

3. The herein-described mechanism for operating foot-power machinery, consisting of a drive-chain composed of serrated links, said chain passing around an appropriate chain-gear on the driving-shaft of the machine, and a pawl-carrier connected by a pitman to the treadle of the machine, and provided with serrated pawls adapted to engage the drive-chain, substantially as and for the purposes described.

4. The pawl-carrier F², consisting of a base, *g*, provided at opposite corners with the flanges *g'* and *g²*, and the pawls G G', pivoted to the base *g* and opposing the flanges *g'* and *g²*, substantially as and for the purposes specified.

5. The pawl-carrier F², having the flanges *g'* and *g²*, and the pawls G G', having serrated edges to engage with the chain E, said pawls being provided with the weighted portions *h h'*, to keep the points of said pawls in contact with the chain, substantially as and for the purposes specified.

6. The pawl-carrier F², having the flanges *g'* and *g²*, and flanges *t t'*, and the pawls G G', pivoted to the carrier, and respectively opposing the flanges *g'* and *g²*, substantially as and for the purposes specified.

7. The combination of the pawl-carrier F², pawls G G', driving-chain E, pitman F', and treadle, substantially as and for the purposes specified.

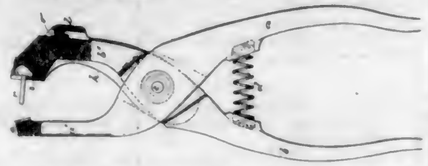
8. The combination of the pitman F' and the treadle F, the pitman being connected to the treadle by the plate H and spring H', to permit a slight amount of variation in length of said pitman, substantially as and for the purposes specified.

9. The combination of the treadle F, spring H', and pitman F', substantially as and for the purposes specified.

10. The combination of the treadle F, spring H', and pitman F', the pitman being connected to the treadle by a spring, substantially as and for the purposes specified.

11. The combination of drive-belt, pawl-carrier, pawls, pitman, spring, as H', and treadle, substantially as and for the purposes specified.

12. The combination of drive-chain, pawl-carrier, pitman, spring, as H', treadle, and spring N, substantially as and for the purposes specified.



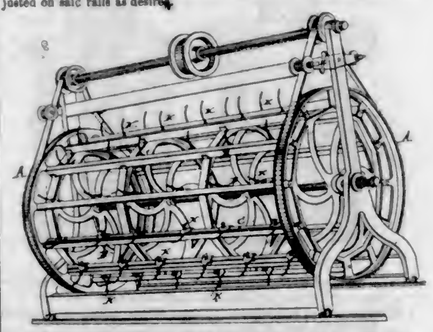
13. The combination of the wheel B, brake J, having shoe *j*, and pitman provided with pin *k*, and drive-belt and pawl-carrier and pawls, substantially as and for the purposes specified.

14. The combination of the pitman F', provided with a pin, *k*, and the brake J, having a shoe, *j*, and the wheel B', said brake being adapted to be raised and brought into contact with the wheel J by said pitman, substantially as and for the purposes specified.

15. The drive-chain, serrated on inside of links *e*, and smooth on outside, in combination with the pawl-carrier and gear-wheel and bearing C', substantially as and for the purposes specified.

16. In combination with a drive-chain composed of alternate single links *d'* and double links *e*, serrated on the inside, the gear-wheel provided with depressions *f* and slots or depressions *f'*, substantially as and for the purposes specified.

292,437. INSTRUMENT FOR ATTACHING BUTTONS. CONRAD A. KOECHLER, Brooklyn, N. Y., and CHARLES VOGEL, Fort Lee, N. J. Filed May 31, 1883. (No model.)



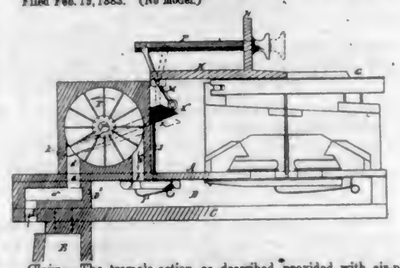
Claim.—1. The combination, in a button-attaching implement, of two handles pivoted together, two jaws, one of which is recessed for the reception of the button-head, and the other is provided with ridge for spreading the penetrating-points, and a slotted plate for receiving the button-shank, and a pivot upon which such slotted plate swings, substantially as specified.

2. The plate *h*, pivoted at *c*, and having the slotted holder *i* and the lip *l*, in combination with the jaw *b'*, having a recess for the button-head, the spring *o*, acting upon the lip *l*, and the spreading-block *e*, and jaw *a'*, substantially as set forth.

292,438. YARN-REEL. GEORGE LAING, Worcester, Mass., assignor to Silas W. Goddard, same place. Filed Mar. 26, 1883. (No model.)

Brief.—To each of the longitudinal bars of the reel is secured a metallic bar or rail upon which are placed adjustable slides, which are provided at their outer ends with sockets for the reception of the hank-separating pins, whereby said pins are adapted to be longitudinally adjusted on said rails as desired.

Claim.—1. The combination of a longitudinal reel-bar with a metallic bar secured upon the side of the reel-bar, blocks fastened upon the side of the reel-bar and raising the metallic bar from the same, and slides having inwardly-bent clamping-edges, securing thumb-screws, and hank-separating pins, as and for the purpose shown and set forth.



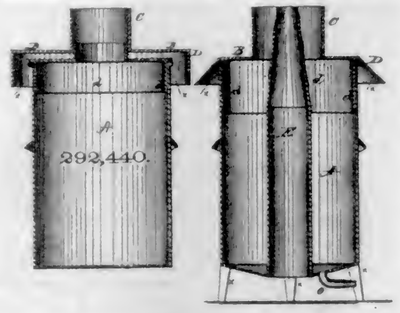
2. The combination of a longitudinal reel-bar with a metallic bar fastened to and raised from the side of the reel-bar, slides having sockets in their outer ends, and clamping-edges, securing thumb-screws, and hank-separating pins, as and for the purpose shown and set forth.

3. The combination of a longitudinal reel-bar with a metallic bar secured to the side of the same, adjustable slides having sockets at their outer ends, and bent hank-separating pins having inner split and spread ends, as and for the purpose shown and set forth.

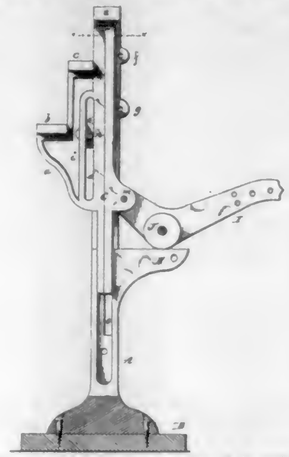
4. The combination of a longitudinal reel-bar with a metallic bar secured to the side of said bar, slides having sockets in their outer ends, and bent clamping-edges, securing thumb-screws, and bent hank-separating pins having split and spread ends, as and for the purpose shown and set forth.

5. The combination of a longitudinal reel-bar with a metallic bar fastened upon its side and having a gage marked upon it, blocks secured between the reel-bar and the metallic bar, slides having sockets at their ends, and bent clamping-edges, securing thumb-screws, and hank-separating pins having split and spread ends, as and for the purpose shown and set forth.

292,439. TREMOLO FOR REED-ORGANS. ELMER H. LORING, Worcester, Mass., assignor to the Loring & Blake Organ Company, same place. Filed Feb. 19, 1883. (No model.)



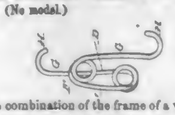
Claim.—The tremolo-action, as described, provided with air-passages *a a' a² a³* and *b b'*, arranged and located relatively to the reed-board A and bellows-board C, in the manner shown, in combination with the valve I, located within the wind-chest D, as and for the purpose set forth.



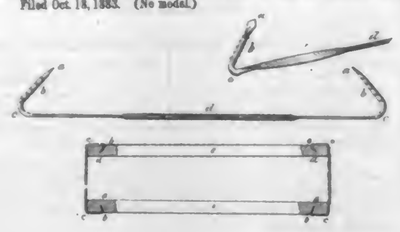
292,440. MILK-CAN. WILLIAM P. MANN and CHARLES H. SWAB, Cedar Rapids, Iowa. Filed Apr. 13, 1880. (No model.)

Claim.—1. The milk-can cover B, provided with an inner flange or rim, *d*, extending down within the can, and another flange or rim extending downwardly outside and about the can at its top, as shown, and having a central and unobstructed aperture surrounded by an upwardly-extending flue or tube, C, substantially as shown and described.

2. A milk-can combined with a cover having a central and unobstructed opening and an inner and an outer flange, whereby when the can is placed in water a water-seal is obtained around the upper edge of the can and a ventilating-opening provided for its upper parts, substantially as described.



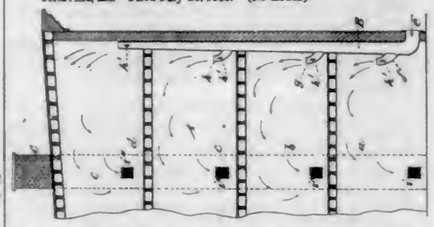
292,441. WAGON-JACK. THOMAS MAXON, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Nov. 8, 1883. (No model.)



Claim.—The divided frame A, with its bracket H, in combination with the vertically-playing bar C, having its bracket with steps and guide-opening *d*, and the operating-lever I, with wheel J, the several parts being constructed and operating as and for the purpose set forth.

292,442. SASH-HOLDER. CHARLES E. MURRAY, Brandt, Ohio. Filed Oct. 31, 1883. (No model.)

Claim.—The combination of the frame of a window, the sash having a recess in its edge, and a spring consisting of a straight portion, having its ends coiled in opposite directions, the ends of which coils are passed back in opposite directions and secured in the bottom of the recess, as and for the purpose shown and set forth.



292,443. SHINGLE-BAND. WILLIAM S. NEWSON, Manistee, Mich. Filed Oct. 18, 1883. (No model.)

Claim.—1. A shingle-band composed of a round wire having two inwardly-bent, barbed, and chisel-pointed ends, and a flattened surface next to said ends, substantially as and for the purpose set forth.

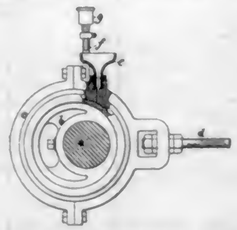
2. The combination, with the two wooden strips or bands *a a*, of the wires *d d*, provided each with the flattened surfaces *c c*, and the barbed hooks *b b*, having chisel-points *a*, substantially as and for the purpose set forth.

292,444. VENTILATING BUILDINGS. FRANKLIN ALBERT PILLING, Colesville, Md. Filed July 20, 1883. (No model.)

Claim.—1. The combination, with a building, of a main inlet pipe or duct opening into the outer air near the base of said building, decreasing in cross-sectional area toward the top, and provided with branch or delivery pipes opening into the several apartments of the building, situated in its various stories, substantially as set forth.

2. The combination, with a building, of a main inlet pipe or duct opening to the outer air near the base of said building, decreasing in cross-sectional area toward the top, and provided with branch or delivery pipes and dampers for discharging and regulating the admission of air to the various apartments of said building, situated in its various stories, substantially as set forth.

3. A main inlet pipe or duct opening to the outer air near the base of a building, decreasing in cross-sectional area toward the top, and provided with branch or delivery pipes for discharging air into the several apartments situated in the several stories of the building, combined with a flue having openings located near the floors of the several apartments, substantially as set forth.



292,445. PISTON. WILLIAM ROWAN, Belfast, County of Antrim, Ireland. Filed Sept. 18, 1883. (No model.) Patented in England Feb. 6, 1883, No. 649.

Claim.—1. The combination, with a piston having packing-rings A, of the inner ring or spring-hoop, C, and the helical springs B, which expand the packing and press the rings A against the sides of the cylinder, substantially as and for the purpose set forth.

2. The combination, with a piston having packing-rings A, of the inner ring or spring-hoop, C, and the helical springs B, which press the packing-rings A against the sides of the cylinder, and the wave-shaped spring F, placed between the packing-rings and serving to press them apart from each other and against the junk-ring or cover and the piston-flange, substantially as and for the purposes set forth.

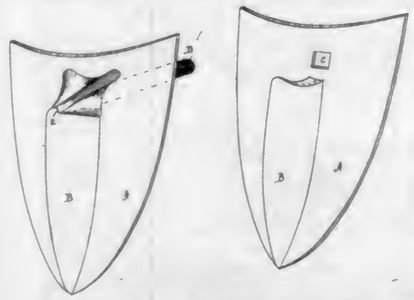
292,446. LUBRICATOR. GARDNER C. SIMS, Providence, R. I., assignor to the Armington & Sims Engine Company, same place. Filed Aug. 25, 1883. (No model.)

Claim.—1. An improved lubricator for steam-engines, consisting of a fixed reservoir for the bulk of lubricant, and an attachment secured to a moving part of the machine, for conveying the lubricant from the reservoir to the bearing-surfaces of said moving part, the said attachment being at its receiving end of greater length than the throw of said moving part, whereby the lubricant is at all times received from the reservoir.

2. The combination, with an engine-eccentric, of a funnel secured to the eccentric, and a reservoir fixed upon a rigid portion of the engine, the mouth of said funnel being of greater length than the throw of the eccentric, for the purposes set forth.

3. In a steam-engine, the combination, with the eccentric *b* and ring *c*, of the funnel *e*, the oil-cup *g*, and the bracket *f*, constructed to lubricate the eccentric from a fixed reservoir, as described.

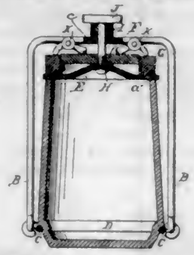
292,447. HOLDER FOR INCANDESCENT ELECTRIC LAMPS. ALFRED SWAN, Gateshead, County of Durham, England. Filed July 23, 1883. (No model.) Patented in England May 21, 1883, No. 2,526; in France June 19, 1883, No. 154,137; in Belgium June 21, 1883, No. 61,778; in Canada Aug. 10, 1883, No. 17,468, and in Austria-Hungary Oct. 8, 1883, No. 27,360 and No. 43,386.



Claim.—1. The holder for incandescent electric lamps, consisting of the part A, which directly holds the bulb, and a part, B, united to part A by spring fastening devices, so that the bulb can be readily removed from the part A, or the part A and bulb removed together from part B, substantially as described.

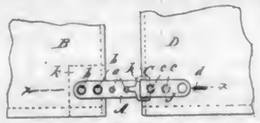
2. In a holder for incandescent lamps, the combination of the recessed part B, the part A, detachably connected with the bulb and having shoulders or ledges on opposite sides, and springs on said part B, for engaging with said shoulders or ledges when the part A is turned in the proper position, substantially as described.

3. The combination, with the part B and springs *b*, connected with the line-wires, of the part A, shoulders or ledges extending partly around said part A, for engagement with said springs, and conducting-pins carried by said part A, and arranged so that the said part can be turned to break contact between said clamping-springs and conducting-pins without releasing said shoulders or ledges from engagement with said springs, substantially as described.



4. The combination, with the bulb and looped terminal wires thereof, of the holder and the spring-jaws, carrying pins upon which the loops of said terminal wires are hung, being held thereon by the closing of said jaws, substantially as described.

292,448. PLOW-POINT. GEORGE P. SWIFT, Columbus, Ga. Filed June 11, 1883. (No model.)

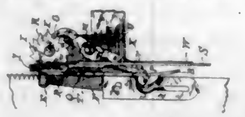


Claim.—A plow-point having its forward portion provided with a vertical cutting-blade, in combination with a fastening-bolt having a longitudinally-grooved head adapted to fit over the upper edge of the blade, substantially as and for the purpose specified.

292,449. BOTTLE-STOPPER. STEPHEN P. M. TASKER, Philadelphia, Pa., assignor to Joseph R. Tasker, same place. Filed July 16, 1883. (No model.)

Claim.—As an improvement in stoppers or covers for bottles, jars, and other vessels, the combination, with a bail secured to the vessel, of a cover composed of a flexible diaphragm, a ring resting thereon, a disk or rest for the inner arms of the levers, a stem connected with the disk and provided with a head or pressure-knob, a spring or cushion interposed between the bail and the pressure-knob of the stem, and bell-crank levers or cams pivoted to the bail, and resting as to their inner extremities upon the disk, and as to their outer extremities upon the ring, the construction being such that the cover as an entirety is seated externally upon the neck of a bottle or vessel, and is held in place thereon by the expansion of the spring and the pressure of the bottle's contents, substantially as set forth.

292,450. GLOVE-FASTENER. AMEDEE TROUTTET, New York, N. Y., assignor to Mary Ann Trouttet, same place. Filed July 28, 1883. (No model.)



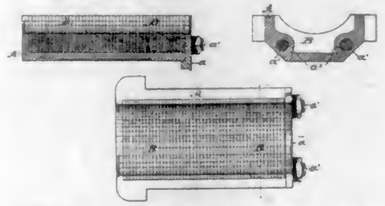
Claim.—1. In a glove-fastener, the sliding buckle or fastener C, provided with the hooks *i* and *g*, and placed upon the fastening-strap A, and arranged to operate substantially as described.

2. The strap A, attached to the flap B of the glove, and having suitable holes or eyelets, in combination with the buckle or fastener C, having hook *i* and hook *g*, and the flap D, having suitable holes or eyelets for receiving the hook *g*, substantially as described.

3. The fastening-strap A and sliding buckle C, in combination with the button *f*, attached to the free end of the strap A, for holding the buckle in place upon the strap, and for fastening the strap down to the wrist, substantially as described.

4. The flap D of the glove, provided with suitable holes or eyelets, *e*, and button-hole *d*, in combination with the strap A, sliding buckle C, and button *f*, substantially as and for the purposes set forth.

292,451. OVERSEAMING ATTACHMENT FOR SEWING-MACHINES. WILLIAM F. VEBER, Bowling Green, Ohio, assignor of one-half to Allan W. Radulph, same place. Filed June 22, 1883. (No model.)

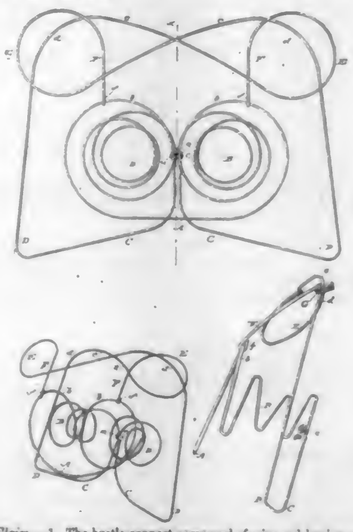


Claim.—1. An over-seamer for sewing-machines, consisting of the combination of the bed-plate, the vertically-reciprocating needle, means for holding the goods to be operated upon on both sides of the needle, means for feeding forward the goods, and the pushing-lever for moving that part of the edges of the goods opposite the needle out of the path of the needle at every alternate stroke of the needle-bar, so that a stitch is alternately made in the goods and outside the edges of the goods, thereby forming an overseam, substantially as set forth.

2. The combination, with the bed-plate of a sewing-machine, of the vertically-reciprocating needle, means for holding the goods to be operated upon on both sides of the needle, means for feeding forward the goods, the guide-plate mounted on the bed-plate, the ratchet-wheel pivoted thereto, the pins carried by the wheel, which are equal to half the number of its teeth, and the pushing-lever mounted on the guide-plate, which is operated by the pins in the ratchet-wheel, whereby that part of the edges of the goods opposite the needle is moved out of the path

of the needle at every alternate stroke of the needle-bar, so that a stitch is alternately made in the goods and outside the edges of the goods, thereby forming an overseam, substantially as set forth.

3. An overseaming attachment for sewing-machines, consisting of the combination of the guide-plate, the ratchet-wheel mounted thereon, the pins carried by the ratchet-wheel, (equal to half the number of teeth in the ratchet-wheel,) the lever Q, for operating the ratchet-wheel, the pusher-lever, which engages with the pins on the ratchet-wheel, and the recessed presser-foot mounted on the guide-plate, the several parts being adapted and arranged substantially as set forth.



292,452. BRASS FOR CAR-AXLE BEARINGS. JOHN WALLACE, Albany, N. Y., assignor of one-half to Geo. T. Weaver, same place. Filed Mar. 6, 1883. (No model.)

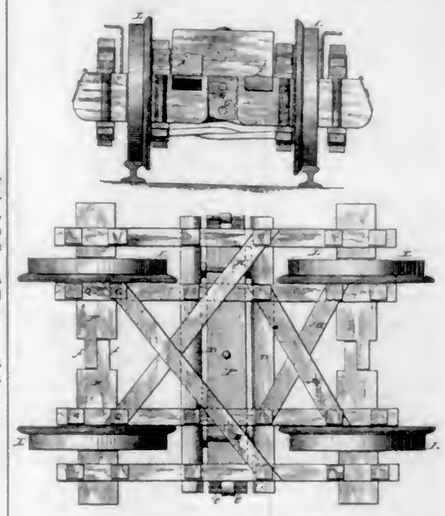
Claim.—1. As an improvement in brasses for car-axles and other bearings, the chambered shell A, containing a filling of compressed paper or paper-board, the said paper or paper-board being cut into shape, substantially as described, to form the filling-pieces B, which are then fixed edgewise in the chamber of the shell A, as and for the purpose herein specified.

2. The combination, with the chambered shell A, provided with a detachable plate, *a*, as herein described, of the filling-pieces B, composed of compressed paper or paper-board, as and for the purpose herein specified.

292,453. BUSTLE. EUGENE J. WEEKS and GEORGE M. CADY, Jackson, Mich., assignors to the Corvuet Corset Company, same place. Filed Feb. 24, 1883. (No model.)

Claim.—1. The bustle-support composed of wire and having a substantially rectangular base, in combination with spiral springs arranged within the bounding-lines of the base, the axes of the springs being substantially at right angles to the plane of the base, substantially as set forth.

2. The bustle-support formed of wire and having a substantially rectangular base, in combination with spiral springs arranged within the bounding-lines of the base, and having their axes at substantially right angles to the plane of the base, and the supplemental coils E E, substantially as set forth.



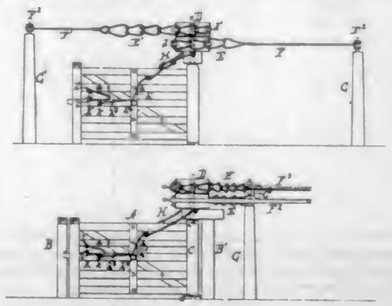
3. The bustle-support formed of wire, and having two spiral springs formed of a continuous piece of wire and connected together at their upper and lower ends, substantially as set forth.

4. A bustle-support formed of a continuous piece of wire, bent to form spiral springs, and also bent to constitute a substantially rectangular frame having its plane at right angles to the axes of the springs, substantially as set forth.

5. A bustle-support formed of wire and having spiral springs arranged side by side, and coils E E, adjustably connected to convolutions of the spiral springs, substantially as set forth.

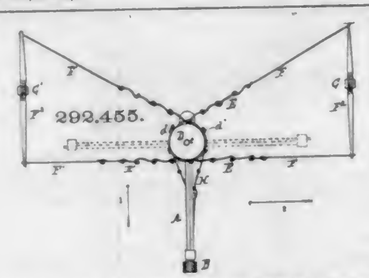
6. A bustle-support formed of wire and having a substantially rectangular base, in combination with spiral springs having their axes at substantially right angles to the plane of the base, one convolution of each spring being connected by a continuous wire and other convolutions of the springs being connected to each other, and the coils E, attached to the convolutions of the springs, substantially as set forth.

292,454. CAR-TRUCK. ANDREW WESTLAKE, Leadville, Colo. Filed July 3, 1882. (No model.)



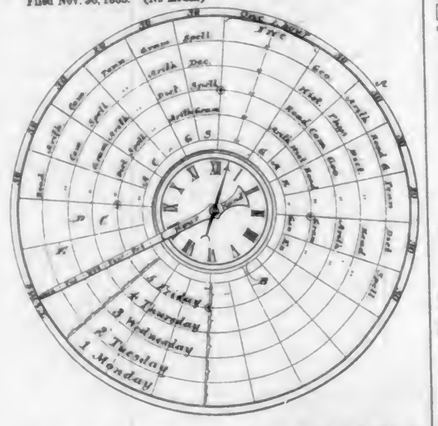
Claim.—1. In a car-truck, the combination, with a double line of arch-bars, A, on each side of the truck, of connecting arch and tie bars B C, transverse connecting channel-bars D, and the diagonal long and short braces H and M, arranged substantially as herein shown and described.

2. In a car-truck, a series of independent axles, in combination with the oil-boxes having chilled ends, and chilled washers K, substantially as and for the purpose herein shown and described.



3. In a car-truck, the long oil-boxes F F, having flanges *f f* bolted together to stiffen the truck, substantially as herein shown and described.

4. Oil-boxes F F, provided with flanges *f f*, riveted together, with back ends of said boxes chilled, and having side openings, *i*, and covers therefor, substantially as herein shown and described.



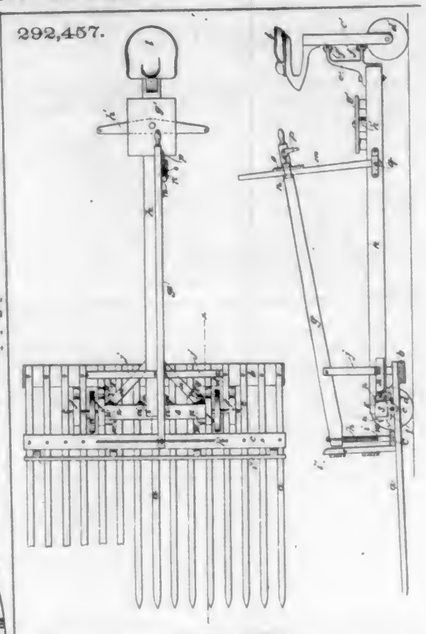
292,455. GATE. JAMES WHEELER, Red Oak, Mo., assignor of two-thirds to Thomas Hagler and James T. Williams, both of same place. Filed July 13, 1883. (No model.)

Claim.—1. The combination, with the post B, the turning-stile C, having the reduced end *c*, the double sprocket-wheel D, secured on such end *c*, the chains E E', cords F F', operating-levers F² F³, cords H H, elbow-lever A', latch K, pivoted to the gate, and spring L, all constructed, combined, and arranged as and for the purpose set forth.

292,456. PROGRAMME-CLOCK. THEODORE WILKES, Millhousen, Ind. Filed Nov. 30, 1883. (No model.)

Claim.—1. The combination of a dial plate or chart divided into a series of columns, and a series of concentric divisions adapted to be marked with one or more days of the week, with the recitations for one or more days in their sequence, and with the time allotted for each, a pointer marked with the days of the week corresponding to those that may be marked on the dial-chart, and any suitable mechanism for moving the pointer over the dial-plate, so as to pass it from one column to the other, to indicate when the time for one recitation has ended and that for the next arrived, substantially as described.

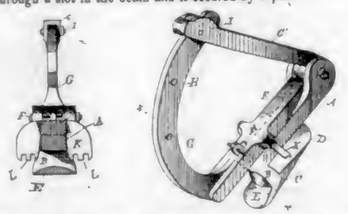
2. The combination, with a clock to indicate the hours of the day, of a dial chart or plate divided into a series of columns and a series of concentric divisions, adapted to be marked with one or more days in their sequence, and with the time allotted for each, a pointer marked with the days of the week corresponding to those that may be marked on the dial-chart, and mechanism for moving the hour-indicating hands of the clock to indicate the hour of the day, and in unison therewith the pointer over the dial-plate, so as to pass it from one column to the other, to indicate when the time for one recitation is ended and that for the next arrived, substantially as described.



292,457. HORSE HAY-RAKE. JAMES M. WEHART, Topeka, Kans. Filed Sept. 1, 1883. (No model.)

Claim.—1. The combination of the wheel *d*, axle *e*, the rake pivoted on said axle, and having bars *b c*, one in rear and the other in front of said wheels, the regulating-lever *g*, the braces *j*, tension-rod A and strut *i*, connecting said lever to said bars, the standard *m*, ratchet *o*, and pawl *p*, substantially as and for the purpose set forth.

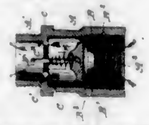
2. The combination of the wheels *d*, axle *e*, the rake pivoted on said axle, and having bars *b c*, one in rear and the other in front of said wheels, the regulating-lever *g*, the braces *j*, tension-rod A, and strut *i*, connecting said lever to said bars, substantially as and for the purpose set forth.



3. The boxes *t*, having flanges *y* and *v*, in combination with the beam *s*, diagonal braces *x*, and push-bar *k*, substantially as described.

292,457.

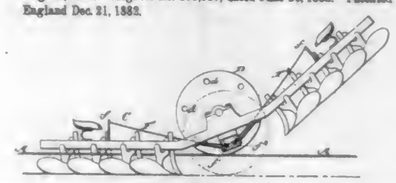
292,458. SHINGLING-BRACKET. STEPHEN WOODARD, Delano, Minn., assignor of one-half to Albert P. Woodard, same place. Filed Nov. 2, 1882. Renewed Dec. 27, 1883. (No model.)



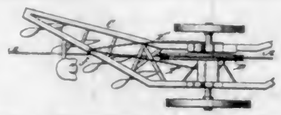
Brief.—A horizontal beam with a curved arm and an inclined supporting-beam are pivoted in the end of a horizontal arm of an upright of a base-piece. The pivoted horizontal beam has lateral toothed projections straddling the horizontal arm, and a standard projects from said arm through a slot in the beam and is secured by a pin.

Claim.—1. In combination with the standard B, mounted on a suitable base, and the arm A, formed thereon, the beam M, pivoted to said arm and having lateral prodded projections adapted to straddle the arm, and the standard projecting from said arm through a slot in the beam, and provided with an aperture for a pin or bolt, substantially as set forth.

2. In combination with the arm A, secured to the standard B on the base and slotted at its end, the beam M, carrying the carved arm G, and the supporting-arm G', both pivoted in the slot, substantially as and for the purposes specified.



292,459. GAS-REGULATOR. PETER KELLER, Philadelphia, Pa. Filed June 11, 1883. (No model.)



Claim.—The combination of the casing A, valve-seat B, having the rounded corners B' and vents B'', plates C, provided with perforations, valve D, provided with a stem, D', which extends through the plate C, and spring E, all combined and arranged to operate substantially in the manner described.

REISSUES.

10,438. STEAM-PLOW. GEORGE GREIG, Edinburgh, Scotland. Filed Aug. 20, 1883. Original No. 279,937, dated June 26, 1883. Patented in England Dec. 21, 1882.

Claim.—1. The combination of two or more plowing-machines, C C, with a single operating rope or chain, A, and impelling means B for the latter, the said plowing-machines being adapted to operate simultaneously, substantially as and for the purpose herein set forth.

2. In steam plowing-machines adapted to operate in pairs or sets, moving one behind another, as specified, the wheel or pulley D, and controlling means adapted to hold and release the rope A, so as to increase or diminish the distance of the machines apart, substantially as and for the purposes herein specified.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

WHITE *et al.* v. DUNBAR *et al.*

Decided December 17, 1883.

UNITED STATES SUPREME COURT RULES.

Rule 30 of Supreme Court rules applies only to cases appealed before its adoption, and is practically obsolete.

APPEAL from the Circuit Court of the Eastern District of Louisiana.

Mr. Joseph P. Hornor, *Mr. F. W. Baker*, and *Messrs. Joyce & Spear* for the appellants.

Mr. Melville Church for the appellees.

STATEMENT OF THE CASE.

This was a motion made by appellants under Rule 30 to suspend or dissolve the injunction granted by the court below. From the statement of facts agreed to by counsel and adopted by the court below it appeared—

1. That appellees were owners of Letters Patent No. 178,916, issued June 20, 1876, for a method of preserving shrimps and other shell fish.

2. That on the 6th of December, 1881, they surrendered said original patent and obtained therefor Reissue Letters Patent No. 9,957, dated said 6th day of December, 1881.

3. That appellants were sued for infringement of the said reissued patent and defended.

4. That upon a preliminary hearing the court ordered an injunction, but subsequently modified its order by allowing the appellants to continue their business upon condition that they filed in court a monthly account of their manufactures and sales.

5. That upon final hearing the court found against the appellants on all the points presented by them, and found that the said original and reissued patents were valid; that they covered a novel invention; that the reissued patent claimed the same invention as that claimed in the original patent; that the reissue was legal and legally issued, and that the appellants infringed the reissued patent by practicing the process patented thereby.

6. That the court issued the perpetual injunction restraining the appellants from further continuing their business in packing shrimps in accordance with appellees' patented invention, and referred the case to a master.

7. That the master reported in favor of the appellees for $1,205.98, and judgment was entered against appellants for that amount, and they appealed.

Appellants, in support of the motion, attacked the validity of appellees' patent, contending, first, that the reissue was illegal, and, secondly, that it did not cover a patentable invention, citing on the first point *Miller* v. *Brass Co.*, (104 U. S., 350;) *James* v. *Campbell*, (104 U. S., 356;) *Heald* v. *Rice*, (104 U. S., 748;) *Russel* v. *Dodge*, (93 U. S., 464,) and other cases, and on the second point *Rubber Tip Pencil Co.* v. *Howard*, (20 Wall., 498;) *Brown* v. *Piper*, (91 U. S., 37;) *Terhune* v. *Philips*, (99 U. S., 593;) *Button* v. *Taggart*, (17 How., 34,) and other cases.

Appellees, in opposition to the motion, contended (1) that the statute (section 4921) gave the court below express power to grant the injunction, and unless it plainly appeared that it erred in matter of law its decision should not be disturbed, citing High on Injunction, volume 2, page 1069; Walker on Patents, page 478; (2) that the statement of facts showed no error or doubt on the part of the court below; (3) that Rule 30 had only been applied in cases where the court below appeared in doubt on a point going directly to the validity of the patent; (4) that the reissue was valid, because it claimed the same invention as that claimed by the original, citing *Powder Co.* v. *Powder Works*, (8 Otto, 138;) *Gage* v. *Herring*, (23 O. G., 2119;) *Cote* v. *Moffat*, (15 Fed. Rep., 345,) and other cases; (5) that the patented invention was novel, but that on the motion the question of novelty could not be inquired into.

Mr. Chief Justice WAITE:

This motion is denied. Under Rule 93 in equity the judge who allowed the appeal had authority to modify the injunction. He did not do so. Rule 30 of this Court, under which this motion purports to have been filed, applies only to cases appealed before its adoption, and is now practically obsolete.

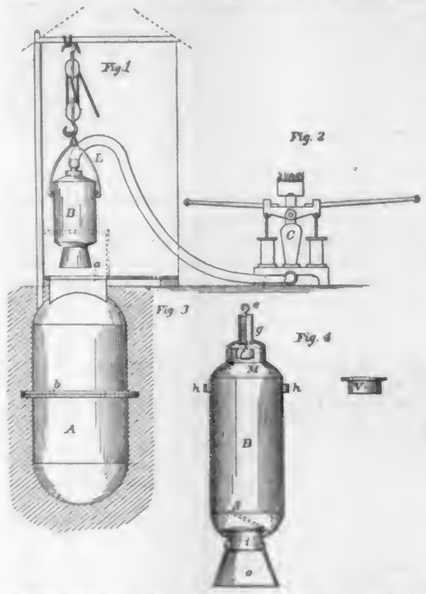
Supreme Court of the United States.

CLEMENTS, APPELLANT, v. THE ODORLESS EXCAVATING APPARATUS COMPANY.

Decided January 7, 1884.

REISSUES—CLAIMS 1 AND 3 OF BULL'S REISSUED PATENT FOR APPARATUS FOR CLEANING PRIVIES DECLARED INVALID FOR ENLARGEMENT.

Claims 1 and 3 of Reissue Letters Patent No. 6,962, granted to Lewis R. Keizer, February 29, 1876, for an improvement in apparatus for cleaning privies, the original Patent No. 115,565 having been granted June 6, 1871, to Henry C. Bull and Joseph M. Lowenstein, on the invention of said Bull, and the application for the reissue having been filed January 11, 1876—namely, "1. A privy-vault-cleaning apparatus consisting of an air-pump, a deodorizer, and suitable tubular connections, in combination with an independently-movable receiving-cask having an induction passage or opening, and also an air-opening for connection with the air-pump, and provided with screw-necks at each opening for receiving sealing caps or covers, substantially as described, whereby the movable cask may be located in any desired position with relation to the vault and privy, and the pump and deodorizer located in any desired position with relation to the vault, privy, and cask, and also whereby the casks, when filled, may be handled as is usual with filled casks, as set forth; 3. The combination, with a portable night-soil cask, of a float-valve located at the air-passage substantially as described, whereby the fluid matter is prevented from entering the air-passage and clogging the suction air-pipe and pump, as set forth"—are invalid, because they are for inventions not indicated in the original patent as inventions, being for sub-combinations in combinations claimed in the original, and were made for the purpose of covering features described in patents issued to others during the interval between the granting of the original and the application for the reissue. Those features are contained in the defendant's apparatus, and that apparatus does not infringe any claim in the original patent.



APPEAL from the Circuit Court of the United States for the District of Maryland.

Mr. H. T. Fenton for the appellant.
Mr. Benj. Price for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought for the infringement of Reissue Letters Patent No. 6,962, granted to Lewis R. Keizer, February 29, 1876, for an improvement in apparatus for cleaning privies, the original Patent No. 115,565 having been granted June 6, 1871, to Henry C. Bull and Joseph M. Lowenstein, on the invention of said Bull, and the application for the reissue having been filed January 11, 1876. The specification says:

My invention consists, mainly, in a sink-cleaning apparatus, consisting of an air-pump, a deodorizer, and suitable tubular connections, in combination with an independent or movable receiving-cask, having an induction passage or opening, and also an air-passage for connecting with the air-pump, and provided with stench and water tight covers for both passages, whereby the movable cask may be located in any desired position with relation to the vault, and the air-pump and the deodorizer properly located with reference to the vault and cask, and also whereby the cask, when filled, may be trundled on its bilge or end, after the usual manner of handling casks or barrels.

My invention consists, further, in the combination, with the cask, of a flanged opening, a detachable suction pipe or funnel connected with the flange of the opening, and a check-valve located within the cask for retaining the offensive matter after passing through the valve.

My invention still further consists in the combination, with the air-passage of a night-soil cask, of a float-valve, whereby, when the cask is filled with fluid matters, the valve will be floated and closed, thereby indicating that the cask is filled, and preventing the fluid matter from entering the conducting-pipe and passing through the air-passage to the air-pump, which otherwise would be liable to have its valves clogged thereby and rendered inoperative.

To more particularly describe my invention, I will refer to the accompanying drawings, in which—

Figure 1 represents, in side view, a cask embodying several features of my invention located within a privy. Fig. 2 represents, in side view, an air-pump connected with the cask by a flexible tube or suction-hose, and provided with a deodorizer. Fig. 3 represents a privy-vault. Fig. 4 represents, on an enlarged scale and in detail, in vertical central section, the cask shown in Fig. 1.

A vault is indicated at A. It is provided with the usual entrance or opening, as at *a*. B denotes one of several casks or receptacles which are employed in connection with an air-pump, as at C, for removing the offensive matter from the vault. The cask B has at one end a screw-neck, *i*, and the check-valve *d*, which opens inwardly. Said cask also has another screw-neck, as at M, to which is attached the suction-hose, which communicates with the air-pump. Attached to this neck is also a float-valve, as at *f*, which guards the entrance to the suction tube or hose. The spindle of the valve *f* is provided, in a well-known manner, with guiding devices. The lower portion of the float-valve is provided with cork or other light material, whereby, when the cask is filled with fluid matter, the valve will be floated and effectually close the entrance to the suction air-pipe, preventing the latter, as well as the pump, from being clogged by said matter. The cask is shown to be provided with shoulders A *h*, whereby the hoisting-clamps L may readily be made to engage with the cask. The induction-pipe O is secured to the proper screw-neck on the cask, and it constitutes a tubular connection with the cask, through which the offensive matter is conducted from the vault into the cask.

In operation I proceed as follows: After removing the seat or floor of a privy, uncovering the entrance to the vault, the cask B is suspended by a block and tackle over the vault, connected by the suction-pipe to the air-pump, and then lowered until the funnel-pipe connection O (which is temporarily screwed to the neck *i* of the cask) is at its lower end immersed in the contents to be removed. The air is then exhausted in the cask by means of the pump, and deodorized by the furnace on the pump. The vacuum thus induced causes the matter to be sucked through the funnel-pipe into the cask until the float-valve is lifted and the air-passage closed. The pump is then stopped and the valve *d* closes. The cask, being wholly free from exterior contact with filth, is then lifted, the funnel and suction pipe removed, and the screw-caps V applied to the necks *i* and M, after which the cask is handled like any filled cask and rolled on its bilge or end.

The reissue has three claims, as follows:

1. A privy-vault-cleaning apparatus consisting of an air-pump, a deodorizer, and suitable tubular connections, in combination with an independently-movable receiving-cask, having an induction passage or opening, and also an air-opening for connection with the air-pump, and provided with screw-necks at each opening, for receiving sealing caps or covers, substantially as described, whereby the movable cask may be located in any desired position with relation to the vault and privy, and the pump and deodorizer located in any desired position with relation to the vault, privy, and cask, and also whereby the casks, when filled, may be handled as is usual with filled casks, as set forth.

2. The combination, with a portable cask, having an induction-aperture at one end, of a check-valve, a screw-neck surrounding the aperture, a funnel-shaped pipe connected with the neck, and an air-eduction passage provided with a screw-neck, substantially as described.

3. The combination, with a portable night-soil cask, of a float-valve located at the air-passage, substantially as described, whereby the fluid matter is prevented from entering the air-passage and clogging the suction air-pipe and pump, as set forth.

The specification of the original patent was in these words, the drawings attached to the original and the reissue being alike:

Figure 1 is a view in perspective of the cask or package A, showing the method of suspending and operating the same. Fig. 2 is a side elevation of the suction-pump and furnace. Fig. 3 is a plan view of the vault. Fig. 4 is a vertical transverse section of the cask or receptacle shown in Fig. 1.

My invention relates to an improvement in devices for cleaning or emptying privy-vaults, whereby the night-soil therein contained may be removed and utilized and the disagreeable odors arising therefrom prevented. It consists of the vault A, receptacles or casks B, and the suction-pump with furnace C, constructed and operated as shown and described.

A, a cylindrical privy-vault, constructed of metal or other suitable water-tight material, and provided with the neck *a* and the flange *b*, which latter is designed as an auxiliary for holding it in a vertical position, as also for strengthening the same. B represents one of several casks or receptacles which are employed as adjuncts of the suction-pump C for removing the fecal matter from the vault. It has located at its lower extremity the funnel O, which fits air-tight upon the neck *i*, and the valve *d*, which opens upwardly; and at its apex the float-valve *f* is provided, which screws upon or is otherwise caused to fit air-tight upon the neck M. The float-valve *f* consists of the rod *e*, located vertically in the tube *g*, the said rod being guided by orifices provided in transverse bars in the upper and lower ends thereof. The lower part of the float-valve is made of cork or other light material, in order that when the cask or receptacle becomes filled by the action of the suction-pump it may press against the orifice of the tube and thereby prevent the contents of the vault A from overflowing or extending beyond the cask B. *h h* are shoulders rigidly attached to the cask B, and are designed for clutching with the clamps L. V represents one of a series of caps, which are screwed upon the neck or necks of casks A when filled by the action of the suction-pump.

The method of operating my device is as follows: After removing the seat or floor the receptacle B is suspended from a block and tackle over the opening, and the cask or receptacle A is then lowered into the vault until the funnel O enters the fecal matter about ten inches, whereupon, by operating the suction-pump, the receptacle or cask becomes filled with the feces until it reaches the float-valve *f*, which presses against and closes the orifice of the tube leading to the pump. The valve *d* then falls and prevents the escape of the contents of the cask. In the meantime the air that is pumped out of the receptacle B is forced into a furnace located over the suction-pump, whereby the odor arising therefrom is destroyed. When one receptacle is thus filled the valve *f* is removed and the cap V screwed thereon, whereupon the operation

is repeated by the employment of another cask until the vault is emptied of its contents.

The claims of the original patent are two in number, as follows:

1. The combination and arrangement of the funnel O, neck *i*, and valve *d* with cask B, neck M, and float-valve *f*, substantially as shown and described.

2. The combination and arrangement of the vault A, cask B, and suction-pump C, substantially in the manner and for the purpose described.

Infringement of only claims 1 and 3 of the reissue is insisted on. It is set up as a defense in the answer that the reissue is not for the same invention as that described in the original patent. The apparatus used by the defendant is constructed in accordance with the description contained in two letters patent—one, No. 158,743, granted to Samuel R. Scharf, January 12, 1875, for an improvement in machines for cleaning privy-vaults, the other, No. 179,993, granted to Jerome Bradley and Samuel R. Scharf, July 18, 1876, for a machine for cleaning privy-vaults and like places. In that apparatus there is an independently-movable cask having two necks in its upper head as it stands. The suction-pipe from the vault is screwed to one neck, and the air-pipe which leads to the pump is screwed to the other neck. There is an air-pump, by means of which a vacuum can be formed and maintained in the cask, and a deodorizer, through which the air drawn into the pump is expelled by the working of the pump. The suction-pipe and the air-pipe are both of them tubular flexible connections. There are caps for closing the necks after the barrel is filled. There is inside of the cask no check-valve, but there is a float-valve, so arranged with reference to the opening of the air-pipe that the fecal matter lifts the valve and closes the passage when the barrel is sufficiently full.

It is quite apparent that the defendant's apparatus did not infringe either one of the two claims of the original patent. Claim 1 made the valve *d* in the bottom of the cask, opening to admit the entrance of material, and shutting when the orifice to the pump was closed by the float-valve, a necessary element in the combination covered by that claim. Without the valve *d* the peculiarly-constructed cask of the patent could not be operated. So as to claim 2, there could be no operative combination of vault, cask, and pump unless the cask should have the valve *d*, and that valve was a part of the combination covered by claim 2. The valve *d* is not found in the defendant's apparatus, nor is there any substitute or equivalent for it. The material is taken into the barrel through its head as it stands on its bottom, and hence there is no need of a check-valve.

There is not in the specification of the original patent any suggestion or indication of any invention other than the two combinations severally claimed in the two claims. In the reissue there are material enlargements of the scope of the invention described and claimed in the original patent, and, apparently, with a studied view to include and cover by descriptive words and by broader claims an apparatus like that used by the defendant. If claim 1 of the reissue be construed so as to exclude the check-valve from the combination covered by that claim, no warrant is found in the original specification for such a construction. It is apparent that the inventor contemplated the use of no other description of cask than one having such a check-valve as the original specification describes. If claim 1 of the reissue be construed so as to include only such a cask as is described, that is—one with a check-valve—there is no infringement of that claim.

Claim 3 of the reissue is for the combination of a float-valve with a cask of same kind. Whether it be a cask with a check-valve or one without a check-valve, the claim is an expansion of the invention beyond anything indicated in the original specification as the invention. In claim 1 of the original patent four other elements are made necessary, with the cask and float-valve, to constitute the combination claimed. In claim 2 of the original the cask and the pump cannot be combined so as to practically co-operate in working unless the float-valve is used. The original specification states that unless the float-valve is used the contents of the vault will overflow or extend beyond the cask. The specification of the reissue states that, in the absence of the float-valve, the fluid matter will enter the air-pipe and pass through it to the air-pump, and tend to clog the air-pipe and the valves of the pump and render the latter inoperative. It is, moreover, as true of claim 3 of the reissue as it is of claim 1 that, if the cask of claim 3 be construed to be a cask without a check-valve, there is no ground in the original patent for such a construction, and that if claim 3 includes no cask except one with a check-valve, it is not infringed.

The original specification indicates nothing but a cask having the entrance-opening in its bottom, furnished with a check-valve to open and shut such entrance automatically, the cask suspended vertically over the vault and lowered into it until the funnel at the bottom is sufficiently immersed, the filling of the cask in that position, and the raising it and emptying it. The cask in the defendant's apparatus has the entrance-opening in its top, has no check-valve, is not suspended over or lowered into the vault, is placed at a distance from the vault, and is connected with the vault by a flexible pipe. The patent to Scharf, No. 158,743, granted January 12, 1875, a year before Reissue No. 6,962 was applied for, shows an apparatus substantially the same as that used by the defendant. There is a barrel or tank, in the head of which, as it stands on its bottom, there are two short metallic pipes. A flexible pipe extends from one into the vault, and another flexible pipe extends from the other to an air-pump. There is a deodorizer connected with the air-pump by a third flexible pipe. The cask is filled by the action of the air-pump in creating a vacuum in it. The foul air passes through the cask and the pump into the deodorizer. The barrel and the air-pump are described as "independently movable about the vault" by reason of the flexibility of the pipes. The attempted expansion of the original Bull patent to cover what is shown in the Scharf patent is manifest. The funnel O of the original patent is called in the reissue "an induction passage or opening." It is said in the reissue that "the movable cask may be located in any desired position with relation to the vault," and that the operation may be performed "within or near the privy." In claim 1 of the reissue it is stated that "the movable cask may be located in any desired position with relation to the vault and privy." The effort was to obtain a reissue which should cover an apparatus having the cask located at a distance from the vault, with a flexible pipe from it to the vault, and a receiving-opening in the top of the cask, and no check-valve—all of them features not indicated in the original patent, but all of

them features existing in the Scharf patent, granted after the original Bull patent and before the application for its reissue. The same observations apply to the patent to Frazier, No. 168,473, granted October 5, 1875, more than three months before Reissue No. 6,962 was applied for. That patent shows a portable receiving-cask connected from its top by a flexible pipe with the vault, and by another flexible pipe with an air-pump which has secured to it a deodorizing-vessel. The air is exhausted from the cask and passes through the air-pump into the deodorizer, and the contents of the vault rise into the cask. The cask has no check-valve, and is described as placed suitably near the vault.

The foregoing state of facts brings this case within the principles laid down in *Miller* v. *Brass Co.* (104 U. S., 350) and *James* v. *Campbell*, (*Id.*, 357.) The suggested mistake in the original patent that its two claims were not as broad as they might have been made, and that the combinations claimed were too narrow and contained too many elements, and that subcombinations such as are found in claims 1 and 3 of the reissue might have been claimed in the original patent, in view of the state of the art and of the description and drawings of that patent, was, if a mistake at all, one apparent on the first inspection of that patent. The expansions in claims 1 and 3 of the reissue were afterthoughts, developed by the subsequent course of improvement in the Scharf and Frazier patents, and intended to cover matters appearing in those patents and not claimed in the original Patent No. 115,565. No excuse is given for the delay in applying for the reissue, nor is any actual inadvertence, accident, or mistake shown. The omission to claim subcombinations in the combinations claimed, the existence of such sub-combinations being apparent on the face of the original patent, was, in law on the facts in this case, such a dedication of them, if new, to the public that a reissue to cover such sub combinations in revocation of such dedication cannot be availed of to the prejudice of rights acquired by the public to what is shown in the Scharf and Frazier patents, issued before the reissue was applied for. The reissued patent must for these reasons be held to be invalid as to claims 1 and 3.

The circuit court made an interlocutory decree, declaring the validity of the reissue and its infringement, and awarding a perpetual injunction and an account of profits and damages. By a final decree a sum of money was awarded as damages. From that decree the defendant has appealed. The result of our consideration is that the decree must be reversed, and the case be remanded to the circuit court, with direction to dismiss the bill.

U. S. Circuit Court—Southern District of New York.

UNITED STATES *v.* GUNNING *et al.*

Decided November, 1883.

1. PATENTS OBTAINED THROUGH FRAUD—RIGHT OF GOVERNMENT TO VACATE.

There is no distinction between letters patent for an invention and for land as regards the rights and remedies for vacating them when obtained by fraud. The right is the same as that which a State has to annul the charter of a corporation created by its legislature if obtained by fraud.

2. SAME—PROPER REMEDY.

The appropriate remedy in behalf of the United States when a patent for an invention has been obtained by fraud is by a bill in equity.

Mr. Chas. W. Seymour for Gunning.

Mr. A. J. Todd, of counsel.

Mr. Louis C. Raegener, special assistant attorney for the United States.

WALLACE, *J.*:

This bill is filed to vacate letters patent for an invention granted to the defendants September 26, 1882, upon the ground of fraud and false suggestion, the allegations being that the applicant induced the grant by his statements in his application that he believed himself to be the inventor of the patented subject, and did not know or believe it had been in public use or on sale in the United States for more than two years prior to his application, whereas both of these statements were false to his knowledge. The defendants have demurred, and in support of the demurrer urge that the United States cannot maintain a suit in equity to vacate letters patent for an invention, although the grant was obtained by fraud. It is insisted in their behalf that there is no statutory provision which permits such a suit, and in the absence of statutory authority no such suit can be maintained.

Notwithstanding the expression of opinion of Judge Shepley in *Attorney-General* v. *Rumford Chemical Works* (2 Bann. & A., 298) in favor of the defendants' position, it is believed there is no sound reason why a bill will not lie in such a case as well as where the subject of the grant is land, or is a franchise or right of a different kind. The learned judge laid much stress upon the consideration that in issuing letters patent for inventions nothing is granted which belonged before to the United States, and the rights and remedies of the parties to such grants are dependent solely on the statute enactments, and do not grow out of any previous ownership of the subject of the grant: and it was his view that in such a case express authority for proceedings to annul the grant must be conferred in order to sanction them. The same reasoning would preclude a State from proceedings to annul the charter of a corporation created by its legislature if obtained through fraud. Yet it is a familiar principle that grants of corporate franchises obtained through fraud practiced upon the legislature are void when the State elects to set them aside by a judicial rescission. (Mor. Priv. Corp., 148.) He also refers to the provisions of the patent acts of 1790 and 1793, which authorized proceedings for the repeal of patents obtained surreptitiously or by false suggestion, as indicating that Congress deemed it necessary that authority for proceedings to repeal letters patent obtained through fraud should be conferred by statute. These provisions, however, permitted such proceedings to be taken by any person who chose to complain—a right which did not and does not exist unless expressly conferred. A bill in equity lies to set aside letters patent obtained by fraud, but only between the sovereignty making the grant and the grantee. (*Field* v. *Seabury*, 19 How., 323.) No inference can be justly drawn, therefore, from these provisions that Congress deemed it requisite to confer express authority upon the United States to maintain such a suit, nor from the absence of such provisions in the existing laws that Congress intended to withhold such authority.

In *Mowry* v. *Whitney* (14 Wall., 434) Mr. Justice Miller, in delivering the opinion of the court, assumed without question that there is no distinction between letters patent for an invention and for land as regards the rights and remedies for vacating them when obtained by fraud, and that a bill in equity is an appropriate remedy in behalf of the United States when a patent for an invention has been obtained by fraud. Although the precise point decided was that the owner of a conflicting patent could not maintain a suit in his own name to vacate an interfering patent obtained fraudulently, that conclusion was influenced mainly by the consideration that the Government was the appropriate party to assert the remedy and seek the relief.

The demurrer is overruled.

Patents on Electricity.

The Patent Office has prepared, and has now for sale, an Index (arranged alphabetically, numerically, and by classes) of all patents relating to Electricity granted by the United States prior to June 30, 1882, comprising about four thousand patents, and making a volume of two hundred and fifty pages.

The price, in paper cover, is $3 per volume; bound, $5 per volume.

Issue of January 29, 1884.

Patents	319	No. 292 460 to No. 292 778, inclusive.
Designs	38	No. 14,564 to No. 14,601, inclusive.
Trade-marks	30	No. 10,879 to No. 10,908, inclusive.
Labels	15	No. 3,853 to No. 3,867, inclusive.
Reissues of patents	5	No. 10,439 to No. 10,443, inclusive.
Total issue	407

DESIGNS.

14,564.—FONT OF PRINTING-TYPE.—*Charles H. Beeler, Jr.*, Philadelphia, Pa., assignor to *MacKellar, Smiths & Jordan*, same place. Application filed November 24, 1883. Term of patent 7 years.

14,565.—SALT AND PEPPER BOX.—*Louis Casper*, Meriden, Conn. Application filed October 23, 1883. Term of patent 3½ years.

14,566.—BRACELET.—*James A. Charnley*, Providence, R. I. Application filed November 14, 1883. Term of patent 14 years.

14,567.—PENDANT.—*Bernhard Dreyfus*, New York, N. Y. Application filed November 22, 1883. Term of patent 14 years.

14,568.—CLOTH.—*Henry L. Einstein*, Bound Brook, N. J., assignor to *The Bound Brook Woolen Mills*, same place. Application filed November 3, 1883. Term of patent 7 years.

14,569.—CARPET.—*Walter J. Gadsby*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed December 11, 1883. Term of patent 3½ years.

14,570.—FONT OF TYPE-ORNAMENTS.—*Geo. E. F. Giesecke*, Leipsic, Saxony, Germany. Application filed November 28, 1883. Term of patent 7 years.

14,571.—FONT OF PRINTING-TYPE.—*George F. Giesecke*, Leipsic, Saxony, Germany. Application filed November 28, 1883. Term of patent 7 years.

14,572.—CURRY-COMB.—*John W. Gridley*, Southington, Conn., assignor to *The Southington Cutlery Company*, same place. Application filed March 5, 1883. Term of patent 14 years.

14,573 and 14,574.—CARPET.—*Arthur L. Halliday*, Yonkers, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Applications filed December 8, 1883. Term of patents 3½ years.

14,575.—COVER FOR A HARVESTER.—*William Henry Hill*, Chicago, Ill. Application filed October 29, 1883. Term of patent 14 years.

14,576 and 14,577.—FONT OF PRINTING-TYPE.—*Herman Ihlenburg*, Philadelphia, Pa., assignor to *MacKellar, Smiths & Jordan*, same place. Applications filed November 24, 1883. Term of patents 14 years.

14,578.—FONT OF PRINTING-TYPE.—*William W. Jackson*, Philadelphia, Pa., assignor to *MacKellar, Smiths & Jordan*, same place. Application filed November 24, 1883. Term of patent 14 years.

14,579.—MITT.—*Abraham O. Jennings*, Brooklyn, N. Y. Application filed November 26, 1883. Term of patent 7 years.

14,580 and 14,581.—MITT.—*Warren P. Jennings*, Brooklyn, N. Y. Applications filed November 26, 1883. Term of patents 7 years.

14,582.—CALENDAR.—*Romaine Mace*, New York, N. Y. Application filed July 16, 1883. Term of patent 7 years.

14,583.—LACE-PIN.—*Herman Marcus*, Brooklyn, N. Y. Application filed November 8, 1883. Term of patent 7 years.

14,584.—HARNESS-BREECHING RING.—*Henry C. Maxwell*, Rome, N. Y. Application filed November 30, 1883. Term of patent 14 years.

14,585.—CARPET.—*David O. Melville*, Medford, assignor to *The Roxbury Carpet Company*, Boston, Mass. Application filed December 11, 1883. Term of patent 3½ years.

14,586.—CHILD'S COSTUME.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited.)* same place. Application filed November 19, 1883. Term of patent 3½ years.

14,587.—LAMP CHIMNEY.—*William J. Patterson*, Beaver, Pa. Application filed November 26, 1883. Term of patent 7 years.

14,588.—GLOVE.—*Emile Reussner*, New York, N. Y., and *Charles G. Gottschalk*, Jersey City, N. J. Application filed November 27, 1883. Term of patent 3½ years.

14,589 to 14,593, inclusive.—CARPET.—*Oscar Righter*, Philadelphia, Pa., assignor to *Dornan Bros. & Co.*, same place. Applications filed December 18, 1883. Term of patents 3½ years.

14,594.—GROUP OF STATUARY.—*John Rogers*, New Canaan, Conn. Application filed November 24, 1884. Term of patent 14 years.

14,595.—BLIND HINGE.—*Charles G. Shepard* and *Peter Adams, Jr.*, Buffalo, N. Y. Application filed November 23, 1883. Term of patent 7 years.

14,596 and 14,597.—CARPET.—*Thomas J. Stearns*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Applications filed December 11, 1883. Term of patents 3½ years.

14,598.—ATOMIZER.—*Daniel Tellow*, Philadelphia, Pa., assignor to *Henry Tellow & Brother*, same place. Application filed November 6, 1883. Term of patent 14 years.

14,599 to 14,601, inclusive.—CARPET.—*George Curtis Wright*, Worcester, Mass., assignor to *William James Hogg*, same place. Applications filed December 14, 1883. Term of patents 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,879.—DISTILLED LIQUORS.—*Cook & Bernheimer*, New York, N. Y. Application filed December 4, 1883.
"The representation of a barrel-head containing the representation of a lion and the words 'GOLD LION.'"

10,880.—WHISKY OR BEVERAGES COMPOUNDED OF WHISKY.—*Cook & Bernheimer*, New York, N. Y. Application filed December 4, 1883.
"The words 'GOLD LION.'"

10,881.—BITTERS.—*Cook & Bernheimer*, New York, N. Y. Application filed September 1, 1883.
"The symbol of a golden lion and a shield."

10,882.—HAIR-GROWER.—*The Benton Hair Grower Company*, Cleveland, Ohio. Application filed December 15, 1883.
"Two portraits, accompanied by the words 'BENTON'S HAIR GROWER.'"

10,883.—FAMILY FLOUR.—*David Brainard*, New York, N. Y. Application filed December 20, 1883.
"The word 'OMNIA,' with the monogram composed of the letters 'G C O.'"

10,884.—RYE WHISKY.—*Edw. R. Bruce & Co.*, Baltimore, Md. Application filed December 27, 1883.
"The words 'SOMERSET CLUB,' with a monogram of the initials of the firm-name, 'E B B & Co.' within a garter surmounted by a crown placed upon a circular background representing the head or end of a barrel."

10,885.—HAIR-NETS AND OTHER RETICULATED FABRICS.—*A. G. Jennings & Sons*, Brooklyn and New York, N. Y. Application filed January 4, 1884.
"The arbitrary word 'HUB.'"

10,886.—SAUER-KRAUT.—*William M. Johnston & Co.*, Chicago, Ill. Application filed January 3, 1884.
"The words 'SILVER THREAD.'"

10,887.—COMPOUND EXTRACT OF STILLINGIA AND SARSAPARILLA.—*Susan Imperator Johnston*, Brooklyn, N. Y. Application filed December 11, 1883.
"The figure of a lion and a tablet."

10,888.—CANNED PROVISIONS.—*Platt & Co.*, Baltimore, Md. Application filed December 31, 1883.
"The word 'FAVORITE.'"

10,889.—PERFUMERY AND PERFUMED SOAPS.—*Friedrich A. Richter*, Rudolstadt, Germany. Application filed January 9, 1883.
"An anchor in an oval field."

10,890.—CANNED PROVISIONS.—*Scullay Meat Packing Company*, New York, N. Y. Application filed December 5, 1883.
"The capital letters 'S A S H' arranged in a monogram."

10,891.—YARN AND THREAD COMPOSED OF AN ADMIXTURE OF WOOL AND SILK.—*Paul Schulze*, Manchester, county of Lancaster, England. Application filed October 23, 1883.
"A bear's paw holding an ax."

10,892.—LUNG-MEDICINE.—*Aaron Penn Wirt*, Lebanon, Pa. Application filed December 28, 1883.
"A man digging or hoeing the ground."

10,893.—RUM, WHISKY, AND GIN.—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed January 7, 1884.
"The representation of a sitting animal, a wreath, and a monogram."

10,894.—COCOA.—*James Collier & Sons*, Spitalfields, London, county of Middlesex, England. Application filed November 10, 1883.
"A tin box open with the words 'COLLIER & SON'S' on it."

10,895.—CHOCOLATE.—*James Collier & Sons*, Spitalfields, London, county of Middlesex, England. Application filed November 10, 1883.
"The monogram 'C & S' within a circle."

10,896.—WINE AND LIQUORS.—*Violet Frères*, Thuir, (Pyrénées, Orientales,) France. Application filed December 17, 1883.
"The word 'BYRRH' and two lions on a platform."

10,897.—LIQUEUR OR CORDIAL.—*Frère Marcel Marie Grézier*, Grande Chartreuse, France. Application filed January 2, 1884.
"The word 'CHARTREUSE,' accompanied by the fac-simile signature of L. Garnier."

10,898.—LIQUEUR OR CORDIAL.—*Frère Marcel Marie Grézier*, Grande Chartreuse, France. Application filed January 2, 1884.
"The word-symbol 'CHARTREUSE.'"

10,899.—SMOKING AND CHEWING TOBACCO.—*Joel H. Harris' Sons*, Quincy, Ill. Application filed December 13, 1883.
"The words 'MAY DAY.'"

10,900.—SMOKING AND CHEWING TOBACCO, SNUFF, CIGARS, AND CIGARETTES.—*Marburg Brothers*, Baltimore, Md. Application filed January 4, 1884.
"The word-symbol 'COLUMBIA,' in any form, style, or color of lettering."

10,901.—SMOKING AND CHEWING TOBACCO, SNUFF, CIGARS, AND CIGARETTES.—*Marburg Brothers*, Baltimore, Md. Application filed January 4, 1884.
"The word-symbol 'YALE,' in any form, style, or color of lettering."

10,902.—SMOKING AND CHEWING TOBACCO, SNUFF, CIGARS, AND CIGARETTES.—*Marburg Brothers*, Baltimore, Md. Application filed January 4, 1884.
"The word-symbol 'CAMBRIDGE,' in any form, style, or color of lettering."

10,903.—GREASE-TRAPS.—*The Meyer Sniffen Company, (Limited,)* New York, N. Y. Application filed December 22, 1883.
"The word 'TUCKER.'"

10,904.—WATER-CLOSET.—*The Meyer Sniffen Company, (Limited,)* New York, N. Y. Application filed December 22, 1883.
"The word 'BRIGHTON.'"

10,905.—WATER-CLOSETS, WATER-CLOSET CISTERNS, AND THEIR FITTINGS AND APPLIANCES.—*The Meyer Sniffen Company, (Limited.)* New York, N. Y. Application filed December 22, 1883.
"The words 'EM ESS.'"

10,906.—SELF-CLOSING FAUCETS, BIBS, COCKS, STOPS, &c.—*The Meyer Sniffen Company, (Limited,)* New York, N. Y. Application filed December 22, 1883.
"The word 'DOHERTY.'"

10,907.—LOCK GAS-COCKS.—*The Meyer Sniffen Company, (Limited.)* New York, N. Y. Application filed December 22, 1883.
"The word 'HALL-.'"

10,908.—SMOKING-TOBACCO.—*B. Frank Weyman*, Pittsburg, Pa. Application filed December 31, 1883.
"The word-symbol 'HUBBLE BUBBLE.'"

LABELS.

3,853.—Title: "BENTON'S HAIR GROWER. SINGLE STRENGTH."—*The Benton Hair Grower Company*, Cleveland, Ohio. Application filed September 15, 1883.

3,854.—Title: "BENTON'S HAIR GROWER. DOUBLE STRENGTH."—*The Benton Hair Grower Company*, Cleveland, Ohio. Application filed September 15, 1883.

3,855.—Title: "BENTON'S HAIR GROWER. TRIPLE STRENGTH."—*The Benton Hair Grower Company*, Cleveland, Ohio. Application filed September 15, 1883.

3,856.—Title: "MASSACHUSETTS STANDARD." (FOR PAPER.)—*George J. Carney*, Lowell, Mass. Application filed December 24 1883.

3,857.—Title: "MAGIC CLEANER AND POLISH."—*Henry R. Gillingham*, Washington, D. C. Application filed January 4, 1884.

3,858.—Title: "DR. VON BREHMER'S'S LOCAL AND CONSTITUTIONAL ZYMOTIC CATARRH ANTIDOTE."—*Edwin W. Higbee*, Northampton, Mass. Application filed January 3, 1884.

3,859.—Title: "SWAN SOAP."—*Lovell H. Hedgley*, Binghamton, N. Y. Application filed December 15, 1883.

3,860.—Title: "GENEVA RUBBER TOP ENAMEL." (FOR CARRIAGE TOPS, &c.)—*A. J. Mowery & Co.*, Milan, Ohio. Application filed January 5, 1884.

3,861.—Title: "MASTER MASON," (FOR CIGARS.)—*W. D. Newton*, Victor, N. Y. Application filed December 12, 1883.

3,862.—Title: "THE NEW YORK CRAYON CO'S ENAMELED SCHOOL CRAYON."—*New York Crayon Company*, New York, N. Y. Application filed November 14, 1883.

3,863.—Title: "DR. PEMBERTON'S INDIAN QUERY MAGIC HAIR DYE."—*John S. Pemberton*, Atlanta, Ga. Application filed January 3, 1884.

3,864.—Title: "BAKER'S VANILLA CHOCOLATE."—*Henry L. Pierce*, Boston, Mass. Application filed December 31, 1883.

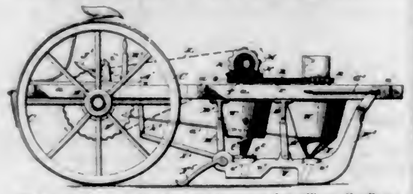
3,865.—Title: "BRILLIANT ILLUMINATOR" (FOR CARBON OIL.)—*Straw & Murphy*, Watertown, Wis. Application filed January 2, 1884.

3,866.—Title: "BAY STATE PAINTS."—*Wadsworth, Howland & Co.*, Boston, Mass. Application filed January 7, 1884.

3,867.—Title: "YANKEE POLISH."—*J. H. Whittaker, Jr.*, Jersey City, N. J. Application filed January 4, 1884.

DISCLAIMER.

9,173. (Reissue.)—*Richard A. Bryson*, St. Louis, Mo. Reissue patent dated April 27, 1880. IMPROVEMENT IN PANNIERS. Disclaimer filed January 19, 1884, by the patentee.



Enters his disclaimer "to that portion of the claim and said specification which is in the following words, to wit:

"2. A crinoline skirt or pannier composed of any suitable fabric, made up with a series of circumferential tubes or pipings stuffed or filled with animal or vegetable fiber, and provided with an elastic diaphragm, E, substantially as described, whereby its circumferential shape is maintained and rendered collapsible, as set forth.'"

PATENTS

GRANTED JAN. 29, 1884.

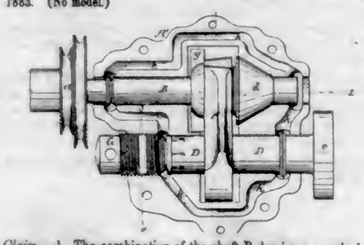
292,460. COMBINED SEED-PLANTER AND FERTILIZER-DISTRIBUTER. W. HARRISON ALBACH, Mansfield, Ohio, assignor of one-half to John F. Stine, same place. Filed Feb. 6, 1883. (No model.)

Claim.—1. In a combined seed-planter and fertilizer-distributer, the combination, with the machine-frame, the rear axle carrying a shiftable sprocket-wheel, the transverse shaft carrying a fixed sprocket-wheel, and provided at each end with a beveled-gear pinion, a drive-chain connecting said sprocket-wheels, and the gear-disks mounted upon the frame, of the double-shoe runners pivoted beneath each side of the frame, the seed-distributers connected each by a beveled gear with the transverse shaft, and the fertilizer-distributers connected each by a beveled gear to the said gear-disks upon the frame, said gear-disks being each placed between the corresponding seed and fertilizer distributers, and said distributers being arranged in pairs at each side of the frame, as set forth.

2. The machine-frame, the rear axle carrying a shiftable sprocket-wheel, the transverse shaft carrying a fixed sprocket-wheel, and provided at its extremities with beveled-gear wheels, the drive-chain connecting said sprocket-wheels, and the seed and fertilizer distributers arranged in pairs at each side of the machine, in combination with the double-shoe single runners, each of which is pivotally secured beneath the frame, and the coverers secured to the rear extremities of said runners, substantially as set forth.

3. The combination, with the machine-frame, the axle, the transverse shaft, the fixed and shiftable sprocket-wheels of said shafts, the drive-chain, and the seed and fertilizer distributers, of the double-shoe single runners, each provided at its forward and deeper portion with a fertilizer-spout and at its rear and shallow portion with a seed-spout, the coverer F^3, and hangers D^2 E^2, for attaching the shoes to the frame, and the coverers F^3, secured to the rear ends of said shoes, as set forth.

4. The combination, with the seed-cylinder, of the ejector-brush secured thereto, and composed of resilient metal and bristles, substantially as and for the purpose set forth.



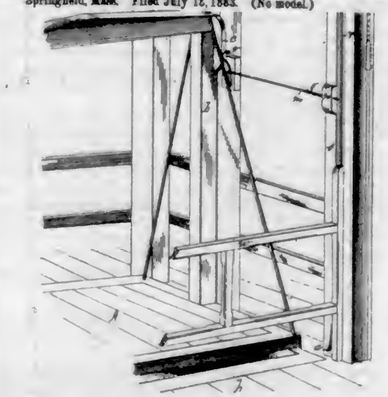
5. The combination, with the axle and sprocket-wheel, of devices for throwing said wheel into and out of rigid connection with said axle, a transverse shaft supported upon the frame in front of the axle, and provided with a sprocket-wheel and a chain connecting it with the sprocket-wheel on the axle, and at its ends with beveled-gear pinions, the intermediate gears, and the fertilizer and seed cylinders provided with vertical feed-shafts, and dropping devices, and the double shoe pivotally secured to the frame, and provided with receptacles to receive and deliver the seed, and with means for raising and lowering it, substantially as set forth.

6. The combination, with the hangers secured to the under sides of the forward side bars of the machine, and the double shoes having forward portions longer than the rear portions, which latter are provided with coverers and pivotally connected to said hangers by links, and having forward extensions guided by elongated staples secured to the said side bars, of the rock-shaft supported in bearings on the machine, and provided with forwardly-projecting arms connected by links to the rear ends of the shoe, and the phosphate and seed cylinders having dropping devices, substantially as described.

7. The combination, with the phosphate-cylinders, of boxes supported upon the frame, and provided, respectively, with spouts emptying each into one of the said cylinders, and provided with a common shaft carrying sets of spiral right and left handed conveyers, and means for operating said shaft, substantially as set forth.

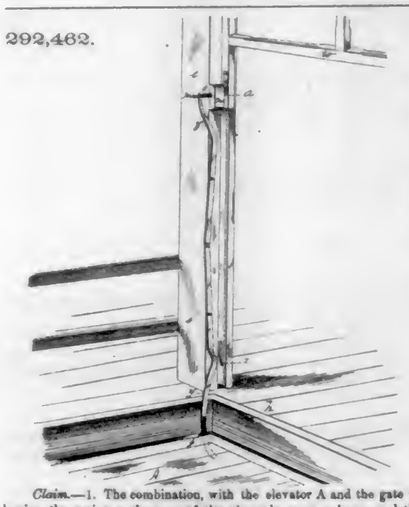
8. The combination, with a phosphate-cylinder provided with a perforated bottom and an inclined discharge-chute, of the shaft located therein, and a wedge-shaped sweep secured thereto, and provided with a series of fine metal pins, whereby the phosphate in the bottom of the cylinder is agitated, substantially as set forth.

292,461. MECHANISM FOR CONVERTING ROTARY INTO VIBRATING MOTION. JAMES BARKER, Philadelphia, Pa. Filed June 25, 1883. (No model.)



Claim.—1. The combination of the shaft B, having a crank, *b*, and conical collar *d*, with the adjustable shaft D, having a forked arm, F, beveled as described, and a box, *f*, tapered in a direction the reverse of the collar *d*, and adapted to the crank *b* and to the forked and beveled arm F, as set forth.

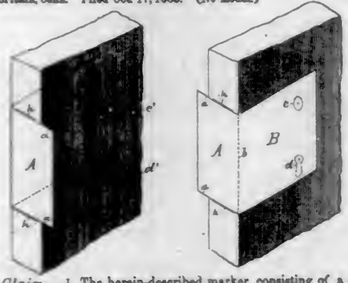
2. The combination of the cranked shaft B, the shaft D, having a forked arm, F, and the adjusting-screw G, bearing against the end of the shaft D, and adapted to a threaded opening in the casing, as set forth.



3. The combination of the casing A A', having a chamber, H, with the shaft D and its forked arm F, and the shaft B with its crank and counter-weight *g*, as set forth.

4. The combination of the casing A A', parted horizontally through the shaft-bearings, with the shafts B and D, the latter having the forked arm F cast therewith, as set forth.

292,462. SAFETY-GATE FOR ELEVATORS. FRANK K. BARTLETT, Springfield, Mass. Filed July 18, 1883. (No model.)

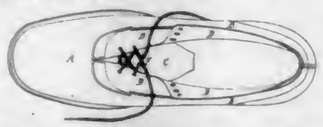


292,462.

Claim.—1. The combination, with the elevator A and the gate *w*, having the spring *a* thereon, of the pin *m* lever *v*, spring *o*, and the cam-block *c*, substantially as set forth.

2. In combination, the gate *w*, having the spring *a* thereon, the elevator A, the pin *m* and spring *o*, and mechanism, substantially as described, for moving pin *m*, to carry its end beyond the side of block *n* when the elevator approaches the landing-floor *h*, substantially as set forth.

292,463. GAGE FOR ADJUSTING LOCKS. MILTON H. BASSETT, New Britain, Conn. Filed Oct. 17, 1883. (No model.)



Claim.—1. The herein-described marker, consisting of a double-faced blade or sheet having suitable indices for laying out the borings and cuttings to be made in fitting articles to doors, &c., said indices being definitely located with reference to gaging from a given working-edge, substantially as described, and for the purpose specified.

2. The herein-described marker, consisting of the blade A, having suitable indices for laying out the two edges of the mortise at the edge of a stile, and the blade B, connected to the blade A, and provided with suitable indices for laying out upon the side of a stile the borings and cuttings to be made in fitting articles to doors, &c., substantially as described, and for the purpose specified.

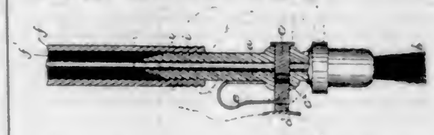
3. The herein-described marker, consisting of the blades B and the folding blade A, attached thereto, said marker having suitable indices for laying out the borings and cuttings to be made in fitting articles to doors, &c., substantially as described, and for the purpose specified.

292,464. UPPER FOR SHOES. JOHN MOULTON BERRY, Farmington, N. H. Filed Nov. 26, 1883. (No model.)

Claim.—1. In the shoe-upper, each of its two ankle and instep parts D D, notched at its lower edge near its front end, and arranged with and applied to the vamp A and one of the quarters B B, so that the said quarter shall extend into the notch, the leg-part portion in advance of such notch overlap the vamp, and the leg-part portion in rear of the notch underlap the quarter, all being substantially and connected as set forth.

2. The vamp A, quarters B B, and tongue C, in one piece of material, cut so that the tongue shall extend between and be detached from the quarters, in combination with each of the two ankle and instep parts D D, notched at its lower edge near its front end, and arranged with and applied to the vamp and one of the quarters, so that the said quarters shall extend into the notch, the leg-part portion in advance of the notch overlap the vamp, and the leg-part portion in rear of the notch underlap the quarter, all being substantially and connected as represented.

292,465. SAWYER'S GAGE. GEORGE S. BLACK, Indianapolis, Ind., assignor of one-half to Elias C. Atkins, same place. Filed Oct. 2, 1883. (No model.)



Claim.—1. A right-angle gage having the notch *c*, for the purpose specified.

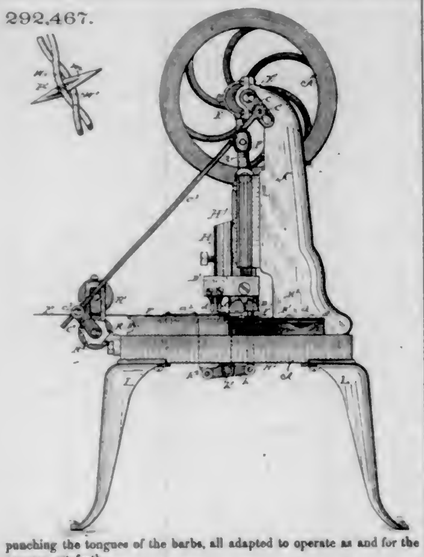
2. A right-angle gage having a series of depressed steps, *d*, substantially as and for the purpose specified.

3. A sawyer's gage, consisting of a right-angle gage having notch *c*, depressed steps *d*, graduations *e*, and notches *f*, all combined substantially as specified.

292,466. BRUSH-HOLDER AND TUBE FOR CEMENTING SHOE-SOLES. CHARLES K. BRADFORD, Lynnfield, assignor to George H. P. Flagg, Boston, Mass. Filed Nov. 22, 1883. (No model.)

Claim.—1. In a sole-cementing apparatus, the combination of flexible tube adapted to conduct rubber cement from a reservoir, the tubular metal shank *a*, forming a metallic continuation of said tube, and having a brush, *b*, at its outer end, and a transverse orifice intersecting the conduit through which the cement passes, a plug-valve, *c*, adapted to move in said orifice, and provided with an orifice, c^3, adapted to coincide with the conduit of the shank when pressed inwardly, and a spring, *e*, whereby the plug-valve is caused to close said conduit when pressure is removed from the plug-valve, as set forth.

2. In a sole-cementing apparatus, the tubular brush-holding metal shank or handle having a tapered or conical end, combined with a rubber tube having a naphtha-proof lining terminating within the tube and molded at its end to receive and closely fit the tapered end of the shank, whereby an extended bearing of the lining on the metal shank is afforded and the cement is prevented from reaching the rubber tube, the end of the rubber tube projecting beyond the molded end of the lining, for attachment to the body of the shank, as set forth.



3. In a sole-cementing apparatus, the combination of a rubber tube having a naphtha-proof lining molded at its outer end, as described, and an inclined portion extending beyond the molded end of the lining, combined with a metallic tubular shank formed to fit the molded end of the lining and the unlined end of the tube, and provided with a brush at its outer end and a valve, whereby the cement may be shut off from the brush, as set forth.

4. The tubular brush-holding metal shank or handle having a tapered end, and peripheral serrations *i i* on a portion adjacent to the tapered end, combined with a rubber tube having a naphtha-proof lining terminating within the tube and molded to fit said tapered end, and an unlined portion extended beyond said molded end and adapted to be secured to the serrated portion of the shank, as set forth.

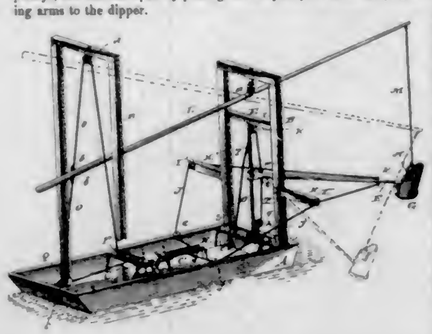
292,467. WIRE-BARBING MACHINE. CURTIS B. BRAINARD, Joliet, Ill. Filed Oct. 25, 1883. (No model.)

Claim.—1. In the wire-barbing machine described, the combination of the bed A, standard A', shaft E', slotted crank *e*, pitman *e'*, eccentric E, two-part connecting-rod *r*, nut P, reciprocating head H, ways H', punch D, chuck D', barb-strip guide B, having the plate a^2 and channels *g* and *g'*, barbed-wire guide B', having the concave channel *a*, follower A^2, walking-beam A, vertical shaft H^2, feed mechanism consisting of the milled rollers R and R', ratchet R^2, and crank e^2, and means for

292,467.

punching the tongues of the barbs, all adapted to operate as and for the purpose set forth.

2. In the barbing-machine described, the combination of the punch D, channeled guides B and B', follower A^2, walking-beam A, shaft H^2, and means for punching the tongues of the barbs, as and for the purpose set forth.



3. In the wire-barbing machine described, the combination of the bed A, reciprocating head H, shaft H^2, walking-beam *k*, follower A^2, punch D, chuck D', barb-strip guide B, having the plate a^2, and channels *g* and *g'*, barbed-wire guide-strip B', having the concave channel *a*, and means for punching the tongues of the barbs, as and for the purpose set forth.

4. In the barbing-machine described, the combination of the tongue-punches *d d*, chuck D', reciprocating head or slide H, connecting-rod *r*, eccentric E, follower A^2, walking-beam A, guide B, and bed A, as and for the purpose set forth.

5. In the wire-barbing machine described, the combination, with the bed of the machine, punch D, to sever the barb from the end of the barb-strip F and press the barb on the strand-wire W and force the tongues F' under to clasp the strand-wire W to attach said barb thereto, guides B and B', follower A^2, plate a^2, the feed mechanism described, and means for punching the tongues of the barbs, as and for the purpose set forth.

292,468. EXCAVATING-MACHINE. HENRY CLAY CARTER, Fairfield, N. C. Filed Sept. 19, 1883. (No model.)

Brief.—Ropes wound reversely in pairs on windlasses operate the dipper, one pair through a lever connected by rope to the dipper-handle and pivoted to one upright frame and a pulley on a second frame and one below on the boat; another pair through connections to the dipper-handle, which slides on a vertical "mast," and by passing around suitable pulleys, and the third pair by passing around pulleys in laterally-projecting arms to the dipper.

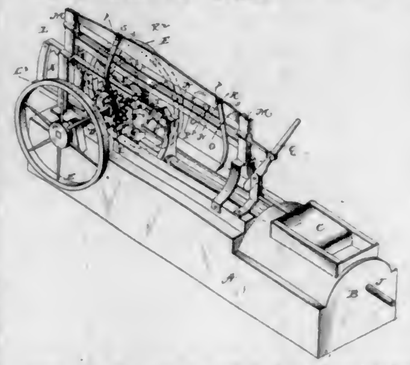
Claim.—1. In a ditching or excavating machine, the combination, with the bucket G, of a mast, D, arm F, adapted to slide vertically thereon at its rear end, and having suitable connection at its front end with the bucket rope or chain M, attached at one end to the bucket-bail, and boom or arm adapted to support said rope M, and windlass P, for operating said rope, substantially as and for the purpose set forth.

2. The combination, with arm F, of the ropes T T', pulleys *k g*, and windlass S, substantially as and for the purpose set forth.

3. The combination of uprights B B', mast D, pivoted boom L, ropes O O', windlass P, and pulley Q, with arm F, bucket G, rope M, arms H H', pulleys I I', ropes T T', pulleys *k* and *g*, and windlasses R and S, substantially as and for the purpose set forth.

292,469. SECONDARY-BATTERY ELEMENT. WILLARD E. CASE, Auburn, N. Y. Filed Feb. 10, 1883. (No specimens.)

Claim.—1. An element or electrode for a secondary or storage battery, composed of an amalgam of lead and mercury, any substance capable of being acted upon in said battery to store electrical potential, and any substance inert in said battery and capable of occluding gases, substantially as described.



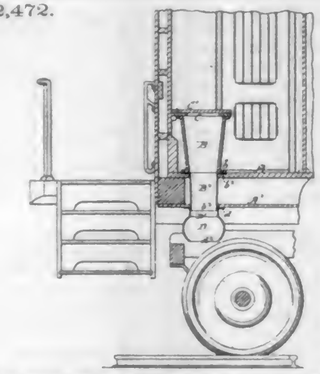
2. An element or electrode for a secondary or storage battery, composed of an amalgam of lead and mercury, any substance capable of being acted upon in said battery to store electrical potential, and carbon in pulverized or comminuted form, substantially as described.

3. The process of making electrodes for a secondary or storage battery, consisting in, first, preparing an amalgam of lead and mercury; second, then adding any substance capable of being acted upon in a secondary battery to store electrical potential; third, then adding any substance inert in said battery and capable of occluding gases; and, fourth, forming the electrode in suitable shape, substantially as described.

292,470. FERTILIZER. DAVID R. CASTLEMAN, Louisville, Ky. Filed June 18, 1883. (No specimens.)

Claim.—The herein-described composition of matter, to be used as a fertilizer for the soil, to assist the growth of plants and other agricultural products, consisting of pulverized or ground tobacco-stems and any of the ordinary phosphates now in use, in the proportions above specified.

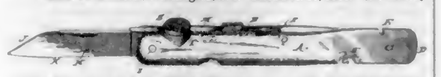
292,471. DEVICE FOR CONVERTING MOTION. ELI CATLIN, Post Oak, Tex. Filed Nov. 19, 1883. (No model.)



Claim.—1. The combination, with the piston of an engine and mechanism for converting its reciprocating motion into rotary, of a lever, Q, connected pivotally with the valve-stem, a slide-rod, P, attached to said lever, and a series of levers pivoted to the slide-rod and adapted to operate the valve-gear, substantially as set forth.

2. The combination of the piston-rod having the toothed frame K, the main shaft, the pinions mounted loosely upon the latter, the ratchet-wheels adjoining the said pinions, the spring-pawls pivoted to the latter, the valve, the lever Q, connected pivotally with the valve-stem, the frame-bars N O, the slide-rod P, the levers R R^2 S S^2, the pin T, projecting laterally from the frame K, and the spring-latches U U, mounted on top of the latter and facing in opposite directions, all arranged and operating substantially as and for the purpose herein shown and specified.

292,472. WATER-CLOSET FUNNEL OF RAILWAY-CARS. ISAAC E. CONGDON, Omaha, Nebr. Filed July 20, 1883. (No model.)



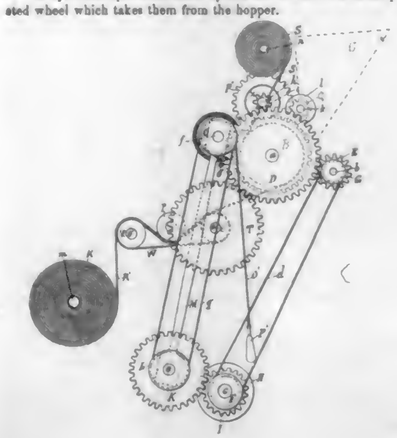
Claim.—1. In combination with the floor of a railroad-car and water-closet funnel passing therethrough, the hollow globular body D, having spherical sides tapering toward the opening in the bottom thereof, substantially as and for the purpose described.

292,472.

2. In combination with the floor of a railroad-car and the water-closet funnel passing therethrough, the hollow globular body D, open at the bottom, and provided with a cylindrical upper portion, D', substantially as and for the purpose described.

292,473. CIGAR-DEALER'S KNIFE. FRED G. DIETERICH and EDGAR CHARLES WALFORD, Washington, D. C. Filed Feb. 20, 1883. (No model.)

Claim.—1. A knife-handle having a slot or recess to receive a folding blade, and having a tapering lower end forming a flat blade integral with the said handle, and having in one side a tack-drawing notch, and at the other side a notch the edge of which is provided with a curved steel blade, substantially as and for the purpose set forth.



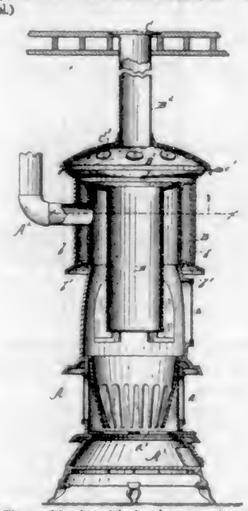
2. In a folding knife, a lock-catch formed of steel, and having a serrated plate or disk adapted to serve for driving tacks, substantially as set forth.

3. In a folding knife, the combination, with the handle formed with shoulders upon its back near the upper end, of the folding blade and a lock-catch formed with a serrated plate or disk adapted to rest upon and be supported by the said shoulders, substantially as set forth.

4. In a folding knife, a cast-metal handle formed with a slot to receive the folding blade, and having shoulders upon the back near the upper end, in combination with the folding blade, a lock-catch formed with a plate or disk adapted to rest upon and be supported by the shoulders of the handle, said lock-catch being pivoted upon a transverse pin in the back of the handle, and an operating-spring mounted upon a transverse pin below the lock-catch, and bearing at its lower end against a shoulder at the lower end of the slot in the handle, substantially as set forth.

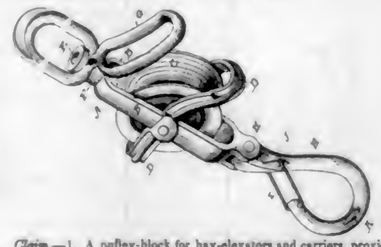
292,474. MATCH-MAKING MACHINE. CHARLES J. DONNELLY and JOHN M. DONNELLY, Philadelphia, Pa. Filed Apr. 4, 1883. (No model.)

Brief.—The splints are taken by two bands directly from the pocketed wheel which takes them from the hopper.



Claim.—1. In a match-making machine, the combination of a hopper for the splints, a pocketed drum adapted to revolve partially within the said hopper and to remove the splints separately from the same, plain tapes which pass under and remove the splints from the said pocketed drum, other plain tapes to press the said splints in contact with the first-named tapes, and mechanism to roll the clamped splints into a coil or coils, substantially as specified.

2. In a match-making machine, the combination of a hopper for the splints, a pocketed drum adapted to revolve partially within the said hopper and to remove the splints separately or one by one from the same, and tapes to remove the splints from the said pocketed drum and at the same time clamp them so that they may be wound into a coil, substantially as specified.

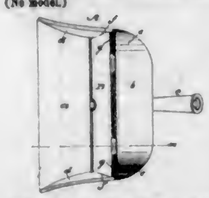


3. In a match-making machine, the combination of a hopper for the splints, a pocketed drum adapted to revolve partially within the said hopper and to remove the splints separately therefrom, a pair of plain tapes which pass under and remove the splints from the said pocketed drum, a second pair of plain tapes to press the said splints in contact with the first-named tapes and hold them so that they may be wound into a coil, and a rotary knife to cut the said splints into two parts, and thereby produce two independent coils of splints, which may be dipped separately, substantially as specified.

292,475. STOVE. JOHN EckERT, Madison, Ind. Filed May 8, 1883. (No model.)

Claim.—The combination of the heating-stove A, provided with pipe A^2, the jacket B, covers B' C', provided with openings c c, adapted to register with each other and be operated by a handle, c', the air-space b, having supply-openings b' b', air-chamber D, open at top and closed at bottom, air-space d, and pipe B^2, all constructed, arranged, and operating substantially as described and shown.

292,476. PULLEY-BLOCK FOR HAY-ELEVATORS. HENRY L. FISHER, Alden, Ill. Filed Oct. 27, 1883. (No model.)

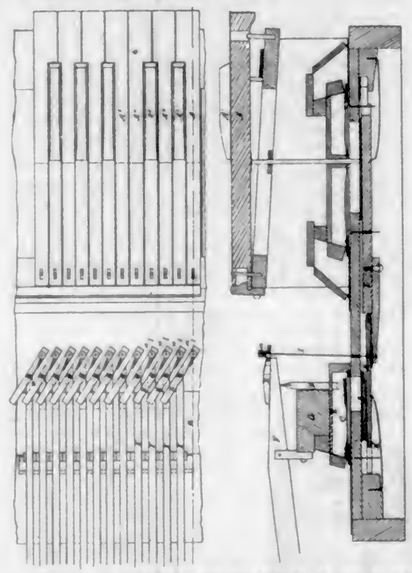


Claim.—1. A pulley-block for hay-elevators and carriers, provided at its upper end with a swiveled eye, having a laterally-extending loop, serving as a guide for the hoisting-rope, substantially as and for the purpose set forth.

2. In a pulley-block, the combination of the frame A, having pulley C and shank E, with the swiveled eye F, having laterally-projecting loop G, substantially as and for the purpose set forth.

3. The combination, with a pulley-block, of a hook hinged at the lower end of the frame of the same, beveled catches upon the shank and body of the said hook, and a spring-ball mounted transversely in the point of the said hook, substantially as and for the purpose set forth.

292,477. DUST-PAN. JAMES I. FLANAGEN, Philadelphia, Pa. Filed Oct. 6, 1883. (No model.)



Claim.—1. A dust-pan having a hood of arched form and a lid hinged thereto, substantially as and for the purpose set forth.

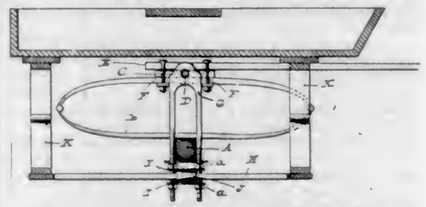
2. A dust-pan having an arched hood and a lid hinged to the front of said hood, cut away and rounded, as at g, substantially as and for the purpose set forth.

3. A dust-pan having an arched hood and a lid hinged to said hood cut away and rounded, as at g, and cut away at the outer sides, as at f, substantially as and for the purpose set forth.

292,478. ORGAN-ACTION. CHARLES RUFUS FORD, Boston, Mass. Filed June 18, 1883. (No model.)

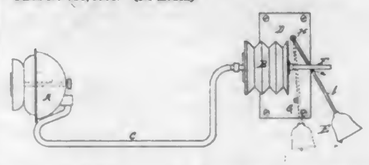
Claim.—1. In combination with the reeds and the keys for operating the valves thereof, the series of mutes and their levers and oblique fingers, arranged and adapted to operate substantially as described, and provided with mechanism for effecting depression of the said levers by means of the keys, as explained.

2. The combination of the mutes, the operative levers, and the series of oblique fingers and their depressing-wires, all being arranged and adapted to operate as set forth.



292,479. EYEGLASSES. IVAN FOX, Philadelphia, Pa. Filed May 6, 1882. (Model.)

Claim.—1. The combination, with a pair of eyeglasses, of the nose-pieces N N', each consisting of the inclined bar a, having the arm b integral therewith, and projecting from a ponit near its middle, substantially as and for the purpose specified.



2. The combination, with a pair of eyeglasses, of the nose-pieces N N', formed of comparatively soft metal, each having the inclined bar a and curved arm b integral therewith, and projecting from a point near its middle, substantially as and for the purpose specified.

292,480. TWO-WHEELED VEHICLE. HOWARD P. GARLAND, San Quentin, Cal. Filed Oct. 22, 1883. (No model.)

Claim.—In a two-wheeled vehicle, the side springs, B B, carrying the pintles D D, and to which the shafts are connected, in combination with the king-clips G G, supporting the swinging frame H, to which are connected the end or bed-supporting springs, K K, substantially as shown and set forth.

292,481. PNEUMATIC SIGNAL. ROBERT P. GARSED, Norristown, Pa. Filed Nov. 23, 1883. (No model.)

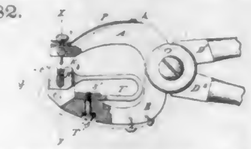
Claim.—1. In a pneumatic signal, in combination with pump A, pipe C, and bellows B, the bracket D, having a bellows-support, J, and suspended bell E, with push-rod adapted to actuate and allow a swinging motion of bell, the whole substantially as and for the purposes set forth.

2. In a pneumatic signal, the combination, with pump A, pipe C, and bellows B, the latter with actuating-rod F, of the bracket D, with bellows-support J, and a free vibrating bell, E, with abutting pin I, said pin also serving for a support for actuating-rod F, substantially as described.

3. In combination, the pump, pipe, and bellows, and a signaling device, the bellows-support J, and flanged and threaded connecting device T, with washer U, said device adapted to hold bellows in place, as well as to form a coupling for air-supplying pipe, the flange, connecting-piece, and coupling end being integral, the whole operating substantially as and for the purposes set forth.

4. In combination, the operative pump, with pipe and bellows, the latter having attached to it a bifurcated arm, F, adapted to surround bell-rod and actuate the same, and pin I, or its equivalent, supporting said arm, in combination with suspended bell, the whole operating substantially as and for the purposes set forth.

5. The pump with rod passing through its center, and the cap k, connected to the base of pump, and adapted to form an air-tight passage for said rod, in combination with the connected pipe and bellows, with support for the latter, substantially as shown and described.



6. In combination with the tracks of a railroad, the lever L, and pump A, with socket-connection for supplying air, the ball X, adapted to engage with and roll upon the lever L upon its operation, and stop the orifice r in said pump, connected pipe, and supported bellows, the whole operating substantially as shown and described.

7. In combination, the lever L, pump A, supporting-frame N, adapted to suspend said pump and allow the free motion of lever L between its supporting-links, the anti-friction ball X, and socket W, the connected pipe, operative bellows, and bracket D, with bell-ringing device, substantially as described.

292,482. IMPLEMENT FOR SETTING BUTTON-FASTENERS. JOHN H. GOODFELLOW, Troy, N. Y. Filed June 11, 1883. (No model.)

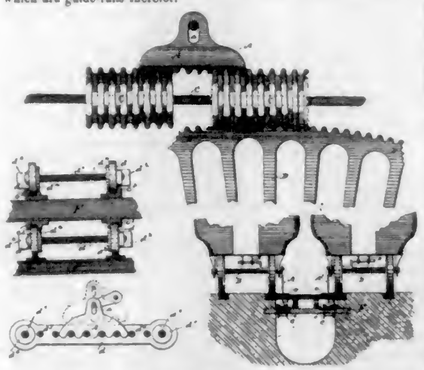
Claim.—1. An implement for attaching buttons, having jaws A and B, the latter being provided with a movable anvil, R, having arms k k pivoted thereto, and spring T, combined to operate substantially as described.

292,482.

2. In an implement for attaching buttons, the spring T, secured to the jaw thereof, carrying the anvil-head R at its free end, the anvil having the arms *k k* pivoted therein, as described, and adapted to operate in connection with the lower jaw, substantially as and for the purpose set forth.

3. In an implement for attaching buttons, the combination of the upper jaw, having means for holding a button and staple, as described, and the lower jaw, B, having the spring T attached thereto, and carrying the anvil R, provided with the pivoted arms *k k*, which are adapted to spread apart and force the legs of a staple up against the fabric in a line with each other, all substantially as described and set forth.

4. In an implement for attaching buttons, the combination of an upper jaw provided with means for holding a button and staple, with the lower jaw provided with a movable anvil having pivoted arms, which are adapted to move in the grooves *a' a²* in the lower jaw, for the purpose of spreading the legs of a staple, all substantially as described.



5. In an implement for attaching buttons by staples, the jaw B, furnished with the movable anvil R, and the arms *k k*, pivoted to the anvil and extending outward beyond the anvil and over the jaw, substantially as set forth.

6. In an implement for attaching buttons by staples, the jaw B, furnished with the movable anvil R, and arms *k k*, pivoted to the anvil, and having the guide-grooves *b b*, substantially as shown and described.

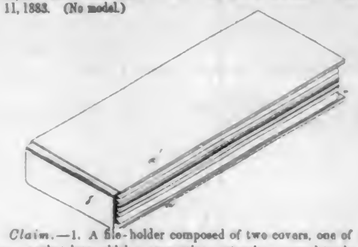
7. In an implement for attaching buttons by staples, the jaw A, having the raised platform F and slot J in the platform, and furnished with a forked spring extending along the sides of the platform, substantially as shown and described.

292,483. PROPULSION OF STREET-CARS AND OTHER VEHICLES. NEIL F. GRAHAM, Falls Church, and HOWARD H. YOUNG, Carlins Springs, Va. Filed May 29, 1883. (No model.)

Brief.—An endless traveling corrugated chain or conveyer driven by corrugated driving-drum, the car carrying a corrugated shoe for contact with said conveyer. The conveyer traverses a sewer-excavation in which are guide-rails therefor.

Claim.—1. The corrugated adjustable shoe A, for the propulsion of vehicles, substantially as described.

2. The corrugated shoe A, in combination with an endless corrugated conveyer, C, traveling in a sewerage-excavation, for the propulsion of vehicles, substantially as described.



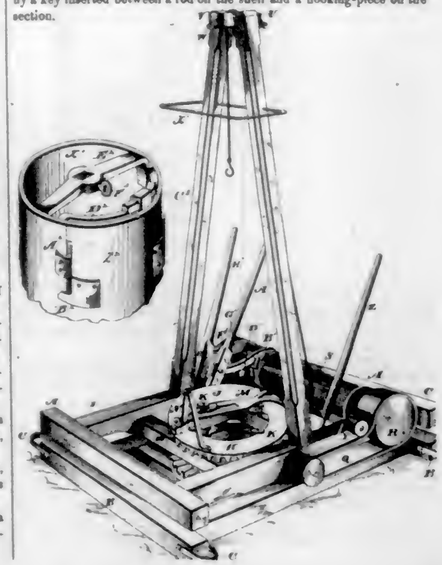
3. The corrugated motor-drums D, in combination with the corrugated shoe A and corrugated endless conveyer C, substantially as described.

4. In the endless conveyer C, the combination of the pivoted links *d*, pivot-bolts *d'*, lugs *d²*, rounds or bolts *d³*, and friction-rollers *d⁴*, adapted to the said conveyer, substantially as described.

5. The endless conveyer C, in combination with the shoe-arm A', plates *c'*, *c²*, and *c³*, friction-rollers *c⁴*, and tramway E, substantially as set forth.

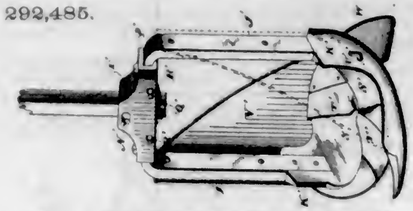
6. The combination, with the corrugated endless conveyer C, of a device upon the car to engage therewith, having a correspondingly-corrugated engaging surface or face, as and for the purpose set forth.

292,484. EXTENSION-FILE. JOHN GROSS, Ottawa, Ill. Filed Oct. 11, 1883. (No model.)



Claim.—1. A file-holder composed of two covers, one of which forms a pocket into which a connecting-extension secured to the other cover may be pushed, or from which it may be partially withdrawn at will, substantially as and for the purpose set forth.

2. A file-holder made in two parts, one of which forms a pocket containing a slotted intermediate piece, and the other has secured to it an extension formed with a T-head or tongue upon its end, substantially as and for the purpose set forth.



3. In a file-holder, the cover *a*, provided with the extension *b*, having the tongue *c*, in combination with the cover *a'*, forming a pocket in which is secured the intermediate part, *d*, formed with slot *d'*, substantially as and for the purpose set forth.

292,485. APPARATUS FOR BORING WELLS. JAMES W. HAMMETT, Grant, W. Va. Filed Nov. 7, 1882. (No model.)

Brief.—An annular bevel-face gear with projecting arm for attachment of a motor turns on rollers and engages a bevel-pinion having an extended pulley-shaft, and carried by a frame supported from within the gear-wheel. Through the pinion the gear drives an upper and similar gear having means for holding and rotating the auger-shaft interiorly of the gears. Through a belt-tightener a windlass for the auger-lifting cord is driven at will by a belt from the above pulley-shaft. For hand operation in either direction of this windlass it is provided with three ratchet-wheels, the middle one turned reversely from the others, and engaged by a pawl pivoted on a hand-lever, the others being engaged by a pin inserted, when desirable, transversely through the pawl. The auger consists of two cutter-arms with detachable blades, extensions, and valves. The upper ends of the arms are fitted loosely into openings in a head, and secured therein by bolts adjustable to enable the spreading of such arms by a spring pressing the ends within the head. Hooks on the exterior of the cutter-arms may be used for attaching either triangular-curved "wings" or an entirely-closing casing with lower cutting-edge having a detachable section with sleeves sliding onto pins projecting downward from bearings on the edges of the main shell. The section is locked by a key inserted between a rod on the shell and a hooking-piece on the section.

292,485.

Claim.—1. In a boring apparatus, the combination, with a frame, and an annular face-wheel which has bearing upon it, of a frame supported above the frame aforesaid by a structure rising within said face-wheel, an annular face-wheel mounted upon the upper frame, and a bevel-pinion meshing with both wheels, substantially as set forth.

2. In a boring apparatus, the combination, with a frame, an annular face-wheel, and a sweep attached to said wheel, of a frame supported above the frame aforesaid by a structure rising within said wheel, an annular face-wheel mounted upon the upper frame, a pinion meshing with both wheels and rollers, located within the wheels, substantially as set forth.

3. In a boring apparatus, the combination, with power mechanism, of a drum on which the drill-cord is wound, a loose belt uniting the power mechanism and said drum, and a hand-operator stress-pulley to impart to the belt the tension required to actuate the drum, substantially as set forth.

4. In a boring apparatus, the combination, with a power mechanism, of a drum on which the drill-cord is wound, three ratchets grouped together on said drum, the outer ratchets being cut oppositely from the ratchet between them, a hand-lever, and a gravity-pawl having a removable pin in its outer end, and adapted to engage with said ratchets, substantially as set forth.

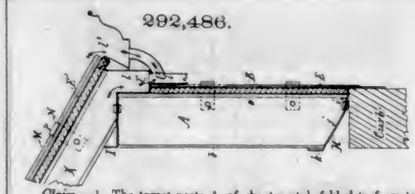
5. In a boring apparatus, an auger consisting in the combination, with a centrally-perforated auger-head having open ends, of two depending arms, the curved upper ends of which are secured in the open ends of the auger-head, and cutters curved in general contour, having convex outer and concave inner faces provided with detachable extensions and valves, and adapted to be removably secured to the lower ends of said depending arms, substantially as set forth.

6. In a boring apparatus, the combination, with an auger-head, arms depending therefrom, and cutters removably secured to the lower ends of the arms, of wings detachably attached to the arms and the cutters, substantially as set forth.

7. In a boring apparatus, the combination, with an auger-head having open ends, of depending arms the upper ends of which are secured in the open ends of the said auger-head, and a spring located in the auger-head, and arranged to impinge on the ends of the said arms, substantially as set forth.

8. In a boring apparatus, the combination, with an auger-head having open ends, of two depending arms the upper ends of which are secured in said head, of a spring located in the auger-head, and arranged to impinge on the ends of said arms, and spiral lifters detachably secured to the lower ends of the arms, substantially as set forth.

9. In a boring apparatus, the combination, with a shell having a bail and a rod attached to its upper end, of a removable door provided with a hook, to engage with the rod attached to the shell, and a key to be interposed between the hook and rod, to lock the door to the shell, the lower end of the door and shell being shaped to form cutters, substantially as set forth.



10. In a boring apparatus, the combination, with a shell having one side cut away, of pins mounted in bearings projecting beyond both edges of the cut-away portion of the shell, a door, and sleeves secured to the opposite edges thereof, and arranged to be engaged with the pins aforesaid by adjusting the door on the shell and sliding it longitudinally to its true position, substantially as set forth.

292,486. SKYLIGHT. GEORGE HAYES, New York, N. Y. Filed May 12, 1883. (No model.)

Brief.—Consisting of turret-posts formed with two sides, having inside and outside lateral flanges and cut at intervals to receive removable louver-slats. The base-plate is so constructed as to fit the curb, and also forms the lower louver-slat. The corner-posts are formed of one piece of sheet metal with diverging plates or faces. The inside gutter in base-frame and the outside gutter form a molded cornice and discharge through the same leader.

292,486.

Claim.—1. The turret-posts A, of sheet metal, folded to form two sides, *a a*, inside lateral flanges, *b b*, and outside lateral flanges, *c c*, the flanges *c c* cut in at intervals for reception and support of louver-slats, essentially as shown and described.

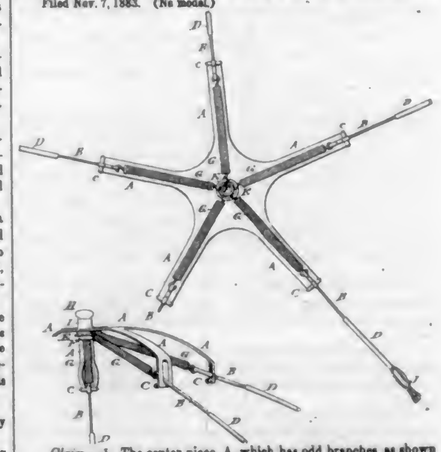
2. In combination with posts A and strips B, constructed essentially as set forth, louver-slats C, set in and secured substantially as shown and described.

3. In combination with posts A and strips or caps B, constructed and combined essentially as set forth, the reticulated screen or perforated sheet-metal plate D, secured thereto, substantially as shown and described.

4. The combination of posts A, caps B, louver-slats C, and screen D, substantially as shown and described.

5. The corner-posts F, constructed of one piece of sheet metal, formed with diverging portions *e e*, inside flanges, *f f*, and outside flanges, *g g*, the outer flanges cut in at intervals for the reception and support of louver-slats, essentially as shown and described.

6. In combination with the corner or angle posts F, the caps or angle-pieces G, secured thereto by strips N, substantially as shown and described.



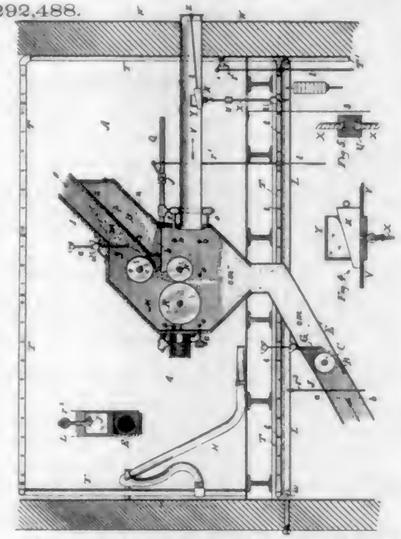
7. The base-plate H, having apron *h*, flat portion *i*, slope *j*, and "set-back" or curve *k*, substantially as shown and described.

8. In combination with the posts A F and rafters or bars K, constructed as set forth, the transom I, provided with gutter *l* and clip *m*, substantially as shown and described.

9. The vertical walls of a turret, consisting of posts A F, base H, transom I, louver-slats C, all constructed, arranged, and combined essentially as shown and described.

10. The combination of outside gutter, P, with inside gutter, *l*, substantially as shown and described.

292,487. HAT-PROTECTOR. CHARLES A. HELSEL, Indianapolis, Ind. Filed Nov. 7, 1883. (No model.)



Claim.—1. The center piece, A, which has odd branches, as shown in Fig. 1, so as to prevent an opposite contact of frame when folded, as specified fully heretofore.

2. Sliding tubes D, applied to rod B, as duly described, so as to enable universal use of my invention, and decrease the size when the whole is folded, so that it may be placed in the smallest crown of a hat when not using.

3. The springs G, attached as clearly specified, acting as a support of the frame, as shown in Fig. 2, and, furthermore, is a factor to facilitate immediate unfolding, the spring being in a strained condition, as shown in Fig. 3, all substantially as set forth.

292,488. CONSTRUCTION OF MALT AND GRAIN MILLS. CHAS. JOHN HELANDER, Philadelphia, Pa. Filed Feb. 27, 1883. (No model.)

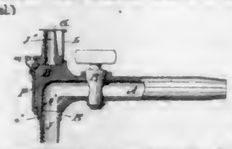
292,488.

Claim.—1. The method of preventing fires resulting from explosions of grain-dust within the mill-boxes of malt or other grain crushing or grinding mills from extending from the mill-box to the elevator-boots and other parts of the building, which consists in maintaining a continual plenum of the ground or crushed grain in the outlet-pipe from the mill-box, in conjunction with a suitable vent leading from the latter into the open air, substantially as set forth.

2. In combination with the mill-box having the grinding or crushing rolls therein and the efflux-pipe leading therefrom, an adjustable discharger for regulating the flow of the ground grain from the efflux-pipe, so as to maintain the plenum in said pipe above the discharger, substantially as and for the purposes set forth.

3. The mill-box having the grinding-rolls therein, and its bottom conical or hopper shaped, the efflux-pipe leading therefrom, and the adjustable discharger, all combined, constructed, arranged, and operating substantially as and for the purposes described.

4. The combination, with the mill-box having the grinding-rolls therein, and the influx and efflux pipes communicating therewith, a feeder in the former pipe and a discharger in the latter, said feeder and discharger being adapted to be relatively adjusted and regulated, so as to preserve a continual plenum of the ground grain within the efflux-pipe, substantially as and for the purposes set forth.

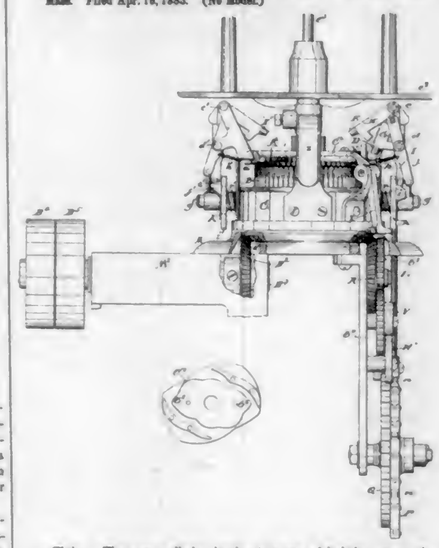


5. The combination, with the mill-box having the grinding-rolls therein, and the influx and efflux pipes, of means for preserving the described plenum within the efflux-pipe, and the vent-pipe V, communicating with the interior of the mill-box, substantially as and for the purpose set forth.

6. In combination with the mill-box, efflux-pipe, and the gate J, means for automatically causing said gate to close said pipe from the result of an explosion within the mill-box, substantially as and for the purpose set forth.

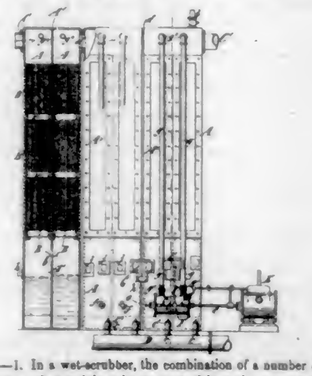
7. In combination with the mill-box, efflux-pipe, gate J, and means for automatically causing the said gate to close the said pipe from the effect of an explosion within the mill-box, the vent-pipe V, substantially as described.

8. The combination of the mill-box, the efflux-pipe, the gate J, and the drop-lever L, connected with said gate, all constructed, combined, and adapted to operate substantially as and for the purpose specified.



292,489. FAUCET. PETER HUFF, New York, N. Y. Filed Sept. 20, 1883. (No model.)

Claim.—1. In combination with a revolving ring, E, arranged at the end of a faucet, and provided with a series of branch pipes, the plate or shield G, closing the ends or mouths of all the branches, except the one in communication with the mouth A′ of the faucet, as and for the purpose specified.



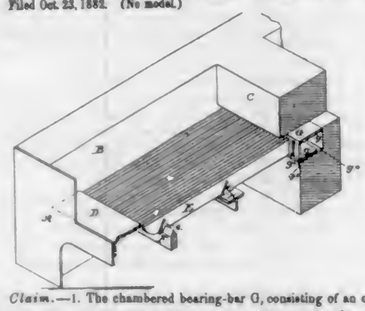
2. In a faucet, the pin *m*, in combination with the movable ring E, having holes *n*, *n′*, *n″*, and *n‴*, for the purpose substantially as set forth.

292,490. KNITTING-MACHINE. WARREN D. HUSE, Laconia, N. H., assignor to O. Twombley, Lake Village, N. H., and T. S. Newell, Boston, Mass. Filed Apr. 16, 1883. (No model.)

Claim.—The cam-cylinder having two sets of knitting-cams, the cylinder-needles, needle-bed, the bed or plate for the dial-needles, the cam-plate, the dial-needles, and two sets of knitting-cams on the cam-plate, and two sets of yarn-guides composed each of two separate yarn-guides, combined with two yarn-changing patterns, a pattern-chain, and means actuated thereby to permit the two yarn-changing patterns to be moved at each revolution of the cam-cylinder, and with means to rotate the said cam-cylinder and to move the pattern-chain two steps at each revolution of the cam-cylinder, substantially as described.

292,491. GAS-SCRUBBER. CHARLES W. IRBELL, New York, N. Y. Filed Nov. 29, 1882. (No model.)

Claim.—1. In a wet-scrubber, the combination of a number of upright chambers, each containing plates arranged in stationary groups, and provided with openings through which they communicate with each other directly, alternately above and below said groups of plates, whereby the gas is caused to pass upward through the plates of one chamber and downward through the plates of the next chamber throughout the series, overflow boxes or openings for maintaining the desired level of liquor in the several chambers, and means for raising liquor from the bottom to the top of said chambers, so as to obtain a highly-concentrated ammoniacal liquor, substantially as and for the purpose herein described.



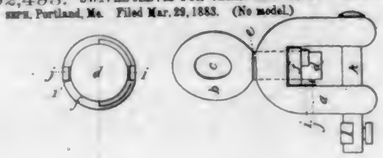
2. In a scrubber, the combination of a number of upright chambers, each containing plates arranged in stationary groups, and provided with openings through which they communicate with each other alternately above and below said groups of plates, overflow openings or apertures in the outer sides of said chambers, and overflow-boxes connecting the openings or apertures of adjacent chambers on the exterior of the scrubber, substantially as and for the purpose herein described.

3. In a scrubber, the combination of chambers containing groups of plates and arranged in pairs, the several pairs forming separate and distinct structures, which are connected together by communicating openings or nozzles above said plates, and the chambers of each pair being in communication below said plates, overflow-boxes connecting the chambers below said plates, and means for raising liquor from the bottom to the top of said chambers, substantially as and for the purpose herein described.

4. In a gas-scrubber, the combination, with two upright chambers containing groups of plates, and provided with overflow-boxes for controlling the level of ammoniacal liquor in them, of a double-acting circulating-pump having the chambers connected below said plates by suction-pipes with the opposite ends of the pump-cylinder, and connected above said plates by discharge-pipes with opposite ends of the pump-cylinder, whereby one pump is made to serve for both chambers, substantially as and for the purpose herein described.

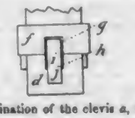
5. In a scrubber, the combination of pairs of upright chambers containing groups of plates, and provided with overflow-boxes for controlling the level of ammoniacal liquor in them, and a double-acting circulating-pump for each pair of chambers, having the suction and discharge of the two ends of the cylinder communicating with the said two chambers, and having pipes leading from the gas-space of the scrubber to the ends of the pump-cylinder, substantially as and for the purpose herein described.

292,492. FURNACE-GRATE. MILTON C. JONES, Green Island, N. Y. Filed Oct. 23, 1882. (No model.)



Claim.—1. The chambered bearing-bar G, consisting of an open-sided box, composed of the upper flange, *g*, lower flange, *g′*, and vertical front plate, g^3, the latter containing a series of openings, g^3, which conform to the shape and number of the grate-bars E, and which will permit said grate-bars to expand endwise therein, but will prevent the ashes from entering the chamber g^4, as herein specified.

2. The combination, with the grate-bars E, having their forward ends locked in a fixed position, as herein decribed, of the chambered bearing-bar G, consisting of an open-sided box, constructed as herein described, and having its vertical front plate, g^3, provided with a series of openings, g^3, for containing the movable ends of said grate-bars, and adapted to exclude the ashes from the chamber g^4, as herein specified.



3. The combination, with a grate-bar, E, adapted to be locked in a fixed position at one end, and provided in its under edge with a slotted recess, e^2, as herein described, of a bearing-bar, H, having on its upper face a series of cars, *i*, adapted to engage in the recesses e^2 of said grate-bars, in the manner and for the purpose herein specified.

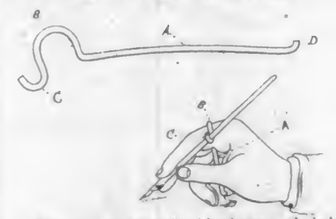
4. The combination, with the chambered bearing-bar G, as herein described, of the bridge-wall C, erected directly upon the upper flange, *g*, so as to overhang the forward face, g^3, of said bearing-bar, as and for the purpose specified.

292,493. SWIVEL-CLEVIS FOR CHAIN-CABLES, &c. FRANK JOSEPH, Portland, Me. Filed Mar. 29, 1883. (No model.)

292,493.

Claim.—The combination of the clevis *a*, of the swivel *b*, with its eye *c* and stock *d*, with the hole *e* in the bend of the clevis, washer *f* in the lower end of the stock *d*, slots *g g′* in the washer *f*, slot *h* in the stock *d*, and the pin *i*, as herein set forth.

292,494. ROD FOR SAW-FRAMES. JOHN M. KOEBERLE, Philadelphia, Pa. Filed Aug. 31, 1883. (No model.)



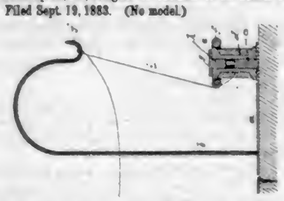
Claim.—1. A rod for a saw-frame, consisting of a swivel, a yoke, the ends whereof are formed with journals, and a piece having a recessed head forming the bearings of said journals, the end of the piece being connected with the swivel, substantially as and for the purpose set forth.

2. In a saw-frame rod, a headed piece receiving the journals of the yoke, formed with lips which are bent over the journals, substantially as and for the purpose set forth.

3. In a saw-frame rod, a headed piece receiving the journals of the yoke, formed with a central lip which limits the inward motions of the limbs of the yoke, substantially as and for the purpose set forth.

4. In a saw-frame rod, a headed piece receiving the journals of the yoke and engaging with a screw-swivel, said piece having lips which cover said journals, and a central lip projecting between the ends of the yoke adjacent to said journals, substantially as and for the purpose set forth.

292,495. PEN-STAFF AND HAND-SUPPORT. WARREN H. LAMSON, Lynn, Mass. Filed Sept. 3, 1883. (No model.)



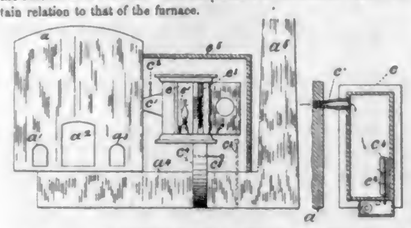
Claim.—1. In a pen-staff and hand-support, the body A, provided on one end with the finger-loop B and reverse staff-loop C, substantially as described, and for the purposes set forth.

2. In a pen-staff and hand-support, the body A, provided on one end with the finger-loop B and staff-loop C, as specified, the opposite end of said body being provided with the curved end D, substantially as set forth.

3. In a pen-staff and hand-support, the body A, provided on one end with staff-loop C and finger-loop B, said staff-loop C having its point bent forward, as set forth, whereby the pen holder or staff is held in close relation with the finger, substantially as set forth.

4. In a pen-staff and hand-support, the combination of the body A, bent end D, finger-loop B, and staff-loop C, the point of said staff-loop being bent slightly forward, substantially as described, and for the purposes set forth.

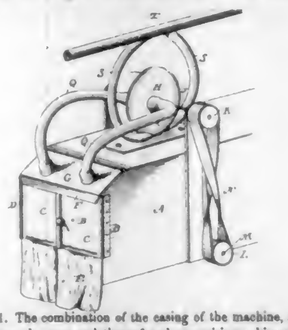
292,496. THREAD-GUIDE FOR SEWING-MACHINES. THOMAS LA TOUR, Philadelphia, Pa., assignor of one-half to M. Luther Finckel, same place. Filed Sept. 19, 1883. (No model.)



Claim.—1. The cap *e*, provided with the ring, rim, or edge *f*, round in cross-section, and adapted to encompass the head of a spool and project below its under surface, and made with a centering-pin, *h*, combined with a guide-arm, substantially as shown and described.

2. The cap *a*, composed of the ring, rim, or edge *f*, round in cross-section, and adapted to encompass the head of a spool and project below its under surface, the plate *g*, and the attached, fixed centering-pin *h*, substantially as shown and described.

292,497. DEVICE FOR INDICATING THE TEMPERATURE IN ANNEALING-FURNACES. MICHEL A. LAUBSCHER, Buffalo, N. Y. Filed May 5, 1883. (No model.)



Brief.—A small quantity of hot air from the furnace is mixed with the cool air in the reducer. The temperature of the mixture bears a certain relation to that of the furnace.

Claim.—1. The combination, with a furnace, of a reducer connected thereto by a tube, and to the main flue of the furnace by a flue, c^4, and a thermometer, substantially as and for the purposes described.

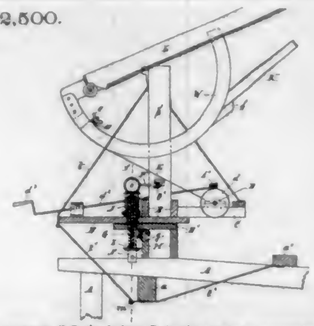
2. The reducer *c*, connected to the furnace by a tube, c', provided with a damper or valve, c^3, in combination with a thermometer and an outlet-tube, c^4, connected with the furnace outlet-flue a^4, the flue a^4 having a damper or valve, c^5; as and for the purposes described.

292,498. DUST EXHAUSTER AND CONVEYER FOR THRASHING MACHINES. DAVID LOGAN, Hartstown, Pa. Filed June 7, 1883. (No model.)

Claim.—1. The combination of the casing of the machine, a closet arranged to close the rear end thereof and comprising a hinged lid or cover, a fan-chamber having a rotary fan, and elastic exhaust-pipes extending from the fan-chamber to openings in the said cover, as and for the purpose set forth.

2. The combination of the closet adapted to close the end of the casing to which it is applied, and comprising the hinged doors, the cap or cover of the closet hinged and formed with the flange that engages the doors to retain the same closed, a fan-chamber secured near the closet, and provided with a rotary fan, the elastic exhaust-tubes extending from openings in the sides of the fan-chamber to openings in the hinged cover, and the conveyer-tubes extending from different ends of the fan-chamber up and in different directions, as and for the purpose set forth.

292,499. CAR-SEAL. THOMAS H. MALONE, Milwaukee, and GEORGE A. WHITING, Neenah, Wis. Filed July 16, 1883. (No model.)



Claim.—1. A seal formed of a sheet-metal band having its ends doubled together and secured by transverse tongues upset from the sides thereof, and having identifying symbols, numbers, or letters impressed upon the metal, substantially as described.

2. A seal formed of a sheet-metal band having its ends doubled together and secured by tongues upset thereon, said tongues being provided with grooves or depressions therein, substantially as described.

292,500. STRAW-STACKING MACHINE. CHARLES F. MERRIFIELD, Indianapolis, Ind. Filed Oct. 30, 1883. (No model.)

Claim.—1. The combination, in a straw-stacking machine, of the

292,500.

carrier-supports S S, the bolster B, having a tongue-extension, the iron brace-rods *t t*, bolted to the carrier-supports S S near the top of the same and to the bolster-extension at a point right in front of the pivot-point of the bolster, and the iron rods t' t^3 and t^3, the connection of said rods being made by an eye, *m*, formed by the rods t^3 t^3 right under the pivot-point of the bolster B, all as described, and for the purpose specified.

2. In a straw-stacking machine, the combination of the standards S S, the carrier-frame L, pivoted to the standards S S, the bolster or turntable B, the bolster-plate B', the boxing G, located in front of the standards S S, and forming a pivot for the bolster B, the cross-beams H H, the carrier-truck A, the cross-beams *a* and *a'*, and the iron brace-rods *t t*, t', and t^2 t^2, all constructed and adapted to operate substantially in the manner and for the purpose specified.

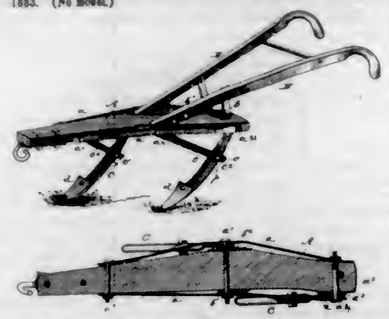
3. In a straw-stacking machine, the combination of the standards S S, the carrier-frame L, pivoted to the standards S S, the bolster B, the frame-work C, the shaft D, mounted on the frame-work C, the spirally-toothed wheel *d*, firmly secured to the shaft D, the shaft d^2, the endless screw d', secured to the end of the shaft d^2 and operating the wheel *d*, the crank d^3 at the end of the shaft d^2, the ropes E E, and the hoisting-wheels W W, all as described, and for the purpose specified.

4. In a straw-stacking machine, the combination of the standards S S, the carrier-frame L, pivoted to the standards S S, the bolster B, the frame-work C, the shaft D, the wheel *d*, the endless screw d', the shaft d^2, the crank d^3, the ropes E E, wound and unwound on the shaft D by the operation of the crank d^3, the hoisting-wheels W W, and the set-screws *s s*, securing the ropes E E to the hoisting-wheels W W, substantially as described, and for the purpose specified.

5. In a straw-stacking machine, the combination of the standards S S, the carrier-frame L, pivoted to the standards S S, the hoisting-wheels W W, secured to the sides of the carrier-frame L, the braces K K, the sockets *k k*, secured to the wheels W W, and the sockets *l l*, secured to the carrier-frame L, substantially as described, and for the purpose specified.

6. In a straw-stacking machine, the combination of the horizontal shaft P, the gimbal-joint O in said shaft P, the boxing G, the spindle I, operating in said boxing G, the horizontal shaft P', the gimbal-joint O' in said shaft P', and the bevel-gear at each end of the spindle I, substantially as described, and for the purpose specified.

7. In a straw-stacking machine, the combination of the carrier-truck A, the cross-beams H H, the bolster-plate B', the bolster B, the carrier-supports S S, the boxing G, forming a pivot for the bolster B in front of the carrier-supports S S, and the shoulders *g g*, securing the boxing to the front one of the beams H H, substantially as described, and for the purpose specified.

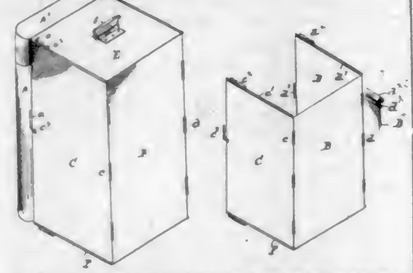


8. In a straw-stacking machine, the combination of the carrier-truck A, the cross-beams H H, the bolster-plate B', the bolster B, the carrier-supports S S, the boxing G in front of the carrier-supports S S, the shoulders *g g*, securing the boxing G to the front one of the beams H H, the brackets N N at the lower end of the boxing G, the sleeve J, and the bracket *j*, operating around the upper end of the boxing G, the gear-shafting P, P', and I, and the gimbal-joints O and O' in said shafting P and P', all constructed and arranged to operate substantially as described, and for the purpose specified.

9. In a straw-stacking machine, the combination of the carrier-frame L, the standards S S, the bolster B, the bolster-plate B', the gear-shafting P, I, and P', the boxing G, forming a pivot for the bolster B, the brackets N N, the sleeve J, the bracket *j*, the shoulders *g g*, the cross-beams H H, the carrier-truck A, the cross-timbers *a* and *a'*, the iron braces *t t t' t² t²*, and the eye *m* under the pivot-point of the bolster B, all arranged and adapted to operate substantially as described, and for the purpose specified.

10. In a straw-stacking machine, the combination of the truck-axle A, the clevises or sockets *r r*, secured to the axle A, the braces R R, shoved through the wheels of the truck up into said clevises or sockets *r r*,

and the blocks *r' r'*, driven between the braces R R and the truck-axle, substantially as described, and for the purpose specified.



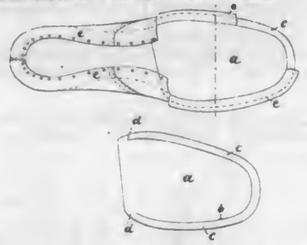
292,501. PLOW. HENRY L. MOORE, near Dawson, Ga. Filed Oct. 26, 1883. (No model.)

Claim.—1. A plow having a stock, A, or beam, the central part enlarged, the handle, braces, or securing-plates *b'*, the adjustable standards and the plates or strips *a* being secured together at said central part of the beam by a single bolt, substantially as shown and described, and for the purpose set forth.

2. In a plow, the combination, with a beam beveled from the center toward the ends thereof, of the adjustable standards, the outwardly-sprung strips *a*, and the handles, the ends of which rest on the top of the beam, the securing-plates of which are bolted to the stock by a single central bolt, which also secures the bars *c'* and strips *a*, substantially as shown and described, and for the purpose set forth.

292,502. COMBINED LUNCH-BOX AND DRINKING-FLASK. JOS. F. MORAN, Detroit, Mich. Filed June 12, 1883. (No model.)

Claim.—1. A combined lunch-box and drinking-flask consisting of a box with three sides, a top, and a bottom, the construction being such that said sides, top, and bottom may be packed together, and in connection therewith a flask having a removable top, said flask forming the fourth side of the box, and means for connecting the box to the flask, the flask being of a size adapted to receive within it the parts constituting the box, substantially as described.



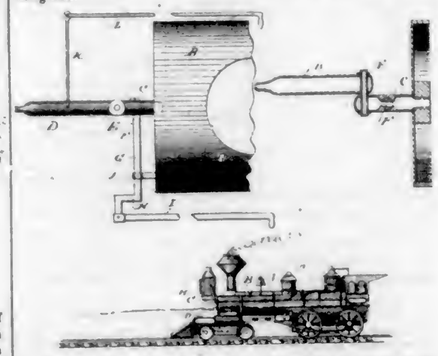
2. The combination, with the three sides of a box, of top and bottom pieces adapted to engage with and hold the sides in place, and be packed together with said sides, and a flask adapted to engage the box and constitute a side for its open face, substantially as described.

3. A combined lunch-box and flask consisting of a flask with a removable top, a box with three hinged sides and removable top and bottom, the flask forming the fourth side, and means for connecting the box to the flask, the flask being of a size adapted to receive within it the parts constituting the box, substantially as described.

4. The combination, with the three sides of the box, of top and bottom pieces adapted to be slid into place from the open side to engage and hold the sides in place, and a flask adapted to engage the box and constitute a side for its open face, and at the same time serving to hold the sliding top and bottom pieces in place, substantially as described.

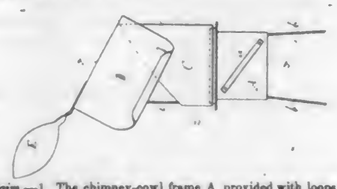
5. The combination, with a flask, of a box consisting of three hinged leaves and sliding top and bottom pieces, and means for engaging the box to the flask, so the latter will constitute the fourth face of the box, and in combination therewith a removable top for the flask, said top, when in place, adapted to secure the top plate of the box, the construction being such that when removed the top of the box may be slid out over the flask, substantially as described.

292,503. MANUFACTURE OF BOOTS AND SHOES. LAWRENCE F. NORMAN, Boston, Mass. Filed Feb. 17, 1883. (No model.)



Claim.—1. In a boot or shoe, a sole or half-sole, *a*, circumferentially cut or slit from or near the shank entirely around its sides and toe portion, thus leaving a separated welt or margin, an upper having the edges of the fore part passed down at the inner side of the said welt, or through such cut or slit, and having its edge turned outward underneath such welt, and an outer sole united to the welt and out-turned upper by suitable fastenings, the said sole *a* being disconnected from the outer sole and upper, as described, and for the purposes set forth.

2. In a boot or shoe having an outer sole and out-turned upper, as described, a welt cut from leather, substantially in the form which the welt is to ultimately assume in the completed boot or shoe, the upper crossing the inner edge of and being extended outward under the said welt, and the welt, upper, and outer sole being united by fastenings outside the body portion of the upper, substantially as described.

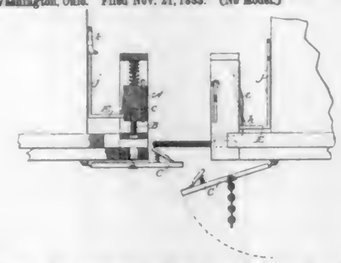


292,504. ATTACHMENT FOR LOCOMOTIVES. LA FAYETTE WILSON PAGE, Shreveport, La. Filed Mar. 26, 1883. (No model.)

Brief.—The supply of water to the horizontally-adjustable tube and the adjustment of the tube are controlled from the engine-cab by operating-rods.

Claim.—The combination, with a locomotive-boiler, of a tube, C, extending in front of the same, a nozzle, D, connected to said tube by a hinge-joint, E, the stop-cock F in tube C, the arm K, extending laterally from nozzle D, and operating-rods extending to the engineer's cab, for operating the said stop-cock and nozzle, as set forth.

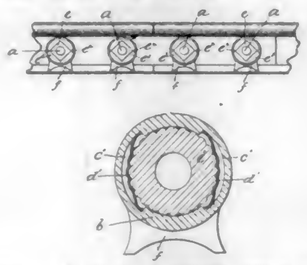
292,505. CHIMNEY-TOP. NICOLAI PETERSEN, Chicago, Ill. Filed July 27, 1883. (No model.)



Claim.—1. The chimney-cowl frame A, provided with loops *a* and depending spring-arms *b*, substantially as described and shown.

2. The chimney-cowl frame A, provided with loops *a* and depending spring-arms *b*, in combination with revolving pipe C, carrying cover D, as described and shown.

3. The chimney-cowl frame A, provided with loops *a* and depending spring-arms *b*, and having stripe *c c* and ring *h*, in combination with pipe C, having cover D and strips *k l*, the two held together by rod B, as described and shown.



4. The rod B, screw-threaded on its upper end, and provided with pin *f* and nut *m*, in combination with frame A, provided with stripe *c c* and ring *h*, and pipe C, provided with strips *k l*, as and for the purpose set forth.

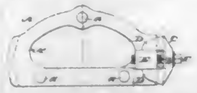
292,506. CAR-COUPLING ADJUSTER. JOHN P. PIRE, near New Washington, Ohio. Filed Nov. 21, 1883. (No model.)

Claim.—The combination of block A, pin B, bridge C, and bolt and shoulder D *h*, all constructed and arranged substantially as set forth.

292,507. NUT-LOCK. JOHN F. PLUMMER and HENRY P. CHAPMAN, Essex, Conn. Filed Dec. 13, 1883. (No model.)

Claim.—1. In a nut-lock, the chambered washer *b*, with projections *f f'*, and bearing within the chamber the frictional clamp *d*, and the nut *e*, with the tapered and roughened body part *e'*, all substantially as described.

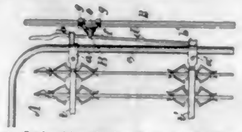
2. In combination, as a nut-lock, the washer *b*, having feet *f*, and chamber *c*, with sockets *c'*, bearing the frictional clamp *d*, and the nut *e*, having the tapered and corrugated body part *e'*, all substantially as described.



3. In combination, the chambered washer *b*, with projections *f f'* and tags *e²*, and bearing within the chamber the frictional clamp *d*, and the nut *e*, with the tapered and roughened body part *e'*, all substantially as described.

292,508. MANUFACTURE OF NON-CALCAREOUS LININGS FOR METALLURGICAL FURNACES. JACOB REESE, Pittsburg, Pa. Filed Aug. 23, 1883. (No specimens.)

Claim.—1. The method herein described of forming and repairing non-calcareous basic linings of Bessemer converters, which consists in melting non-calcareous metallic oxides in a suitable vessel or refining-chamber, and then casting the fluid oxide into the converter and around a suitable core, substantially as and for the purpose specified.



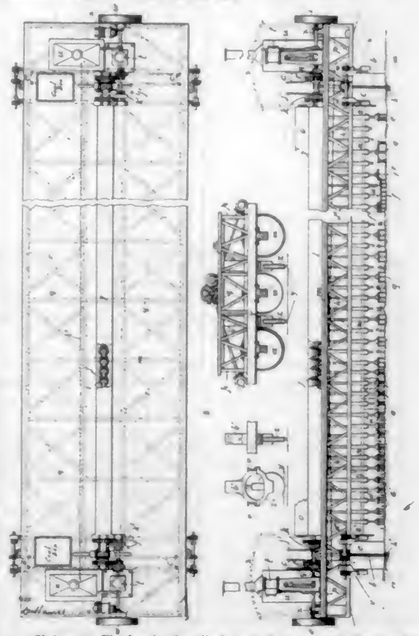
2. As a new article of manufacture, a non-calcareous basic lining consisting of a single mass of hard, close, dense non-calcareous metallic oxides, substantially as described.

292,509. ICE-CREEPER. JOHN REIST, Philadelphia, Pa. Filed Oct. 31, 1883. (No model.)

Claim.—An improved ice-creeper consisting of a plate with a fixed clip at one side and a fixed perforated lug at the other side, a movable slotted clip fitted to said lug, and a screw which passes through the movable clip and engages with the perforated lug, substantially as described.

292,510. LATCHING DEVICE FOR GATES FOR IRON FENCES. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 24, 1883. (No model.)

Claim.—1. In latching devices for gates for iron fences, a thin bifurcated socket-clamp for securing the lower end of the latch-rod, the upright of the frame, and the rail end together, said clamp being formed with internal shoulders and a square socket for the latch-rod, and having its sides diverging toward the end where the bolt is inserted, so that when compressed inwardly the fastening-bolt and its nut secure the latch-rod frame and ends of the rails together, as shown and specified.



2. In latching devices for gates for iron fences, a socket-clamp having a loop for the operation of the latch-rod therein, interior shoulders, and thin compressible sides, in combination with the frame and rails of the gate, as and for the purpose set forth.

3. A catch-plate for gate-latches, having its engaging-notch encircled by a frame-work of guard-bars, substantially as described, for the purpose of protecting the clothing of persons passing through from being torn thereon, as set forth.

4. A catch-plate for engaging with the latch of a gate for iron fences, constructed with a frame-work or guard encircling the same, and with a section of the clamp plate or plates for securing it to the post integral therewith, the whole being cast in a single piece, as and for the purpose hereinbefore set forth.

292,511. SYSTEM AND APPARATUS FOR FARM CULTIVATION AND HARVESTING. ROBERT ROMAINE, Ottawa, Ontario, Canada. Filed Nov. 6, 1882. (No model.)

Brief.—A frame intended to span an entire field or section of land. The ends of the frame project beyond the broad bearing-wheels and have a locomotive-engine mounted at each end.

Claim.—1. The herein-described method or system of farm cultivation, which consists in dividing the land into sections of uniform width, with compacted dirt roads on both sides of each section, and carrying over such section a bridge or frame supported near its ends by road-locomotives traveling upon said roads, the frame or bridge being provided with implements to act upon the soil or crop over the entire width of the span or section.

2. The system or method of farm cultivation, which consists in suspending the implements from a frame or bridge-like structure extending entirely across the section to be cultivated, and carried at its ends outside of said section upon road-locomotives, causing said structure to travel from end to end of the section, and then transferring it laterally to the adjoining section and repeating the operation.

3. A locomotive-bridge for carrying cultivating or farming implements, consisting of an elevated horizontal frame or structure supported at opposite ends by road-engines, substantially as shown, and for the purposes set forth.

4. In a locomotive bridge or structure for carrying or suspending farm machinery for use in the field, an elevated horizontal trussed platform carried near its ends upon traction-wheels, and projecting beyond the latter at each end, and an engine mounted upon the projecting portion at each end, substantially as shown, whereby it is adapted to counterbalance the central portion of the structure.

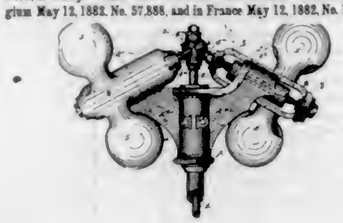
5. In combination with an elevated frame or platform carried at its ends by traction-wheels, and driven by engines mounted upon said platform, a horizontal shaft extending from one side or end of the platform to the other, and provided at short intervals with wheels or gearing, whereby it is adapted to impart motion to independent implements of machinery at different points on the platform, as shown and described.

6. In a locomotive-bridge, substantially such as described, for use in farm cultivation, the combination of a platform, traction-wheels at opposite ends thereof supporting the same, engines mounted upon said platform, and friction-clutches connecting the separate engines, each with traction-wheels at the end of the platform on which the particular engine is mounted, and connected by rods with hand-levers at each end of the platform, whereby the steersman at either end of the said platform may retard either set of bearing-wheels by momentarily holding the clutch at that end out of action, as shown and described.

7. In combination with the platform-bridge k^2, traction-wheels *c c*, engines *l*, and boilers *a*, steam-pipe *i*, connecting the steam-chambers of the two boilers, whereby both engines are caused to act with like power, substantially as shown and described.

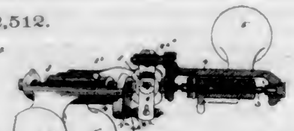
8. In combination with a locomotive-bridge arranged to do farm-work, traveling on compacted dirt roadways, substantially as shown and described, the small pilot-wheels *w'*, two on each side of said bridge, having projecting flanges or rims to travel and form indented channels upon and in the said compacted dirt roadways, for the purpose of indicating to the steersman the proper line of movement, substantially as described and shown.

9. The combination, with the locomotive-bridge herein described, of a reel having hooks h^4, and bolts, whereby it may be readily attached to or detached from the bridge, for the purpose explained.



10. A locomotive-bridge for farm cultivation, provided with main carrying-wheels, and supplemental carrying-wheels permanently set at right angles to the first, and means, substantially such as described and shown, whereby the weight of the bridge may be thrown entirely upon the transverse wheels, and the main wheels raised from the ground to permit the lateral movement of the bridge from one section to the other, as shown and described.

11. In a locomotive bridge or frame, substantially such as shown and described, the combination of the main carrying-wheels and secondary wheels, and pressure-cylinders adapted to guide the spindles of the secondary wheels and to receive the fluid by which the said bridge is raised upon said spindles, as shown and described.



12. In combination with a locomotive-bridge substantially such as described, adjustable frame-works s^4, one attached to each side of the locomotive-bridge, and each provided with independent shafts u^4, adapted to be raised and lowered, as explained, and for the purpose set forth.

13. In combination with a locomotive-bridge substantially such as shown and described, a series of self-adjusting vertical spindles armed with tools or implements at their lower ends to operate in or upon the soil or crops over which the bridge passes.

292,512. CENTRIFUGAL GOVERNOR. JOHANNES SELWIG, Brunswick, Germany. Filed June 29, 1882. (No model.) Patented in Belgium May 12, 1882, No. 57,888, and in France May 12, 1882, No. 148,913.

292,512.

Claim.—1. An astatic centrifugal governor consisting of two or more oscillatory pendulums revolving with the regulator-shaft, said pendulums consisting of a pair of balls mounted in different horizontal planes on an oscillatory axis, having suitable connections with the said regulator-shaft, whereby said shaft will be operated upon by the oscillation of the pendulums, substantially as set forth.

2. In an astatic centrifugal governor, a pendulum consisting of a pair of balls mounted in different horizontal planes on an oscillatory axis, whereby their centrifugal force will cause said axis to oscillate, substantially as and for the purposes set forth.

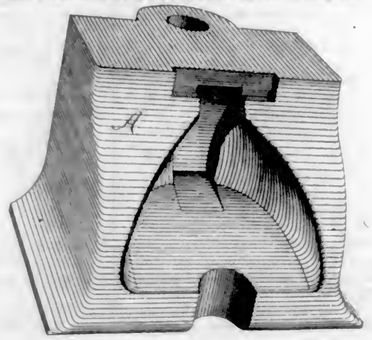
3. The combination, with the regulator-shaft 1 and the sleeve 2, carrying brackets 2^a, of the pendulums mounted upon axes secured in adjustable bearings in the said brackets, and having bearings in the said regulator-shaft, substantially as described.

4. The combination, with the regulator-shaft 1, having a cap, 6, provided with bearings 6^a, and the sleeve 2, carrying supporting-brackets 2^a, of the pendulum 5, secured laterally upon hollow semi-cylindrical castings 4, said semi-cylindrical castings having shafts 3, journaled in suitable bearings in semi-cylindrical bracket-arms and loose connection with the cap 6, substantially as and for the purpose set forth.

5. In a centrifugal governor, the combination of an oscillatory pendulum mounted on suitable axis, substantially as herein described, and a supporting-bracket having adjustable bearings for said axis, as set forth.

6. In an astatic centrifugal governor, the combination, with an oscillatory pendulum substantially as herein described, of a lug or stop to arrest its oscillation, as and for the purpose set forth.

292,513. LOCK-NUT. N. EMORY SHAILER, Pullman, Ill. Filed June 27, 1883. (Model.)



Claim.—1. The combination of the cup, the spring, and the follower having one or more recesses on its under side.

2. The combination of the cup, the spring, and the follower having a ratchet on the upper side, the ratchet-teeth having an equal angle, or such angle as will permit the nut to be screwed closely and unscrewed by the use of an ordinary wrench.

3. The combination, with a bolt, of the cup, the spring, and the follower having on its upper side serrations or teeth of equal angle on each side, combined with a nut having on its under side serrations or teeth of equal angle on each side, or of such angle as to permit the nut to be screwed and unscrewed with the use of an ordinary wrench, the serrations or teeth of each follower or nut in use reciprocally closely fitting together.

4. The combination, with a bolt, of the cup, the spring, and the follower having corrugations on its upper side, with a nut having corrugations on its under side, or each such side having some reciprocal depression or elevation of such character as will permit the operation of the same by the use of an ordinary wrench.

292,514. MOLDING STIFFENERS FOR BOOTS OR SHOES. NATHAN J. SIMONDS, Woburn, Mass. Filed Feb. 2, 1883. (No model.)

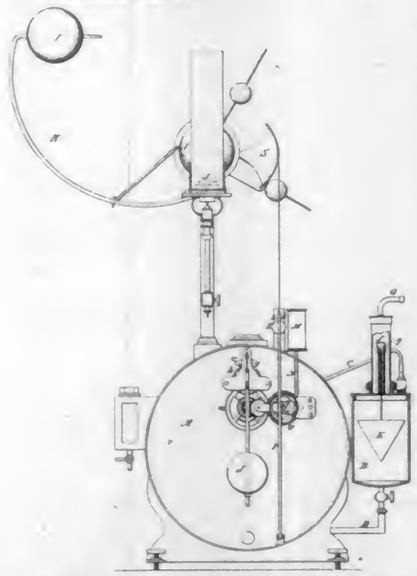
Claim.—1. The herein-described method of molding stiffeners, the same consisting in first subjecting them to pressure in molds adapted to act upon and compress the forward portion thereof, and then repeating such molding in dies adapted to mold the rear portion, and to set the stiffener in form with converging front ends, substantially as specified.

2. The combination of molds A and B, adapted to mold the forward portion of the stiffener, and provided with means for holding the stiffener in position, and the molds F G, adapted to mold the rear portion of such partially-molded stiffener, and to set the same with converging ends when held upon said male mold G, substantially as specified.

3. The combination of molds A and B, adapted to mold the forward portion of a stiffener, and means connected with mold B for holding the stiffener in position thereon, and mold A formed with a rear recess to receive such holding devices of mold B, substantially as specified.

4. In combination with mold B, the pivotal lever *h*, its stiffener-holding spring *i*, compression-screws *j j*, dislodging-pin *m*, with elastic buffers between the said screws and said lever-dislodging pin, and means for automatically actuating said pin and lever, substantially as specified.

5. The combination of molds F and G, adapted to mold and set the rear portion of the stiffener, and means connected with mold G for holding the stiffener in position thereon, mold F being formed with side recesses to receive such holding devices of mold G, substantially as specified.



6. In combination with mold G, the vibrating gripping-jaws *b*, with springs to enforce their contact with the stiffener, opening-pins *h'*, sliding pin *g'*, formed with inclines, to actuate pins *h'*, and means to automatically actuate said inclined pins *g'*, substantially as specified.

7. In combination with mold A and its supporting-pin *a*, the screw-nut *c*, threaded in head *b*, and interlocked with said pin by spline *d*, for raising and lowering said nut, substantially as specified.

8. A male and female mold shaped and adapted to mold the forward part of a heel-stiffener, and cut away or recessed at the rear part to form a break in the contour of the mold, whereby when said molds are brought together a space will exist between the male and female mold at the rear portion thereof, substantially as specified.

9. A male and female mold shaped and adapted to mold the rear part of a heel-stiffener, and cut away or recessed at the front part to form a break in the contour of the mold, whereby when said molds are brought together a space will exist between the male and female mold at the front portion thereof, substantially as specified.

292,515. PHOTOMETER. THOMAS O'CONOR SLOANE, Brooklyn, N. Y. Filed Jan. 31, 1881. (No model.)

Claim.—1. In an apparatus for determining the illuminating-power of gas, a differential thermometer constructed as described, and balanced and arranged in combination with a gas-meter, substantially as shown and described.

2. In an apparatus for determining the illuminating-power of gas, a differential thermometer contracted as described, and balanced and arranged so as to indicate changes in the relative quantity of radiant heat developed by a flame of gas, and transmit such changes to a recording mechanism, substantially as shown and described.

3. In an apparatus for determining the illuminating-power of gas, a differential thermometer balanced and arranged as described, in combination with an Argand burner, as and for the purposes shown and described.

4. In an apparatus for determining the illuminating-power of gas, a differential thermometer balanced and arranged to indicate the changes in the heat of the flame, and operated in combination with an Argand burner receiving gas from a meter provided with a governor which regulates the pressure and maintains an even flow of gas, substantially as shown and described.

5. In an apparatus for determining the illuminating-power of gas, the combination of a differential thermometer, balanced and arranged as shown, with the sliding nut *k*, carrying a needle arranged to receive the stroke of the spring-rod P, actuated by the cam O, all working together substantially as and for the purposes shown and described.

6. In combination with an Argand burner and a differential thermometer arranged in the manner shown, and a gas-meter provided with a regulating-escapement and pendulum, an auxiliary chamber connected with the water-space in a wet-meter by a pipe, D, at a point below the water-line, and also with the inlet of the meter by pipe C, or to the inlet and outlet of a dry-meter by tubes corresponding to C and D, such chamber containing a float adapted to open and close the inlet by its rise and fall, substantially as shown and described.

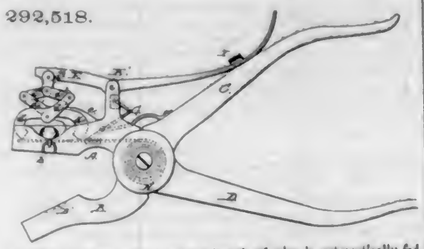
292,516. STAPLE OR FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Nov. 21, 1883. (No model.)

Brief.—The fastener is stamped out of sheet metal, with a curved shoulder projecting at each end.

Claim.—1. An improved sheet-metal staple or fastener consisting, essentially, of a base and two or more prongs integral therewith, and projecting from the base in substantially the same direction from the edge and in the plane of the said base, both of the said prongs being adapted to enter the material while they are in the plane of the said base, and to be subsequently bent or clinched, the metal composing said staple or fastener being of the strength and condition in which it existed in the sheet from which it was cut, and being without bends, all substantially as and for the purpose set forth.

2. The herein-described improved metallic staple or fastener, consisting of the base *a*, with two prongs, *b*, integral therewith, projecting from one edge thereof at points between the center and ends of the said base, to thereby provide the shoulders *a'* and afford three bearing-surfaces, a^2, the metal composing said staple or fastener being of the same strength and condition in which it existed in the sheet from which it was cut, all as shown, and for the purpose set forth.

292,517. COMBINED COLLAR-STUD AND CRAVAT-HOLDER. E SMITH STRAIT, Troy, N. Y. Filed June 30, 1883. (No model.)

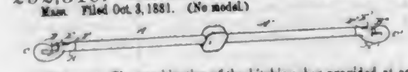


Claim.—In a collar-stud, the combination, with the shoe, shank, and a hinged head formed or provided with a perforation, of a spur or prong attached to the shank and adapted to enter the perforation in the head, substantially as and for the purpose set forth.

292,518. INSTRUMENT FOR ATTACHING BUTTONS TO FABRICS, &c. PARKER H. SWEET, Jr., Washington, D. C. Filed Feb. 2, 1883. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described setting-instrument for attaching buttons to fabrics, consisting of the jaws A B, adapted to be operated by the handles C D, and the upper jaw, A, of which is provided with a receptacle for receiving the button, a mechanism for feeding a length of wire through the shank of each button, and a mechanism for cutting off the length of wire and forming a fastener or connection therefrom, and the lower jaw, B, of the instrument being provided with a suitable die for bending or deflecting the prongs of said fastener into or upon the lower surface of the fabric, after passing through the same, all substantially as and for the purpose specified.

2. In a setting-instrument for attaching buttons to fabrics, the upper jaw, A, provided with the central recess, *a*, anvil *b*, curved openings *c*, feed mechanism G, and cutting and forming dies *d*, having arms *d' d'* and d^2 d^2, adapted to be operated by the lever E, pivoted to the arm F,

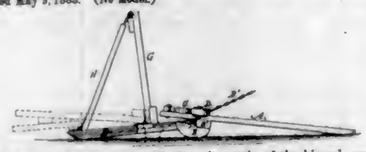


292,518.

of said upper jaw, and whereby a length of wire is automatically fed through the shank of the button, cut off, and formed into a fastener or connection during the operation of opening and closing the jaws of said setting-instrument, substantially as and for the purpose specified.

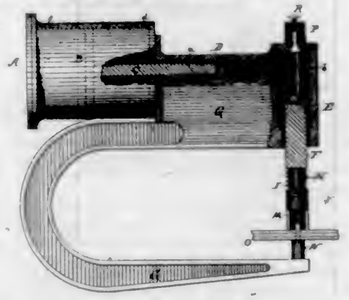
3. In a setting-instrument for attaching buttons to fabrics, the upper jaw, A, formed as described, and provided with mechanism whereby a length of wire is automatically fed through the shank of a button, cut off, and formed into a fastener or connection during the operation of opening and closing the jaws of said instrument, substantially as and for the purpose specified.

292,519. HORSE-HITCHING BAR. FREDERICK TAYLOR, Lowell, Mass. Filed Oct. 3, 1881. (No model.)



Claim.—1. The combination of the hitching-bar provided at each end with a snap-hook, and means, substantially as described, for simultaneously locking both of said snap-hooks by a single operation, as and for the purpose specified.

2. The combination, in a hitching-bar provided at each end with a hook, of two oppositely-sliding bolts and a locking mechanism adapted to be simultaneously engaged with or disengaged from both of said bolts, as and for the purpose specified.



3. The combination of the hitching-bar, provided with sliding bolts, with the bolts and springs of a lock, as and for the purpose specified.

292,520. HORSE HAY-RAKE. SOLOMON F. WEAVER, Portis, Kans. Filed May 9, 1883. (No model.)

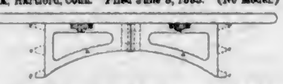
Claim.—The combination, with the rake-teeth, of the hinged rear runners, the folding or hinged frame G, and the braces H H, all arranged for operation together substantially as and for the purposes set forth.

292,521. HYDRAULIC RIVETING-MACHINE. WM. R. WEBSTER, Athens, Pa. Filed Aug. 29, 1883. (No model.)

Claim.—1. The herein-described direct-acting riveting-machine, consisting of the cylinders A, D, and E, plungers C and F, and snap H, all arranged and operating substantially as and for the purposes set forth.

2. The herein-described device for holding the work firmly while being riveted, consisting of the spring I and sleeve M, substantially as set forth.

292,522. RATCHET-DRILL. PARDON A. WHITNEY, Cleveland, Ohio. Filed Jan. 29, 1883. (No model.)

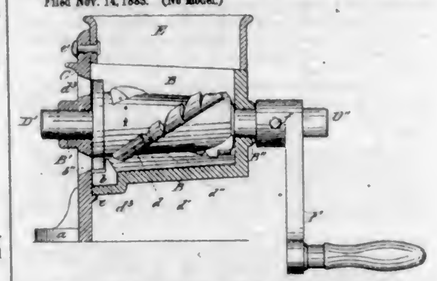


Claim.—1. The combination of the double screw-spindle J, having the intermediate head, J^4, with the threaded sleeve K and the head B, provided with a threaded socket for the lower end of the screw-spindle, all substantially as described.

2. Jointly with the head B, having the threaded socket, the interchangeable parts, screw M and double screw-spindle J, all substantially as described, and for the purpose set forth.

3. The combination of the revolving head B, provided with the wheel C, the handle *A*, socketed for the reception of said head and wheel, the ring D, and the pin E, substantially as described.

4. The combination of the handle A, provided with sockets for the ratchet C and pawl F, the head B, provided with the ratchet C, the pawl F, provided with a cylindrical bearing, and the ring and pin D E, by which the parts are secured in place, substantially as described.



292,523. BRACKET, SHELF, OR PICTURE SUPPORT. JAMES E. WEEKAM, Hartford, Conn. Filed June 8, 1883. (No model.)

Claim.—1. The within-described corner-shelf and picture-frame support, consisting of the two sections *a a*, the teeth *e* on the ends of the latter, and the hinge *b*, combined and operating substantially as set forth.

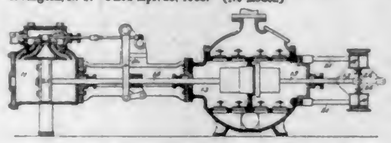
2. The combination, with a corner-shelf, of the sections *a a*, hinged together and provided with teeth on their ends and with the projections *c a*, substantially as set forth.

292,524. GRINDING-MILL. FRANK WILSON, Easton, Pa., assignor of two-thirds to John L. Wilson and James E. Wilson, both of same place. Filed Nov. 14, 1883. (No model.)

Claim.—1. The combination, with the shells of a grinding-mill, of a central crushing-tooth placed in the lower portion of the shell and projecting upwardly to a considerable distance above the plane of the upper extremities of the serrations upon the contiguous inner surface of the lower portion of the shell.

2. The combination, with the shell of a grinding-mill, the inner surface of which is provided with a series of serrations, of a central crushing-tooth located at the bottom of the discharging end of the shell and projecting upwardly above the general surface of the interior bottom portion of the same.

3. The combination, with the shell of a grinding-mill, of a crushing-tooth which is centrally located in the bottom of the shell, at one end thereof, and a revoluble cone which is provided with crushing arms or teeth which are adapted to move unground material against the centrally-located crushing-tooth.



4. The combination of a grinding-shell which has interior serrations, and an upwardly-projecting tooth, with a revoluble cone which has spiral grinding-ridges and end crushing arms or teeth.

5. The combination, in a grinding-mill, of a shell the interior surface of which is provided with a series of serrations and an end crushing-tooth, and the larger end of which is provided with a disk which has a series of discharge-openings, with a revoluble grinding-cone, which has upon its sides spiral ridges and upon its larger end crushing arms or teeth, substantially as described.

6. The combination, with the shaft or journal of a grinding-mill, of a detachable disk, such disk being provided with cutting-surfaces and with outwardly-enlarging orifices, through which the ground material is ejected when the mill is in operation.

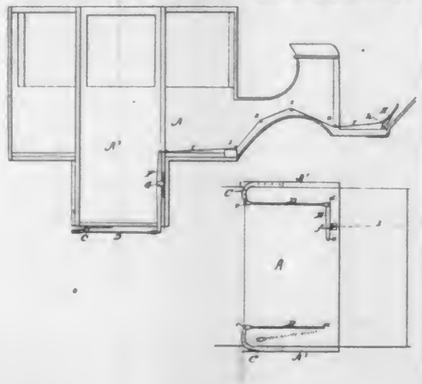
7. The combination, in a grinding-mill, of a shell the interior surface of which has a series of serrations, a revolable cone which has spirally-arranged ridges and end crushing arms or teeth, and a disk which has outwardly-enlarging discharge-orifices.

292,525. DUPLEX PUMPING-ENGINE. CHARLES C. WORTHINGTON, Irvington, N. Y. Filed Apr. 28, 1883. (No model.)

Claim.—1. The combination, with a duplex pumping-engine provided with means whereby the inlet and exhaust valve or valves of one side thereof is or are operated by the other side, of means, substantially as described, whereby power is stored up at one and utilized at another period of the stroke of each side of said engine without preventing the variable pause at the end of each stroke peculiar to this engine.

2. The combination, with the main cylinders and pistons forming the two sides of a duplex pumping-engine, provided with means whereby the inlet and exhaust valve or valves of one side thereof is or are operated by the other side, of a compensating cylinder or cylinders at each side of said engine, each provided with a piston and rod and supplied with a suitable motor-fluid, and acting in opposition to the main cylinder and pistons to which they are connected during the first part of the stroke of said main pistons and in conjunction therewith during the last part of their stroke, substantially as described.

3. The combination, with the main cylinders and pistons forming the two sides of a duplex pumping-engine, provided with means whereby the inlet and exhaust valve or valves of one side thereof is or are operated by the other side, of a compensating cylinder or cylinders at each side of said engine, each provided with a piston and rod and supplied with a suitable motor-fluid, and acting in opposition to the main cylinders and pistons to which they are connected during the first part of the stroke of said main pistons and in conjunction therewith during the last part of their stroke, and a cut-off mechanism, substantially as described.



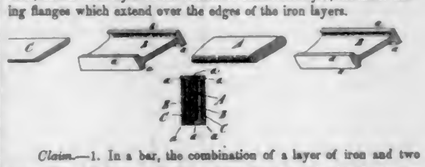
4. The combination, with a main cylinder and piston, of one or more compensating cylinders and pistons and means for regulating the pressure of the fluid admitted to said compensating cylinder or cylinders, substantially as described.

5. The combination, with a main cylinder and piston, of one or more compensating cylinders and pistons, a tank, as 4, means for regulating the pressure of the fluid in said tank, and connections, substantially as described.

6. The combination, with a cylinder, as 18, provided with a piston, and means for maintaining a constant pressure upon one side of said piston, of means for permitting the ingress and egress of a fluid from the opposite side of said piston in such manner as to cushion said piston when it exceeds its normal speed, substantially as described.

292,526. DEVICE FOR CLOSING CARRIAGE-DOORS. HARVEY W. YONLEY, Denver, Colo. Filed Sept. 3, 1883. (No model.)

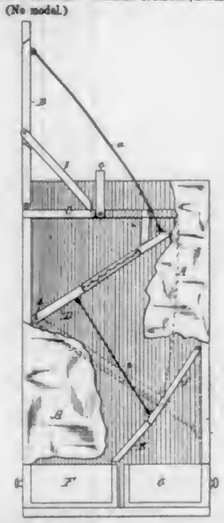
Brief.—Carriage-doors have arms attached thereto. At the ends of the arms are pivoted bars which are coupled to a lever pivoted to the bottom of the carriage-body. To said lever is coupled another lever, which is pivoted to said body, and to which is attached a cord which passes forward, resting on rollers, and is attached to a foot-lever at the driver's seat.



Claim.—1. In devices for closing carriage-doors, the combination, with the carriage-doors A', having the arm C attached thereto, of the bar D, lever E, the lever F, hinged to the carriage-body, and the cord I, extending from the lever F to and attaching with the foot-lever H, substantially as set forth and described.

2. The herein-before-described device for closing carriage-doors, consisting of the arm C, the bar D, the levers E and F, the cord I, the rollers 1, 2, 3, and 4, and foot-lever H, all arranged as described, and for the purpose specified.

292,527. JAIL-BAR. LEVI D. YORK, Portsmouth, Ohio. Filed Apr. 18, 1883. (No model.)



Brief.—Consists of a layer of iron inclosed between two layers of steel, and an iron layer on the outside of each steel layer, the latter having flanges which extend over the edges of the iron layers.

Claim.—1. In a bar, the combination of a layer of iron and two layers of steel fitting outside the said iron layer, and having flanges extending over the edges of the iron layer, substantially as specified.

2. In a bar, the combination of a layer of iron, two layers of steel fitting against the said iron layer, and two iron layers fitting against the outer sides of the steel layers, the said steel layers having flanges which extend over the edges of the said iron layers, substantially as specified.

292,528. ASH-SIFTER. WILLIAM T. ADAMS, Baltimore, Md. Filed June 1, 1883. (No model.)

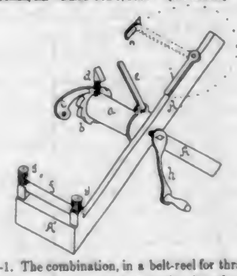
Claim.—1. A box having a lid hinged to one edge of its top and a brace to hold said lid up, in combination with a sieve hinged at one edge within the box, a rod connecting the free edge of the sieve with the free edge of the box-lid, and two drawers in the lower portion of the box, one drawer beneath the sieve to receive ashes falling through it, and the other drawer in position to receive coal sliding from the sieve, as and for the purpose specified.

2. A box having a stationary top, a hole therein, and a lid covering the hole, in combination with a lid hinged at one edge of the box to close upon the said box-top, a brace to hold said lid raised, a sieve within the box, hinged at one edge thereto, a rod connecting the free edge of the sieve with the free edge of the lid, to hold the front edge of the sieve raised when the lid is raised, and to lower the sieve by lowering the lid, a drawer in the bottom of the box, beneath the sieve, to receive ashes falling through it, and another drawer in the bottom of the box to receive the coal sliding from the edge of the sieve when the same is lowered, as specified.

3. A box provided with a hinged lid, a sieve hinged at one edge within the box, and a rod connecting the free edge of the sieve with the free edge of the lid, in combination with a slanting shelf or spout beneath

the sieve, a portion of the bottom of said spout hinged at its upper edge, and a rod connecting the free edge of said hinged portion of the spout with the sieve, whereby raising the lid will raise the sieve and the hinged portion of the spout in position to receive coal and ashes upon the sieve, and to turn in one direction the ashes falling through, and lowering or closing the lid will lower the sieve and the hinged portion of the spout and discharge the coal from the sieve in a place separated from the ashes, as specified.

292,529. ELECTRICAL TRACTION-MOTOR. WILLIAM E. AYRTON and JOHN PERRY, London, England. Filed Apr. 18, 1883. (No model.) Patented in England July 17, 1882, No. 3,380.

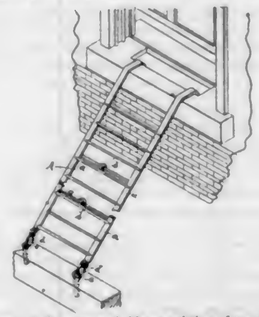


Brief.—The pull of the load is made to tighten the grip of the traction-wheels by means of toggle and scissor levers.

Claim.—1. In an electrical traction-motor, the combination of a known rotary electrical motor and suitable gearing and gripping traction wheels with levers or links and a hauling bar or bars, so that the traction-grip is proportional to the hauling-load, substantially as herein described.

2. In an electrical traction-motor, the combination of a known rotary electrical motor, suitable gearing and gripping wheels, and a pair of inclined spring-pressed tail-levers automatically gripping fast the rail, rod, or rope when the travel of the motor is forcibly reversed, substantially as herein described.

292,530. BELT-REEL FOR THRASHING-MACHINES. LEANDER P. BARNES, Orsana, Ill. Filed Oct. 8, 1883. (No model.)

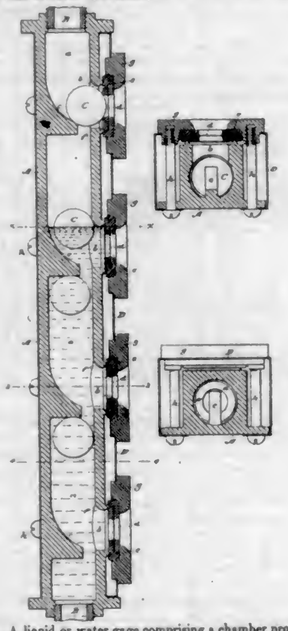


Claim.—1. The combination, in a belt-reel for thrashing-machines, of frame A, drum *a*, clamp *e*, catch *d*, ratchet *b*, and pawl *c*, as and for the purpose set forth.

2. The combination of frame A, reel *a*, clamp *e*, and rollers *f* and *g g*, as and for the purpose set forth.

3. The combination with frame A, reel *a*, clamp *e*, and ratchet and pawl *b c*, of lock-bar *i*, as and for the purposes set forth.

292,531. FIRE-ESCAPE LADDER. ANDREW J. BARTLETT, Elk Flat, Oreg. Filed Oct. 2, 1883. (No model.)



Brief.—A ladder made of flat metallic side pieces and double wire rungs, and having hooks at its lower end for fastening it to the street-curbing.

Claim.—1. A fire-escape ladder consisting of two flat leather or metallic side pieces, *a a*, attached to and rolled around the shaft or roller *f*, which is secured in a receptacle opening through the window-sill, said side pieces being connected by a series of double wire rungs, and the lower end of each side piece having attached a snap-hook arranged to fasten in a ring secured to the curbing of the street, all as described.

2. The combination of the shaft or roller *f*, secured in a receptacle opening through the window-sill, said shaft being provided with a removable crank, with the side pieces, *a a*, the double wire rungs or steps *b*, the snap-hooks *d*, and the attaching-rings *e*, the latter secured in the street-curbing, all substantially as described.

292,532. LIQUID OR WATER GAGE. EUGENE BIDDS, Paterson, N. J. Filed June 16, 1883. (No model.)

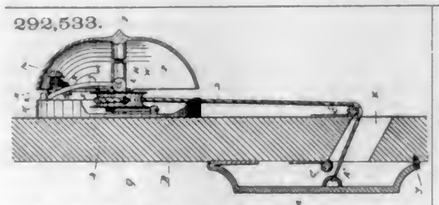
Claim.—1. A liquid or water gage comprising a chamber provided with sight-holes in its face covered with some transparent material, floats arranged in said chamber, one for each sight-hole, and means, substantially as described, for confining these floats each to its proper section of said chamber, substantially as set forth.

2. A liquid or water gage comprising a chamber, A, provided with a bore, *a*, sight-holes *b*, and deflectors *c*, the transparent plates or disks *d*, arranged over said sight-holes, and floats C, all constructed and arranged to operate substantially as set forth.

3. The combination, in a liquid-gage, of the chamber A, provided with sight-holes, deflectors, and sharp-edged seats *f*, the floats, the transparent plates *d* and their soft-metal frames, the annular frames *g*, and the securing-screws, all constructed and arranged substantially as described.

4. The chamber A of the gage, provided with deflectors *c*, having curved or inclined upper faces to deflect or guide the float up to the transparent plate over the sight-hole, substantially as set forth.

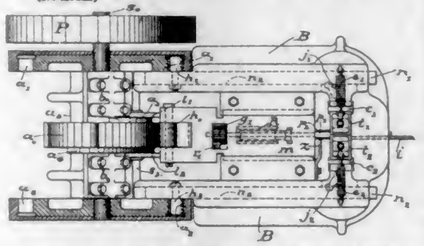
5. The chamber A of the gage, provided with means, substantially as described and shown, for confining the floats each to its proper section of said chamber, and for guiding each float, when acted on by gravity, up to the transparent plate which covers the sight-hole, substantially as set forth.



6. A liquid-gage provided with a sight-hole covered with a transparent material, a spherical float, and a frame or margin around said sight-hole, constructed as a valve-seat, to receive the float in case the transparent plate is accidentally broken, substantially as set forth.

292,533. LETTER-BOX. JOSEPH B. BROOKS, Oswego, N. Y. Filed May 17, 1883. (No model.)

Claim.—1. In combination with a door, B, having slot E, the hinged plate A, having eye A', cord D, and friction-pulleys C C', and wheel W, adapted to operate the striking devices, as shown and described.



2. In a letter-box, the door B, having slot E, the hinged plate A, having eye A', the cord D, attached at one end to eye A' and at the other to wheel W, having pin *w*, adapted to engage with pivoted arm S and operate the hammer G, the whole in combination, as described, and for the purposes set forth.

292,533.

3. In a letter-box, the door B, having slot E, provided with friction-rollers C C', hinged door-plate A, having eye A', in combination with cord D, wheel W, pin *w*, spring Q, and stud P, as described, and for the purposes set forth.

292,534. BOLT-HEADING MACHINE. JOHN BRUDERER, New York, N. Y., assignor to George W. Fowkes, Harrisburg, Pa. Filed Apr. 25, 1883. (No model.)

Claim.—1. The combination, substantially as shown and described, of the mechanism for forming, with a single stroke, a conical-shaped head and enlarged round shank for bolts, and the mechanism for changing the planes of elevation of said matrices, to enable them to act successfully in upsetting and squaring the enlarged round shank, the whole combined with the mechanism for giving a quarter-turn to the plunger carrying the bolts preparatory to the second squaring thereof.

2. In a bolt-heading machine, the combination, substantially as shown and described, of the shaft a_5, cams a_6, a_7, and a_8, cushion-roller h_5, slide m, plunger p_1 p_2, gear-wheel g_2, rack-bars r, r_2, levers l, l_5, roller l_6, pulley R, and weight W.

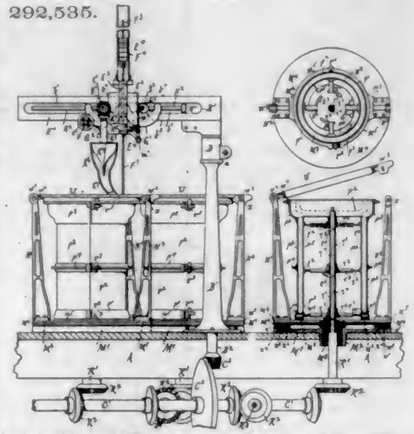
3. In a bolt-heading machine, shaft a_5, cams a_6, a_7, rollers h, h_5, slide-bars n, n_2, toggle-joints j_1 j_2, intermediate pieces, c_1 c_2, springs c, c_3, and supports B B.

4. The combination, substantially as shown and described, of shaft a_5, pulley P, cams a_6 a_7, rollers h, h_5, slide-bars n, n_2, toggle-joints j, j_2, intermediate pieces, c_1 c_2, springs c, c_3, cams a_6 a_7 a_8, roller h_5, slide m, plungers p_1 p_2, gear-wheel g_2, shaft a_5, levers l, l_5, and bed-plate B of a bolt-heading machine.

5. The combination, substantially as shown and described, of pulley P, shaft a_5, cams a_6 a_7, rollers h, h_5, slide-bars n, n_2, toggle-joints i, i_2, matrices or dies d, d_2, springs c, c_3, cam-shafts s_1, and bed-plate B of a bolt-heading machine.

6. The combination, substantially as shown and described, of the pulley P, shaft a_5, bearings b, b_5, cams a, a_2, rollers h, h_5, slide-bars n, n_2, toggle-joints j, j_2, push-pieces c_1 c_2, springs c, c_3, matrices or dies d, d_2, tongue t, t_2, cam-shaft s_1, gear-wheel g_2, rack-bars r, r_2, gear-wheel g_2, levers l, l_5, shafts a, roller l_6, cams a_6 a_7 a_8, roller h_5, slide m, plunger p_1 p_2, stop s, pulley R, weight W, and bed-plate B, all forming a complete machine.

292,535. SEWER-PIPE MACHINE. JOHN ROLAND BURDICK and WILLIAM H. DAVIS, Minneapolis, Minn. Filed Feb. 21, 1883. (No model.)



Claim.—1. The combination of a rotary mold adapted to receive plastic material for forming pipe, means for rotating the mold on its axis, and a tamping-bar having a rising and falling movement and radial and circular adjustments, substantially as and for the purpose herein specified.

2. The combination of a rotary mold for receiving plastic pipe-forming material, means for rotating the mold on its axis, means for automatically feeding the plastic material into the mold, and a tamping-bar having a rising and falling movement and radial and circular adjustments, substantially as and for the purpose specified.

3. The combination of a rotary mold for receiving plastic pipe-forming material, means for rotating the mold on its axis, a rising and falling tamping-bar, and revolving segmental cams G' G², adapted to alternately lift the tamping-bar and to let it drop upon the pipe-forming material in the mold, substantially as specified.

4. The combination of a rotary mold for receiving plastic pipe-forming material, means for rotating the mold on its axis, a tamping-bar

292,535.

having a rising and falling movement, a feeding spout or case, K³, adjustable in position over the mold, a screw-feeder, K⁴, and means for rotating the said feeder, substantially as herein specified.

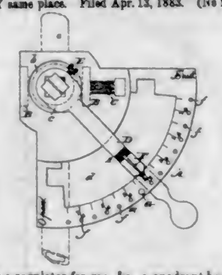
5. The combination of two or more rotary molds adapted to receive plastic pipe-forming material, means for rotating each mold, a standard equidistant from the several molds, a frame revolving on the standard and carrying the tamping-bar, and a rising and falling tamping-bar having an adjustment upon the carrying-frame toward and from the supporting-standard, for the purpose specified.

6. The combination, with two or more molds adapted to receive plastic pipe-forming material, means for revolving said molds, an upright standard, B', equidistant from all of said molds, a horizontal frame, E', adapted to revolve upon said standard as a center, a plate, E², adapted to slide upon said horizontal frame, segmental cams G' G², means for revolving said cams, and a tamping-bar, F', held loosely upon said plate E², and adapted to be raised upward by said cams and allowed to fall of its own weight, substantially as described.

7. The combination, with two or more molds adapted to receive plastic pipe-forming material, means for revolving said molds, an upright standard, B', equidistant from all of said molds, a horizontal frame, E', adapted to revolve upon said standard as a center, a plate, E², adapted to slide upon said horizontal frame, segmental cams G' G², means for revolving said cams, a tamping-bar, F', held loosely upon said plate E², and adapted to be raised upward by said cams and allowed to fall of its own weight, and a brake adapted to be applied to said tamping-bar at the end of its upward stroke, substantially as and for the purpose set forth.

8. The combination, with two or more molds adapted to receive plastic pipe-forming material, means for revolving said molds, an upright standard, B', equidistant from all of said molds, a horizontal frame, E', adapted to revolve upon said standard as a center, a plate, E², adapted to slide upon said horizontal frame, segmental cams G' G², means for revolving said cams, and a tamping-bar, F', held loosely upon said plate E², and adapted to be raised upward by said cams and allowed to fall of its own weight, and a screw-feeder, K⁴, substantially as and for the purpose set forth.

9. The combination, with two or more molds adapted to receive plastic pipe-forming material, means for revolving said molds, an upright standard, B', equidistant from all of said molds, a horizontal frame, E', adapted to revolve upon said standard as a center, a plate, E², adapted to slide upon said horizontal frame, segmental cams G' G², means for revolving said cams, and a tamping-bar, F', held loosely upon said plate E², and adapted to be raised upward by said cams and allowed to fall of its own weight, a guide-tube, E⁴, and weights F⁴, substantially as and for the purpose specified.

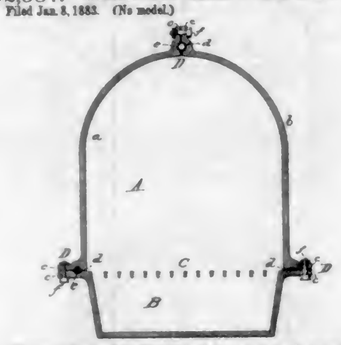


10. The combination, with the mold adapted to receive plastic pipe-forming material, of a central sheet-metal core, I², adapted to be expanded or contracted, fixed tube T', having slots t^5, stationary disks T², provided with grooves t', and disks T³, having cam-slots t^3, and spurs t^4, substantially as set forth.

11. The combination of the stationary base-plate M', provided with a lubricating-channel at its outer edge and a sleeve, M², at its center, a revolving plate, M⁴, having a hub, M³, fitting into said sleeve, a mold adapted to receive plastic pipe-forming material, standards N' N², and ring U, substantially as specified.

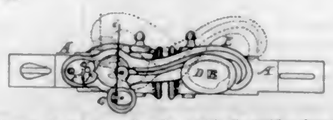
12. The combination of a mold adapted to receive plastic pipe-forming material, a tamping-bar, F', and removable shoe F², substantially as and for the purpose set forth.

13. The combination of a revolving mold for forming oval and irregular shaped pipe, a rising and falling tamping-bar, and means, substantially as described, for giving the mold a rotary movement accurately beneath the tamping-bar in every part of the revolution, for the purpose specified.



292,536. REGULATOR FOR GAS AND WATER. ABRAHAM E. COHN, Philadelphia, Pa., assignor of one-third to Levi Simon and Edwin S. Simon, both of same place. Filed Apr. 12, 1883. (No model.)

Claim.—1. In a regulator for gas, &c., a quadrant having a circular row of openings and the key or lever operating the plug of the cock, in combination with a removable pin, G, substantially as and for the purpose set forth.



2. A regulator for gas, &c., consisting of a quadrant with a graduated rim and attaching-lugs, a securing-screw, a lever or key, an index, and a removable pin, said lever having its handle end and the connected index on opposite sides of the rim of the quadrant, and said rim having a circular row of openings for said pin, substantially as and for the purpose set forth.

292,537. FURNACE-JOINT. EZEKIEL C. CONDIT, Kansas City, Mo. Filed Jan. 8, 1883. (No model.)

Claim.—In combination with the parts *c*, each formed with a groove, *e*, a rod, *d*, of impressible material of a thickness greater than the joint depth of said grooves, and seated therein, and the bolts *f*, arranged as shown, to draw the parts firmly against the interposed rod, said rod being formed of a material more expansible under heat than the bolts *f*.

292,538. CAR-COUPLING. JOHN COUP and DAVID MCCURDY, Cleveland, Ohio, and WILLIAM B. REES, New York, N. Y. Filed Oct. 1, 1883. (Model.)

Claim.—1. In a car-coupling, the combination, with a draw-head adapted to be coupled with the ordinary link and pin, of a rotating shaft provided with eccentrics C C', and a pallet, D, for operating a coupling-hook, substantially in the manner and for the purposes specified.

2. In a car-coupling having a draw-head adapted to be coupled with the ordinary link and pin, and provided with a rotating shaft having the eccentrics and pallet placed in the manner shown, of a coupling-hook arranged to be operated by said shaft and eccentrics, and to engage with a pallet on an opposite draw-head, substantially as and for the purpose specified.

3. In car-couplings, a coupling-hook having rear projection provided with crom-pin *e* and latch or pawl F, said pin engaging with inclined guide A inside of draw-head, for holding or retaining the hook in an elevated or depressed position, as and for the purpose specified.

4. The guide A in the side of the draw-head, for adapting same for operating in conjunction with coupling-hooks in making coupling in cars varying in height, as specified.

5. In car-couplings, the combination, with the rotating shaft, of a pear-shaped crank having pivoted wheel or ellipse carrying a vertical rod for operating the coupler from top of car, as described.

6. The combination, with the rotating shaft, of the ring *j*, having lips or socket for adapting the said shaft to manipulate a link in making a coupling with an ordinary link-and-pin coupling, or car not having car-coupler attached.

292,539. ELECTRIC CONDUCTOR. ALFRED A. COWLES, New York, N. Y., assignor to the Ansonia Brass and Copper Company, Ansonia, Conn. Filed Oct. 22, 1883. (No model.)

Claim.—1. The combination, in a cable, of two or more electric conductors, each having a wrapping of adhesive water-proof tape, and a braiding or winding outside the same, and a wrapping of adhesive water-proof tape around the covered conductors to bind them together, substantially as set forth.

2. The combination, with two or more electric conductors, each having a wrapping of adhesive water-proof tapes, of cords or strings laid at each side of the line of contact between the coverings of the conductors, and a wrapping or winding outside of and around the covered conductors and strings, substantially as set forth.

3. The combination, with two metallic wires, each having a fire and water proof insulating covering, of a wrapping of water-proof insulating material to bind the two conductors together, as set forth.

4. The combination, in a cable, of two conductors, insulating fire and water proof material for the same, an external covering of adhesive tape, a winding of threads around the same, and adhesive material to unite the parts, substantially as set forth.

5. The combination, in a cable, of two conductors, insulating material for the same, filling-cords, a covering of adhesive tape around the same, an exterior covering of thread and adhesive water-proof material applied to the covering, as set forth.

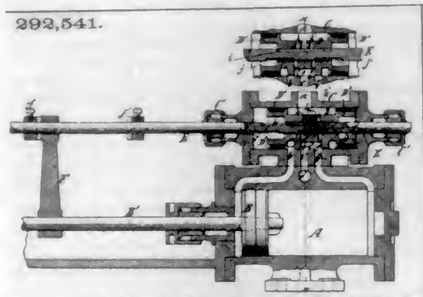
6. The combination of a conducting-wire, a wrapping of adhesive water-proof tape upon the same, and a winding or braiding upon such wrapping, whereby the wrapping is pressed into intimate contact with the wire, and the winding or braiding adheres to the adhesive wrapping, substantially as set forth.

7. The combination, in an electric conductor, of a winding or braiding of threads, a wrapping upon the same of adhesive water-proof tape, and a winding or braiding of threads outside the tape, substantially as set forth.

8. The combination, in an electric conductor, of a winding or wrapping of adhesive water-proof material, a winding or braiding of threads upon the same, and a second wrapping of adhesive water-proof strips or tapes, substantially as set forth.

9. The combination, in an electric conductor, of a winding or wrapping of adhesive water-proof material, a winding or braiding of threads upon the same, a wrapping of adhesive water-proof tape, and an exterior braiding or winding of threads, substantially as set forth.

292,540. PROCESS OF TINNING SHEET-COPPER. ALFRED A. COWLES, New York, N. Y., assignor to the Ansonia Brass and Copper Company, Ansonia, Conn. Filed Nov. 9, 1883. (No specimens.)



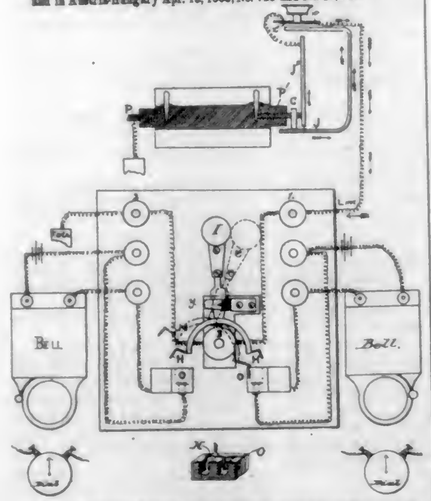
Brief.—Protects side not intended to be tinned with silicate of soda.

Claim.—The process herein specified of tinning sheet-copper, consisting in coating one surface of such copper sheet with a material that will not be materially injured by the action of the heat made use of, and which will exclude the air, pouring melted tin or other metal over the sheet, allowing the surplus to run off, and spreading the tin or coating metal and rendering the same uniform by a rubbing operation, and then removing the protecting-coating from the untinned side of the copper, substantially as specified.

292,541. STEAM-ACTUATED VALVE. WILLIAM CRAIG, Brooklyn, N. Y. Filed May 9, 1883. (No model.)

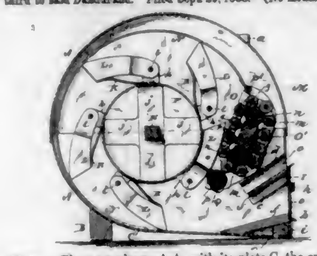
Claim.—1. The combination, with the auxiliary cylinder C, the aux-

292,541.



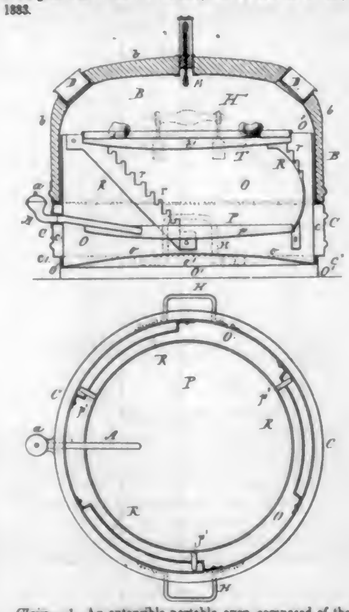
illiary pistons D' D², fitting the bore of said cylinder, and the main valve D, interposed between said pistons, said pistons and valve being constructed with a central bore or aperture, and with a port, *k*, or ports *k k'*, leading from the induction-space of the chest, and ports *l l'*, leading from the exhaust-cavity of the valve to said aperture or bore, of the auxiliary valve working through said main valve and pistons, and constructed with grooves which form ports, for establishing communication between the ends of the auxiliary cylinder and the said ports in the main valve, substantially as and for the purpose herein described.

2. The combination of the auxiliary cylinder C, the main valve and auxiliary pistons D D' D², constructed with a port, *k*, or ports *k k'*, and ports *l l'*, and the auxiliary valve E, constructed with the long port *i* and the two shorter ports *j j'*, all substantially as and for the purpose described, whereby communication is afforded between the ends of the auxiliary cylinder, the live-steam space, and the exhaust-cavity of the main valve through the said ports in the main valve and auxiliary pistons and the said ports in the auxiliary valve, and without the necessity of ports or passages through the auxiliary cylinder C.



3. The combination, with an auxiliary cylinder and a main valve and auxiliary pistons working therein, of an auxiliary valve working through the main valve and said pistons, to control the admission of a motive agent to the ends of said auxiliary cylinder and its exhaust therefrom, the portions of the auxiliary valve which work through the ends of said cylinder being of smaller diameter than the portion within the cylinder, so as to form the shoulders *o o'*, substantially as and for the purpose described.

292,542. ELECTRIC SIGNALING APPARATUS. LOUIS JOHN CROMLEY and WALTER EMMOTT, Halifax, and JOHN FREDERIC HARRISON, Bradford, County of York, England. Filed Nov. 6, 1882. (No model.) Patented in England Apr. 27, 1882, No. 1,328; in France Sept. 16, 1882, No. 151,123; in Italy Sept. 30, 1882, XVI, 14,664, XXIX, 192; in Belgium Oct. 9, 1882, No. 59,224; in Victoria Nov. 29, 1882, No. 3,356; in New South Wales Jan. 19, 1883, No. 1,133; in Spain Apr. 11, 1883, No. 3,743, and in Austria-Hungary Apr. 13, 1883, No. 725 and No. 15,120.



Claim.—The combination, in a telephonic-exchange system, with the axis or spindle of the revolving coil or coils of a magneto-electric call-bell apparatus, of one or more cams, pins, or the like, key K, and its springs J and J'', whereby, in addition to the ordinary call-signal, a distinct and separate signal may be transmitted to advise the exchange-operator that the wires are free, substantially as hereinbefore described.

292,543. QUARTZ-CRUSHING MACHINE. CYPRIEN DANDURAND and LOUIS M. LAFRANCE, Virginia City, Nev.; said Lafrance assignor of one-third to said Dandurand. Filed Sept. 29, 1883. (No model.)

Claim.—The outer drum, A A, with its plate C, the cylinder F, the rotary arms L L L, and the springs K K, in combination with the endless chains of rollers O O, the rollers *m m*, the rollers Q Q, and the frame M, as hereinbefore described, and for the purposes set forth.

292,544. PORTABLE OVEN. LÉON DAUBE, Paris, France. Filed Jan. 10, 1883. (No model.) Patented in France Jan. 31, 1882, No. 147,130; in Belgium Feb. 5, 1883; in Germany Jan. 5, 1883, and in Italy Jan. 5, 1883.

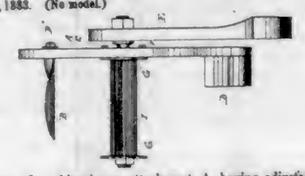
Claim.—1. An extensible portable oven composed of the body of the oven, a cover for the same, and one or more sections adapted to be interposed between the cover and body of the oven and form an air-tight structure, substantially as and for the purposes specified.

2. An extensible portable oven composed of the body of the oven, a cover therefor, and one or more sections adapted to be interposed between the body and cover and form an air-tight and non-radiating structure, substantially as described, for the purposes specified.

3. In a portable oven, the combination, with the body of the oven, provided with an exterior flange or seat for a cover, racks to support the material treated, and a cover, of one or more removable sections adapted to be interposed between said oven and its cover, said parts having their walls provided with a suitable non-conductor of heat, and constructed to form a practically air-tight structure, substantially as and for the purposes specified.

4. In a portable oven, the combination, with the oven proper, provided with racks R, of a pan for supporting the material treated, and a heat-deflecting plate, both adjustable vertically upon the racks of a cover, and one or more removable sections adapted to be interposed between said cover and the oven, substantially as and for the purposes specified.

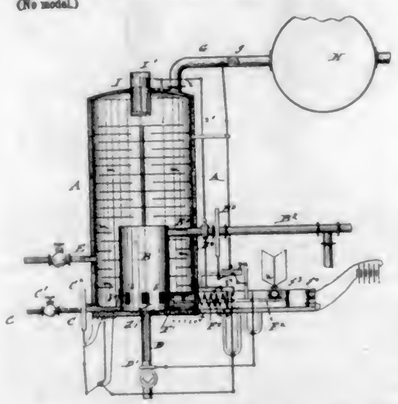
5. In a portable oven, the combination, with the oven proper, a removable cover therefor, and the support for the material treated, of a heat-deflecting plate adjustable toward and from said support between it and the source of heat, substantially as and for the purposes specified.



6. In a portable oven, the combination of a cover provided on its surface with a coating of a non-conducting material, with the oven O, provided with an exterior dead-air chamber constructed to form a seat for said cover, substantially as described.

7. In a portable oven, the oven-body O and the removable cover B thereof, said oven-body having an exterior dead-air chamber constituting the seat for said cover, in combination with a deflecting-plate, P, arranged within the oven, a steam-pipe to inject steam upon said plate, and a pan, T, said parts being arranged for co-operation, substantially as and for the purposes specified.

8. In a portable oven, the combination of the oven proper, O, having a dead-air chamber constructed to form the seat for the cover, a double-walled cover, B, filled with a non-conducting material, having peep-holes D, and a thermometer, E, and means, substantially such as described, for supporting a pan or pans, all arranged for co-operation substantially as described, for the purposes specified.



9. The combination, with the oven O B, provided with supporting-racks, of a pan and a heat-deflecting plate adjustable vertically within the oven, and having flanges projecting beyond their bottoms to form heat-collecting recesses, substantially as described, for the purposes set forth.

292,545. BICYCLE. WILLIAM H. DAVIS, Glens Falls, N. Y. Filed July 9, 1883. (No model.)

Claim.—In a bicycle, an attachment, A, having adjustable toplift B and balance-weight D, substantially as described, and for the purposes set forth.

292,546. METHOD OF AND APPARATUS FOR GENERATING STEAM. GEORGE DIECKMANN, New York, N. Y. Filed Apr. 12, 1883. (No model.)

Claim.—1. The method herein described of generating steam, which consists, first, in subjecting a body of water to the action of successive explosions of a suitable air and gas mixture, raising the temperature and transforming the water into steam by the heat generated by said explosions and their products of combustion, and conducting then the steam so generated, at intervals between the explosions, to a separate accumulating or storage vessel and from the same to the engine or other place of use, substantially as and for the purpose specified.

2. The combination of a generator, a valved explosion-chamber at the interior of said generator, means for supplying gas and air in proper quantities to said explosion-chamber, means to ignite said gas and air mixture, means to discharge the products of combustion from the explosion-chamber, means to regulate the pressure in the generator, a steam accumulating or storage vessel, and means by which the steam is conducted at intervals between the explosions to said accumulator, substantially as set forth.

3. The combination of a generator, A, having a water-supply pipe, E, a valved interior explosion-chamber, B, a valved gas-supply pipe, C, leading into the explosion-chamber, a valved air-pipe, D, also leading into the explosion-chamber, a valved eduction-pipe, B² B³, leading from the explosion-chamber to a feed-water heater or other apparatus, a pressure-regulating gravity-valve, I, a valved steam-conducting pipe, G, an accumulator, H, and devices whereby the valves of the different supply and eduction pipes are actuated to secure the proper working of the apparatus, substantially as set forth.

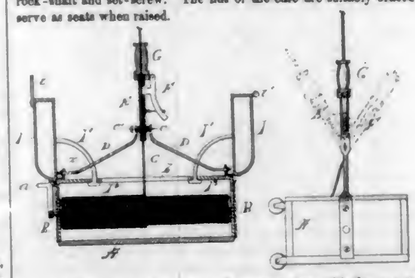
292,547. BILLIARD-TABLE ATTACHMENT. JAMES DOCKSTADER, Syracuse, N. Y. Filed Sept. 24, 1883. (Model.)

Claim.—1. In a billiard-table attachment, the combination of a bar adapted to cross the entrance of a pocket, a bolt seated below the top of the bar, and a hook adapted to embrace the bolt and the hoop of the pocket, substantially as specified.

2. In a billiard-table attachment, the combination of a bar, a bolt having wings, and a hook bent or arched to give space for the rotation of the wings, substantially as specified.

3. In a billiard-table attachment, a bar provided with flanges at its top and bottom for receiving a cushion or cushion-sections, the bar being formed in one piece, substantially as specified.

4. The bar A, consisting of the back *a*, bottom *a'*, ribs *a²*, top *a³*, and extensions *a⁴*, the whole formed in a single casting, substantially as specified.



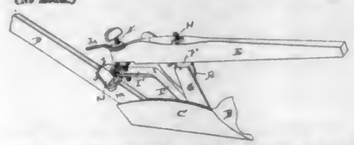
5. The combination of the bar A, formed in one piece, and slotted, as at *a²*, with the cushion-sections D and screws *d*, substantially as specified.

6. The combination of the bar A, bolt B, and the arched hook C, substantially as shown and described.

7. The combination of the bar A, having the ribs *a²*, the extensions *a⁴*, slotted, as described, the cushions F D, the bolt B, having wings *b*, the hook C, having the bend *c*, and the hoop E, substantially as shown and described.

292,548. FIRE-ESCAPE. HENRY E. DORER, Grand Rapids, Mich. Filed Apr. 27, 1883. (No model.)

Brief.—The friction-sleeve is provided with a pressure-clamp and a fastening-loop, and is adjustably connected to the arms by a collar or rock-shaft and set-screw. The lids of the case are suitably braced to serve as seats when raised.



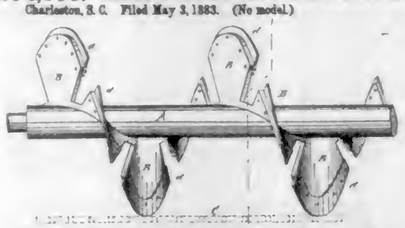
Claim.—1. In a fire-escape, the combination, with the receptacle and rope or cable, of the sleeve and its collar or rock-shaft adapted to move independently of the bail of the receptacle, substantially as and for the purpose set forth.

2. In a fire-escape, the combination, with the rope or cable sleeve, of the pressure-brake having a notched lever pivoted to the said sleeve and provided with a detent or projection passing through a slot or aperture in the sleeve, and the articulated bail or loop connected to the sleeve and embracing the lever, substantially as and for the purpose set forth.

3. The fire-escape, substantially as described and shown, consisting of the receptacle A, the windlass B, having crank *a*, the rope or cable,

the bail D, constructed as described, the collar c, sleeve E, hand-hold G, and the lids I, having curved brace-bars I', hinged to the opposite ends of the receptacle, and adapted to provide seats for the operators when turned up, and a cover for the box when turned down, as set forth.

292,549. PLOW. OMA A. EMRY, Canton, Ohio. Filed Nov. 23, 1883. (No model.)



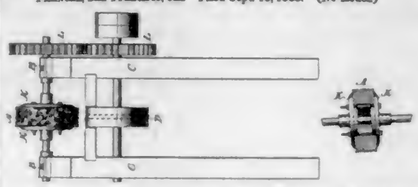
Claim.—1. The combination, with the standard and the beam pivoted thereto, of the brace I I', pivoted to the plow at its forward end, (whereby it may swing horizontally,) and connected to the rear end of the beam, and means for securing the brace and beam in the various horizontal positions into which they may be swung, to cause the plow to take more or less land, substantially as set forth.

2. The combination, with the standard and beam pivoted thereto, of the brace I I', pivotally seated in a plate, *g*, at its lower forward end, and connected with a slotted plate at its rear end, and a bolt connecting the rear end of the beam and the part I' of the brace, whereby the beam may be adjusted both vertically and laterally, substantially as set forth.

3. The combination of the standard and the beam pivoted thereto, the brace I I', pivotally seated at its lower forward end in a plate, *g*, the screw-rod K, passing through the beam and engaging with the said brace, the lock-nut L, the slotted plate M, and the nut and bolt N N', substantially as set forth.

292,550. SEPARATOR AND CONVEYER. JOHN SPENCER FAIRLY, Charleston, S. C. Filed May 3, 1883. (No model.)

Claim.—In a separator and conveyer, the combination, with the shaft A and perforated trough C, of a spiral conveyer formed of the flights B, each cut out on both sides to within a short distance of the shaft, as and for the purpose specified.

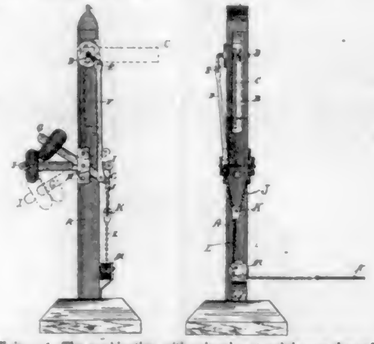


292,551. GAGE. JOHN H. FENERTY, Boston, Mass. Filed Oct. 5, 1883. (No model.)

Claim.—1. The combination of a slotted plate or body having graduated scales at its upper and lower edges, two arms, both attached at their inner ends to said plate and relatively adjustable at different inclines to each other, their edges passing both scales, said arms being free and disconnected at their outer ends, whereby they are adapted to enter a tapered tube or recess or to receive a tapered body between them, and means for adjusting or fastening said arms on said plate, the width of the plate and the length of the arms being of certain relative proportions, substantially as described.

2. The combination of a slotted plate or body provided with an arm and with two graduated scales at its upper and lower edges, and a second arm, also attached to said plate and adjustable at an incline to the first arm, its inner edge passing both scales, the outer ends of said arms being disconnected and adapted to receive a tapered spindle lengthwise between them, substantially as described.

292,552. ORNAMENTATION OF FRAME-MOLDINGS. PHILIP E. FRANCKE, San Francisco, Cal. Filed Sept. 13, 1883. (No model.)



Claim.—1. In an apparatus for forming ornamental designs in plastic materials and applying them to molding in continuous strips, the revolving pattern-cylinder A, the material being compressed in said cylinder, in combination with the adjustable feed-cylinder D, adapted to advance the molding, the driving-gears L L, secured to their shafts and meshing with each other, and the adjustable cutter G, by which means the material is trimmed after it is applied to the frame, all substantially as described, and for the purposes set forth.

2. In an apparatus for forming ornamental designs in plastic materials and applying them to moldings in continuous strips, the revolving cylinder A, in which the material is compressed, in combination with the adjustable feed-cylinder D and the gears L L, secured to their shafts and meshing with each other, whereby they are revolved toward each other, substantially as shown and described.

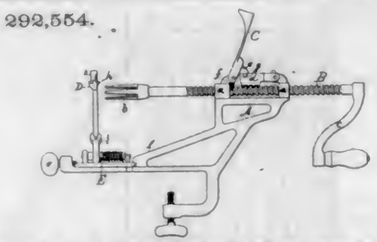
292,553. COMPENSATING DEVICE FOR SIGNALS. DAVID S. GARDINER, Hudson, N. Y. Filed Sept. 26, 1883. (No model.)

Brief.—Two unequally-weighted levers connected by a short cable passing through a pulley-block, to which is secured the signal-cable. When the signal-arm is housed, if the signal-cable be lengthened by expansion, the longer heavier lever will fall and take up the slack. If the cable be contracted, the heavier lever will rise by the pull, because the lighter lever is at its highest point.

Claim.—1. The combination, with a signal-post and the arm thereof, provided with means for raising said arm, of a weighted lever, as I, and a chain or equivalent device having one end connected to the weighted lever and the other with the arm C, and running through a pulley connected to the operating wire or cable, substantially as described.

2. The combination, with the signal-post and its arm, of two unequally-weighted levers, one of which is connected with the arm, and a chain or equivalent device running from one lever to the other and through a pulley connected to the operating wire or cable, substantially as described.

3. The combination, with the signal-post A, of the pivoted arm C, crank E, pitman F, weighted levers G I, chains J L, pulleys K M, and operating wire or cable N, substantially as described.



4. The combination, with the signal-post A, of the pivoted arm C, crank E, pitman F, weighted levers G I, chains J L, pulley K, operating wire or cable N, passing loosely around the eccentric pulley M, running on a stationary support, all constructed and arranged substantially as and for the purposes specified.

292,554. POTATO-PARER. GEORGE GEER, Peterborough, N. H. Filed June 24, 1882. (Model.)

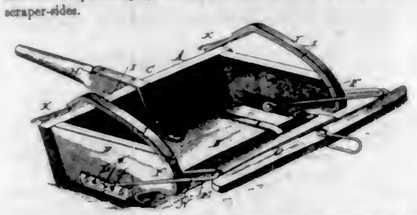
Claim.—1. The combination of the screw-shaft, fitted to slide longitudinally, with the hinged rack and the hinged knock-off, all operating together substantially as described, and for the purpose specified.

2. The combination of the shaft, fitted to slide longitudinally and

292,554.

bearing the fork *b*, with the hinged knock-off hung over one of the bearings of the shaft, and adapted to swing over the shaft from the position represented in Fig. 1 to that represented in Figs. 2 and 3, substantially as described, and for the purpose specified.

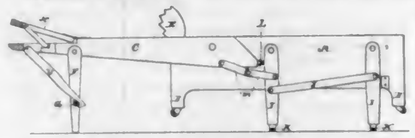
3. The combination of the hinged rack, the hinged knock-off, the screw-shaft, and the crank adapted to drive the screw-shaft, and also to throw over said hinged knock-off, substantially as described, and for the purpose specified.



4. In a potato-parer, the combination of the knife-arm, the U-shaped paring-knife, and the guard having the rounded lower end of a contour corresponding to the cutting-edge of the said knife but smaller, said guard being formed of sheet metal, and having that portion which is above its rounded and hardened end free to be bent while secured to said knife-arm, in order to properly adjust the hardened point of said guard with reference to the paring-knife, substantially as described.

5. In a paring-machine, the sheet-metal guard formed with a broad body by which to secure it to one side of the knife-arm, the rounded end which forms the guard proper, *k*, and a narrow neck with the angular bend therein between said body and guard proper, substantially as described, and for the purpose specified.

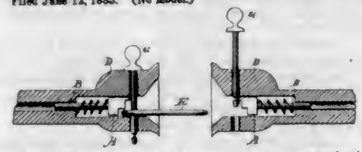
6. In a paring-machine, the combination of the main frame, a supplemental frame having the paring-knife and its appurtenances mounted thereon, and mechanism for securing and releasing said supplemental frame and its appurtenances to and from the main frame, substantially as described, and for the purpose specified.



292,555. EXCAVATOR AND LAND-LEVELER. BENJAMIN MURRELL HAGUE, Wild Flower, Cal. Filed June 19, 1883. (No model.)

Brief.—Scraper has forward-projecting sides having runners above and carried around the ends. Adjustable cross-pieces on such runners limit the scraper-dump by striking draft-links pivoted adjustably to the scraper-sides.

Claim.—The combination of the bowl A, the sides D of which extend in front of the blade, so as to form horns F, the runners I, attached to and arched above the sides D, the cross-pieces K, attached adjustably to said runners, and the bails F, pivoted adjustably to the sides D, for the attachment of the draft, as herein set forth.

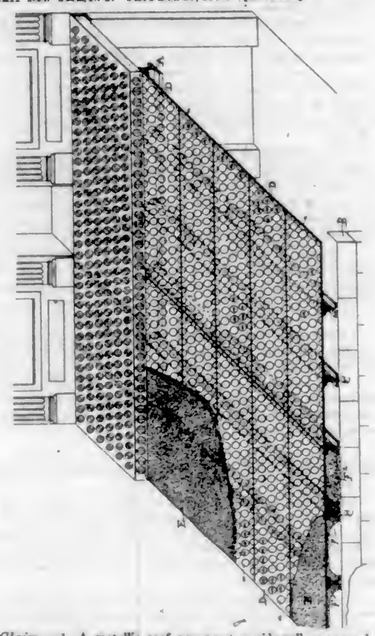


292,556. BED-LOUNGE. AUGUST HANSEN, San Francisco, Cal. Filed May 17, 1883. (No model.)

Claim.—1. The seat-frame A, having supplemental legs I, and the links J connecting them, in combination with the pivoted back C and links *m*, for the purpose set forth.

2. In a bed-lounge, the seat-frame A, having stationary legs B and adjustable pivoted legs I, and the connecting-links J, in combination with the pivoted back C, rollers L, connecting-links *m*, pawls F, and the serrated standards E, substantially as and for the purposes herein shown and described.

292,557. CAR-COUPLING. FRANCIS A. HOYT, West Cleveland, Ohio, assignor of two-thirds to L. H. Ware and J. W. Moore, both of same place. Filed June 12, 1883. (No model.)



Claim.—The arrangement of a cam, A, having two projections, as shown, working in combination with a slotted pin, C, in the draw-head D, in the manner set forth.

292,558. CARRIAGE. RALPH C. HUSE, Georgetown, Mass. Filed Jan. 31, 1883. (No model.)

Claim.—In a carriage constructed and adapted as and for the purpose set forth, an opening in the inclined foot-board and a door or trap therefor, said door or trap being pivoted to swing in said opening, and having the beveled edge-faces *a* and *b*, which meet corresponding edge-faces at the sides of the opening, whereby, in closing the door or trap, it is readily brought to coincide with the balance of the foot-board, substantially as specified.

292,559. CONCRETE AND CONCRETED PAVEMENT AND ROOF-PAVEMENT, AND SUBSTRUCTURE FOR THE SAME. THADDEUS HYATT New York, N. Y. Filed Dec. 27, 1883. (No model.)

Claim.—1. A metallic roof-pavement or sidewalk composed of metal beams and metal plates, in combination with a trottoir or foot-surface made of Portland cement or of hydraulic concrete combined in plastic condition with the plates, substantially as and for the purposes herein described.

2. A metallic roof-pavement or sidewalk composed of perforated or grating metal plates and metal beams, in combination with a trottoir or foot-surface made of Portland cement or of hydraulic concrete combined, when in a plastic state, with the metal plates, substantially as and for the purposes herein set forth and illustrated.

3. A metallic roof-pavement or sidewalk composed of perforated or grating metal plates and metal beams, in combination with a trottoir or foot-surface made of Portland cement or of hydraulic concrete combined with a protecting under face of like material, substantially as and for the purposes herein set forth and illustrated.

4. A metallic roof-pavement or sidewalk composed of perforated or grating metal plates and metal beams, in combination with a trottoir or foot-surface made of Portland cement or of hydraulic concrete combined with a protecting under face of like material brought down in cantalever fashion upon the bottom flanges of the beams, substantially as and for the purposes herein set forth and illustrated.

5. A metallic roof-pavement or sidewalk composed of perforated or grating metal plates and metal beams, in combination with a trottoir or foot-surface made of Portland cement or of hydraulic concrete combined with an under face of like material brought down between the beams under the plates in mass sufficient to weight the structure and produce the necessary *vis inertiæ* to enable it to resist impact and concussions, substantially as and for the purposes herein set forth and illustrated.

6. A metallic roof-pavement or sidewalk frame or skeleton composed of metal plates and metal beams combined to form the foundation for a concrete metallic structure, substantially as and for the purpose herein set forth and illustrated.

7. A metallic roof-pavement or sidewalk frame or skeleton composed of metal plates and metal beams (wherein the plates are perforated or grating plates) combined to form the foundation for a concreted metallic structure, substantially as and for the purposes herein set forth and illustrated.

8. A safety-surface metallic roof-pavement or sidewalk composed of metal beams and perforated or grating metal plates cast with gutters between rows of perforations, in combination with a concrete trottoir or foot-surface laid between the gutters in strips, substantially as and for the purposes herein set forth and illustrated.

9. A safety-surface metallic roof-pavement or sidewalk composed of metal beams and perforated or grating metal plates cast with gutters between the rows of perforations, in combination with a concrete trottoir or foot-surface set with glasses between the gutters, substantially as and for the purposes herein set forth and illustrated.

10. A safety and dry sidewalk or pavement for the purposes of a public footway, wherein the safety and the dryness of the trottoir or foot-surface are obtained by a combination of metal gutters with concrete.

11. A safety and dry sidewalk or pavement for the purposes of a public footway, wherein the safety and the dryness of the trottoir or foot-surface are obtained by combining concrete with metal gutters laid or made to run in a diagonal direction to the sidewalk or line of travel over it.

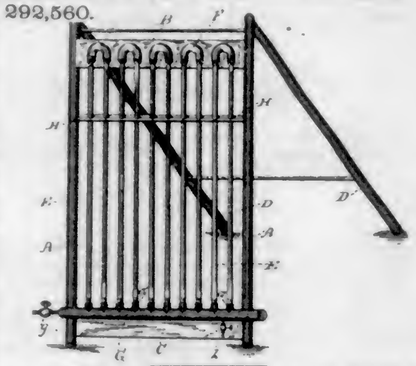
12. A safety-surface metallic roof-pavement or sidewalk composed of metal beams and perforated or grating metal plates cast with gutters between rows or lines of perforations, in combination with concrete in strips put in between the gutters, wherein the gutters and strips run or lie in a diagonal direction to the sidewalk or course of travel over it, substantially as and for the purposes herein set forth and illustrated.

13. A safety-surface metallic roof-pavement or sidewalk composed of metal beams and plates cast with gutters, in combination with concrete in strips laid in between the gutters, the same lying or running diagonally (or otherwise) across the face of the pavement.

14. As a manufacture or article, a cast-metal pavement-plate formed with safety-channels, in combination with non-slipping or foot-holding material put between the channels, substantially as and for the purposes herein set forth and illustrated.

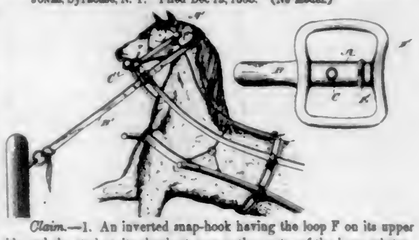
15. A cast-metal pavement-plate formed with safety-channels, in combination with non-slipping or foot-holding material between the channels combined with glasses to give light, substantially as and for the purposes herein set forth and illustrated.

292,560. COAL-SCREEN. JOHN JONES, Portsmouth, Ohio. Filed Aug. 4, 1883. (No model.)



Claim.—1. In combination with a screen having chambers or passage-ways formed in its screening-surface, a pipe adapted to convey steam or hot air to said chambers, and means for withdrawing the steam or hot air after it has performed its work, whereby the screening-surface may be kept warm and free from an accumulation of frozen material, substantially as set forth.

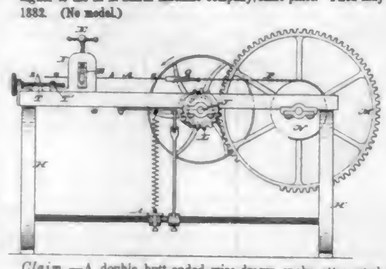
2. A screen having its frame provided with interior chambers or passage-ways for the reception of steam or hot-air, and having, also, interior chambers or passage-ways in its screening-surface connected with the interior chambers of the frame, substantially as set forth.



3. A screen having its screening-surface formed of hollow bars or pipes, in combination with a hollow supporting frame-piece, and screw-threaded connections between the frame-piece and the longitudinal bars, substantially as set forth.

4. A screen having its screening-surface formed of the hollow bars or pipes E, in combination with a transverse steam-pipe, G, to which the pipes E are at one end connected, and the U-shaped couplings F, connecting the opposite ends of adjacent pipes E, substantially as set forth.

292,560.



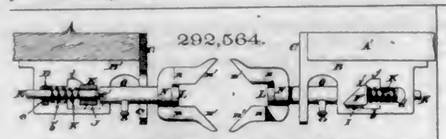
292,561. SAFETY HITCHING LOOP AND STRAP. RICHARD W. JONES, Syracuse, N. Y. Filed Dec 13, 1883. (No model.)

Claim.—1. An inverted snap-hook having the loop F on its upper side and the stud on its shank at or near the center of the loop, substantially as and for the purpose set forth.

2. The combination of the inverted snap having the loop F on its upper or outer side and the stud C on its shank, with the perforated hitching-strap and bridle-ring, substantially as and for the purpose set forth.

292,562. WIRE SPOKE. WILLIAM S. KELLEY, Smithville, N. J., assignor to the H. B. Smith Machine Company, same place. Filed May 13, 1882. (No model.)

Claim.—A double butt-ended wire-drawn spoke attenuated between the butts by supplementary die-drawing, in contradistinction to a spoke butt-ended by upsetting the ends or by making the butt-ends of separate pieces, and presenting continuously throughout the fiber unbroken found in the wire from which it has been made.

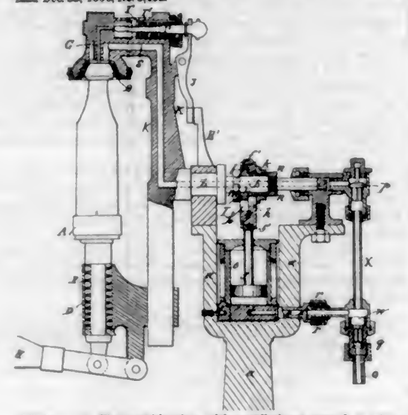


292,563. GAME APPARATUS. GUSTAVUS A. LILLIENDAHL, Greenville, assignor to Henry T. Lilliendahl, Jersey City, N. J. Filed July 24, 1883. (No model.)

Claim.—Blocks having a geometric form, either plain or inscribed on the facets thereof, provided with knobs or points at the apices, and adapted to be used as a game, substantially as set forth and shown.

292,564. CAR-COUPLING. CHARLES G. MCCORMICK, Cincinnati, Ohio, assignor of one-half to George L. McCormick and John N. McCormick, both of same place. Filed Jan. 27, 1883. (No model.)

292,564.



Claim.—1. In combination with the housings B B' of a car-coupling, having reversely-inclined bearings I I' J J', the self-leveling block F *f*, provided with reversely-inclined guides G G' H H', and traversed by the draw-bar E, as and for the purpose herein described.

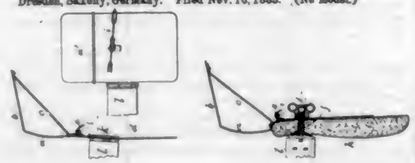
2. The combination, in a car-coupling, of housings B B', reversely-inclined bearings I I' J J', self-leveling block F *f* G' G H H', slots *b b'*, fulcrum-block D *d d'*, draw-bar E, and spring K, which spring preserves both of said blocks in their proper positions, as herein described.

3. The combination, in a car-coupling, of draw-bar E and the fulcrum-block D, which latter is provided with journals *d d'*, that play in the slots *b b'* of the housings B B', as herein described.

4. The combination of rod P *p*, fixed collar *p'*, disks R *s*, web S, hanger T *t t'*, washer U, and spring V, which rod P is attached to the draw-head *n n*, as and for the purpose specified.

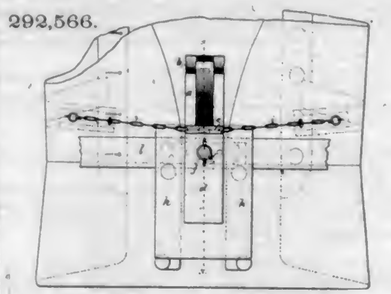
292,565. APPARATUS FOR BOTTLING AND SIRUPING AERATED BEVERAGES. JAMES MCEWEN and SIMEON SPENCER, Manchester, County of Lancaster, England. Filed Dec. 15, 1882. (Model.) Patented in England Dec. 23, 1880, No. 5,402.

Claim.—1. The combination, with a cylinder mounted on pivots near its lower end and provided with a piston, of an adjustable eccentric for oscillating said cylinder and operating said piston, substantially as described.



2. The combination, with the shaft *b*, of the eccentric *g*, provided with a slot, *h*, enlarged at *h'*, the sleeve *i*, having head I, and the nut *k*, substantially as described, and for the purpose set forth.

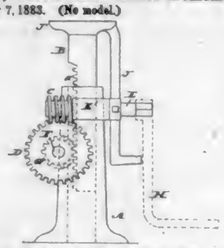
3. The combination, with the shaft *b*, provided with the catch *m*, of the eccentric *g*, provided with a slot, *h*, enlarged at *h'*, sleeve *i*, provided with head I, having lug *l*, and the nut *k*, substantially as described, and for the purpose set forth.



4. The combination, with the bottle-carriers A B and shaft *b*, provided with the catch *m*, of an adjustable eccentric, *g*, sleeve *i*, having lug *l*, piston-rod *f*, and cylinder *c*, mounted on pivots near its lower end, substantially as described.

5. The combination, with the aerated-water valve C and the shaft *b*, carrying the eccentric *g*, which operates the piston and cylinder, of the cam *o* on the end of the said shaft, whereby the aerated water and sirup are alternately admitted into the bottle, substantially as described.

292,566. MEANS FOR CARRYING KNAPSACKS. ALFRED MENDEL, Dresden, Saxony, Germany. Filed Nov. 10, 1883. (No model.)

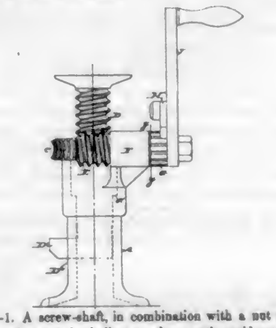


292,566.

Claim.—1. The combination, with the knapsack-bearer, of attaching devices for connecting such bearer to the coat at the sides thereof, substantially as specified.

2. The combination, with the knapsack-bearer, of the attaching devices for connecting such bearer to the coat at the sides thereof and the device for connecting the bearer to the waist-belt, substantially as specified.

292,567. SCREW-JACK. EDWARD H. MIDDLETON, Philadelphia, Pa. Filed May 7, 1883. (No model.)



Claim.—1. The stand, in combination with a rack-bar, B, pinion G, a worm, C, a worm-wheel, D, and shafts E F, said stand having cast with it a horizontal boss, E', and bearing F', and provided with a removable bearing, F'', the pinion and worm-wheel being fixed to the same shaft, F, and both shafts E F being mounted outside of the stand, substantially as and for the purpose set forth.

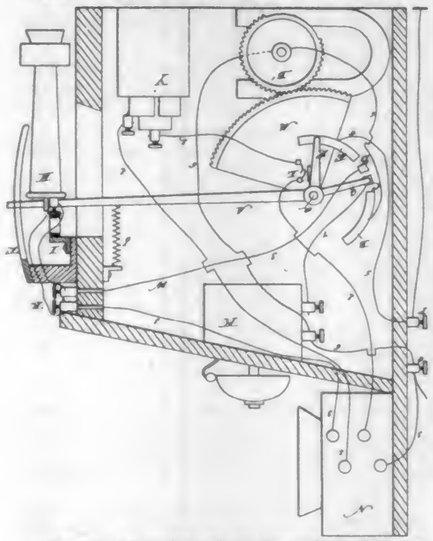
2. A screw-jack consisting of the stand A, with boss E', and bearing F', cast therewith, the removable bearing F'', the lifting rack-bar B', the pinion G, the worm C, the worm-wheel D, the shafts E F, and a foot-lift connected with said bar, substantially as and for the purpose set forth.

3. In a screw-jack, a swiveled collar on the lifting-bar, in combination with a foot-lift depending from and secured to said collar, and adapted to be moved around the stand, substantially as and for the purpose set forth.

292,568. SCREW-JACK. EDWARD H. MIDDLETON, Philadelphia, Pa. Filed Nov. 6, 1883. (No model.)

Claim.—1. A screw-shaft, in combination with a nut and worm-wheel, connected as stated, a hollow stand supporting said nut and wheel, on its inner shoulder and top edge, as described, a worm mounted on the stand engaging with the worm-wheel, and an operating-handle, substantially as and for the purpose set forth.

2. A stand, a nut and worm-wheel, a non-rotating screw-shaft, a



worm, and a handle, said worm being connected with a shaft which carries a toothed wheel, with which engages a reversible dog attached to said handle, the parts being combined and operating substantially as and for the purpose set forth.

3. A screw-shaft with a foot, D', a stand with a slot, D'', a nut and worm-wheel, B C, a worm, E, a toothed wheel, G, a dog, H, and operating-handle J, combined and operating substantially as and for the purpose set forth.

292,569. ARTIFICIAL SLATE. ANDREW M. MURRAY, Richmond, Ind. Filed Oct. 29, 1883. (No specimens.)

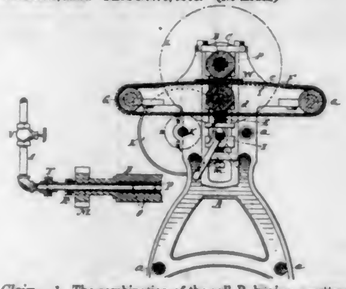
Claim.—A composition composed of two (2) parts of lamp-black or drop-black, one (1) part of rotten-stone, one (1) part flour of emery, one (1) part mineral-brown, one part ultramarine-blue, mixed with oil-shellac to consistency of stiff paste.

292,570. TELEPHONE CALL-BOX. JOHN M. ORAM, HENRY M. SUTTON, and HENRY GARRETT, Dallas, Tex. Filed Feb. 3, 1883. (No model.)

Claim.—1. In a telephone call-box, the combination of the lever A, formed with arms F G, the anvils B, C, D, and E, a generator operated by the movement of the lever, and the circuit-connections, substantially as shown and described.

2. The combination, with the switch-anvils, of a switch, a movable support for the telephone-receiver attached to the switch, and a guard for preventing the receiver from being removed from its support until the switch has been adjusted to the magneto-call terminals, the said telephone-support having a range of movement from its normal position for receiving calls, first, down below the guard, to send a call and permit the dislodgment of the telephone, and then a movement to the opposite side of its normal position, to make connection with the battery telephone and transmitter, substantially as described.

3. The combination, with the switch-anvils, of a switch, a telphone-receiver support attached thereto for movement in unison therewith, a guard for preventing dislodgment of the receiver until its support is moved, and a magneto-generator connected to and arranged to be operated by the movement of the telephone-receiver support when said receiver is dislodged from its support, substantially as shown and described.



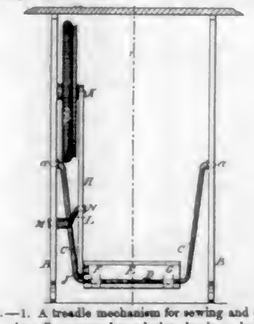
4. The slotted piece I, in combination with the lever A and receiver H of the circuit-connections, substantially as shown and described.

292,571. CLAMP-FASTENING FOR CARRIAGE-CURTAINS. ASHAEL S. PARKER, Cincinnati, Ohio. Filed Dec. 9, 1882. (No model.)

Claim.—The herein-described clamp-fastening, consisting of a base-plate, B, box-loop G, spring D, loop E, and stud C, the parts being united and relatively arranged in the manner and for the purpose specified.

292,572. MACHINE FOR PEBBLING OR EMBOSSING BOOT OR SHOE UPPERS. JAMES H. PARKER, Milford, assignor to John L. Parker, Worcester, Mass. Filed Nov. 5, 1883. (No model.)

Claim.—1. The combination of the roll B, having a patterned surface, the lower roll having plain surface, and an endless traveling belt or apron passing between said rolls and supported on guiding-rolls at either side, and means for imparting uniform rotative movement to said pattern and bed rolls, for the purpose set forth.



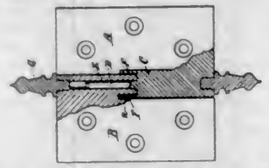
2. The combination of the pattern-roll B, the bed-supporting roll D, the endless traveling bed-belt F, the guide-rolls G, the springs E, support-plates H, and means for elevating and depressing said plates and bed-rolls, substantially as and for the purpose set forth.

3. The combination of the pattern-roll B, mounted in fixed bearings, the roll D, mounted in movable bearings, and geared to said roll B, for uniform action therewith, the endless traveling bed-belt F, passing between said rolls and around guiding-rolls G, the springs E, the support-plates H, the cam-shaft I, having cams i for elevating said plates, the adjustable bearings J, and the adjusting-screws m, substantially as and for the purposes set forth.

4. The combination, with the pattern-roll and bed-roll in a machine for pebbling or embossing leather pieces, of a belt-apron or traveling bed for passing the work between said rolls, composed of a comparatively firm backing-ply and a soft face-ply or cushion-surface, substantially as set forth.

5. The belt or apron F, formed of a ply or backing, *f*, of leather, and a ply or facing, *e*, of thick felt, secured together, in combination with the pattern-impressing rolls in an embossing-machine, substantially as and for the purpose set forth.

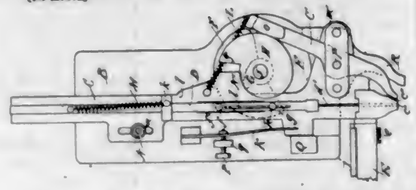
292,573. TREADLE MECHANISM. JOHN PARFIELD, Sedgley, County of Stafford, England. Filed Nov. 15, 1883. (No model.) Patented in England Sept. 7, 1883, No. 4,308.



Claim.—1. A treadle mechanism for sewing and other machines, comprising a pivotally-mounted tread-plate having a horizontal reciprocating movement, and means, substantially as described, for communicating to the crank the movement imparted to the tread-plate by the foot, substantially as set forth.

2. A treadle mechanism comprising a swinging bar or frame, a tread-plate pivotally mounted on said frame, and means, substantially as described, for connecting said tread-plate to the crank, all arranged to operate substantially as set forth.

3. A treadle mechanism comprising the horizontally-reciprocating tread-plate, the rod which connects said plate with the crank, and the radius or guide rod, all constructed and arranged to operate substantially as set forth.



4. A treadle mechanism comprising the swinging frame C C, the tread-plate pivotally mounted thereon, the connecting-rod H, and the guide or radius bar L, all constructed and arranged to operate substantially as set forth.

292,574. HINGE. WILLIAM PATTERSON, San Francisco, Cal. Filed Oct. 25, 1883. (No model.)

Claim.—In a hinge composed of two leaves, one of which carries a single fixed pintle and the other a socket to fit over the said pintle, an extension or cup surrounding the pintle, in combination with the socket E, in which is fitted into the top a removable tip, G, said socket being provided with a slot, *a*, formed between its lower end and the leaf, whereby the socket is allowed to enter the cup and turn therein, substantially as herein described, and for the purpose set forth.

292,575. LASTING-MACHINE. AUGUSTUS W. PEARSON, Nyack, assignor to James Cavanaugh, Trustee, Brooklyn, N. Y. Filed Oct. 6, 1882. (No model.)

Claim.—1. In a lasting-machine, the combination, with the last-rest, of the jaw-plate and jaw and their operating mechanism, said jaw-plate and jaw being adapted to grasp the edge of the upper and carry it straight upward from the inner sole, whereby the tendency to crowd the inner sole and to cause the upper to bind, as is the case when it is drawn directly over and in contact with the sole, is obviated, substantially as set forth.

2. In a lasting-machine, the combination, with the last-rest, of the gripping-jaw and jaw-plate and their operating mechanism, said jaw-plate and jaw being adapted to grasp the edge of the upper and carry it straight upward from the inner sole, and then in a curvature over and down upon the inner sole, whereby slack in the upper, which would take place were the upper released at the upper end of the straight movement of the jaw and plate, is overcome, substantially as set forth.

3. The combination, with the jaw-plate C, jaw C', and nail-feeding device E, of the hammer D, and operating-cams F, G, and H, substantially as and for the purposes set forth.

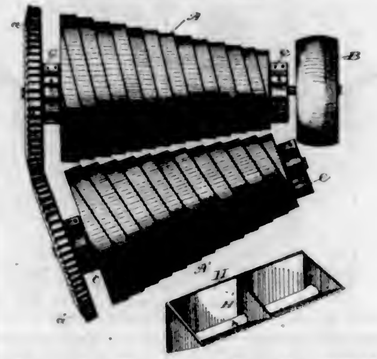
4. The jaw C', attached to the jaw-plate C, in combination with the spring K and cams G and H, whereby the jaw-plate is moved vertically and laterally and the jaw C' opened and closed, substantially as described.

5. The jaw C', attached to the jaw-plate C, in combination with the springs K L and cams G H, the spring K being stronger than the spring L, substantially as and for the purposes set forth.

6. The face B, provided with the rest R, in combination with the jaw-plate C, jaw C', hammer D, and cams F, G, and H, substantially as and for the purposes set forth.

7. The jaw-plate C, adapted to have lateral movement, in combination with the feeding device E, pawl *b*, ratchet *c*, and suitable feed-wheels, whereby the lateral movement of the plate C will feed the nails under the hammer, as set forth.

8. The jaw-plate C, provided with the jaw C', and pivoted to the face B, in combination with means, substantially as described, for giving the plate C direct upward and curved lateral movement, as and for the purposes set forth.



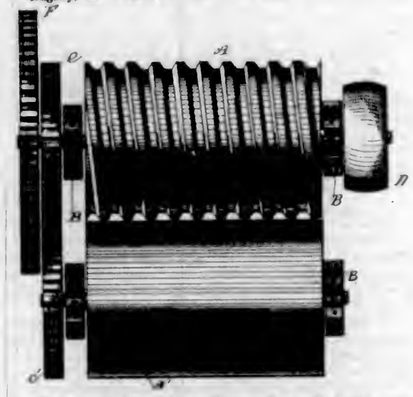
9. The spring K, made adjustable by the screw P, in combination with the upward and laterally-moving plate C, substantially as and for the purposes set forth.

10. The combination, with the feeding device E, of the adjustable tongued plate *j*, whereby nails of different lengths may be held in the device, as set forth.

11. In a lasting-machine, the combination of the shaft J, the fixed beveled friction-disk A', fixed clutch-piece *a'*, loose driving-pulley B', and sliding clutch-piece *a*, with the shifting-lever E', with one arm adapted to move the loose pulley B', and the other arm held under the action of the spring T, and the treadle S, connected to the lever E', substantially as and for the purpose set forth.

12. The face B of the frame, formed with the recess A, in combination with the jaw-plate C, provided with the angle-arm O, and attached to the plate by the headed bolt N, passing through the slot *m* in the plate, as and for the purposes set forth.

292,576. CLAY-CRUSHING ROLLER. JAMES W. PENFIELD, Willoughby, Ohio. Filed Dec. 21, 1883. (No model.)



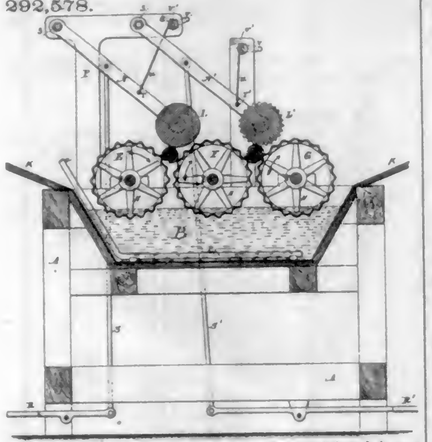
Claim.—1. Conical corrugated clay-crushing rollers, substantially as set forth.

2. Conical clay-crushing rollers, one or more of which are provided with a spiral corrugation extending from end to end of the roller, substantially as set forth.

3. In clay-crushing rollers, a partition or end piece so arranged as to leave an opening at the bottom for the passage of stone, and set at some distance from the end of the roller where the stones are discharged, so that the clay that passes through the said opening with the stone may be crushed by the roller before reaching the end thereof.

292,577. CLAY-CRUSHING ROLLER. JAMES W. PENFIELD, Willoughby, Ohio. Filed Dec. 21, 1883. (No model.)

Claim.—1. In clay-crushing rollers, a roller provided with a corrugation, rib, projection, groove, or depression on the periphery thereof, and extending spirally around the roller from end to end, in combination with a roller that is without a spiral corrugation, substantially as set forth.

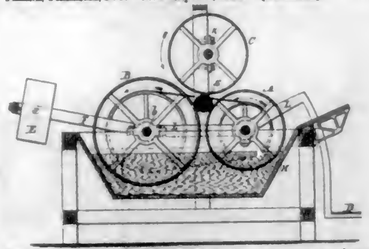


2. In a clay-crushing machine, a roller provided with a spiral corrugation extending around the roller from end to end thereof, in combination with a roller, plate, bar, or other device for holding the clay in contact with the said roller in the process of crushing the said clay, but such roller, plate, bar, or other device being without corrugations, substantially as set forth.

3. In a clay-crushing machine, the combination, with one or more rollers provided with a spiral corrugation extending from end to end of the roller, of a clay-breaker located above the said roller or rollers, and provided with projections or teeth adapted to break large lumps of clay, substantially as set forth.

292,578. MACHINE FOR FELTING AND SIZING HAT-BODIES. JOHN J. PERINE, Plainfield, N. J. Filed Apr. 25, 1883. (No model.)

Claim.—1. The cylinders, in a hat-felting machine, made with cast



292,578.

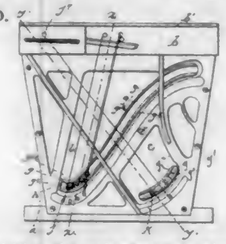
metal shells, with corrugations in their surfaces parallel to their axes, said shells being attached to heads upon shafts, so as to revolve in and be heated by the water and not be injured by the acid, substantially as set forth.

2. In a hat-body-felting machine, the combination, with two cylinders revolving in hot water, of a roller arranged to move sufficiently close to the cylinder that tends to raise the roll of hat-bodies to prevent such hat-bodies escaping from beneath such roller, substantially as set forth.

292,579. MACHINE FOR SIZING OR FELTING HATS. JOHN J. PERRIN, Plainfield, N.J. Filed Sept. 17, 1883. (No model.)

Claim.—1. The combination, with the hot-water vat in a hat felting or sizing machine, of two cylinders, B and C, in fixed bearings, and a cylinder, A, in the water-vat, below the cylinder C and in front of the cylinder B, and a pivoted frame and bearings for such cylinder A, whereby access is given for inserting or removing the roll of hats by depressing the pivoted frame, substantially as set forth.

2. The combination of the cylinders B C and the fixed bearings for the shafts of the same with the vat H, the cylinder A, the pivoted frame L, and bearings for the axis of the cylinder A, the foot-piece D, and the counterpoise for raising the cylinder A, substantially as set forth.



3. The cylinders A and B, means for rotating the same in one direction, and the frames L, pivoted upon the shaft of the cylinder B, and provided with bearings for the shaft of the cylinder A, in combination with the cylinder C, in stationary bearings above the cylinders A and B, the treadle D, and counterpoise F, substantially as set forth.

4. The combination, in a hat-sizing machine, of a water-vat, a rear cylinder in that vat in fixed bearings, a front cylinder also in the vat, and movable bearings for the same, and a cylinder in fixed bearings above the lower cylinders, the lower rear cylinder being larger than the front cylinder, for the purposes and substantially as specified.

292,580. PIANO. JOSEPH R. PERRY, Wilkes-Barré, Pa. Filed Jan. 15, 1883. (Model.)

Claim.—1. In a piano having the strain exerted on the opposite ends of the wrest-plank, substantially as described and shown, the combination, with the wooden frame, the iron frame mounted thereon, and the wrest-plank placed on the wooden frame, with its upper side flush with the upper side of the wooden frame, and its lower side abutted against the upper side of the iron frame, of a metallic brace-plate placed down against the upper side of the wrest-plank and the wooden frame,

292,580.

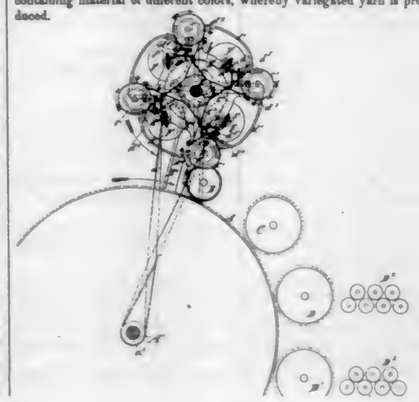
and secured rigidly to the wooden frame and against the wrest-plank, whereby the said wrest-plank is clamped firmly between the iron frame and the brace-plate, substantially as described, and for the purposes specified.

2. The agraffe made of wood and provided with string-openings, and a transverse re-enforcing pin passed through the body of said agraffe, in close proximity to the string-openings, substantially as and for the purposes set forth.

3. In an upright piano, a removable frame for carrying the strings, composed of a wooden frame having its upper end fitting into the outer casing and its edges tapered or drawn inward, whereby the main body of said frame, sounding-board, and iron frame are separated from the said casing, a wrest-plank fixed to the upper end of the frame, a sounding-board, an iron frame abutted against the wrest-plank and made to coincide with the form of the main frame, and a base, sill, or supporting-bar fixed to the lower end of the frame, and having its ends extended to rest on supports in the outer casing, as set forth.

4. In an upright piano, a string-frame having its upper end fitting snugly within the outer casing, and having its lower end made narrow, and having the ends of its base or sill piece extended outward to provide supports, as set forth.

292,581. PAPER OR PAMPHLET HOLDER. JOHN O. POOR and RUFUS E. BEAN, Franklin, N. H. Filed Dec. 3, 1883. (No model.)



Claim.—1. A paper or pamphlet holder composed of two wires or springs, A A, connected together at their centers and formed with hooks B B, or their equivalent, at both ends, extending outward at substantially right angles from the said wires, whereby they are adapted to clasp the book or pamphlet, in combination with clips or clasps C C, closely surrounding the wires or springs at both ends, and adapted to be moved along said wires, substantially as set forth.

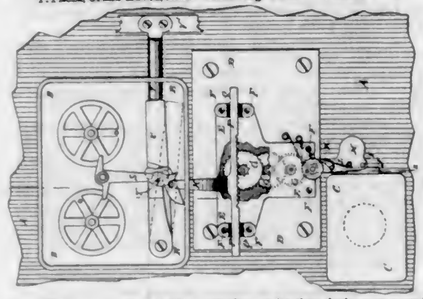
2. A paper or pamphlet holder composed of two wires or springs connected together at one side at the center, each wire being bent and joined so as to form two parallel wires, substantially as set forth.

292,582. APPARATUS FOR PRODUCING ROPING FOR MAKING VARIEGATED OR CLOUDED YARN. WILLARD F. PROSSER, Mystic Bridge, Conn., assignor of one-half to Williams Rogers Wells, Hopkinton, R. I. Filed Feb. 14, 1883. (No model.)

Brief.—In connection with the main cylinder and worker is arranged a rotary carrier sustaining a circular series of spools, said spools containing material of different colors, whereby variegated yarn is produced.

Claim.—1. The combination, with the main cylinder and the worker of a carding-engine, of a rotary carrier, mechanism for rotating it, and a circular series of spools carried by it, and devices for drawing or feeding roping from said spools and presenting it to the action of the worker, substantially as and for the purpose herein described.

2. The combination, with a main cylinder and a worker of a carding-engine, of a rotary carrier, mechanism for operating it, a circular series of spools carried by said carrier, feed-rolls for drawing ropings from said spools, also carried by said carrier, and mechanism for rotating said feed-rolls and causing them to present the ropings to the action of the worker, substantially as and for the purpose herein described.



3. The combination, with a main cylinder and a worker of a carding-engine, of a rotary carrier, mechanism for operating it, a circular series of spools, and feed-rolls for drawing or feeding ropings therefrom, all carried by said carrier, and variable operating mechanism for imparting rotary motion to said feed-rollers on their own axes, substantially as and for the purpose herein described.

4. The attachment for a card, comprising a carrier and a circular series of spools carried thereby, feed-rollers for drawing or feeding ropings, also carried by said carrier and provided with pulleys, a sleeve on the shaft of the carrier, provided with pulleys, and belts extending from the sleeve-pulleys to the roll-pulleys, all combined and adapted to operate substantially as herein described.

5. The combination of the shaft E, heads or flanges E', spools F, feed-rollers G, jaws *d*, and devices for supporting them, sleeve H, pulleys *c* and *c'*, and belts c^2, all substantially as described.

6. The combination of the shaft E, heads or flanges E', spools F, feed-rolls G, jaws *d*, and adjustable devices for supporting them at different distances from the faces of the rolls, the sleeve H, the pulleys *c c'*, and belts c^2, all substantially as described.

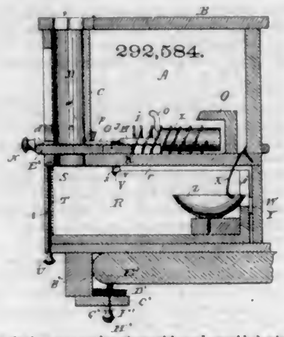
292,583. UNLOCKING ATTACHMENT FOR TIME-LOCKS. HIRAM P. PRIME, Grand Haven, Mich. Filed Aug. 7, 1883. (Model.)

Claim.—1. An unlocking attachment for time-locks constructed substantially as herein shown and described, and consisting of a weighted lever connected by a pawl and ratchet-wheel with a train of gear-wheels operating a rack-bar provided with a trip-arm, to adapt the attachment to be interposed between a combination-lock and a time-lock, as set forth.

2. In an unlocking attachment for time-locks, the combination, with the bolt of a combination-lock and the trip-latch of a time-lock, of the weighted lever H, the pawl and ratchet-wheel K M, the train G of gear-wheels, and the rack-bar P, having trip-arm R, substantially as herein shown and described, whereby the said latch will be tripped by the continued movement of the said bolt, as set forth.

3. In an unlocking attachment for time-locks, the combination, with the bolt of a combination-lock and the trip-latch of a time-lock, of a weighted lever connected by a pawl and ratchet with a train of gear-wheels, and means, substantially as herein shown and described, for communicating the motion given to the train of gear-wheels by the bolt of the combination-lock to the trip-latch of the time-lock, as and for the purpose set forth.

292,584. COIN-COUNTER FOR MONEY-DRAWERS. CHARLES GOTTLIEB RABER, Washington, Ind. Filed Sept. 15, 1883. (No model.)



Claim.—1. In a money-drawer, the combination of strip B^2 and piece C^2, secured to the bottom of the drawer, with a series of springs attached to the piece, and a plate or rod connecting the upper ends of the springs, said plate having a wire, F^2, connected thereto and passing outward through the piece, arranged and operating for the purpose set forth.

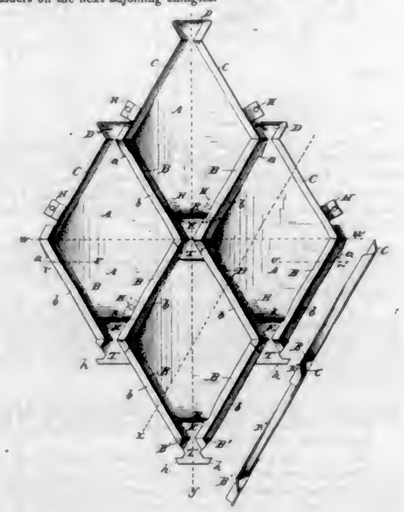
2. In a money-drawer, the coin-receiving chambers provided with slots *e* at the upper portion, crossing each other, and a sliding false bottom, for the purposes set forth.

3. In a money-drawer, the coin-receiving chambers provided with a sliding false bottom formed of three separate pieces sliding in suitable slots in the casing, arranged and operating for the purpose set forth.

4. The drawer provided with a spring-plate, in combination with

292,584.

a series of wires connecting therewith, and provided with a suitable operating-handle, the spring-plate engaging with a notch in the casing, and a rod or bar, V, engaging with the slot *s* in the sides of the drawer, as and for the purpose set forth.



5. In a money-drawer, the combination, with the coin-receiving chambers, of shanks provided with necks, which carry shoes communicating with the chambers, springs secured to the shanks at one end, and coiled around the shanks and necks, the forward end of the springs being free and arranged to form a bearing as the shanks are moved forward, and a rod attached to the rear end of the shanks, and adapted to operate the same, as and for the purpose set forth.

6. In a money-drawer, the combination, with the coin-receiving chambers, of shanks provided with necks having shoes attached thereto, said shoes communicating with the coin-chambers, springs secured at one end to the shanks and free at the other end, so as to form a bearing, said springs encircling the shanks and necks, as shown, a bar adapted to engage with the shanks at their junction with the necks, and a rod attached at the rear end of the shanks, arranged and operating for the purpose set forth.

7. In a money-drawer, the combination, with the coin-receiving chambers, of spring-pressed shanks carrying shoes which communicate with the chambers, means for operating the same, a bar having a suitable handle for engaging with the ends of the shanks and holding the latter inoperative, and a strip, J, and cover O, arranged in the manner and for the purpose set forth.

292,585. METALLIC ROOFING-SHINGLE. EPHRAIM B. REPP, New Windsor, Md., assignor to the Anglo-American Roofing Company, New York, N. Y. Filed Nov. 16, 1881. Renewed Feb. 28, 1883. (No model.)

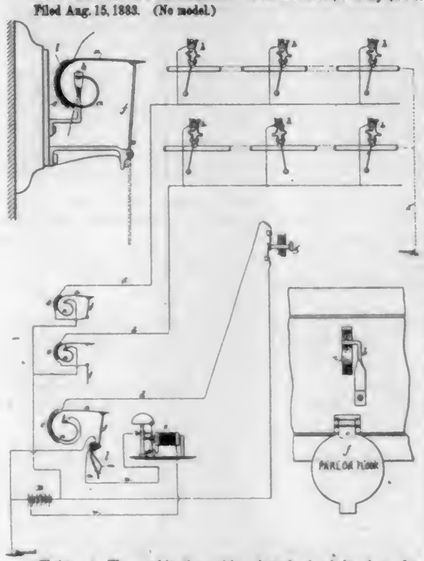
Brief.—The sides are struck up to form inclined walls entirely around the shingle, and a projection on the lower end fits into a pan-shaped projection on the upper end of the next lower shingle and interlocks with shoulders on the next adjoining shingles.

Claim.—1. A metallic shingle, substantially as shown and described, having its sides struck up to form inclined walls around the body of the shingle, for the purposes specified.

2. A metallic shingle, substantially as shown and described, having the flanges B, *b*, C, and B′, for the purposes specified.

3. In a metallic shingle, the hooks or projections adapted to be drawn under the obtuse corners of the two adjoining underlying shingles to hold the point of the overlapping shingles in place, as herein set forth.

4. The metallic shingle A, having the tongue T, provided with projections *h*, adapted to interlock with the shoulders *a a* on adjoining shingles, substantially as shown and described, for the purposes specified.



5. The metallic shingle A, having the depression E and rib R, adapted to be combined with the pan D of an underlying shingle, substantially as shown and described, for the purposes specified.

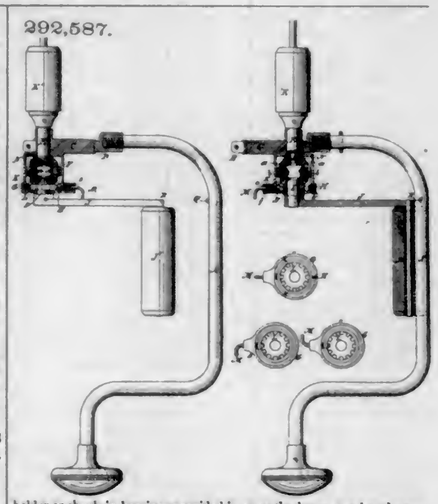
6. The metallic shingle A, having the water receptacle or pan D, substantially as shown and described, for the purposes specified.

7. The metallic shingle A, having the flanges B, *b*, C, and B′, hooks H, shoulders *a*, and tongue T, having the projections *h*, adapted to be combined with shingles similarly constructed, substantially as shown and described, and for the purposes specified.

8. The metallic shingle A, having the flanges B, *b*, C, and B′, hooks H, shoulders *a*, tongue T, its projections *h*, the depression E, rib R, and the pan D, and adapted to be combined with shingles similarly constructed, substantially as shown and described, for the purposes specified.

292,586. ELECTRICAL CIRCUIT-BREAKER FOR ANNUNCIATORS AND GAS-LIGHTING APPARATUS. THOS. H. REDDIE, Brooklyn, N. Y. Filed Aug. 15, 1883. (No model.)

Claim.—1. The combination, with a thermic circuit-breaker, of an electric circuit, and a heating resistance in such circuit, adjacent and parallel to the thermic circuit-breaker and intervening layer of insulating material, whereby the heat developed by the resistance when the circuit is closed acts upon the thermic device to break the electric circuit, substantially as set forth.



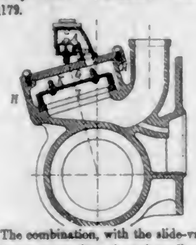
2. The combination, with a thermic circuit-breaker, of an electric circuit, a resistance in such circuit to develop heat and operate the thermic circuit-breaker, and a drop that is disengaged and forms an annunciator, substantially as set forth.

3. The combination, with a thermic circuit-breaker, of an electric circuit, a resistance in such circuit to develop heat and operate the thermic circuit-breaker, a drop disengaged by the circuit-breaker, a local circuit and alarm, and a spring circuit-closer operated upon by the drop, substantially as set forth.

292,587. BIT AND DRILL BRACE. JOHN D. RICHARDSON, Brooklyn, assignor of one-half to Francis L. Manchester, New York, N. Y. Filed June 15, 1883. (No model.)

Claim.—1. The combination, with an ordinary bit or drill brace and a tool-holder or chuck fitted to rotate independently therein, of the bevel-gear N, fast on the shank of the holder or chuck, an independent hand-crank, J, a spindle, I, for said crank, arranged in line with the tool-

292,587.



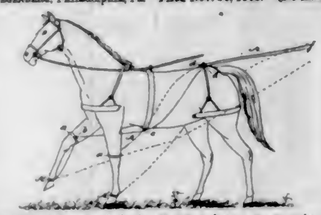
holder or chuck in bearings provided in or on the brace, two bevel-gears, *a a*, carried by the spindle and gearing with N, a bevel-gear, K, and a ratchet-wheel, L, secured together and placed loosely on said spindle, and a pawl attached to the brace and engaging with said ratchet-wheel, substantially as herein described.

2. The combination, with an ordinary bit or drill brace, of an eccentric-yoke firmly secured thereto, an eccentric fitted to said yoke and having the bit-holder or chuck fitted to rotate therein, and a stop to lock the said eccentric in either of two positions in the brace, substantially as and for the purpose herein described.

3. The combination of the brace or stock A, provided with a yoke, B, the eccentric C, fitted to said yoke and carrying the box F, the drill-holder or chuck E′, having its shank E fitted to rotate in said eccentric, the hand-crank J, having its spindle I fitted to rotate in said box, the bevel-gears *a a* N K, gearing the said crank with the drill-shank E, the ratchet-wheel L, fast on the bevel-gear K, which is loose on the crank-spindle I, and the sliding pawl M, fitted to said box F, and capable of engaging with said ratchet-wheel L, all substantially as and for the purpose herein described.

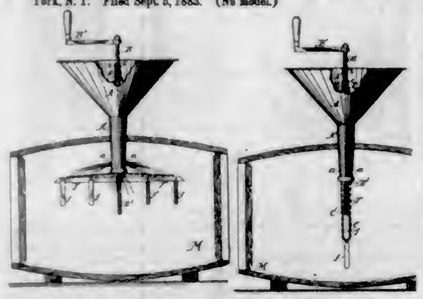
4. The combination, with the stock A and the independent hand-crank J, for operating the bit or drill, of the crank-sleeve J′, having a recess, P, to fit the said brace, substantially as herein described.

292,588. LOCOMOTIVE STEAM-ENGINE. THEOPHILE RECOUR, Tours, France. Filed Apr. 3, 1883. (No model.) Patented in France July 20, 1882, No. 150,179.



Claim.—1. The combination, with the slide-valve casing or steam-pipe of a locomotive steam-engine, of a valve adjusted and balanced for the admission of air during the time that the engine is running with the steam shut off, and arranged to open upwardly, substantially as hereinbefore described.

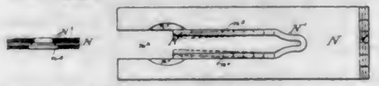
2. In a locomotive steam-engine, the combination, with the air-valve applied to the steam-pipe or slide-valve casing, and operating as hereinbefore set forth, of a coiled spring applied to said valve for the purpose of opening it and holding it open when the engine is running with the steam shut off, substantially as hereinbefore described.



3. The combination, with the flat slide-valves of a locomotive steam-engine and its driving-yoke, of one or more blade-springs bearing against the said yoke and tending to constantly hold the valve off its seat when not pressed forcibly thereon by the steam-pressure, substantially as hereinbefore described and illustrated in Figs. 6, 7, and 7ᵇᵉˢ of the accompanying drawings.

292,589. DEVICE FOR STOPPING RUNAWAY HORSES. ALOYS RUDGENBERG, Philadelphia, Pa. Filed Nov. 30, 1883. (No model.)

Claim.—An improved device for stopping a runaway horse, consisting of lines A, attachments A′, and connections *b c d*, the latter being automatically detachable by the draft on said lines, and when detached the lines are entirely disconnected from the harness, substantially as described.



292,590. BEER-FININGS SPREADER. JEAN SCHAFHAUS, New York, N. Y. Filed Sept. 5, 1883. (No model.)

Claim.—1. In a finings-spreader, the funnel A, having the main body, the neck A′, said neck having the lateral holes *a a*, and the bridge D, said bridge being provided with the cylindrical threaded portion D′.

2. In a finings-spreader, the combination of the funnel A, having the neck A′, with lateral holes *a a*, the bridge D, having the cylindrical threaded portion D′, with the shaft B, said shaft being provided with the crank B′, the flange B², the lower flattened portion, B³, and having affixed the arms or spreaders F F′, said arms having the pendants *f f f f*, the chains C C, the ring *c*, and the follower E, constructed and operated substantially as described.

292,591. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. WILLIAM SCHOTT, New York, N. Y., assignor, by mesne assignments, to the Schott Button Hole Attachment Company, same place. Filed June 21, 1883. (Model.)

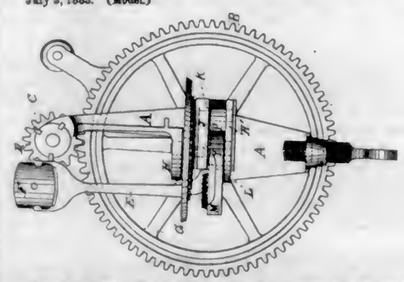
Claim.—1. A button-hole attachment to sewing-machines, containing the following elements: a fixed carrier-plate for supporting a reciprocating foot; a reciprocating foot supporting the mechanism for moving the button-hole form-plate and cloth-clamp; a device for reciprocating the reciprocating foot and regulating the bite of the stitches, comprising an adjustable oscillating frame and a dog connected with the reciprocating foot; a lever having a terminal cross-head operated by the needle-bar and operating the oscillating frame; a clamping device for adjusting or regulating the distance between the stitches; a combined cloth-clamp and button-hole form-plate; a worm for transmitting motion to the same; means, substantially as described, for communicating motion from the needle-bar lever to said worm, and a cloth-stretcher, all combined and operating as herein shown and described.

2. In a button-hole attachment to a sewing-machine, the combination, with the reciprocating foot and the lever operated by the needle-bar, of an oscillating frame provided with oppositely-inclined planes, a dog pivoted on a standard that is rigidly fixed on the reciprocating foot, means, substantially as described, for connecting said lever and dog and said dog and frame, all arranged and operated substantially as herein shown and described, whereby said foot is reciprocated, as set forth.

3. In a button-hole attachment to a sewing-machine, as a means for transmitting motion from the lever operated by the needle-bar to the reciprocating foot, for reciprocating the latter and regulating the bite of the stitches, an adjustable oscillating frame consisting of two sections hinged together, and provided with two vertical oppositely-inclined planes and an adjusting-screw, and pivoted on the rigid reciprocating foot-post, a pivoted dog, and means for communicating motion from the said dog to the said two-part frame Q, substantially as herein shown and described.

4. In a button-hole attachment to a sewing-machine, the combination, with the reciprocating foot O, post O′, dog P, having lugs *p p′*, lever I, provided with cross-headed stud R, having cross-head *r*, and hinged sectional oscillating frame Q, having inclines *s s′*, of the screw q^4, substantially as herein shown and described, whereby said frame may be contracted or expanded, its inclined planes adjusted relatively to each other, and the length of the reciprocation of the foot O and consequent bite of the stitches be adjusted or controlled, as set forth.

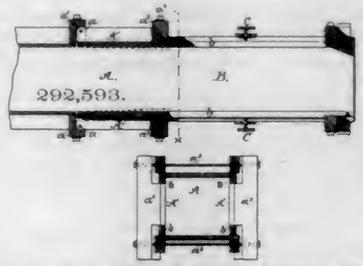
5. In a button-hole attachment to a sewing-machine, provided with a reciprocating foot and a form-plate, as a means for turning the form-plate, the combination, with said form-plate and a cloth-clamp, of a worm supported on the reciprocating foot, and actuated by suitable mechanism connected with said worm, substantially as herein shown and described.



6. In a button-hole attachment to a sewing-machine, of the character herein described, the combination, with the lever I, operated by the needle-bar, and pivoted upon the carrier-plate C, and the lever F^2, operating through suitable mechanism to revolve the form-plate, of an adjustable clamping device connecting the two levers, and adapted to transmit the motion of the one to the other, substantially as herein shown and described.

7. In a button-hole attachment to a sewing-machine, provided with a cloth-clamp, an elastic spring cloth-stretcher provided with downward-projecting pins, substantially as herein shown and described, said stretcher being attached to said clamp, and adapted to be compressed and to return to its normal position, as and for the purposes set forth.

8. The combination, with the grooved carrier-plate C, and reciprocating foot O, and connected mechanism for transmitting motion from the needle-bar-operated lever I to the form-plate M, of the lever I, supported by the carrier-plate, lever-stud R, provided with cross-head *r*, sectional oscillating frame Q, provided with studs q^4 q^4, screws Q^7 q^6, pivoted dog P, provided with lugs *p p′*, and post O′, substantially as herein shown and described, whereby the said foot O may be reciprocated and its length of throw adjusted, as set forth.

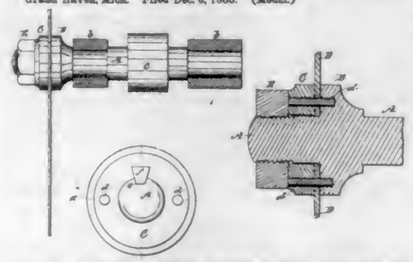


9. In a button-hole attachment to a sewing-machine, as a means for determining the throw of the ratchet-lever F^2, and the consequent rapidity of the movements of the worm G, and of the mechanism for transmitting motion from the said lever to the worm and thereby determining the rate of movement of the form-plate M and cloth-clamp N, and consequently the distance between the stitches, the combination, with the lever I, having slot *i*, and ratchet-lever F^2, having slot *i′*, of the clamping device I′, the sleeve *k*, and screw k^4, having shoulder k^5 with two flat sides, constructed and operated substantially as set forth.

292,592. APPLE-PARER. LANPHEAR H. SCOTT, Newark, N. J. Filed July 3, 1883. (Model.)

Claim.—In an apple-parer, the standard A, provided with the feet or arms H H′, the latter of which is provided with a fixed cogged segment, P, into which meshes the cogged knife-carriage M Y, said knife-carriage being pivoted to the slotted lever J by means of a stud or pivot, L, on the under side thereof, which lever is pivoted by a stud, K, on its under side to the arm H′, in combination with the cam-shaped table-wheel G, which is provided with a pin, I, on its under side for operating in the slot in lever J, whereby the said slotted lever and the knife-carriage are given a forward and reverse motion, and the knife is carried around the fruit, and its motion rapidly reversed, and at the same time it is thrown clear of the fruit, and the necessary operating mechanism, substantially as set forth and described.

292,593. BALING-PRESS. DAVID W. SEELEY, Albany, and ALEXANDER BUCKMAN, Schodack, N. Y.; said Buckman assignor to said Seeley. Filed Oct. 29, 1881. (No model.)



Claim.—1. In a baling-press, the pressing-chamber A, provided with adjustable walls A', hinged, as at *a*, at their forward ends to a contiguous stationary part of the press, and arranged in relation to the baling-chamber B as herein described, for the purpose of completing the compression of the material before the bale is passed into the baling-chamber, as herein specified.

2. In a baling-press, the baling-chamber B, provided at two of its oppositely-located vertical sides with a single opening, B', and guiding-strips *b*, for the purpose of facilitating the operation of tying-off the bale before it is ejected from the press, as herein specified.

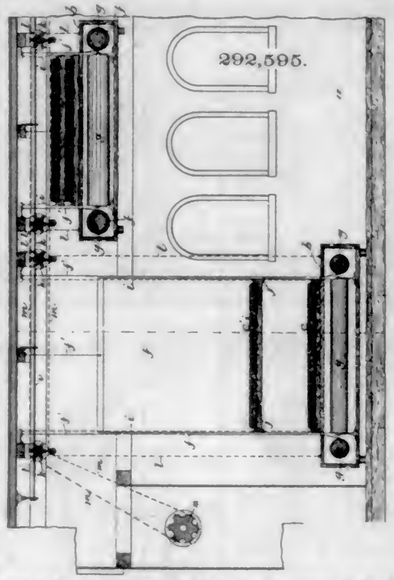
3. In a baling-press, the combination, with the pressing-chamber A, of the baling-chamber B, arranged in relation to the pressing-chamber as herein described, and provided at each of its vertical sides with a single opening, B', and top and bottom guiding-strips, *b*, as and for the purpose herein specified.

4. In a baling-press, the combination, with the baling-chamber B, provided with a single opening, B', in two of its oppositely-located vertical sides, of the guiding-strips *b*, secured at both ends, and adjusting-screws C, adapted to press against the middle portions of the said strips *b*, all constructed and arranged to operate as herein specified.

292,594. HANGING CIRCULAR SAWS. WALLACE D. SHERMAN, Grand Haven, Mich. Filed Dec. 6, 1883. (Model.)

Claim.—1. In means for holding and fastening the loose or clamping collar on the arbor of a circular saw, the loose collar C, fitted with a key, *f*, in combination with the arbor A, having a keyway, *e*, and fast collar B, the saw-driving pins *d d*, arranged to engage with the loose collar, and the nut E, substantially as and for the purposes specified.

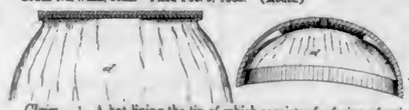
2. The combination, with the loose collar C, of the key *f*, of dovetail construction where it fits or enters within said collar, the saw-arbor A, having a keyway, *e*, along its outer end portion, the saw-driving pins *d d*, and the fast collar B, on or forming part of the arbor, essentially as shown and described.



292,595. SLEEPING-CAR. JOHN SHOREY, Lowell, assignor of two-thirds to Phineas E. Merrithew, Fairhaven, Mass. Filed May 17, 1883. (No model.)

Claim.—1. The combination, with the berth-supporting platform *b*, of the curtains *f*, secured to spring-rollers journaled in bearings attached to said platform, and secured to the top of the car, one curtain of each berth being provided with an opening, f^2, as set forth.

2. The combination of the suspended platform *b*, having berths *a c*, the upper berths, *c' c'*, supported by flexible devices *i* over the berths *c*, and braces or steadying devices for detachably connecting said upper berths to said platform, as set forth.



3. In a car, the vertically-movable berth-supporting platform having rollers secured therein, in combination with curtains secured to said rolls and to the top of the car, and adapted to wind upon the rollers, said curtains forming partitions and supports for the lower platform, as set forth.

4. The berth-supporting platform having four spring-rollers arranged at the sides, as shown, in combination with the four curtains secured to the top of the car and to the rolls, and arranged, as described, to be wound on the rolls so as to form partitions and supports, as shown.

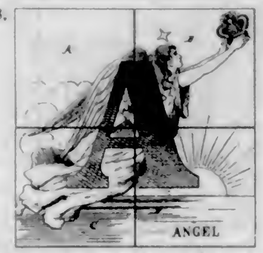
5. The combination, in a car, of the lower-berth platform, having spring-rolls at each side, as set forth, the curtains secured at one end to the rolls and at the other to the top of the car, so as to form partitions and supports for the platform, and the upper berths supported by independent flexible cords extending to the top of the car, directly over the lower berth, so as to be lifted thereby, all substantially as set forth.

292,596. MANUFACTURE OF HAT-LININGS. ALDEN SOLMANS, South Norwalk, Conn. Filed Feb. 9, 1883. (Model.)

Claim.—1. A hat-lining the tip of which consists of a facing of satin or other suitable material pasted smoothly to a stiff backing, whereby the entire tip is made smooth and free from folds or wrinkles.

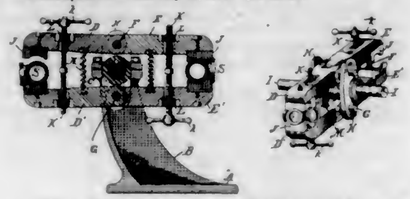
2. The combination, with a hat, of a lining the tip of which consists of a stiff backing having a facing pasted smoothly thereto and a side lining stitched or otherwise secured to the tip, substantially as described.

292,597. HEEL-BURNISHING TOOL. ALBERT E. STRICKLER, Worcester, Mass. Filed Nov. 12, 1883. (No model.)



Claim.—1. A rotary burnishing-tool having a perimeter composed of a number of surfaces, *s*, which are straight in a plane at right angles to the axis of the tool, and intermediate salient curves or convex surfaces, *s'*, connecting said surfaces *s*, substantially as shown and described.

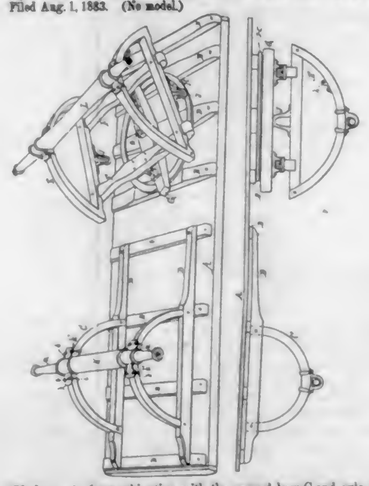
2. A rotary burnishing-tool having its working perimeter composed of surfaces *s*, which are straight in planes in the direction of the circumference of the tool, said planes being connected by curved surfaces *s'*, and having lips, as *r* or *r'*, at the edge of the tool, substantially as set forth.



292,598. SLICED PICTURE. WALTER STRANDERS, New York, assignor to Edward I. Horsman, Brooklyn, N. Y. Filed Dec. 19, 1883. (No model.)

Claim.—The combination of the blocks A, B, C, and D with each other, said blocks bearing the representation of a figure and of a sectional initial letter, all arranged so that the figure, together with the letter, will only be produced complete when the four blocks are placed together, substantially as shown and described.

292,598.

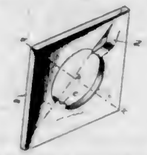


292,599. CHUCK FOR HOLDING FITTINGS. STEPHEN P. M. TASKER, Philadelphia, Pa. Filed July 16, 1883. (No model.)

Claim.—The combination, to form a duplex reversible coupling-holding frame, of two pairs of oppositely-placed hinged jaws, respectively provided with coupling socket-pieces to contain couplings, duplex screws applied to the jaws and adapted to be manually operated to cause the jaws of the respective pairs to interdependently approach or recede, springs interposed between the jaws of the respective pairs, a shaft or axis common to both pairs of jaws, and a suitable housing or supporting-frame for said shaft, the arrangement being such that the frame can be rotated upon the shaft with respect to the housing, substantially as hereinbefore set forth.

292,600. WAGON RUNNING-GEAR. A. HENRY TODT, Lapeer, Mich. Filed Aug. 1, 1883. (No model.)

Claim.—1. In combination with the curved bars C and axle K, a thimble-skein provided with outwardly-projecting flanges *b*, having ears *b'*, and cast integral therewith, forming a bearing, and clips for adjustably securing the axle to said curved bars, substantially as described.



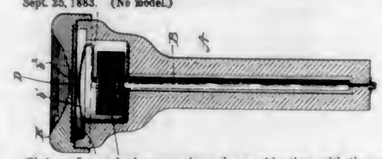
2. In combination with the bed A, transverse bars B, longitudinal bars D, and axle K, the curved bars C, adjustably secured to said axle by clips *c*, passing over the thimble-skeins M, said skein being provided with flanges *b*, both skein and flanges being curved, substantially as and for the purpose specified.

3. The combination, with the bed A, of the circle H, attached thereto, the longitudinal bolster G, pivoted to the bed and supporting the circle H, and a rectangularly-framed platform formed of the transverse bars F, pivoted to both the front and rear ends of the bolster, and the side pieces, E, attached to the bars F and connected with the axle, all substantially as described.

4. The combination, with the bed A, of the circle H, attached thereto, the longitudinal bolster G, pivoted to the bed and supporting the circle H, and a rectangularly-framed platform formed of the transverse bars F, pivoted to both the front and rear ends of the bolster, the side pieces, E, attached to the bars F and connected with the axle, and provided with standards J, all substantially as described.

5. In a wagon, the combination of the bed A, frame E F, bolster G, circle H, and standards J with the axle L, provided with thimble-skeins M, which have cast upon them outwardly-projecting flanges *b*, as a base and support to the side frames of the running-gear, when constructed, arranged, and operating substantially in the manner and for the purposes set forth.

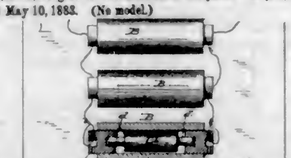
292,601. NUT-LOCK. CHARLES VAN DUSEN, New Albany, Ind., assignor of one-half to William L. Breyfogle, Louisville, Ky. Filed June 30, 1883. (No model.)



Claim.—1. A nut-locking washer provided with a bolt-hole having a spur or spurs extending therein, and a lever member movable to draw said spurs into the threads of the bolt to lock the washer, substantially as shown and described.

2. The combination, with the plate *a*, of beveled spurs *c*, projecting into its bolt-hole, and means, substantially as described, to draw said spurs into engagement with the bolt to which it is applied to lock the nut, as set forth.

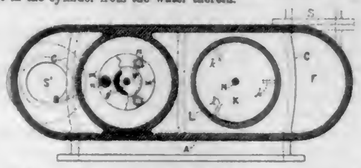
3. The combination, with the plate *b*, having a bolt-hole, *b*, and spurs *c*, projecting into said bolt-hole, of the tongue or lever member *d*, struck up from said plate opposite said spurs, substantially as and for the purpose described.



4. The combination, with the plate *a*, having a bolt-hole, *b*, of spurs *c*, projecting into the said hole, and the tongue or lever member *d*, the said spurs and lever member being arranged in the line of diagonal corners of the plate, substantially as shown and described.

292,602. TELEPHONE-RECEIVER. HENRY E. WAITE, New York, N. Y., assignor to the Molecular Telephone Company, same place. Filed Sept. 25, 1883. (No model.)

Claim.—In a telephone-receiver, the combination, with the sounding-board and the coil, of the magnet provided with the recurved arm or spring, having its free end extended to overhang and slide upon a support at one side of the coil-chamber, said arm being provided at or near the center of its length with a point resting in contact with the sounding-board, substantially as described.



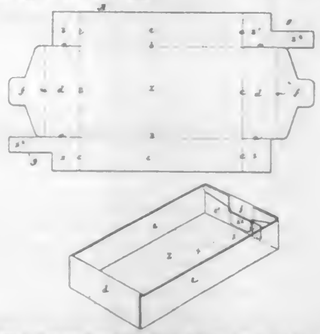
292,603. TELEPHONE-TRANSMITTER. HENRY E. WAITE, New York, N. Y., assignor to the Molecular Telephone Company, same place. Filed May 10, 1883. (No model.)

Claim.—In a telephone-transmitter, the carbon pencil O', provided with tenons upon its ends, in combination with the blocks C and C', of similar material, socketed to receive the tenons upon said pencil, all inclosed within a protecting-cylinder of wood or cork, substantially as described.

292,604. BALANCE PUPPET-VALVE. ALEXANDER WANNER, Philadelphia, Pa. Filed Apr. 10, 1883. (No model.)

Brief.—The table is so constructed and arranged that it and the valve will rise and relieve any excessive back-pressure that may take place in the cylinder from the water therein.

Claim.—1. The combination, with the cup-shaped valve L and its pilot-valve, of a table arranged within said valve L, substantially in the manner set forth.



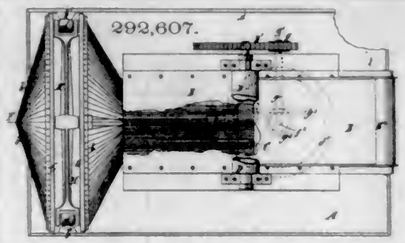
2. The combination, with the valve L, of the table K, provided with the stem Q, and the standard I, provided with a socket, whereby the table is permitted to move vertically, substantially as and for the purposes set forth.

292,605. ART OF EXTRACTING GOLD BY MEANS OF ALKALINE SULPHITES. CHAS P. WILLIAMS, Philadelphia, Pa. Filed Mar. 17, 1882. (No specimens.)

Claim.—1. In the art of extracting gold from ores and artificial gold-bearing products by means of alkaline sulphides, the herein-described process, which consists in mixing the gold-bearing material with carbon and an alkaline sulphate (or the equivalents of such carbon and alkaline sulphate) in proportions substantially as described, calcining said mixture in a non-oxidizing atmosphere at a temperature, substantially as described, below the point of fusion of the charge, cooling the mass out of contact with the air, and leaching the cooled mass with water to dissolve out the soluble sulphides, and recovering the gold therefrom by precipitation, as described.

2. In the art of extracting gold from ores and artificial gold-bearing products by means of alkaline sulphides, the herein-described process, which consists in mixing the gold-bearing material with carbon and an alkaline sulphate (or the equivalent of such carbon and alkaline sulphate) in proportions substantially as described, in a non-oxidizing atmosphere at a temperature, substantially as described, below the point of fusion of the charge, leaching the mass with water to dissolve out the soluble sulphides, and recovering the gold therefrom by precipitation, substantially as described.

292,606. PAPER BOX. ARTHUR G. WILSON, New York, N. Y. Filed Dec. 24, 1883. (No model.)

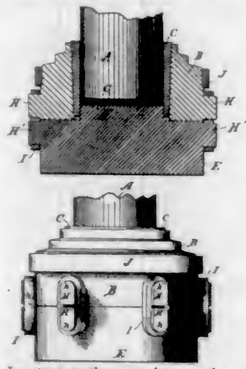


Claim.—A paper box or lid of a box having two turned-in portions, a part of one overlapping a part of the other, and forming a single space or opening between the two, and an end piece provided with a tongue folded over the upper edges of the turned-in portions down through the opening described, and in rear of the lower lip-like portion, i^2, substantially as and for the purpose set forth.

292,607. AUTOGRAPHIC TELEGRAPH. MICHAEL HOFFMAN WILSON, Brooklyn, N. Y., assignor of one-fourth to Clara Louise Wilson, same place, and Henry McCobb, New York, N. Y. Filed June 11, 1883. (No model.)

Brief.—Single line-wire, a large number of severed branch wires at each station, and synchronously-revolving commutators completing the circuit through said severed branch wires successively. Receiving and transmitting instruments identical.

Claim.—1. The combination, with means for producing the travel of the form, of a single line-wire and a number of divided or severed



branch wires connected with said line-wire and having their terminals arranged in the path traversed by the form, and a commutator placed between the separated ends of the said branch wires and serving to close the circuit through the several branch wires in succession, substantially as and for the purpose described.

2. The combination, with means for producing the travel of the form, of a single line-wire and a number of divided or severed branch wires connected with said line-wire, having their terminals arranged in the path traversed by the form, and having their separated ends arranged in arc-shaped or circular series, and a rotary commutator adapted to make contact with said ends and to successively close the circuit through the several branch wires, substantially as and for the purpose herein described.

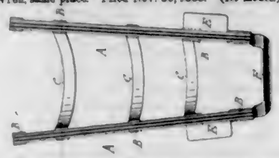
3. The combination, with a rotary cylinder for producing the travel of the form, of a single line-wire and a number of divided or severed branch wires connected with said line-wire and having their terminals arranged in the path traversed by the form, and a commutator geared with said cylinder and moving between the separated ends of the divided branch wires to successively close the circuit through them, substantially as and for the purpose herein described.

4. The combination of the cylinder D, the divided branch wires *b*, the bar C, with which the terminals of said branch wires are connected, the support G for the interrupted adjacent ends of said wires, the rotary commutator H *d*, and means for rotating said cylinder and commutator, substantially as herein described.

292,608. HAMMER-DIE. JAMES WITHINGTON, Chambersburg, assignor to the Trenton Iron Company, Trenton, N. J. Filed July 13, 1883. (No model.)

Claim.—1. In a steam or other power hammer, the combination of a striking-die provided with a series of lugs or projections, a piston-rod plunger or handle provided, substantially as hereinbefore set forth, with a corresponding series of lugs or projections, and bands encircling opposing lugs, substantially as set forth.

2. In a steam or other power hammer, the combination of a piston-rod, a circumscribing cap or head having a series of lugs, means for securing the cap or head rigidly to the piston-rod, a hammer-die having a corresponding series of lugs, and bands fitted to opposing lugs, substantially as set forth.



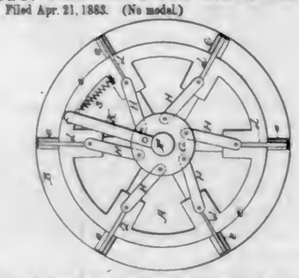
3. In a steam or other power hammer, the combination of a piston-rod, a circumscribing cap or head having a series of lugs, means for securing the cap or head rigidly to the piston-rod in such manner as to create a cavity at the base of said piston-rod, a hammer-die provided with a boss conformed to said cavity, and having a corresponding series of lugs, and bands fitted to opposing lugs, substantially as set forth.

4. In a steam or other power hammer, in which both the die portion and the piston-rod portion are provided with corresponding series of lugs or projections, and are united by means of bands fitted around

opposing pairs of lugs, faced-off portions or bevels upon the opposing faces of the lugs, substantially as and for the purposes set forth.

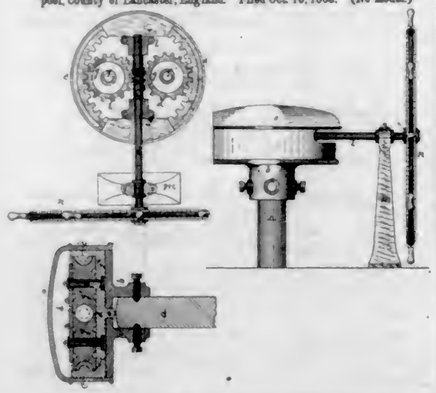
5. The combination of the cap or head, the tapering sleeve, the piston-rod, and the circumscribing-band, substantially as set forth.

292,609. HAND-TRUCK. WM. C. WREN, Brooklyn, N. Y., assignor to George Wren, same place. Filed Nov. 30, 1883. (No model.)



Claim.—1. A truck-frame composed of the sides A, having sockets B for the insertion of handles, the cross-bars C, nose F, and wheel or pillow blocks D, all formed of one piece of metal, substantially as shown and described.

2. In a hand-truck, the combination, with a frame, A, having the thimbles B, nose F, and wheel-block D, all of one piece of metal, of the tubular handles M, held in place by shrinkage of the thimbles, substantially as shown and described.

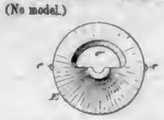


3. In a hand-truck, the leg L, in combination with a frame consisting of the sides A, nose F, cross-bars C, wheel-block D, and sockets B, all substantially as shown and described.

292,610. REEL-SPOOL FOR WIRE. JOSEPH M. YOUNG, Johnstown, Pa. Filed Apr. 21, 1883. (No model.)

Claim.—A wire-reeling spool or block having a flangeless side provided with radial guides or ways *d*, and arms or fingers *e* sliding in connection therewith, a disk-head, G, loose on the shaft, connections H, pivoted to the disk-head, and sliding arms or fingers, the handle K, and spring *s*, all constructed, combined, and adapted to operate substantially as specified.

292,611. STEERING-GEAR FOR VESSELS. WILLIAM ADAIR, Liverpool, County of Lancaster, England. Filed Oct. 10, 1883. (No model.)



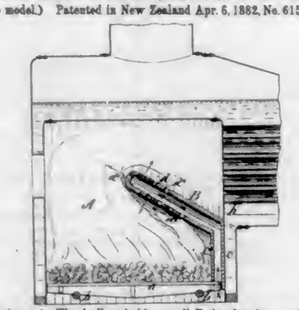
Claim.—1. The combination of the bed-plate *b*, having the quadrants C C', sole-plate *d*, pivoted on said bed-plate and carrying the horizontal worm-shaft *i*, and gearing connecting the worm-shaft and quadrants, substantially as and for the purposes set forth.

2. The combination of the bed-plate *b*, having the quadrants C C', sole-plate *d*, pivoted on said bed-plate and carrying the horizontal worm-shaft *i*, combined worm and spur gear wheels *g g'*, pivoted on said sole-plate and connecting said shaft and quadrants, substantially as and for the purposes set forth.

3. The combination of the bed-plate *b*, having the quadrants C C', sole-plate *d*, pivoted on said bed-plate and carrying the horizontal worm-shaft *i*, combined worm and spur gear wheels *g g'*, connecting said shaft and quadrants, standard *m*, and steering-wheel *n*, substantially as and for the purposes set forth.

4. The combination of the fixed standard *p*, bed-plate *b*, having the sleeve *q*, fitting over said standard, sole-plate *d*, pivoted on said bed-plate, and gearing connecting the horizontal shaft *i* and bed-plate, substantially as and for the purposes set forth.

292,612. GRINDING-MILL. JOHN Q. ADAMS, Marseilles, Ill. Filed Feb. 8, 1882. (No model.)



Claim.—1. In a grinding-mill composed of a shell and loose concave burr, and a conical revolving burr fitted within the said shell, the ribs *c' e*, arranged, respectively, upon the shell and concave burr, whereby the said concave burr is permitted to rock, but prevented from revolving.

2. The casing C, having its inner face concave, in combination with the concave burr E, the outer convex face of which is inclined at an angle less than that of the casing, and set loosely within the casing, substantially as and for the purpose set forth.

3. The casing C, having its inner face concave and provided with ribs *c'*, in combination with the concave burr E, having its outer convex surface inclined at an angle less than that of the casing, and provided with ribs *e*, whereby the burr is free to rock within the casing, but is held from rotating with the revolving burr, substantially as described.

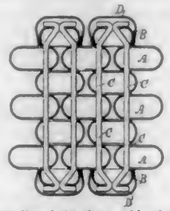
4. Combined with the driving-shaft of a grinding-mill, the pinions *b' k*, the ratchet-wheel on the shaft *k*, the yokes M, the rods O O, and bell-crank P, and the pawls N, pivoted in the yokes, and having weights N', substantially as described.

292,613. STEAM-BOILER. JOHN ALVES, Dunedin, New Zealand, assignor of one-half to Caroline Naef, New York, N. Y. Filed June 30, 1883. (No model.) Patented in New Zealand Apr. 6, 1882, No. 615.

Claim.—1. The hollow bridge-wall B, having its vertical portion c provided with the perforated sides c^2 and the imperforated central portion, c', substantially as herein shown and described.

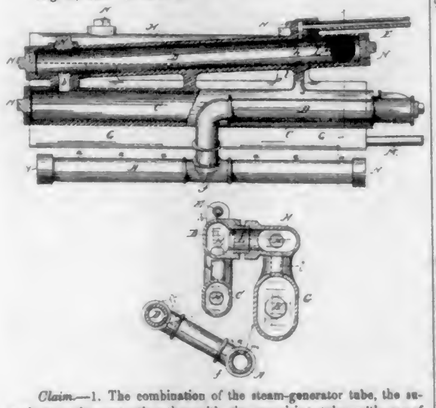
2. The hollow bridge-wall B for furnaces, consisting of the vertical portion c, having the perforated sides c^2 and the imperforated central portion, c', and the inclined arched portion *d*, provided with the perforations d^2 on its upper and lower sides and at its end, substantially as herein shown and described.

292,614. WELL-DIGGER. ROBERT ANDERSON, Memphis, Tenn. Filed Sept. 15, 1883. (No model.)



Claim.—In a well-sinking device, the combination of the outer and inner conical cutting-tubes, substantially as and for the purpose described.

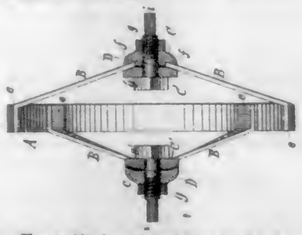
292,615. ORNAMENTAL CHAIN. WALTER BALLOU, North Attleborough, Mass. Filed Oct. 19, 1883. (No model.)



292,615.

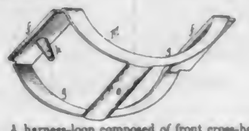
Claim.—1. In a roller-chain, the combination, with the units A A of the end caps, B B, of wires or staples constructed to pass through the central holes of the end caps and the covering-caps D D.

2. A roller-chain consisting of a number of the units A A and the end caps, B B, secured together by means of the bent binding-wires C C, as described, the ends of which being protected by the covering-caps D D, as described.



292,616. VAPOR-BURNER. DAVID R. BANGS, Medford, Mass. Filed Aug. 24, 1883. (No model.)

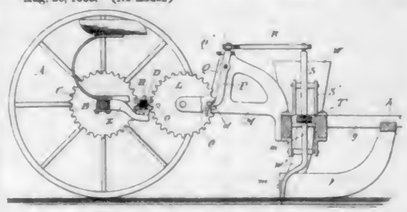
Claim.—1. The combination of the steam-generator tube, the superheater-tube connecting therewith, the vaporizing-tubes with one of which the steam-generator communicates, means for introducing hydrocarbons into said vaporizing-tubes, and the burner-tube communicating with the vaporizing-tubes, and located below the steam and vaporizing tubes, and provided with jet-openings for directing the flame-jets directly against the steam and vaporizing tubes, substantially as described.



2. The combination of the steam-generator tube, the vaporizing-tubes, means for supplying hydrocarbons to said tubes, the superheater-tube communicating with the steam-generator tube and with the vaporizing-tubes at a point where the superheated steam will strike and spray the hydrocarbon as it enters the vaporizing-tube, and the burner-tube communicating with the vaporizing-tubes, and located at a point to direct the flame against both the steam and vaporizing tubes, substantially as described.

292,617. VEHICLE-WHEEL. WILLIAM C. BARR, Jersey City, N. J. Filed Oct. 13, 1883. (No model.)

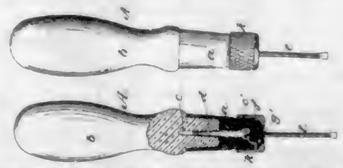
Claim.—The combination, substantially as hereinbefore set forth, with the rim A and arms B, of the washers C C', one recessed to receive the inner ends of the arms, and both beveled on their opposed surfaces in planes corresponding to the position of the arms, and the screw-bolts D, arranged to act on the washers for clamping the arms, the outer ends of the bolts forming journals.



292,618. HARNESS-LOOP. JAMES M. BASINGER, Buffalo, N. Y., assignor of one-fourth to Pratt & Letchworth, same place. Filed June 16, 1883. (No model.)

Claim.—1. A harness-loop composed of front cross-bars, *f f*, a depressed rear cross-bar, *e*, curved side bars, *g g*, connecting the front cross-bars with the rear cross-bar, and formed in one piece therewith, and a tongue, A, formed on the under side of one of the front cross-bars, substantially as set forth.

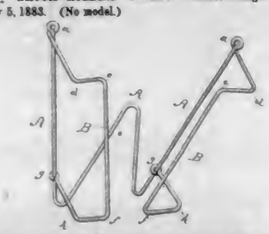
2. The combination, with a fixed strap, A, and a loose strap, D, of a loose loop, E, constructed substantially as described, surrounding both straps, and made lengthwise adjustable on both straps, whereby the loop can be placed in any desired position on the fixed strap for supporting the loose strap, substantially as set forth.



292,619. CORN-PLANTER. THOMAS BELL, Shelby City, Ky. Filed Aug. 20, 1883. (No model.)

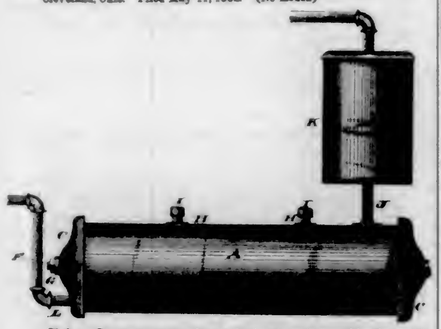
Claim.—1. In a corn-planter, the combination, with the reciprocating bar T, with its ends entering the seed-boxes, of the marking-lever *m*, with its upper end connected directly to the bar T, and having its lower portion curved rearwardly, the centrally-pivoted lever S, the horizontally-vibrating T-shaped lever R, the rocking levers P, with their lower ends provided with rearwardly-curved arms *d d*, the cog-wheel L, having on opposite sides studs O, and shifting-pinion D, adapted to engage with the latter cog-wheel, and the cog-wheel C, substantially as and for the purpose set forth.

2. In a corn-planter, the combination, with the seed-boxes, of the reciprocating bar T, for opening and closing the apertures in the bottoms of the boxes, the lever S, connected with the bar T, the T-shaped lever R, adapted to swing in the horizontal plane and connected with the lever S, two pivoted levers, P, having their upper ends held in the ends of the cross-piece of the T-shaped lever R, the cog-wheel L, provided with studs O, diametrically opposite each other and on opposite sides of the said wheel, the cog-wheel C on one of the driving-wheels of the planter, and the pinion D, engaging with the cog-wheel C and L, and connected with mechanism for withdrawing it from between the said cog-wheels, substantially as herein shown and described, and for the purpose set forth.



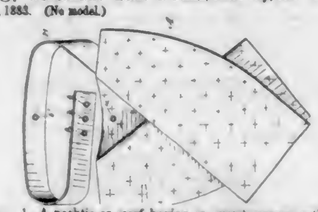
292,620. TOOL-HANDLE. CHARLES L. BELLAMY, Arlington, N. J. Filed May 21, 1883. (No model.)

Claim.—1. The combination of the body of a tool handle or stock having a funnel-shaped or conical tool-socket adapted to receive the tang or shank and shoulder of the tool to be held, or the shoulder of such tool in the wider part of said socket, a clamping-collar adapted to clamp said shoulder in said socket, and a screw-threaded ferrule adapted to a screw on the socket end of the tool-holder, for forcing the clamping-collar down upon the shoulder of the tool, all constructed and operating substantially as specified.



2. The combination, with the body of a tool-holder having a funnel-shaped tool-socket, the wider part of which is non-circular in cross-section, and also having a screw-thread on its socket end, of a clamping-collar made in a form corresponding with the non-circular part of said socket, and a screw-ferrule adapted both to the thread on the socket and of said body and to the clamping-collar, for forcing said collar down upon the shoulder of the tool to be held, and holding the same rigidly in the wider part of said socket, substantially as and for the purpose set forth.

292,621. BROOM-HOLDER. HERMAN C. BERG, College Point, N. Y. Filed July 5, 1883. (No model.)



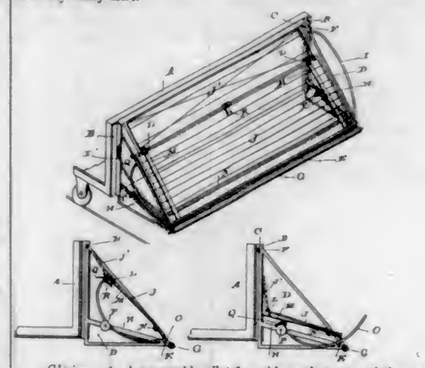
Claim.—As a new article of manufacture, a broom-holder made of a single piece of wire bent, as shown and described, to form the back A, the side divergent wings, B B, and the eyes *a a*, as set forth.

292,622. APPARATUS FOR PRODUCING GAS. GEO. W. BILLINGS, Cleveland, Ohio. Filed May 11, 1882. (No model.)

Claim.—In an apparatus for producing gas, the combination, with the described atomizing-cylinder, of removable heads therefor, a rod extending through the cylinder to hold the heads in place, a homogeneous body of compressed fibrous material filling the cylinder, pipes for the introduction of oil thereinto, and ports for the ingress of air and the egress of gas, respectively located on opposite sides and ends of the cylinder, substantially as and for the purpose set forth.

292,623. NECKSCARF. HENRY T. BLAKE, Cañon City, Colo. Filed Sept. 14, 1883. (No model.)

Claim.—1. A necktie or scarf having an eyelet passing entirely through the same near its upper edge, about midway of its breadth, in combination with a neckband secured at one end to the tie or scarf, and having one or more eyelets near its free end, substantially as described.



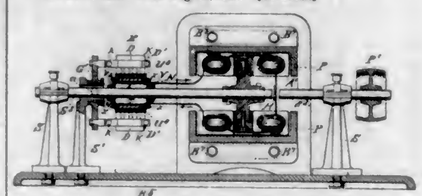
2. A necktie or scarf having an eyelet passing entirely through the same near its upper edge, about midway of its breadth, in combination with a neckband secured at one end to the tie or scarf, and having one or more eyelets near its free end and one or more eyelets near its center, substantially as described.

3. A necktie or scarf having an eyelet passing entirely through the same near its upper edge, about midway of its breadth, and an auxiliary fastening device on its rear side, in combination with a neckband secured at one end to the tie or scarf, and having one or more eyelets near its free end, substantially as described.

4. The combination, with the scarf A, having the eyelet *a* and hook C, of the neckband B, secured to said scarf at one end and having one or more eyelets, *b*, near its free end and one or more eyelets, *b'*, near its center, substantially as described.

292,624. PILOT OR GUARD FOR CARS OF CABLE-ROADS. WM. U. BOHN, San Francisco, Cal. Filed May 4, 1883. (No model.)

Brief.—An adjustable safety-pilot normally held in a retracted position, but which is so arranged as to trip a person and automatically form a cradle to allow his body to fall thereon, and from which the person may easily arise.

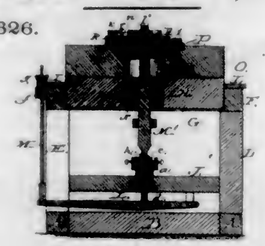


Claim.—1. A removable pilot for cable-road cars, consisting, essentially, of a supporting frame-work, a hinged cradle, and a sliding foot-tripping device, combined and arranged to operate substantially in the manner and for the purpose set forth.

2. In a pilot for cable-road cars, the supporting-frames D D, connected by transverse rails, and having a rubber-covered rod, G, and friction-rollers P P, substantially as shown, and for the purpose set forth.

3. In a pilot for cable-roads, the supporting-frames D D, lower and upper hinged cradles, J J', having flat springs M M, legs L L, and spring-clip R, in combination with the tripper O, having curved end pieces and legs or clips Q Q, substantially as shown, and for the purpose specified.

292,625. DYNAMO-ELECTRIC MACHINE. WILLIAM F. BUCKLEY, Cleveland, Ohio. Filed Aug. 14, 1883. (No model.)

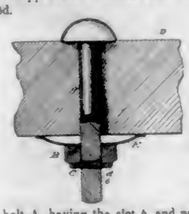


Claim.—1. An armature composed of the armature-sections, having the neck portion *o'* and spaces *o² o²* at its sides, to receive the bobbins, which are removably secured therein by screws, the neck portion of each armature-section being planed away in its lower side to fit astride of the hub H, and secured thereto by bolts B², spaces being left between the sections, and grooves *g* provided in their faces, for the bobbin-connecting wires, substantially as specified.

2. An armature-section having the neck portion *o'*, the spaces *o²*, and the removable bobbins B, secured in place by screws, substantially as specified.

3. A commutator for dynamo-electric machines, having two brass or iron heads, V V, secured to the hard-rubber tube T by screws, and provided with holes N, for the passage of the wires from the armature to the commutator-segments, substantially as specified

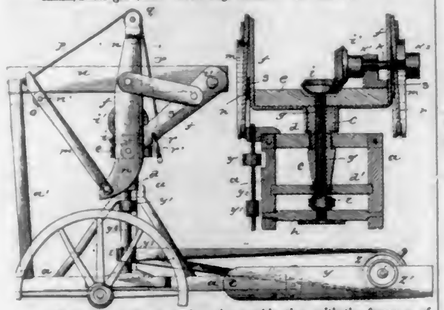
292,626.



292,626. MILLSTONE-ADJUSTING MECHANISM. GEO. H. CORMACK, Rockford, Ill. Filed Mar. 6, 1880. (Model.)

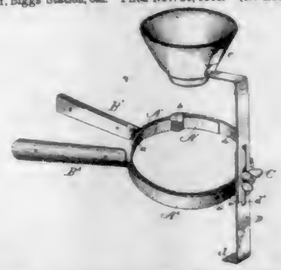
Claim.—The combination, with a tapered spindle, the tapered portion of which projects above the face of the bed-stone, of the runner provided with a fixed eye-plate, and the adjustable tapered rynd having an elongated spindle-aperture, projecting radial arms, binding-screws to secure it to the eye-plate, set-screws which pass through said arms, bear against the eye-plate, and serve to adjust the position of the rynd to the plate, whereby the faces of the stones are relatively adjusted one to the other, substantially as described.

292,627. NUT-LOCK. SAMUEL B. CRAGIN, Ada, Minn., assignor of one-third to Ida L. Cragin, same place. Filed Dec. 4, 1883. (Model.)



Brief.—Screw the nut down sufficiently to put the key into the slot in the bolt and to permit the key to drop in the slot onto the nut and with its tooth in the tap-hole of the nut. Then screw the nut back, jamming the key against the upper side of the slot in the bolt. The spring-washer may be omitted.

Claim.—1. The bolt A, having the slot *b*, and nut B, in combination with the pin C, having notch *d*, substantially as described.

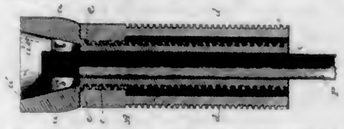


2. In a nut-lock, the combination of bolt A, having slot *b*, nut B, pin C, having notch *d*, and spring E, substantially as described.

292,628. STRAW-STACKER. WILLIAM DECKER and JOSEPH A. MARSHALL, Darlington, Ind. Filed Aug. 18, 1883. (No model.)

Claim.—In a straw-stacker, the combination, with the frame *a*, of the arms *s s*, pulleys *q q* at their upper ends, the arms *s s*, the shaft *c*, pulleys *r r*, the carrier *u*, hinged between the upper ends of the arms *s s*, the arms *m m*, hinged at their lower ends to the arms *n n*, the friction-rollers *o o* near their upper ends, and the ropes *p p*, connecting the arms *m m* and the pulleys *r r*, substantially as specified.

292,629. COMBINED CAN-HOLDER AND FUNNEL. W. MARK DOTY, Biggs' Station, Cal. Filed Nov. 23, 1883. (No model.)

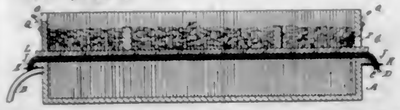


Claim.—1. In combination with a fruit-jar holder, a vertical adjustable arm, D, having a bent portion, *d*, adapted to extend under the base of the jar, substantially as shown.

2. A fruit-jar holder consisting of the spring-bands A' A², provided with perforations *a a'*, and handles B' B², one of said bands being provided with a loop, *b*, and connected to each other by a set-screw, for the purpose set forth.

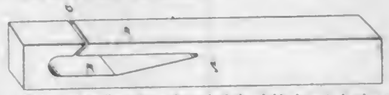
3. In combination with the fruit-jar holder herein described, a funnel-support and a downwardly-projecting arm with bent portion, as shown, for the purposes set forth.

4. In combination with an adjustable jar-holder, a vertically-adjustable arm for supporting a funnel, and an adjustable downwardly-projecting arm, bent at its lower end, as shown, the parts being united to each other by a single set-screw, substantially as shown, and for the purpose set forth.



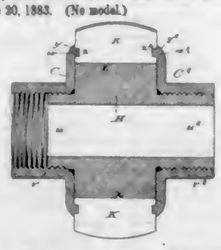
292,630. PIPE-LIFTER FOR OIL-WELLS. SAMUEL K. DUFF, Allegheny, and JAMES B. DUFF, Pittsburg, Pa. Filed Oct. 15, 1883. (No model.)

Claim.—1. In a device for lifting pipes, the combination of a hollow lifting-screw, provided with a hollow cylinder upon its upper end, with an operating jack or mechanism for raising the hollow screw upward, substantially as shown.



2. In a device for lifting pipes, the combination of a hollow screw having a cylinder formed upon its top, the jack A, and the nut B, which is applied to the upper end of the pipe inside of the cylinder, substantially as set forth.

292,631. FILTER. JUSTIN DUREL, New Orleans, La. Filed July 25, 1883. (No model.)

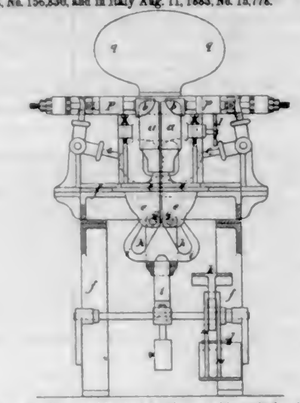


Claim.—The combination, with the tank A, having flanges G, and provided with pins K, and the tank F, having similar flanges G and a perforated bottom, of the cloths C and D, provided with eyelets J to engage pins K, and the bolts H, as and for the purpose specified.

292,632. MAIL-SACK TAG. GEORGE W. DWINGER, Brooklyn, N. Y. Filed Oct. 26, 1883. (No model.)

Claim.—A mail-sack tag formed of the rigid piece A, having the longitudinal beveled slot B, the transverse slot C, and the spring-tongue D, all substantially as shown and described.

292,633. HEEL-TRIMMER. CHRISTOPHER S. DWYER, Spencer, Mass. Filed June 20, 1883. (No model.)



Claim.—1. The combination, in a heel-trimmer, of the hub H, having oblique peripheral grooves *z*, annular grooves *y y²* in its respective faces, and externally screw-threaded ends *u u²*, knives K, having notches *z z²* in their ends, coinciding with said annular grooves, and clamping-collars C C², constructed with annular locking-ribs *w w²* on their inner faces, matching said annular grooves and notches, and with internally screw-threaded ends *v v²*, matching said hub ends *u u²*, substantially as herein specified, for the purposes set forth.

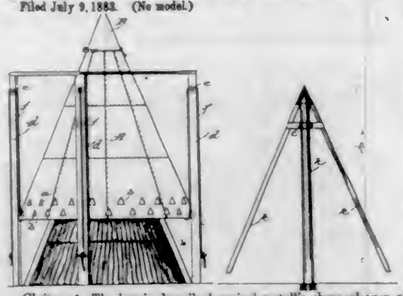
2. In a heel-trimmer, knives K of thin steel, held solidly in oblique

peripheral grooves in a suitable hub, and secured in said grooves by means of annular ribs coacting with corresponding grooves and notches in said hub and knives, substantially as herein described, for the purposes set forth.

292,634. APPARATUS FOR STRETCHING HAT-BODIES. JOHN EATON, Stockport, County of Chester, England. Filed Aug. 6, 1883. (No model.) Patented in England Apr. 19, 1883, No. 1,976; in France Aug. 1, 1883, No. 156,330, and in Italy Aug. 11, 1883, No. 15,778.

Claim.—1. The combination, in a hat-machine, of a hat-block made in two or more parts, and corresponding cups adapted to be held to the said separate parts to retain the hat thereon, and devices, substantially as set forth, for moving the parts of the block away from each other, as set forth.

2. The combination of the frame of a hat-machine, a hat-block made in two or more parts, and standards adapted to guides in said frame, and carrying the parts of the block, with corresponding cups adapted to be held to the said parts to retain the hat thereon, and devices, substantially as described, for moving said standards to separate the parts of the block.



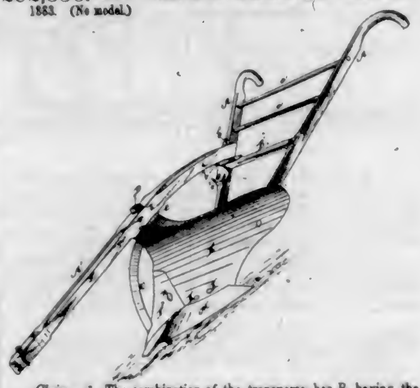
3. The combination of the frame of a hat-machine, and a hat-block made in two or more parts, with a movable frame carrying yielding cups corresponding with the parts of the said block and applied thereto, with devices, substantially as set forth, for separating the parts of the block with their corresponding cups.

4. The combination of the main frame of a hat-machine, a hat-block made in two or more parts, and devices for withdrawing said parts from each other, with a pivoted frame, *p*, carrying cups *b b*, and yielding devices pressing the cups into contact with the parts of the block, substantially as specified.

5. The combination of the main frame of a hat-machine, a hat-block made in two or more parts, and devices for withdrawing said parts from each other, with a movable pivoted frame, *p*, carrying yielding cups adapted to bear on the parts of the block, and a catch, *d*, substantially as set forth.

6. The combination of the frame of a hat-machine, a hat-block made in two or more parts, and yielding cups held to said parts, with sliding standards *e*, carrying the latter, and a plunger, *i*, under the control of the operator to separate said standards, substantially as described.

292,635. CHARCOAL-OVEN. JOHN A. EDWARDS, Columbiana, Ala. Filed July 9, 1883. (No model.)

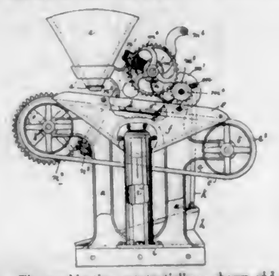


Claim.—1. The herein-described conical metallic charcoal-oven of the described construction, and adapted to rest on the ground, in combination with the corner-posts and hoisting-ropes.

2. The guide having inclined pivoted arms, in combination with a conical charcoal-oven.

3. The combination of the center post, *h*, cross-beam *i*, and arms *k k*.

292,636. PLOW. JOSEPH ELDOCK, Mechanicsburg, Pa. Filed Jan. 11, 1883. (No model.)



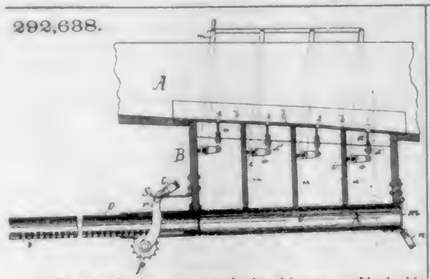
Claim.—1. The combination of the transverse bar B, having the slotted seat *b* and extension or lug *b²*, the handles A, the mold-board E, provided with seat *e*, flange *f'*, and intermediate lug, *e'*, beam A', and bolt D, passing through beam-seat *e* and lug *e'*, substantially as described.

2. The landside G, having the sole I at its front end, the inclined chamber I², arranged above said sole, and the enlargement P and V-shaped socket *p*, substantially as described.

3. The combination of the mold-board having the flanged portion *f'*, the inclined channel *f²*, formed in the lower portion of the latter, and the flat upper bearing-surface, E², located above a portion of said inclined channel, with the reversible plow-point and the landside having the beveled sole I, substantially as described.

4. The combination of the reversible share M, having the curved shoulder *m'* formed upon its opposite sides, and having the inclined perforated and cut-away inner portion, *m²*, with the mold-board having the perforated and recessed portion L, substantially as described.

292,637. ORE-SEPARATOR. HADLEY P. FAIRFIELD, West Medford, Mass. Filed Apr. 16, 1883. (No model.)



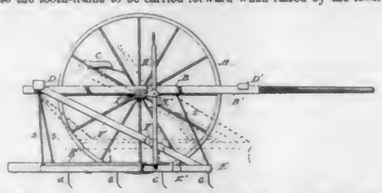
Claim.—The combination, substantially as shown and described, of the hopper, an endless traveling belt provided with transverse riffles and longitudinal deckels, drums to support such belt, with its end next the hopper higher than the other, gearing to drive such belt, an air-chamber through which the upper part of the belt passes, an air-forcing apparatus, a chamber into which the air is forced thereby, and a conduit or pipe connecting the two air-chambers, all and severally as set forth.

292,638. ORE-SEPARATOR. HADLEY P. FAIRFIELD, West Medford, Mass. Filed May 22, 1883. (No model.)

Claim.—1. In an ore-separator, the sluice having narrow transverse slits in its bottom and a substantially water-tight tank or receptacle beneath the said slits, adapted to remain full of water, combined with clearing devices consisting of plates or bars vertically movable into said slits, and supports for said plates or bars, which, together with their supports, are arranged wholly below the said slits, substantially as described.

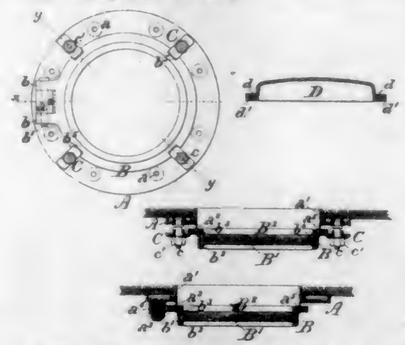
2. A sluice having a transverse slit through its bottom, combined with a clearing device consisting of a plate or bar and means to move it into the said slit, substantially as described.

292,688.



3. The sluice having a transversely-slotted bottom, combined with a clearing plate or bar movable in guides beneath each slit, and actuating mechanism therefor, whereby the said bar is movable upward into the said slit to lift particles therefrom and force them out in the direction from which they entered, as and for the purpose described.

4. The sluice and receiving-chamber beneath it, having a discharge-passage, combined with the ejecting-plunger and actuating mechanism therefor, whereby it may be forced longitudinally through the said passage to eject the contents thereof, substantially as described.



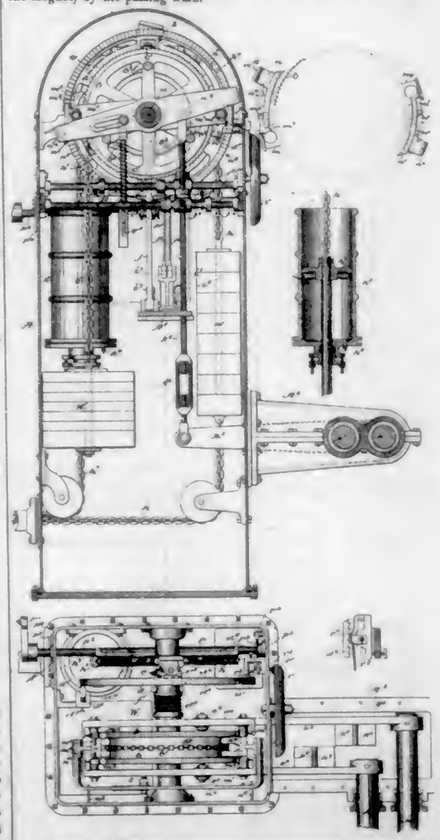
292,689. CULTIVATOR. HARVEY W. FERGUSON, North's Mills, assignor of one-half to William M. Dight, Mercer, Pa. Filed Mar. 15, 1883. (No model.)

Brief.—The angular braces are bolted in front to the cultivator-bars, and at the rear are notched to bear against the frame. The hangers cause the tooth-frame to be carried forward when raised by the lever.

Claim.—The combination, with the main frame and axle, of cultivator-frame E E' E'', the suspending rods S, the lever H, and the inclined braces F F', rigidly screwed to the front end of the cultivator-frame, and arranged to bear against the rear cross-bar and take the strain off the shovels when at work, substantially as shown and described.

292,640. AIR-PORT FOR VESSELS. JOHN F. FOLMER, Philadelphia, Pa. Filed May 1, 1883. (No model.)

Claim.—1. The combination of a plate or frame having a central opening and adapted to be secured to the side of a vessel, a flange surrounding and continuous with or of less diameter than the inner surface of said opening, and a movable sash having a packing-ring which abuts against the inner flange of the frame, said sash being coupled to the frame by a hinge pin or bolt, and secured thereto by a series of circumferential clamps, these members being combined for joint operation, to admit of the swinging aside of the sash by the slackening of the clamps without removing the same, and the insertion of a dead-plate which is adapted to be similarly secured and packed at its joint with the inner flange of the frame, substantially as set forth.



2. The combination, substantially as set forth, of a plate or frame having a central opening and adapted to be secured to the side of a vessel, a movable sash or dead-plate closing said opening, and a series of clamps, each secured by a nut upon a stud in the frame and entering a circumferential recess in the sash or dead-plate.

3. The combination, substantially as set forth, of a plate or frame having a central opening and adapted to be secured to the side of a vessel, a swinging sash or glass-support having a series of circumferential recesses, and hinged to said plate or frame by a pin or bolt passing through an oblong or slotted hole in a standard thereon, and a series of clamps, each entering one of the recesses of the sash, and secured against the same by a nut engaging a stud upon the frame.

4. A balanced clamp for securing an air-port, sash, or shutter, having a central hub or boss and an opening therein for the passage of a supporting-stud and two clamping-arms, projecting one upon each side of the central hub, substantially as set forth.

292,641. AUTOMATIC RAILWAY-GATE. GEORGE F. FORBES, Hyde Park, Mass. Filed Apr. 16, 1883. (No model.)

Brief.—A single gate-actuating mechanism is inclosed in an independent case, from which the power is transmitted to any desired number of gates that are to be operated simultaneously, and weights are employed to both close and open the gates. The devices are duplicated, so that a single apparatus inclosed in a single case is sufficient to operate any desired number of gates. The operating mechanism comprises a drum actuated by a weight, a clutch to connect the same with the gate, detents to hold the weight from action until it is desired to close the gate, detents and triggers with electro-magnet to engage the clutch and liberate the weight, and a winding mechanism operated (as is also the magnet) by the passing train.

Claim.—1. The combination of the main actuating-weight with the clutch for applying the said weight, and the duplicate clutch-controlling devices, substantially as and for the purpose described.

2. In an automatic gate-actuating apparatus, the main actuating-weight and clutch for applying the same, combined with duplicate winding mechanism for the said weight, whereby the said weight may be wound by trains passing on different tracks, substantially as described.

3. The main actuating-weight and its duplicate sets of winding mechanism for winding the said weight by the action of trains passing over different tracks, combined with a disengaging device common to both sets of winding mechanism, whereby the winding operation ceases when the weight is sufficiently raised, substantially as described.

4. The main shaft and main actuating-weight applied thereto, combined with the pulley loose on the said shaft, and clutch for connecting it therewith, and the restoring-weight and regulating device, substantially as described.

5. The clutch-wheel and its shipper, combined with a lever connected with the said shipper, and means, substantially as described, to move either end of the said lever independently, as and for the purpose set forth.

6. The clutch and its shipper, combined with a detent-arm, *f*, provided with a series of engaging projections or teeth, a detent-lever, *i*, having a projection, *i*, for engaging the said teeth, and an electro-magnet and its armature, controlling the said detent-lever, substantially as described.

7. The clutch and its shipper, and detent-arm therefor, provided with a series of teeth combined with the detent-lever having a yielding projection to engage the said teeth, an electro-magnet controlling the said lever, and restoring mechanism actuated by the said detent-arm, whereby the detent-lever is placed in proper position to engage the teeth of the detent-arm, substantially as described.

8. The clutch, its shipper, and lever connected therewith, combined with the independent clutch-disengaging devices connected with the said lever, and independent mechanism actuated by the trains passing over the different tracks, for actuating the said disengaging devices, respectively, substantially as described.

9. The main shaft and main actuating-weight applied thereto, combined with the pulley loose on the said shaft, having a secondary or restoring weight applied to it, and the clutch for connecting the said shaft and pulley, and duplicate winding and clutch-shipping mechanism corresponding to the different tracks, whereby the said main weight is wound when a train passes over either track and the clutch is shipped, substantially as and for the purpose described.

10. The weight W, its winding-drum having ratchet-wheels at either side, and the independent pawl-carriers and pawls, combined with the pawl-raising devices and actuating device therefor, operated by the weight when wound, whereby the winding-pawls are disengaged from the ratchets when at rest in their normal position, and are also retained disengaged during their entire movement after the weight is raised sufficiently high, substantially as described.

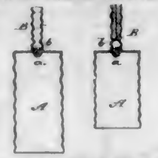
11. The main shaft and pulley loose thereon, connected with the gates, combined with the hand-operated shaft *p'* and means to throw it into engagement with the said pulley to operate the gates, substantially as described.

12. The main shaft and pulley loose thereon, connected with the gates and with a restoring-weight, as described, and provided with a worm-gear, combined with the hand-operated shaft, provided with a worm, and the movable bearing-piece for the said shaft, substantially as set forth.

13. The loose chain-pulley, connected with the gates and with a restoring-weight, combined with the hand-operated shaft adapted to be thrown into engagement with or disengaged from the said pulley, and its ratchet and pawl, whereby the said shaft is permitted to turn the pulley in one direction only to raise the said weight, substantially as and for the purpose described.

14. The combination, with the main shaft and weight applied thereto, of the chain-pulley loose on the said shaft and connected with the gate, and provided with a laterally-projecting pawl, and the clutch-wheel longitudinally movable on the said shaft, provided with ratchet-teeth on both faces, and the fixed pawl for engaging the said clutch-wheel when disengaged from the chain-pulley, substantially as described.

15. The main shaft and clutch-wheel longitudinally movable thereon, provided with ratchet-teeth, combined with the alarm-bell and its hammer, adapted to be operated by the teeth of the said clutch-wheel, substantially as described.



16. The shaft, winding-drum thereon, and pawl-carrier and pawls for winding it, combined with the yoke pivoted on the said shaft, provided with pawl-raising surfaces, its lifting-rod, and movable foot-piece actuated by the weight in rising, and the spring interposed between the said rod and foot-piece, substantially as described.

17. The rock-shaft adapted to be operated by a passing train, and the crank connected therewith, combined with the spring F, acting on the said arm, as described, and the weight-winding and clutch-shipping mechanism actuated by the said arm, substantially as set forth.

18. The main shaft, winding-drum thereon, actuated by passing trains, and the yoke fixed on the said shaft, and provided with friction-rollers, combined with the clutch-wheel longitudinally movable on the said shaft, in engagement with the said rollers, and the chain-pulley loose on the said shaft, connected with the gate, and adapted to be engaged and disengaged by the said clutch-wheel, substantially as described.

19. The gate-shaft and eccentric or cam-shaped sprocket-wheel, combined with the gate-actuating mechanism comprising a chain-pulley and actuating-weights, and the chain connecting the said pulley and sprocket-wheel, substantially as described.

292,642. SAFETY-SHELL FOR BLASTING. GEORGE FREUND, Durango, Colo. Filed June 23, 1883. (No model.)

Claim.—1. A screw-threaded blasting-shell having a screw-threaded nozzle or tube, substantially as herein shown and described.

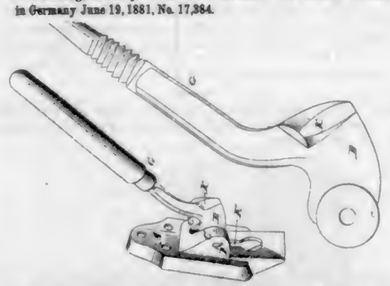
2. In safety-shells, the tube or nozzle B, for receiving a fuse, formed with an annular inwardly-projecting shoulder or neck, *b*, for separating the fuse from the fulminate or fulminate-cap, substantially as herein shown and described.

3. A screw-threaded blasting-shell having a screw-threaded nozzle, in combination with a threaded firing-cap, substantially as herein shown and described.

4. A screw-threaded blasting-shell formed with a screw-threaded nozzle or tube at one side, substantially as herein shown and described.

5. A double screw-threaded shell for blasting, formed with a screw-threaded tube or nozzle at its mid-length to receive a fuse for firing charges in both ends of the shell, substantially as shown and described.

6. The combination, in a blasting-shell, of the screw-threaded sections A A', provided with a screw-threaded nozzle or tube, B, substantially as shown and described.

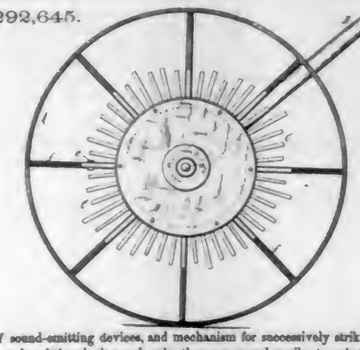


292,643. SKEWER-PULLER. AUGUSTUS F. FRIEND, Gravesend, N. Y. Filed Dec. 12, 1883. (No model.)

Claim.—1. A skewer-puller constructed substantially as herein shown and described, and consisting of the handles A B, pivoted to each other at their forward ends, and provided at their said forward ends with jaws C D, having their faces concaved longitudinally, as set forth.

2. In a skewer-puller, the jaws C D, concaved longitudinally, substantially as herein shown and described, to adapt them to take a firm hold upon a skewer, as set forth.

292,644. WOOD-SPLITTING MACHINE. AUGUST FUCHS, Cannstadt, Würtemberg, Germany. Filed June 25, 1883. (No model.) Patented in Germany June 19, 1881, No. 17,384.



Claim.—A wood-splitting tool consisting of a frame or base adapted to be secured to a fixed support, and having lugs and an opening or slot, E, a blade pivoted at one end to the lugs, and having an extended handle, the said blade being narrow at one edge and having wedge-shaped enlargements, substantially as described.

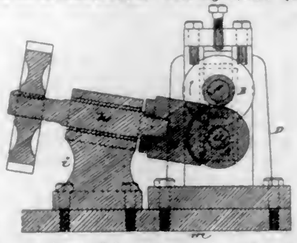
292,645. MUSICAL TOY. WILLIAM ALFRED GAY, Tonawanda, N. Y. Filed Sept. 28, 1883. (No model.)

Claim.—1. In a musical toy, the combination of a circular series

292,645.

of sound-emitting devices, and mechanism for successively striking said sound-emitting devices, whereby they are caused to vibrate, substantially as set forth.

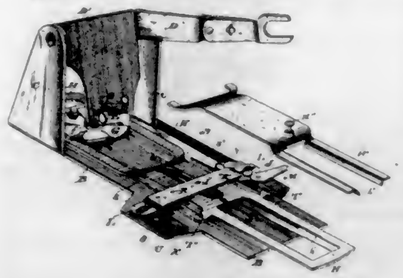
2. In a musical toy, the combination of a circular series of sound-emitting devices, an axle arranged centrally within said series, and mechanism mounted on said axle and adapted to come in contact successively with said sound-emitting devices, whereby they are caused to vibrate, substantially as set forth.



3. The combination, with a toy hoop, of a series of sound-emitting bars or tongues and mechanism whereby the same are vibrated, substantially as set forth.

4. The combination, with a toy hoop, of a handle, a circular series of sound-emitting devices, and a striking-finger, substantially as set forth.

5. The combination of a toy hoop, an axle on which the hoop turns loosely, a handle rigidly secured to the axle, a circular series of sound-emitting devices attached to the axle, and a striking-finger attached to the hoop, substantially as set forth.



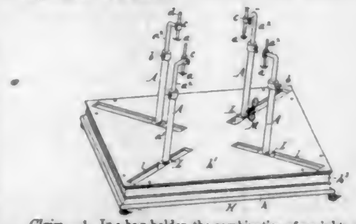
6. In a musical toy, the combination, with a disk, D, of sound-emitting bars or tongues C, secured to said disk, substantially as set forth.

292,646. MACHINE FOR BENDING BOOT AND SHOE COUNTERS. ROBERT GLOVER, Leominster, Mass. Filed Aug. 20, 1883. (No model.)

Claim.—The improved shoe-counter-shaping machine, substantially as described, consisting of the revolvable sphere, cup, and concave roll, arranged and having mechanism for operating them essentially as set forth, the axes of revolution of the sphere and roll being parallel and that of the cup being at right angles to that of the sphere.

292,647. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. HENRY C. HARTLEY and JAMES L. RODGERS, Springfield, Ohio. Filed Mar. 29, 1883. (Model.)

Claim.—1. In a button-hole attachment for sewing-machines, the combination of a rotary cam pivoted to the bed-plate, and provided with a circular rack adapted to receive motion from the needle-bar, as described, with a cloth-clamp surrounding and bearing at all times on diametrically-opposite points of the cam, whereby said cam imparts an oscillating motion to the clamp and is adapted to hold said clamp firmly in the extreme positions to which it is carried, substantially as set forth.



2. In a button-hole attachment for sewing-machines, the combination of the cloth-clamp having means of oscillation, as described, and the eccentrically-pivoted cams having two bearing-points, of which one or the other may be brought into engagement with the cloth-clamp, according to the desired direction of feed.

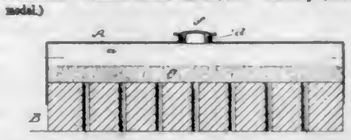
3. The combination of the oscillating cloth-clamp, having rods S S' hinged thereto, and the transverse slide, having pins R R' and pivoted blocks Q Q', between which the rods S S' are alternately clamped and released, substantially as described.

4. In a button-hole attachment for sewing-machines, means for adjusting the center of oscillation of the cloth-clamp, and thereby controlling the length of stitch, in combination with intermediate means whereby the same adjustment regulates the distance between the stitches, as set forth.

5. The combination of the transversely-adjustable slide carrying the pivot on which the cloth-clamp oscillates, and the longitudinally-adjustable slide mechanically connected thereto, for shifting the center of oscillation of said cloth-clamp relatively to the point where said oscillation is produced, as and for the purpose set forth.

292,648. BAG-HOLDER. MICHAEL HAYMAN, Buffalo, N. Y. Filed Sept. 4, 1883. (No model.)

Claim.—1. In a bag-holder, the combination of uprights and standards adapted to support the bag, sliding supports to which said standards are attached, a base-frame, and mechanism whereby the sliding supports are connected and caused to move simultaneously toward or from each other, substantially as described.



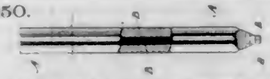
2. The combination, with the standards A, of the rack-bars *f f'* and *g g'*, and a central pinion, I, meshing with said rack-bars, substantially as set forth.

3. The combination, with the standards A, of the rack-bars *f f'* and *g g'*, guides J J' and K K', and a central pinion, I, meshing with said rack-bars, substantially as set forth.

4. The combination, with the standards A, of the rack-bars *f f'* and *g g'*, guides J J' and K K', base H, provided with slots *l*, and a central pinion, I, substantially as set forth.

5. The combination, with the base H and standards A, of mechanism whereby the lower ends of the standards are connected to move simultaneously toward or from each other, and a locking device, M, whereby the standards can be secured in position on the base H, substantially as set forth.

292,649. POLISHER AND CLEANER FOR METAL AND OTHER SURFACES. WILLIAM HEARD, Paterson, N. J. Filed July 5, 1883. (No model.)



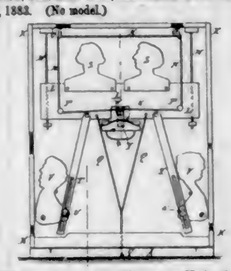
Claim.—The reservoir A, having opening *d* and cap *f*, in combination with the percolator B, held in the reservoir A, so as to form the space *a* for holding the polishing or cleaning material, substantially as described.

292,650. SHADING-PENCIL. GEO. BAPTISTE HECKLINGER, Streator, Ill., assignor of one-half to Charles Hecklinger, New York, N. Y. Filed Aug. 15, 1883. (No model.)

Claim.—1. A shading-pencil made substantially as herein shown and described, and consisting of a handle inclosing leads of different colors, placed side by side, as set forth.

292,650.

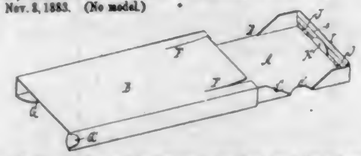
2. In a shading-pencil, the combination, with the handle A, of two or more leads, B, of different colors, placed side by side, substantially as herein shown and described, whereby a mark shaded in different colors can be made at a single stroke, as set forth.



292,651. REFUSE ATTACHMENT FOR TABLE-PLATES. ALBERT HEYDECKER, Philadelphia, Pa. Filed Dec. 7, 1883. (No model.)

Claim.—1. A refuse-holder designed and adapted to form an attachment to table-plates, the same consisting of a pan or tray having means for securing it to a plate, substantially as and for the purpose set forth.

2. The device herein described, consisting of a shallow pan or tray, B, having legs *b b* and lip *b'*, constructed and adapted for attachment to a plate, substantially as shown and described.



292,652. TOY TARGET. ARTHUR HENRY HOFFMAN and WILLIAM FREDERICK LLOYD, East New York, and JOSEPH H. BLOCK, Brooklyn, N. Y. Filed Sept. 7, 1883. (No model.)

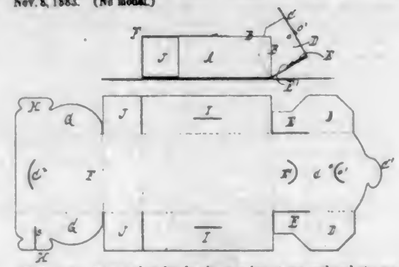
Claim.—1. The combination, with a box, K, having rods M suspended from its top, and between them the hooks O O, of the cross-bar L, arranged to slide vertically on said rods, having pins P P, and carrying the target-plates S, the spring-band N, connecting with hooks O and pins P, and the cord Q, attached to said cross-bar and passing through the base-board, as shown and described.

2. The combination, with a sliding cross-bar, L, movable down by a cord and up by a spring, of the slotted rods T and the pivoted target-plates V, screw-clamped in said slots, said plates being pivoted at the outer lower corners to the box, as and for the purpose specified.

292,653. PAPER BOX. GUSTAV L. JAEGER, New York, N. Y. Filed Nov. 8, 1883. (No model.)

Claim.—1. A paper box having a thumb-opening formed partly in the side and partly in the bottom and intermediate the ends of the box-sides, substantially as described.

2. A paper box having a thumb-opening formed partly in the side and partly in the bottom and intermediate the ends of the box-sides, in combination with a tubular cover, through which the box is capable of sliding longitudinally, substantially as described.



3. The combination, with a paper box, of a tubular cover having slits formed in the end or ends thereof opposite to the top of the box, substantially as shown and described.

4. A paper box having an end piece bent inward upon itself, side ears turned into the fold of the end piece, and a vertically-projecting tongue fixed in position along its horizontal base portion, the upper free end of the tongue lapping over the free edge of the end piece, substantially as described.

5. A paper box having an end piece bent inward upon itself, a tongue in such end piece to receive the free edge thereof, and side ears turned inward into the fold of the end piece, substantially as shown and described.

6. A paper box having an end piece bent inward upon itself and scored lengthwise on its inner part, side ears turned inward into the fold of the end piece, and a tongue or tongues to engage the free edge of the end piece, substantially as shown and described.

292,654. PAPER BOX. GUSTAV L. JAEGER, New York, N. Y. Filed Nov. 8, 1883. (No model.)

Claim.—1. A paper box having its opening at one end and at a portion of the top adjacent to that end, and provided with a closing-flap constructed at its free edge to engage the box top, and having a tongue-piece at or near its central line, a cheek-piece attached to each of its sides, and an ear-piece forming part of each cheek-piece and lying back on the closing-flap, and both ear-pieces engaged by the tongue-piece, said cheek-pieces of the closing-flap embracing the sides of the box, substantially as described.

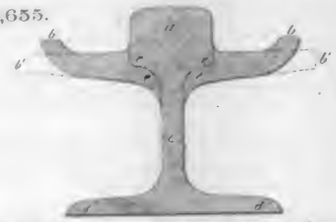
2. A paper box having its opening at one end and at a portion of the top adjacent to that end, and provided with a closing-flap, C, constructed at its free edge to engage the box top, and having slots at or near its central line, forming, respectively, the tongue-piece E' and thumb-piece *c'*, said closing-flap also having at each side a cheek-piece, D, joined to an ear-piece, E, turned back on the closing-flap, and both ear-pieces engaged by the tongue-piece, the cheek-pieces moving with the re-enforced flap to embrace the sides of the box, substantially as described.

3. A paper box having its opening at one end and at a portion of the top adjacent to that end and the slit C² in its top, and provided with the closing-flap C, having hook C' on its free edge and a thumb-piece, *c'*, back of such hook, substantially as described.

4. A paper box having its opening at one end and slots I in its opposite sides, and provided at one end with a flap, F, having at each side a cheek-piece, G, provided with a hook, H, respectively engaging the side slots, and at the other end with a closing-flap, C, having its free edge constructed to engage the flap F, substantially as described.

5. A paper box having its opening at one end and slots I in its opposite sides, and provided at one end with a flap F, having the slot C², and a cheek-piece, G, at each side, provided with a hook, H, respectively engaging the side slots, and at the other end with a closing-flap, C, having its free edge provided with the hook C' to engage the slot in the flap F, substantially as described.

6. A paper box having slots I at its opposite sides and at one end provided with ears J, resting against the slotted sides, and the flap F, having a slot, C², and cheek-pieces G, each having a double hook, H, engaging one of the side slots, and at its other end provided with a closing-flap, C, having cheek-pieces D, a thumb-piece, *c'*, and a hook, C', at its free edge to engage the slot in the flap F, substantially as described.

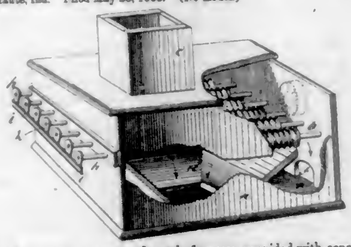


7. A paper box made from a single blank, having slots I in its sides, the flap F, constructed with cheek-pieces G, provided with hooks H, and the closing-flap C, provided with cheek-pieces D, and with means to engage the said flap F, substantially as described.

292,655. RAILROAD T-RAIL. TOM L. JOHNSON, Indianapolis, Ind. Filed Feb. 20, 1883. (No model.)

Brief.—A T-rail having integral with the head side flanges for vehicle-wheels, said flanges having their outer ends upturned to facilitate the inflow of ballast.

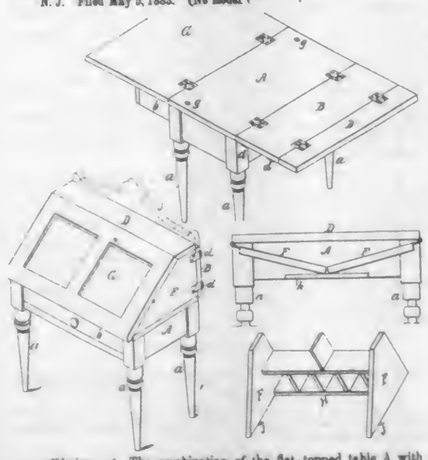
Claim.—1. As a new article of manufacture, a rail whose head, web, and foot are substantially of the form and proportion of the ordinary T-rail, provided with two side flanges integral with the body of said head and formed therefrom into side tracks for ordinary wheels of street-vehicles, as and for the purposes set forth.



292,655.

2. A T-rail having a central head provided with side flanges integral with the body of said head, and adapted for use as tracks for the wheels of ordinary street-vehicles, the extremities of said flanges being curved, so as to facilitate the inflow of street-ballast on either side into pockets sufficiently capacious to bond said rail with the adjacent street material, substantially as set forth.

3. A T-rail having a flange on each side of its head integral with the body of said head, and formed into two side tracks whose extremities are curved upward for street-vehicles, as described, whereby great facility is secured for the passage of such vehicles across such rails at any angle thereto, when laid in track, and wear of street adjacent to said rails largely prevented, substantially as set forth.



292,656. SEPARATOR FOR GRAIN, &c. FRANK L. KIDDER, Terre Haute, Ind. Filed May 28, 1883. (No model.)

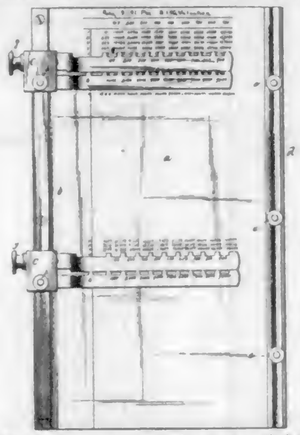
Claim.—1. A separator formed of screws, provided with connected threads intermeshing but not in contact with each other, and mechanism adapted to rotate the adjacent surfaces of each pair of screws in opposite directions, as described.

2. The combination of the box *a*, supply-tube *c*, intermeshing screws *b*, and outlet-hopper *d*, as shown and described.

292,657. FOLDING TABLE. EDWARD C. D. KIRKPATRICK, Camden, N. J. Filed May 5, 1883. (No model.)

Claim.—1. The combination of the flat-topped table A with a structure, as described, for inclosing a space above the top of the table, the back B and flap G of this structure being hinged to the table, as set forth, whereby they can be turned down, and thus form opposite projecting leaves of the table, as set forth.

2. The combination of the flat-topped table A with a structure, as described, for inclosing a space above the table, and comprising the back B, top D, ends F, and flap G, the back and flap being hinged to the table, as described, so as to form projecting leaves thereof, and the top D being hinged to the back B, as set forth, so as to form a continuation of the same when it is turned down to form a leaf, as specified.

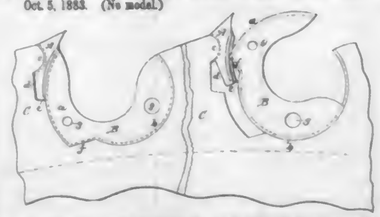


3. The combination of a detachable pigeon-hole frame, H, with a flat-topped table, A, and with an inclosing structure, as described, the back B and flap G of which are hinged to the table, as set forth, whereby they can be turned down, so as to form opposite projecting leaves of the table, as specified.

4. The combination of the table A, having openings *g*, with the hinged flap G and hinged back B, and the ends F, having pins *f*, adapted to the openings *g*, as set forth.

5. The combination of the table A, having a cleat, *h*, at the back, with the hinged back piece, B, and the ends F, hinged thereto, as described, whereby they can be adjusted so as to rest upon the cleat when the back is turned down, as set forth.

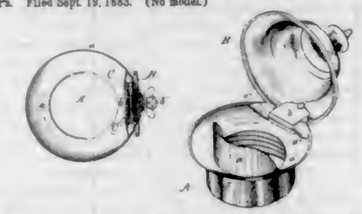
6. The combination of the table A, having rear openings, *m*, with the hinged back B, and the ends F, hinged thereto, as described, and having pins *f* near their outer ends, as set forth, whereby said pins may be caused to enter the openings *m* when the back is turned down, as specified.



292,658. TAX, INTEREST, AND PERCENTAGE CALCULATOR. WILLIAM S. KISER, Albion, Ind. Filed Nov. 14, 1883. (Model.)

Claim.—1. In a tax, interest, and percentage calculator, the combination, with a tablet having a guide-strip at its left-hand edge, of a triple sliding indicator and a tabulated sheet, on which the per centam for one to one thousand has been calculated and arranged in columns of one hundred resultants, whereby the sliding indicator may be removed to expose the amount of tax, interest, or percentage on a given principal, substantially as specified.

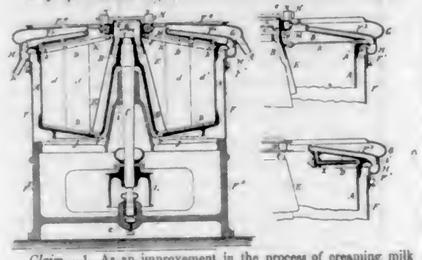
2. In a tax, interest, or percentage calculator, the combination, with a tablet having a guide-strip at one edge and a securing-strip at the other edge, of a tabular calculation and a triple indicator connected adjustably to a grooved slide upon the guide-strip, substantially as specified.



292,659. SAW-TOOTH. ANDREW KRINGER, Columbus, Ohio. Filed Oct. 5, 1883. (No model.)

Claim.—1. The combination of the saw-plate, a removable saw-tooth, and a clamping plate or device, the upper end of the tooth being rigidly clamped between the saw-plate and clamp, while its lower end remains free, substantially as shown.

2. The combination of the saw-plate C, having the projection *c*, and a recess formed by the lines *d e* just below it, the removable tooth A, having a recess in its rear edge to receive the projection *c*, and the clamping-plate B, the upper end of the tooth alone being clamped between the saw and clamping plates, while its lower end is separated from the saw-plate, substantially as set forth.



292,660. JUG-TOP. GEORGE PH. LANG and PETER LAUSTER, Allegheny, Pa. Filed Sept. 19, 1883. (No model.)

Claim.—1. A jug-top cover having a hinge-piece projecting downwardly from the inner portion of its rim, said hinge-piece having a single transverse opening adapted to receive a hinge-pin and a closing-spring surrounding said pin, substantially as set forth.

2. The combination of a peripherally-recessed cap-piece having sockets at the ends of its recess, a cover provided with a hinge-piece fitting within said recess, a hinge-pin passing through a transverse opening in said hinge-piece and fitting the sockets of the cap-piece, and a closing-spring within the opening of the hinge-piece, said spring surrounding the hinge-piece and bearing at its ends against the cover and cap-piece, substantially as set forth.

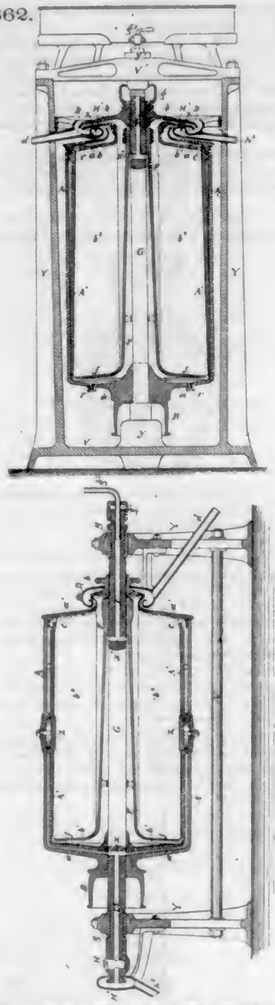
292,661. CENTRIFUGAL CREAMER. WILHELM C. L. LEFELDT and CARL G. C. LENTSCH, Schöningen, Brunswick, Germany, assignors to Theodore Bergner, Philadelphia, Pa. Filed July 28, 1879. Patented in France June 6, 1879, No. 131,257; in England Dec. 24, 1879, No. 5,271, and in Germany Apr. 6, 1880, No. 12,728.

Claim.—1. As an improvement in the process of creaming milk mechanically, driving off the cream mechanically, and removing the skimmed milk mechanically by centrifugal force, the hereinbefore-described method of regulating and adjusting the discharge of skimmed milk while the drum is rotating, substantially as and for the purposes described.

2. As an improvement in the process of creaming milk mechanically, driving off the cream mechanically, and removing the skimmed milk mechanically by centrifugal force, the hereinbefore-described method of supplementing the constant minimum discharge of skimmed milk by a variable discharge regulated while the drum is rotating, substantially as and for the purposes described.

3. The combination, in a centrifugal machine, of a revolving drum, vertical escape-openings therein, and cocks for regulating the escape through said openings, substantially as described.

4. The combination, in a centrifugal machine, of a revolving drum, vertical or lateral escape-openings therefrom, regulating-valves, and regulated cocks, substantially as and for the purposes set forth.



5. The combination, in a centrifugal machine, of a revolving drum, escape-openings therefrom, and regulated escape-cocks leading to said escape-openings, substantially as set forth.

292,662. CENTRIFUGAL CREAMER. WILHELM C. L. LEFELDT and CARL G. C. LENTSCH, Schöningen, Brunswick, Germany, assignors to Theodore Bergner, Philadelphia, Pa. Filed July 28, 1879. Patented in France Jan. 7, 1879, No. 128,351, and in Germany Jan. 28, 1879, No. 9,241.

Claim.—1. The combination of the cylinder A with the drum A′, revolving together, substantially as and for the purposes described.

2. The combination of the drum, the cylinder, the channel *c′*, the cross-hole *x′*, and the closed sleeve, substantially as and for the purposes described.

292,662.

3. The combination of the cylinder A, the drum A′, the inlet *c′*, and the outlet c^3, substantially as and for the purposes described.

4. The combination of the cylinder A, the drum A′, and the screw-cap *b*, substantially as and for the purposes described.

5. The combination of the cylinder, the drum, the screw-cap, the chamber or trough D, and the outlet c^3 with the chamber or trough H′, substantially as and for the purposes described.

6. The combination of the cylinder, the supply g^2, and the discharge H, substantially as and for the purposes described.

7. That improvement in the method or process of creaming milk which consists in separating the cream therefrom by centrifugal action, discharging a portion of the skim-milk while the drum is in rapid rotation, then feeding the drum while in rapid rotation, so that the fresh milk is introduced next the inner wall of the drum into the skim-milk in the drum, and between the drum and the cream-wall previously formed and then established within the drum.

8. That improvement in the art of feeding or introducing milk into a centrifugal machine, to separate the milk from the cream and keep the cream-wall unbroken during the creaming operation, which consists in feeding the milk into the machine next the inner wall of the then revolving drum.

9. A closed centrifugal drum mounted upon a vertical tubular axle,

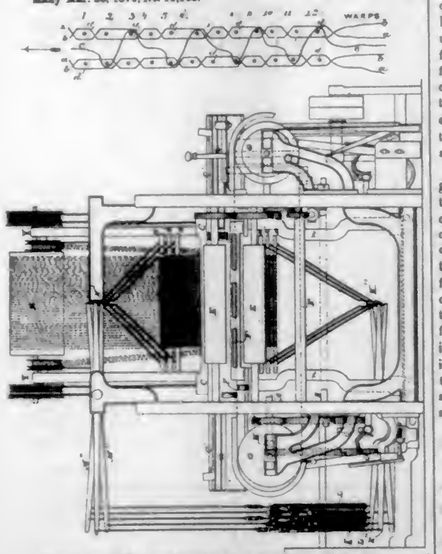
and provided with interior radial flanges, and with a series of peripherical discharge-tubes located above the drum.

10. A closed centrifugal drum mounted upon a vertical tubular axle, and provided with interior radial flanges, and with a discharge-tube concentric with the axle, opening from the upper center of the drum.

11. A closed centrifugal drum provided with a double set of central discharge-pipes adjustable in relation to each other, one of said pipes communicating with the periphery and the other with the center of the drum.

12. A closed centrifugal drum provided with radial interior flanges, and a double set of vertical discharge-tubes, in combination with a central vertical tubular axle, and a distributing-shield attached thereto.

292,663. MANUFACTURE OF SPANGLED GLASSWARE. WM. LIBERTON, Jr., Wheeling, W. Va. Filed Sept. 26, 1883. (Specimens.)



Claim.—1. The improvement in the art of manufacturing ornamented glassware, which consists in incorporating spangles, flakes, or fragments of infusible crystalline material into the substance and between the layers of glass after fusion and while in a plastic condition, and thereafter blowing the same into any desired shape, substantially as set forth.

2. The improvement in the art of manufacturing ornamented glassware, which consists in gathering a ball from a melting-pot, rolling said ball on a marver, on which is spread infusible crystalline material in flakes or fragments, gathering an additional layer of glass upon said ball by returning it to the melting-pot, and finally blowing the ball into any desired shape, substantially as set forth.

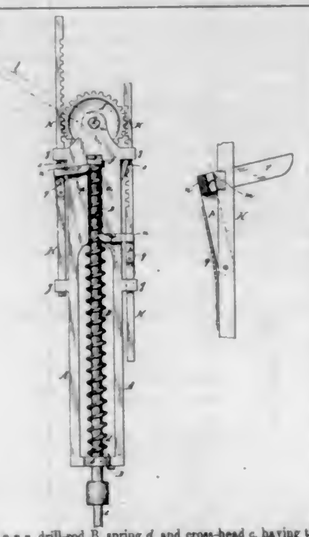
3. As a new article of manufacture, a piece of glassware having spangles or flakes of infusible crystalline material embedded between upper and lower layers or strata of its mass, substantially as set forth.

292,664. LOOM FOR WEAVING DOUBLE PILE FABRICS. SAMUEL C. LISTER and JOSE REYACH, Manningham, near Bradford, County of York, England. Filed Nov. 23, 1881. (No model.) Patented in England Aug. 23, 1878, No 3,327; in France Mar. 13, 1879, No. 129,564, and in Germany Mar. 25, 1879, No. 10,163.

Claim.—1. The combination of means for supplying two sets of ground-warps, one above the other, for forming a top fabric and a bottom fabric; mechanism for passing a weft-thread between the warps of top fabric when crossed, and for simultaneously passing a weft-thread between the warps of bottom fabric when they are likewise crossed; mechanism for causing the crossing of the ground-warps of the top fabric alternately after one pick of weft has been passed into that fabric, and then after two consecutive picks of weft have been put into it, and then, again, after a single pick of weft has been put into it, and so on; mechanism for causing the ground-warps of the bottom fabric to make corresponding crossings, but to make them either one pick before or one pick after the like crossing of the warps of the top fabric; means for supplying a set of pile-warps; mechanism for raising and lowering these warps, arranged to first (when a pick of weft is simultaneously thrown into both fabrics) cause the pile-warps to be caught into one fabric by the second of the two consecutive picks of weft that have to be put into that fabric, then at the next pick of weft to cause the pile-warps to be caught into the other fabric, (similarly by the second of the two consecutive picks of weft that have to be put into that fabric,) and afterward at the next pick of weft, to cause the pile-warps to be held centrally between the two fabrics, so as not to be caught into either of them, and so on in succession; a batten for beating up the weft-threads, and take-up mechanism for taking up the cloth as it is woven, substantially as hereinbefore set forth.

2. The combination of the batten, the two shuttle-boxes, one above the other, at each end of the batten, shuttle-actuating mechanism, two healds operating upon the ground-warps of the top fabric, their two actuating-cams, two healds operating upon the ground-warps of the bottom fabric, the two cams for actuating them similar in construction to the cams for working the ground-warps of the top fabric, a heald operating upon the pile-warp, the single cam for actuating this heald, and the levers and connecting-rods interposed between the respective cams and healds, the several cams being shaped and set upon the cam-shaft, as described, to cause the ground-warps of the top fabric to be crossed alternately after one pick of weft has been put into that fabric and after two consecutive picks of weft have been put into it, and to cause the ground-warps of the bottom fabric to make corresponding crossings, but to make them either one pick in advance of or one pick after the like crossings of the top warps, and to cause the pile-warp to be caught into each fabric by the second only of the two consecutive picks of weft put into that fabric, substantially as hereinbefore described.

3. The combination of the batten, the two shuttle-boxes, one above the other, at each end of the batten, shuttle-actuating mechanism, the two healds and their two actuating-cams for operating the ground-warps of the top fabric, said cams being formed so as to cross these warps alternately after one pick of weft has been put into that fabric and after two consecutive picks of weft have been put into it, the two healds and their pair of actuating-cams for operating the ground-warps of the bottom fabric, the said cams corresponding with those for operating the ground-warps of the top fabric, but so set upon the cam-shaft as to produce the corresponding crossings of the warps either one pick in advance of or one pick after the like crossings of the warps of the top fabric, the single heald and its cam for operating upon the pile-warp, so formed and set upon the cam-shaft as to cause the pile-warp first to be caught into one fabric by the second of the two consecutive picks of weft put into that fabric, then to be caught into the other fabric by the second of the two consecutive picks of weft put into that fabric, and next to be held centrally between the warps of the two fabrics, so as not to be caught into either of the fabrics when a pick of weft is put into each of them, and the levers and connecting-rods interposed between the respective cams and healds, substantially as and for the purpose hereinbefore set forth.



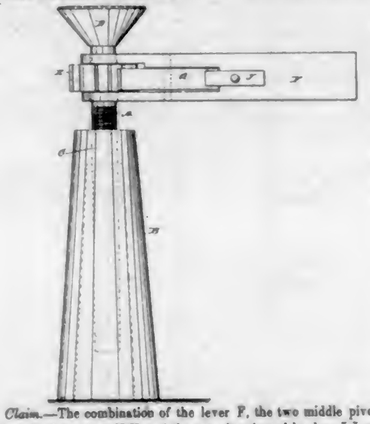
4. The combination of the two healds for raising and lowering the ground-warps of the top fabric, the two healds for raising and lowering the ground-warps of the bottom fabric, the two corresponding pairs of cams, L L', one pair for each two healds, each pair formed so as to raise one heald and lower the other during one-twelfth of a revolution, then during the next one-twelfth of a revolution to retain the healds at rest, then during the next one-twelfth of a revolution to reverse the movement formerly given to the healds, and so on in succession, and with one pair of cams set one-twelfth of a revolution in advance of the other pair upon the cam-shaft, the heald for raising and lowering the pile-warp, its cam formed to raise the heald during one-twelfth of a revolution, lower it during the next twelfth of a revolution, and hold it in a central position during the next twelfth of a revolution, the connecting-rods and levers interposed between the cams and the healds, the shaft upon which the cams are mounted, the driving-shaft, and the gearing connecting said shafts, substantially as and for the purpose hereinbefore set forth.

292,665. HAND ROCK-DRILLING MACHINE. ROBERT MAGILL, Pittsburg, Pa. Filed May 29, 1883. (No model.)

Claim.—1. In a drilling apparatus, the combination of the oscillatory pinion I, lever *l* on the shaft thereof, rack-bars H, engaging with said pinion, and spring-actuated drill-rod B, said bars H being provided with means for engaging the rod B and automatically releasing the same, substantially as described.

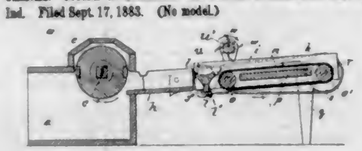
2. The combination of oscillatory pinion I, reciprocating rack-bars H, engaging therewith, frame A, having guides *g* for said rack-bars,

292,665.



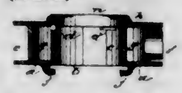
spring-triggers *p u r*, drill-rod B, spring *d*, and cross-head *c*, having toes *f*, said triggers adapted to engage the cross-head in their upward movement and yield in the downward movement, substantially as described.

3. The reciprocating bar H, having recess *m*, in combination with the cross-bar *n*, having notch *o*, lugs *p*, and arms *r*, and spring *q*, and the drill-rod B, having cross-head *c*, and toes *f* in the path of said arms *r*, substantially as described.



4. The combination, with drill-rod B, having toes *f*, of reciprocating bars H, having spring trigger-arms *r*, and frame A, provided with inclines *z*, substantially as described.

292,666. LIFTING-JACK. BENJAMIN F. MANSFIELD, Centerville, Oreg. Filed Oct. 12, 1883. (No model.)



Claim.—The combination of the lever F, the two middle pivoted pawls, G G, the springs H H, and the opposite pivoted latches, J J, with a toothed wheel, E, on the screw-spindle, as shown and described.

292,667. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. JOSEPH A. MARSHALL and FLAVIUS H. MARSHALL, Darlington, Ind. Filed Sept. 17, 1883. (No model.)

Claim.—In a band-cutter and feeder for thrashing-machines, the combination, with the hinged carrier-frame, the rotary band-cutter *u*, the endless apron, the rotary feeder or shaker *f*, having its bearings in the projecting ends of the side rails of the carrier-frame, the short arms *g*, the inclined chute, and operating mechanism, substantially as specified.

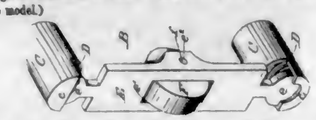
292,668. TUYERE. ENOCH P. H. MARTIN, Wilmington, Del. Filed May 1, 1883. (No model.)

Claim.—1. A tuyere having its bottom plate provided with an inner flange, *c*, notched at *d*, an outer flange, *e*, and a pipe-connection, *f*, made integral therewith to support the cover and form a wind-chest, as described.

2. The combination, in a tuyere, of the top plate, *h*, having a central hole through it, and the bottom plate, *a*, having the flanges *e c*, pipe-connection *f*, gateways *j*, and the hand-hole *k*, said hand-hole being located with relation to the gate *i* for being closed by it, substantially as described.

292,669. PROCESS OF SOLIDIFYING LIQUID OR SEMI-LIQUID FATTY ACIDS. WILLIAM FITZ CHARLES MASON MCCARTY, Aix-la-Chapelle, Germany. Filed Aug. 7, 1883. (No specimens.)

Brief.—Improvement on Letters Patent to same inventor, dated August 7, 1883, No. 282,547, and August 14, 1883, No. 283,003.



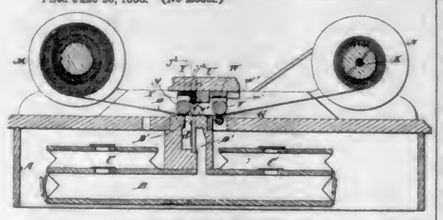
Claim.—1. The transformation of oleine into a solid fatty acid with high melting-point, so that the same can be employed to like purposes as stearic acid of first quality, substantially as set forth in the foregoing specification.

2. The transformation of mineral, vegetable, and animal oils into a solid fatty acid by first saponifying or otherwise treating the same until they obtain a gelatinous-like consistency, and then treating them according to my said process, so that the same are converted into solid fatty acids, substantially as set forth in the foregoing specification.

3. The improved process for solidifying and transforming liquid or semi-liquid fatty acids into solid fatty acids, consisting of (*a*) heating the fatty acids by means of free steam under continuous agitation of the mass by means of air; (*b*) successively adding about eight to ten per cent. common or five per cent. concentrated nitric acid during the agitation of the mass; (*c*) maintaining a temperature of about 100° centigrade for the space of about one hour under a continuous agitation of the material; (*d*) successively adding about one per cent. of starch or other similar product and continuing the aforementioned agitation; (*e*) continuing the agitation for about two hours, raising the temperature to about 120° centigrade, and then reducing the same to about 70° centigrade; (*f*) washing the product so obtained until all trace of acid is eliminated; (*g*) treating the material with a like quantity, in weight, of water strongly saturated with lime, caustic potash, ammoniac, or other equivalent material; (*h*) heating the product; (*i*) washing the product so obtained, then allowing the water and chemical products to settle or subside out of the same; (*j*) treating this product with about one per cent. of sulphuric acid and energetically agitating the same; (*k*) distilling the product in a continuous vacuum, thus obtaining a pure white mass with very high melting-point, substantially as described.

4. The application and employment of the transformed and solidified oleine and the solidified and transformed mineral, vegetable, or animal oils for themselves alone or suitable admixtures of the same for the manufacture of candles and other industrial purposes, substantially as set forth in the foregoing specification.

292,670. SASH-HOLDER. WILLIAM A. MCDONALD, Minneapolis, Minn., assignor of one-half to Frank J. Cross, same place. Filed Sept. 29, 1883. (No model.)



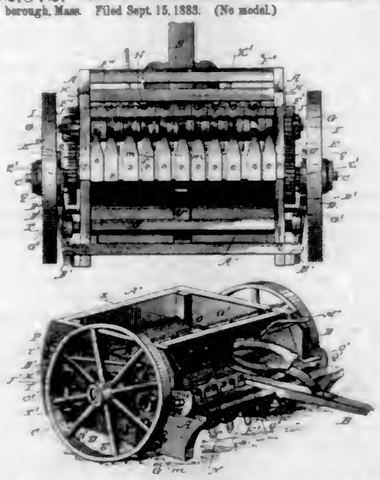
Claim.—1. The combination, with the springs D D, of cups C C, open at one side and having the lip *c*, and a roller face-plate, having ends *e*, fitting under said lips, to receive the pressure of the springs, as shown and described.

2. The spring-cup C, constructed, substantially as described, with the lip *c*, and adapted to receive the spring D and face-plate E, as set forth.

3. The face-plate E, constructed, substantially as described, with the opposite ends, *e*, and slot *e'*, and adapted to fit the cup C and to receive the roller F, as set forth.

292,671. AUTOMATIC MUSICAL INSTRUMENT. JOHN MCTAMMANY, Jr., Worcester, Mass., assignor to Alexander McTammany, same place. Filed June 20, 1883. (No model.)

Claim.—1. In combination with the bellows of an automatic musical instrument, a spring bearing against an attachment thereof, and a push-button and stem bearing directly against said spring, whereby the resistance of said spring may be varied and the tone correspondingly affected.



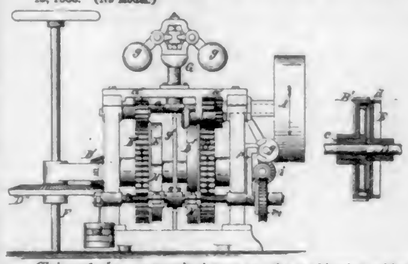
2. A pivoted rack carrying a spring-pressed upper feed-roll or idler, and a pressure-roll for holding the music-sheet against a fixed part of the instrument, in combination with the lower feed-roll of a musical instrument, the axes of the upper and the lower feed-roll being in the same transverse vertical plane with that of the rack when said pressure-roll is in its normal position for operation.

3. An upper feed-roll or idler, in combination with a spring-plate, in the ends of which said roll is journaled, a pivoted rack, to which said spring-plate is attached, and a lower or inner feed-roll, against which said upper feed-roll normally bears, substantially as set forth.

4. A pressure-roll, a pivoted rack, and an upper feed-roll, the latter having its axis vertically under the axis of said rack, in combination with a plate-spring attached to said rack, the ends of said spring forming bearings for said feed-roll, substantially as set forth.

5. A pressure-roll, in combination with a plate or bar having downwardly-extended ends, which form bearings for said roll, a perforated lug extending upward from its middle portion, a pivoted rack recessed to receive said lug, and a pivot-screw which extends through the front of said rack and through said lug, leaving the latter free to rock thereon in said recess, substantially as set forth.

292,672. FERTILIZER-DISTRIBUTER. ALBINO MERRIMAN, Middleborough, Mass. Filed Sept. 15, 1883. (No model.)

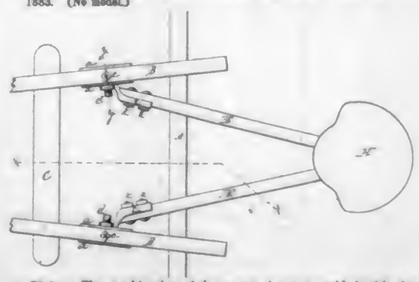


Claim.—1. In a fertilizer-distributer of substantially the described construction, the combination of the frame A, having the transverse opening A', downwardly-projecting spring-teeth N N, rotary feeder F, having teeth F' and annular grooves F'', teeth or plates *m*, having upwardly-curved reduced ends fitting within the annular grooves F'', means or mechanism by which the rotary feeder F may be rotated in the same direction as the drive-wheels D D, attachment O, adapted to serve as an agitator, and means by which the same may be vibrated, as and for the purpose shown and set forth.

2. In a fertilizer-distributer of substantially the described construction, the combination of the frame A, having the transverse opening A', downwardly-projecting spring-teeth N N, rotary feeder F, having teeth F' and annular grooves F'', teeth or plates *m*, having upwardly-curved reduced ends fitting within the annular grooves F'', means or mechanism by which the rotary feeder F may be rotated in the same direction as the drive-wheels D D, attachment O, adapted to serve as an agitator, and means by which the same may be vibrated, movable bottom A'', shaft S, having a central cam, U, and means or mechanism by which the shaft S may be rotated, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

3. In a fertilizer-distributer of substantially the described construction, the combination of the movable bottom A'', shaft S, having a central cam, U, and end pinions, T, constructed as described, levers B', adapted to be operated by cams D' on the hubs of the drive-wheels D, and provided with pawls C', and suitable mechanism for throwing the pawls C' out of engagement with the pinions T, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

292,673. GOVERNOR FOR WATER-WHEELS. JAMES MORTON, Norwich, assignor to James Buckley, Grosvenor Dale, Conn. Filed July 12, 1883. (No model.)

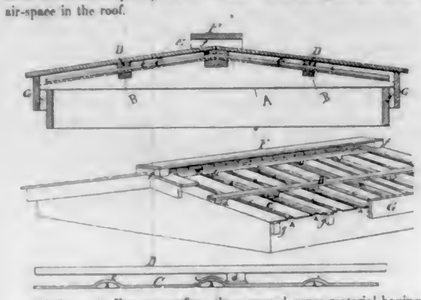


Claim.—1. In a water-wheel governor, the combination, with the main driving-shaft *a* and pinions *a' a''*, of the gears B and B', mounted loose on the driving-heads C C, the friction-disks E and E', and the strap-brakes *d*, constructed to be operated through the governor, and the brake-shoes H to regulate the gate, as described.

2. The combination, with the main driving-shaft and its pinions, of the gears B B', the driving-heads C, friction-disks E and E', straps *d d*, the governor G, rod *g'*, and shoes H H, constructed to move the shaft D and regulate the water-supply, as described.

3. In a water-wheel governor, the combination, with the shaft D, of the driving-heads C C, the gears loosely mounted on the driving-heads, the disks E E', and band-brakes *d d*, constructed to connect and disconnect the gears, as described.

4. The combination, with the gears B B', driving-heads C C, disks E E', and band-brakes *d d*, and the brake-shoes H H, mounted on the shaft *a* and controlled by the governor, of the beveled gear I, pinion *i*, worm *l*, and worm-gear *m*, provided with the slots *o o*, constructed to release the brake-shoes, as described.



292,674. CULTIVATOR. REUBEN C. NORTON, Rockford, Ill., assignor to Union Foundry and Machine Company, same place. Filed July 14, 1883. (No model.)

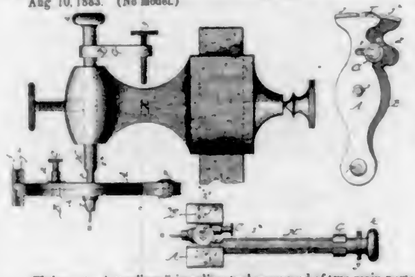
Claim.—The combination of the tongue-beams provided with the slotted adjustable flanged bed-plates, the seat-frame beams provided with the brackets F, having a series of adjusting holes, and stud-journals connecting said parts together, substantially as and for the purpose set forth.

292,675. CAR-ROOFING. WILLIAM H. PAINE, Cleveland, Ohio. Filed Oct. 1, 1883. (No model.)

Brief.—Provides sheets of prepared paper having corrugated overlapping edges resting upon semicircular strips, the parts being placed on the rafters. Purlines extend above the sheets and have spacing-blocks, as also the ridge-piece and running-board. A molding at the eaves is secured to spacing-blocks. The several spacing-blocks form an air-space in the roof.

Claim.—1. For car-roofing, the prepared paper material having corrugations, as and for the purpose specified.

2. In car-roofing, the combination of ridge-piece E, having supporting-blocks *e*, with the prepared paper and outer roofing, as and for the purpose specified.



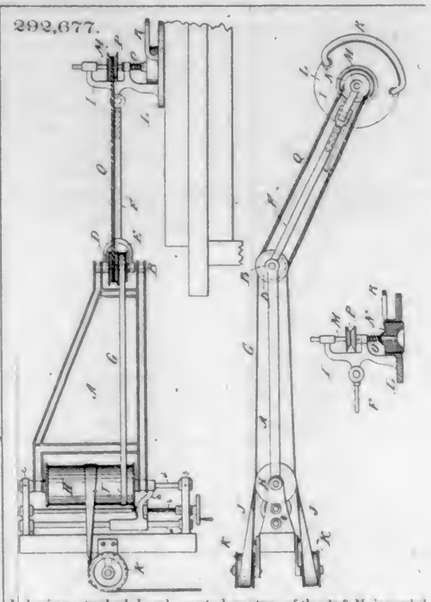
3. In combination with the corrugated paper roofing-sheets, the corrugation-supporting strips *h*, as and for the purpose specified.

4. In a car-roof, the combination, with the rafters A and purlines B, and the semicircular strips *h*, of the sheets of paper C, corrugated at *c* by means of said strips *h*, and the purlines D, having blocks *d* at suitable intervals apart, whereby said paper is held firmly, as shown and described.

5. In a car-roof, the combination, with the rafters A, purlines B, semicircular strips *h*, sheets of paper C, corrugated at *c* by means of said strips, and the purlines D, having blocks *d* at suitable intervals apart, of the ridge-piece E, having corresponding blocks, *e*, to those of the purlines D, and the run-board F, resting over said ridge-piece by means of the end blocks, *f*, as set forth.

6. The combination, with the car-roof having the sheets of paper C, the purlines D, having blocks *d*, and the ridge-piece E, having corresponding blocks to those of the purlines D, of the spaced block *g*, secured to the eaves, and the molding G, secured to the blocks *g*, whereby air-spaces are formed, as set forth.

292,676. JEWELING-TOOL. JAS. R. PARSONS, La Porte, Ind. Filed Aug 10, 1883. (No model.)



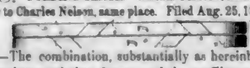
Claim.—1. A "caliper" jeweling-tool composed of two main parts, united by a pivotal connection and an adjusting device, and provided, respectively, parallel with and equidistant from the axis of said pivotal connection, with a cutting-bit or cutter and a holding-tang projecting in opposite directions, said tang forming the fixed axis of the tool and adapted to be inserted in an ordinary back-center, as a substitute for a removable center-point, or in a handle inserted as a substitute for the ordinary back-center, substantially as herein specified, for the purpose set forth.

2. In a caliper jeweling-tool constructed and operating substantially as herein described, a pair of jaw-plates at one extremity of the tool, one of said jaw-plates having elongated screw-holes to provide for adjusting the tool, so as to render it perfectly accurate as applied to a given lathe, as specified.

3. The handle H, constructed with a knob, *k*, and a socket, *s'*, at its respective extremities, and provided with a gage-bar, G, traversed by a gage-screw, *g*, substantially as shown, in combination with a caliper jeweling-tool, substantially as herein described, having a tang, *t*, fitted to said socket *s'*, for the purpose set forth.

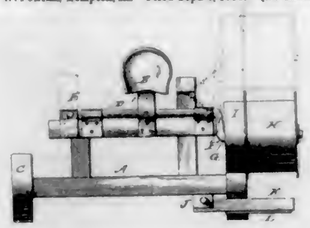
292,677. POLISHING-MACHINE. JEAN PIERRON, Elizabethport, N. J. Filed Oct. 25, 1883. (No model.)

Claim.—1. In a polishing-machine, the combination, with the plate L, having a standard, I, and a central aperture, of the shaft M, journaled in arms of the standard I, the abrading-disk N, mounted on the lower end of the shaft M, and adapted to revolve in the aperture of the plate L, the spring O, and of means for revolving the shaft M, substantially as herein shown and described.



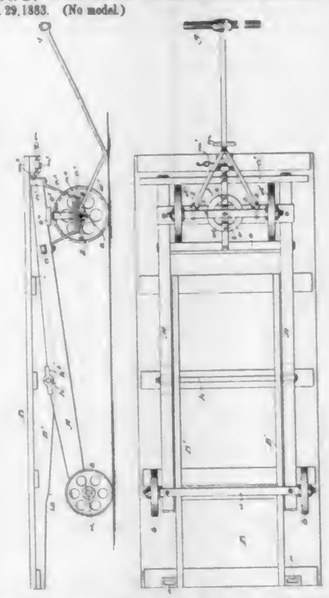
2. In a polishing-machine, the combination, with the plate L, having a standard, I, of the shaft M, journaled in arms of the standard I, the abrading-disk N, mounted on the lower end of the shaft M, and adapted to revolve in an aperture of the plate L, the spring O, the handle R, and means for revolving the shaft M, substantially as herein shown and described.

3. In a polishing-machine, the combination, with the plate L, provided with a standard, I, of a laterally-swinging rod, F, to which the standard I is pivoted, the shaft M, the disk N, and of means for revolving the shaft M, substantially as herein shown and described.



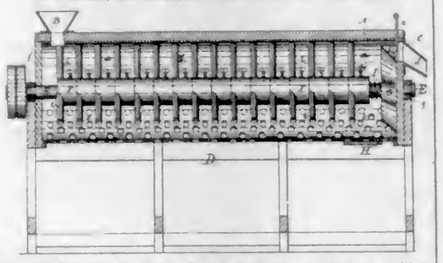
4. The combination, in a polishing-machine, of the attaching-arms supporting two guide-rods, upon which moves the adjusting bracket, with the frame A and drum H, mounted upon one of the guide-arms above the adjusting-bracket, and a screw-rod for reciprocating said adjusting-bracket, substantially as set forth.

292,678. FOLDING SLATE. CONRAD PILGRIM, East New York, N. Y., assignor to Charles Nelson, same place. Filed Aug. 25, 1883. (No model.)



Claim.—The combination, substantially as hereinbefore described, with the two slates and slate-frames and the muffling-strips forming the edges of the frames, of the flexible band or bands extending from an aperture under the muffling-strip of one frame, over such strip, thence through an aperture under the muffling-strip of the second frame, over this strip, and finally into a second aperture under the muffling-strip of the first-named frame, the ends of the bands being fastened in the proper apertures.

292,679. WIRE-STRETCHER FOR CHECK-ROWERS. WHEELOCK W. PORTER, Kempton, Ill. Filed Sept. 4, 1883. (No model.)

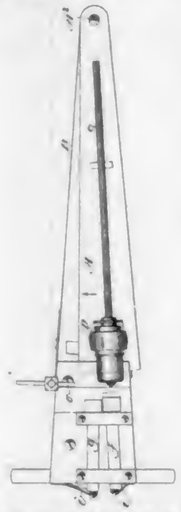


Claim.—The combination of a corn-planter frame mounted upon wheels, a transverse shaft journaled upon the said frame, and having a treadle upon its straight portion and forming a crank at one end, a reel journaled upon the horizontal portion of said crank, and having a narrow friction-rim at its inner end, and a transversely-rocking hand-lever pivoted at its lower end upon the planter-frame, forming a handle at its upper end, and having a laterally-extending arm provided with a downwardly-projecting plate having a longitudinal slot with inwardly-beveled edges, all constructed to operate as and for the purpose shown and set forth.

292,680. HAND-TRUCK. GEORGE H. RAUB II, Boston, Mass. Filed Sept. 29, 1883. (No model.)

Claim.—A hand or warehouse truck consisting of the platform B and the parallel sills A, upon which the said platform is pivoted a little in rear of the middle of the sills, the front wheels, and the rear wheels of smaller diameter than the front wheels, and axles for both front and rear wheels, and on which rear wheels the sills A are directly supported, the front axle supporting the sills by the usual fifth-wheel, all substantially as shown and described.

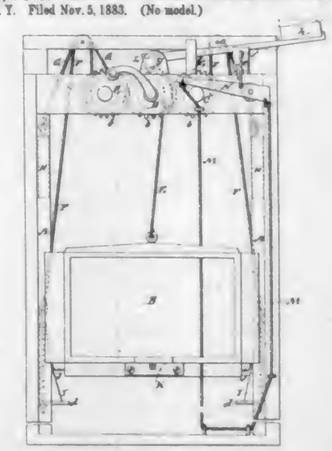
292,681. MACHINE FOR CLEANING COFFEE AND OTHER GRAIN. JOHN REANEY, New Orleans, La. Filed Oct. 27, 1883. (No model.)



Claim.—The herein-described grain-cleaning machine, comprising a horizontal cylinder, A, provided with closed ends, one of which is formed with a discharge-opening, C, a central shaft provided with hubs or disks F, having agitating-arms, a discharge-wheel, G, and a spring, I, substantially as described, and for the purpose set forth.

292,682. SHOE-FORM. ANDREW W. ROGERS, Salem, Mass. Filed May 28, 1883. (No model.)

Claims.—As an improved article of manufacture, the within-described device for expanding the upper of a boot or shoe, consisting of a hollow bottomless body portion arched and shaped to the contour of the front top portion of a last, and terminating in side pieces extending rearwardly and curved at their extremities to pass around the heel end of the last, and serve to prevent the withdrawal of the former in removing the last, substantially as described.



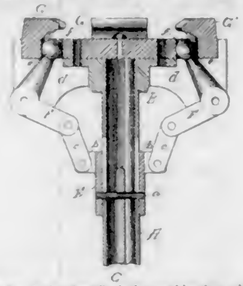
292,683. METAL-SCREW MACHINE. CHARLES F. ROPER, Boston, Mass. Filed Apr. 6, 1882. (No model.)

Claim.—1. A pivoted vibrating radius-bar and revolving rod-rotating chuck carried thereby, combined with one or more tool-holders made movable in lines radiating from the center of motion of the said radius-bar, to operate substantially as described.

2. The pivoted vibrating radius-bar, its revolving rod-rotating chuck, and two or more tool-carrying slides made movable in lines radiating from the center of motion of the radius-bar, combined with a fixed cutting-off or parting tool, substantially as and for the purpose described.

292,684. ELEVATOR. GEORGE ALEXANDER SAXER, New Brighton, N. Y. Filed Nov. 5, 1883. (No model.)

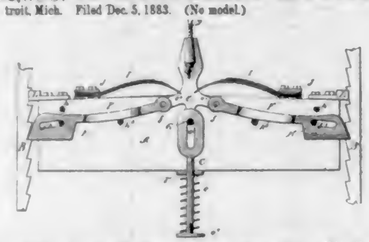
Claim.—1. The combination, with the car and its hoistway, of the geared drums C, C', and D, the hoisting-rope E, and the ropes F F, having attached safety appliances which move with the car, though independently of it, substantially as specified.



2. The combination, with the car and its hoistway, of the geared drums C, C', and D, the hoisting-rope E, the safety device, operating-ropes F F, and the counterbalance-weight ropes G G, arranged to work on and off the same drums as the ropes F F, but in reverse direction thereto, essentially as described.

3. The safety-wedges I I, in combination with the hoistway-uprights A A, the car B, the ropes E F F, and the geared drums C C' D, substantially as and for the purposes specified.

4. The sliding pawls or bolts J J and their adjusting wedge or slide K, in combination with the car B and its hoistway, the safety-wedges I I, the ropes E F F, and the geared drums C C' D, essentially as described.

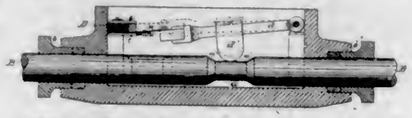


5. The automatic brake L, in combination with its releasing mechanism N *e f*, the hand-rope M, the car B, the geared drums C C' D, the hoisting-rope E, the ropes F F, and the safety-wedges I I, having attached car supports or plates *d d*, substantially as specified.

292,685. SNAP FOR HOLDING GLASS ARTICLES. HENRY C. SCHRADER, Wheeling, W. Va. Filed May 5, 1883. (No model.)

Claim.—In the device described, the combination, with the hollow slotted handle A, provided with the spring-actuated rod C, pin *a*, and sliding collar E, of the arms *c c*, bell-crank levers F, and beveled-edged jaws G, sliding horizontally and radially in dovetail grooves *f' f'* of the top or bed plate, B, substantially as described and shown.

292,686. ELEVATOR STOP MECHANISM. FRANK SCOONRAD, Detroit, Mich. Filed Dec. 5, 1883. (No model.)



Claim.—1. The combination, with an elevator, of a slide, C, provided with a longitudinal orifice, and a stem, C', extending through a suitable bearing, and in connection therewith lever-arms having a hinged connection with said slide, said levers provided toward their free extremities with orifices *f'* and *f''*, substantially as described.

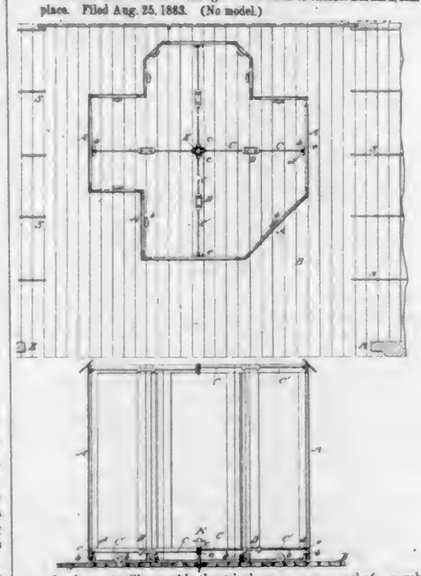
2. In an elevator, a slide, C, provided with a longitudinal orifice and a depending stem, and in combination therewith levers having a hinged connection with said slide, and provided with suitable guiding mechanism at the opposite ends, and in addition thereto suitable springs bearing on said guide, substantially as described.

3. In an elevator, the slide C, provided with a longitudinal orifice and a depending stem, levers having a hinged connection with said slide, said levers provided with suitable guiding mechanism, springs bearing upon said slide, suitable stops adapted to prevent the bending of the levers, and in combination therewith rack-bars adjacent to the outer ends of said levers, the construction being such that the levers may be engaged with the rack-bars and disengaged therefrom by opposite movements of the slide, substantially as described.

4. The combination, with suitable cross-beams of an elevator-frame, of a slide, C, adapted to be engaged with a hoisting-cable, and provided with a longitudinal orifice, through which said slide is mounted upon a suitable bearing, levers having a hinged connection with said slide and extending in opposite directions therefrom, mechanism for guiding the motion of said levers, springs bearing upon said slide, the construction being such that the outer ends of said levers may be forced in and out by opposite movements of the slide, substantially as described.

292,687. RAILWAY-SWITCH CIRCUIT-CLOSER. CHAS. A. SCOTT, Boston, Mass. Filed Apr. 16, 1883. (No model.)

Claim.—1. The cylindrical rod B, having a groove, *a*, extending around it, such groove terminating in inclines *a'*, in combination with a pivoted arm, *d*, a circuit make-and-break contact-piece on said arm, and one or more pairs of circuit-terminals, substantially as set forth.



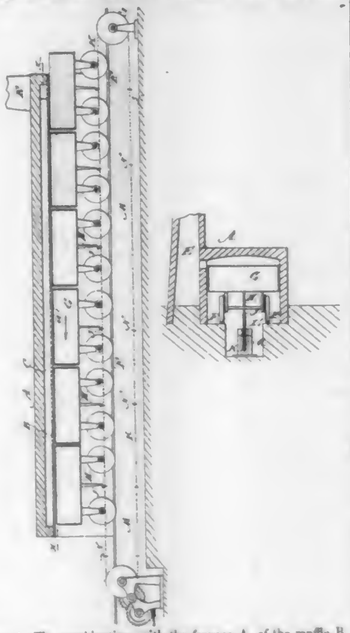
2. An incline, *a'*, arranged on rod B with relation to the rails R, from which the rod B takes its motion, and with relation to the circuit make-and-break mechanism, to which its motion is transmitted, substantially as described, with reference to breaking the circuit at the beginning of the rail movement from main line to siding, and restoring such circuit only at the end of the reverse movement, in the manner set forth.

292,688. STRAND-WIRE FOR BARBED FENCES. HIRAM B. SCOTT, Joliet, Ill. Filed Aug. 9, 1883. (No model.)

Claim.—The combination of the two strand-wires W W, each having a fin, *a*, the two strand-wires being twisted together in such manner that their backs opposite the fins are in contact, and so that the fins project in opposite directions from each other and outward from the coiled strand-wires, as and for the purpose set forth.

292,689. CHANGEABLE SCENERY FOR THEATERS. LAFAYETTE W. SEAVEY, New York, N. Y., assignor of one-half to Charles Barnard, same place. Filed Aug. 25, 1883. (No model.)

Claim.—1. Changeable theatrical scenery composed of a number of separate scenes or part scenes, arranged and combined so as to form a complete set scene or structure, capable of standing alone or independent of any other scene or outside support, also capable of ready dismemberment, as described, to facilitate transportation, and provided with attached rollers under the scenes or part scenes, to admit of the rotation in different directions about a common center of the set-scene when put together, and of rolling it from one part of the stage to another, for the purpose of exposing different sides of the structure and for varying its position relatively to the other scenes on the stage, substantially as specified.



2. In changeable theatrical scenery composed of a number of separate scenes or part scenes, combined to form a complete set scene or structure, the combination, with a center hand-screw and rollers on the

bottoms of the part scenes, of adjustable tie-rods arranged to connect the part scenes or certain of them with the hand-screw, and constructed to provide both for the binding of the set-scene together, and to admit of its rotation around the center hand-screw which screws into the stage, essentially as specified.

3. The combination, with the scenes or part scenes A of a set scene or structure, of the rollers *b* on the bottoms of said scenes or part scenes, the center hand-screw, E, the sectionally-constructed tie-bolts C C', formed with a loop, *c*, at their one end and a hook, *d*, for engagement with the scene or part scene at their opposite end, and the screw or turn-buckles D, uniting the sections of said rods, essentially as shown and described, and for the purposes herein set forth.

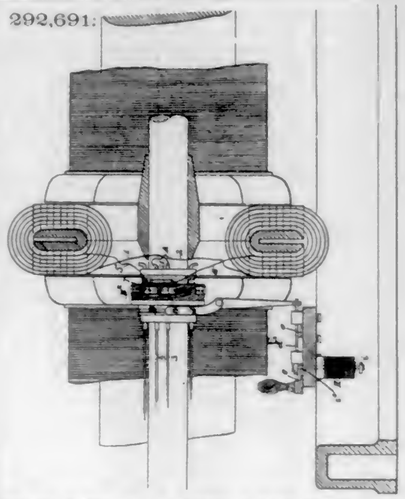
292,690. FURNACE FOR TREATING ORES CONTINUOUSLY.

ANTOINE M. G. SEBILLOT, Paris, France, assignor to the United States Ore Separating Company, New York, N. Y. Filed Apr. 27, 1883. (No model.)

Claim.—1. The combination, with the furnace A, of the muffle B, arranged within the furnace, the inverted-U-shaped flue arranged between the sides and tops of the furnace and muffle, and the flue P, extending from the flue C and to the receiver Q, substantially as and for the purpose set forth.

2. The combination, with an ore-furnace, A, having a trough or gutter, M, formed in its bottom, of the endless chain K, provided with catches N, the pulleys L L' at the ends of the furnace, the arms H, projecting from cars running through the furnace, and the hooks or catches J at the lower ends of the arms H, substantially as herein shown and described, and for the purpose set forth.

292,691. DYNAMO-ELECTRIC MACHINE.



JOHN S. SELLON, Hatton Garden, County of Middlesex, England. Filed July 14, 1883. (No model.) Patented in England Jan. 13, 1883, No. 217; in Germany June 17, 1883, and in France June 20, 1883.

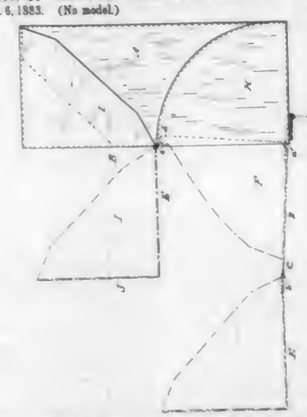
Claim.—1. The combination, with a dynamo-electric machine excited by current from its own circuit, of switch mechanism for connecting both the armature-coils and field-coils in parallel circuits or in series, substantially as described.

2. In an electrical machine provided with a switch between the armature-coils and commutator for connecting the armature-coils in tension or in series, according to the position of the contact-pieces of said switch, and in combination with the said armature-coils, commutator, and contact-pieces, an insulating-support common to one set of contact-pieces and movable with respect to the other contact-pieces, so as to change simultaneously, by the same movement of said support, the electrical connection of the armature-coils, substantially as described.

3. In combination with the armature of an electrical machine, a switch carried by and revolving with said armature, and mechanism for

292,691.

operating the same while the armature is turning, substantially as described.



4. The combination, with the armature and field coils of a dynamo-electrical machine, of switch mechanism comprising contact-makers for changing the connection of the armature-coils and contact-makers connected with the former, to be operated simultaneously therewith for altering the connection of the field-coils, substantially as described.

5. The combination, with the coils of an electrical machine and a switch for altering the connection of the said coils, of an automatic lock for obstructing or permitting the movement of said switch, substantially as described.

6. In combination with a dynamo-electrical machine, a rotating and a non-rotating switch connected with each other for simultaneously altering the connection of the armature-coils and field-coils, substantially as described.

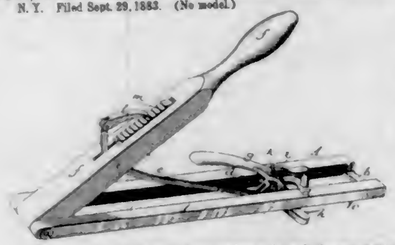
292,692. FILE-BOX.

FERNANDO M. SEMPER, Columbus, Ohio. Filed Dec. 6, 1883. (No model.)

Claim.—1. A file-box composed of the main body A, and section C, hinged thereto, which forms the inclosure for one side and one end of the box, said hinged section being composed of the sections E and D, hinged together and adapted to fall back separately or together from the main section A, as set forth.

2. In a file-box, the hinged and folding section C, composed of the sections E and D, each being provided with wings or side pieces, F I, as set forth.

3. A file-box having a hinged and folding section provided with wings or sides adapted to enter pockets or cavities formed on or in the main section of the box, as set forth.



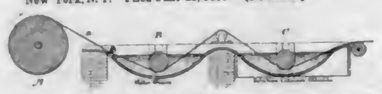
4. A file-box having a hinged and folding section, E, provided with

wings or sides I, and also an end extension, J, which forms the cover for the top of the main section, said sides or wings being adapted to slide over the sides of the main portion of the box, as set forth.

5. In a file-box, the combination of section D, having the wings or sides F, provided with the lugs or extensions *d*, with the pockets or cavities G, and lugs or stops *e*, as and for the purpose set forth.

292,693. CARPET-STRETCHER.

EDWARD P. SHAFFER, Rochester, N. Y. Filed Sept. 29, 1883. (No model.)

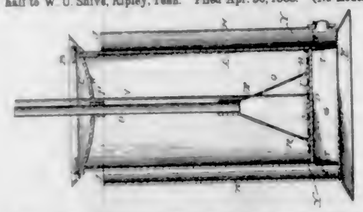


Claim.—1. The base-frame having the stud or pin for engagement with the floor, in combination with the sliding plate, the toothed lever mounted on said plate, means for locking said lever and the plate, the hand-lever mounted on the frame and connected with the sliding plate, and a locking device for said lever, substantially as described and shown.

2. The longitudinally-slotted frame having the dependent stud or tooth, in combination with the sliding plate, the curved toothed lever *g*, mounted upon said plate, the dog *i*, and the lever *f*, with its locking devices, substantially as shown.

3. In combination with the longitudinally-slotted frame having the stud or tooth on its under side, the reciprocating plate *d*, the lever *g*, carrying teeth to engage the carpet, the hand-lever provided with a ratchet-plate, *m*, and the bar or rod *e*, pivoted to the sliding plate and hand-lever and extended through the latter, and the pawl *l*, pivoted to the rear end of said bar, as described and shown.

292,694. INSULATED CONDUCTOR OF ELECTRICITY.

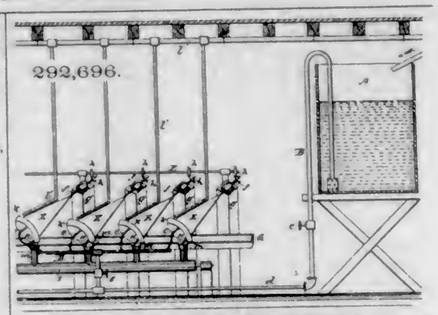


WILLIAM ANTHONY SHAW, Pittsburg, Pa., assignor of one-half to Lebbeus H. Rogers, New York, N. Y. Filed June 25, 1883. (No model.)

Claim.—The method of covering wire with fire-proof insulating material by coating the same with soluble glass, then subjecting it to the action of a decomposing agent—such as calcium chloride—so as to render the same insoluble, substantially as described.

292,695. CHURN.

ROBERT R. SHIVE, Oxford, Miss., assignor of one-half to W. U. Shive, Ripley, Tenn. Filed Apr. 30, 1883. (No model.)



Claim.—The combination of the cylindrical churn-body, the cap or cover therefor, having the two openings, the dasher having its staff passing through one of these openings, and formed conical and with perforations, the butter-lifter comprising the perforated disk, adapted to rest upon the bottom of the churn-body, and having its lifting-rod passing up through one of the perforations in the dasher and out through the perforation in the cover, as set forth.

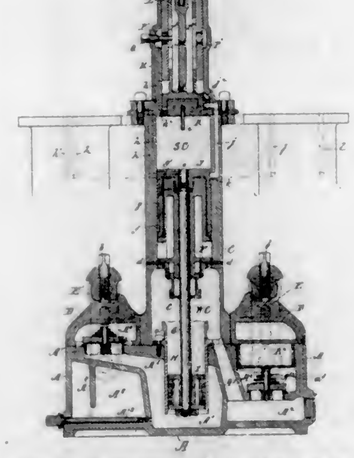
292,696. APPARATUS FOR THE MANUFACTURE OF CARBON-BLACK.

GEORGE G. SHOEMAKER, Edenburg, Pa. Filed Nov. 6, 1883. (No model.)

Claim.—1. In apparatus for the manufacture of lamp or carbon black, the combination, with one or more rotating devices for the collection of the black upon the surface or surfaces thereof, of one or more cup-shaped burners packed with asbestus, mineral wool, or other like incombustible material, and devices for supplying the fuel under pressure to the burner or burners, substantially as specified.

292,696.

2. In an apparatus for manufacturing carbon-black, the combination of the rotating hollow cones E, made open at their bases, and arranged for operation as described, and of burners within said cones, arranged to project their flames against the upper sides of the cones, with ducts or pipes arranged to distribute cold or cooling water over the upper sides of the cones, on the exterior thereof, and in relation with the burners, essentially as and for the purposes herein set forth.



3. In an apparatus for manufacturing carbon-black, the combination of the rotating hollow cones E, arranged for operation as described, and having deflecting flanges or curbs *k* around their open bases, the perforated cold-water-distributing pipes *l'*, and the burners C, substantially as shown and described.

4. In an apparatus for manufacturing carbon-black, the combination of the stationary scrapers H with the rotating hollow cones E and the burners C, arranged for operation in relation with each other essentially as and for the purposes specified.

5. In an apparatus for manufacturing carbon-black, the combination of the elevated tank A, the siphon B, the pipes *d* D, the burners C, and the rotating hollow cones E, substantially as described.

292,697. STEAM PUMPING-ENGINE.

EDWD. G. SHORTT, Carthage, N. Y. Filed July 17, 1883. (No model.)

Claim.—1. The combination, with the cylinder C and partition F, and a suitable steam-valve, of the piston J, rod G, plunger I, and smaller open-end cylinder H, protruding into the lower end of cylinder C, substantially as shown and described.

2. The combination, with the cylinder C, having hand-hole with detachable head-plate H P, and a suitable steam-valve, of the partition F, and piston J, arranged above the hand-hole, the rod G, the plunger I, and the smaller open-end cylinder H, arranged below the hand-hole and projecting into the lower end of cylinder C, substantially as shown and described.

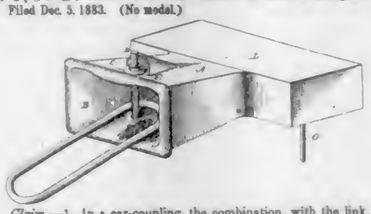
3. The combination of the steam-piston, its cylinder having the in-

duction-ports *n* and *m*, opening into the extreme ends thereof, and the exhaust-ports *n'* and *m'*, opening at some distance from the ends to cushion the steam, the valve M, having live-steam openings *o' o²* and exhaust-channel *o*, and the shell L, having live-steam openings S S' and exhaust-openings E E' E², substantially as and for the purpose described.

4. In a direct-acting engine, the combination of the steam-pistop and the main steam-valve, arranged in alignment and inclosed by a case having ports therein, the piston having the primary function of transmitting working-power and the secondary function of a slide-valve to operate the main steam-valve, and the main steam-valve having the primary function of regulating steam to the main steam-piston, and the secondary function of a piston operated in turn by the working-piston, the two being disconnected, as described.

5. The combination, with the valve M, having piston M', of the casing K, having port *h*, leading from the steam-supply, plate R, having passage-way *h²*, cylinder C, having two ports, *h h'*, side by side, and the piston having recess *f*, for admitting steam to the lower end of the valve, as set forth.

6. The combination, with the valve M, having piston M', of the casing and cylinder having ports *j* and *l*, and the piston J, having passage-way *k* for exhausting the steam from beneath the valve, as described.



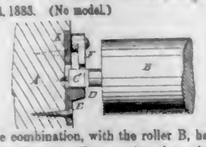
7. The combination of the piston with hole *e*, port *g'*, and elongated recess *g*, the cylinder having port *h'*, and the plate R, having passage-way *h²*, whereby the pressure of steam below the valve-piston M' is maintained by open communication with the steam-chamber S C after steam from port *h* has been cut off, as set forth.

8. The inverted-cup-shaped piston constructed as a slide-valve, with recesses combined with the boss F, of less diameter, and having a feather-and-groove connection therewith to prevent turning axially, as described.

9. The steam-valve M, combined with the case having ports at each end to form a steam-cushion at each end, and with the main steam cylinder and piston arranged in alignment with the valve, said piston being disconnected from the said valve and arranged to operate the same through live steam admitted to the valve through ports controlled by the piston, substantially as described.

10. The valve M, having its side M², which is opposite the orifices E S, made separate and held in close contact with the metal forming said orifices by the live steam, as described.

292,698. CAR-COUPLING. MILTON M. SHUR, Washington, D. C. Filed Dec. 5, 1883. (No model.)



Claim.—1. In a car-coupling, the combination, with the link, of a lever, I, pivoted in the draw-head and formed with two arms, *i i'*, and a rock-shaft, also journaled in the draw-head in the rear of the lever and formed with a stirrup, P, for operating upon one of the arms, as set forth.

2. In a car-coupling, the combination of the lever pivoted in the draw-head, and provided with means for operating the same, with a pin adapted to rest at its lower end upon said lever, as and for the purposes set forth.

3. In a car-coupling, the combination of a lever pivoted in the draw-head, and provided with means for operating the same, with a pin resting upon said lever, and an inclined-passage, as set forth.

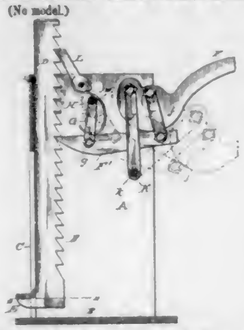
4. In a car-coupling, the combination, with the draw-head provided with an opening, C, and a pin having a circular head near the top and fitting in said opening, of an inclined passage in rear of the opening, and a conical-shaped hood, G, extending over the opening partly around the pin, as set forth.

292,699. ROLLER-FIXTURE. JAMES H. SKIDMORE, New York, N. Y. Filed Nov. 24, 1883. (No model.)

Claim.—The combination, with the roller B, having the end of its pivot C flattened, of the plate E, secured to the casing of a window, and provided with the bearing D and rectangular slot *a*, and swinging button F, substantially as shown and described.

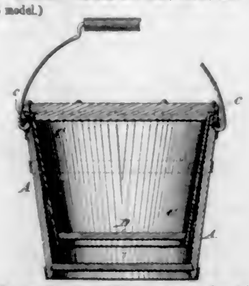
292,700. BUTTON. HENRY SMITH, Newark, N. J. Filed Nov. 13, 1883. (No model.)

Claim.—In a button, the perforated front and back plates, A B, the latter being provided also with a transverse recess, in combination with the tubular rivet C, for securing the plates together, said rivet being provided with a transverse cross-bar, D, passing through its sides, and whose ends rest in the transverse recess in plate B, substantially as set forth.



292,701. CHIMNEY-PROTECTOR. IRA A. SMITH, East Barkshire, Vt. Filed Sept. 3, 1883. (No model.)

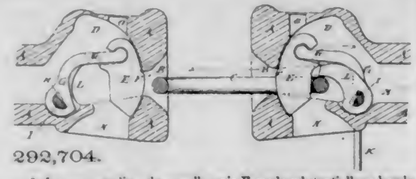
Claim.—1. A metallic chimney protector and roof consisting of the band B, connected to the roof E by the molding D, the roof having hooded openings F, provided with bottom inclined flanges, H, and projecting eaves *e*, substantially as described, and for the purpose set forth.



2. In a metallic chimney-protector, the combination of a roof provided with hooded openings F and flanges H with a molding, D, and band B, substantially as set forth.

292,702. RAILWAY-JACK. MORTON B. SOWER, Feanville, Mich. Filed Dec. 1, 1883. (No model.)

Claim.—In a railway-jack, the combination of the rack-bar having a shoe or projection at its lower end adapted to support the rail to be lifted, the retaining-pawl, lever F', having bolt *g*, yoke or hangers G, lever F, having head or cam *f*, yoke or hangers I, connecting the head of lever F to the outer end of lever F', and swinging arms J, having their fulcrum upon the bolt K, the whole constructed and combined substantially as and for the purpose shown and set forth.

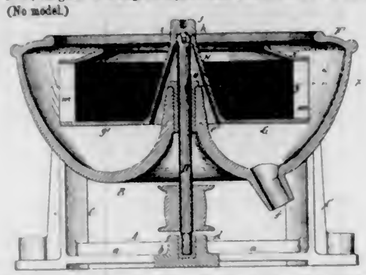


292,703. BUCKET. GEORGE A. STROUD, Toledo, Ohio. Filed Nov. 17, 1883. (No model.)

Claim.—The combination, with a wooden bucket, of a sheet-metal vessel adapted to snugly fit within said bucket, and provided with a removable wooden bottom and an annular top flange resting upon the top edge of the bucket and secured by the cover of the latter, substantially as set forth.

292,704. CAR-COUPLING. WILLIAM STAMP, Susquehanna Depot, Pa. Filed Sept. 15, 1883. (No model.)

Claim.—1. A car-coupling constructed substantially as herein shown and described, and consisting of the draw-head A, having large interior space, the coupling-pin E, having shoulder F and curved arm G, and the semi-cylindrical shaft I, as set forth.



292,704.

2. In a car-coupling, the coupling-pin E, made substantially as herein shown and described, with a shoulder, F, to prevent accidental uncoupling, and an arm, G, to connect with an uncoupling-shaft, as set forth.

3. In a car-coupling, the combination, of the semi-cylindrical shaft I and the coupling-pin arm G, having a semicircular hole, H, larger than the said shaft of the arm L, substantially as herein shown and described, whereby the said arm can be operated by the said shaft to guide the coupling-link without moving the coupling-pin, as set forth.

4. In a car-coupling, the combination, with the semi-cylindrical shaft I, carrying the arm G of the coupling-pin, of the crank K, substantially as herein shown and described, whereby the cars can be uncoupled from the side of the track, as set forth.

292,705. CENTRIFUGAL MACHINE. HENRY B. STEVENS, Buffalo, N. Y., assignor to George L. Squier, same place. Filed June 28, 1883. (No model.)

Claim.—1. The combination, with a vertical spindle, of a basket supported loosely upon the upper end of the spindle and adapted to balance itself upon the same, substantially as set forth.

2. The combination, with a vertical spindle, of a basket constructed with a central hollow cone or chamber, H, supported loosely upon the upper end of the spindle, substantially as set forth.

3. The combination, with a vertical spindle, of a basket and a ball-and-socket joint whereby the basket is supported on the upper end of the spindle, substantially as set forth.

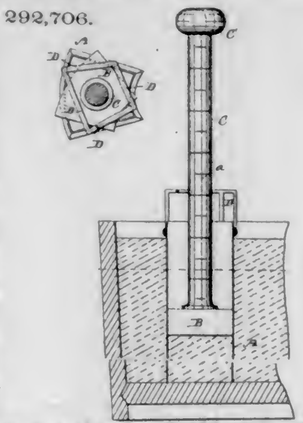
4. The combination, with a vertical spindle having a slotted spherical knuckle, *h*, of a basket constructed with a spherical socket, *i*, and a bolt, *k*, extending through said socket, substantially as set forth.

5. The combination, with a vertical spindle having a spherical knuckle, *h*, of a basket constructed with a central hollow cone, H, a spherical socket, *i*, formed in the upper end of the cone, and means whereby the basket is rotated from the spindle, substantially as set forth.

6. A basket constructed with a perforated or foraminous cylindrical wall, and supporting wings or blades arranged on the outer side of said wall, substantially as set forth.

7. In a basket, the combination of a bottom plate, *g'*, and upright wings or blades *m*, cast on said bottom plate, with a perforated or foraminous cylindrical wall resting against the inner edges of said wings, substantially as set forth.

8. The combination, in a basket, of upright wings or blades *m*, and a cylindrical perforated or foraminous wall composed of sections having oblique edges each secured to a number of said wings or blades, substantially as set forth.



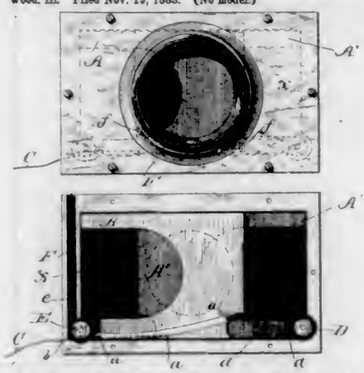
9. The combination, with a basket having a top ring, *n*, provided with elongated openings *o*, of a detachable rim, N, constructed with hooks *p*, substantially as set forth.

10. The combination, with a revolving basket, of a casing, B, having a raised inner wall surrounding the spindle, and a raised outer wall surrounding the basket, standards C, and a base frame, A, provided with a central step for the spindle, all cast in one piece, substantially as described.

11. In a centrifugal machine, a basket having the joint in its perforated wall formed diagonally or obliquely, substantially as and for the purpose set forth.

292,706. BUTTER-CUTTER. NEWTON H. SWEET, Stephentown Centre, N. Y. Filed June 22, 1883. (No model.)

Claim.—1. The combination, with the tube A, open at both ends,



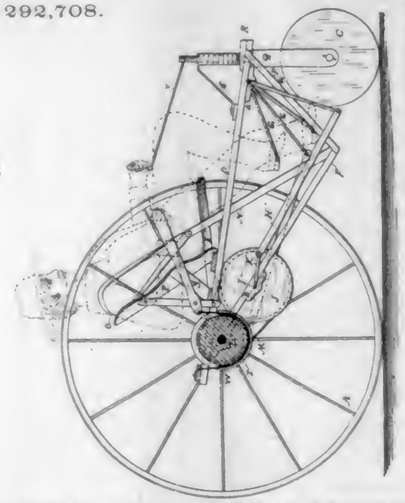
292,706.

and the piston B, having handle-rod C, of the frame D, secured to the upper end of the tube, with its sides diagonal to those of the tube and at a distance above the top of the tube equal to or greater than the thickness of the piston, substantially as herein shown and described, and for the purpose set forth.

2. The tube A, open at both ends, and having a cross-section in the shape of a wedge, with its ends curved from the same center, and the frame D, secured to the upper end of the tube, with its sides diagonal to those of the tube, in combination with the correspondingly-shaped piston B, having the graduated handle C, substantially as herein shown and described.

292,707. PHOTOGRAPHIC SHUTTER. DEXTER B. SWEET, Englewood, Ill. Filed Nov. 19, 1883. (No model.)

Claim.—1. In a photographic shutter, the combination of frame X, having aperture B, slides A A', spring F, studs *f f*, cord C, cord *d*, and wheel or pulley D, all arranged, operated, and controlled substantially as described, and for the purpose specified.



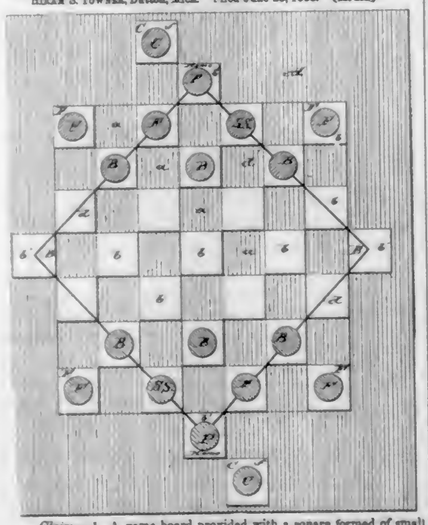
2. In a photographic shutter, frame X, having aperture B, and slides A A', in combination with spring F, cord *e*, pulley or wheel E, cord *d*, pulley or wheel D, and cord C, all substantially as described, and for the purpose specified.

292,708. VELOCIPEDE. JOHN COURTON TENNENT, Glyndon, Md. Filed May 28, 1883. (No model.)

Claim.—1. A motor for velocipedes, tricycles, and for driving all kinds of mechanism, consisting of one or more treadles to be operated by the feet, said treadles being connected to the intermediate mechanism in substantially the manner described, and straps, yokes, or braces placed around the shoulders or connected to the body of the operator and to the body of the machine in a line direct through shoulders and feet, whereby a resistance to the power exerted by the feet and legs on the treadles is obtained in a direct line of the body and feet, as set forth.

2. The combination, in a motor for velocipedes and other purposes, of one or more treadle-levers connected to the pitmen and to the intermediate and driving mechanism, as set forth, with the bars N and straps

292,708.



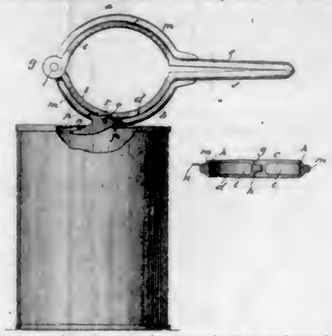
or yokes O, all arranged to operate in direct line of body through shoulders and feet in the manner set forth.

3. The combination, with the frame of a velocipede or other motor, of a shoulder brace or yoke attached to the frame, and adapted to be placed over the shoulders of the operator and to lie in a line parallel with the length of the body of the operator and in a direct line through the shoulders, hips, and feet, substantially as and for the purpose set forth.

4. The combination of the bent treadle-levers mounted in the reaches D, and adapted to be oscillated by the feet of the operator, with the pitmen H and H', shaft I, belt M, and axle B, as and for the purpose set forth.

292,709. CHECKER AND BASE-BALL COMBINATION GAME. HIRAM S. TOWNER, Dutton, Mich. Filed June 28, 1883. (Model.)

Claim.—1. A game-board provided with a square formed of small squares, and having a small square outside of the main square at the middle of each side of the large square, substantially as herein shown and described.

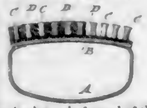


2. A game-board provided with a square formed of small squares, having a small square outside of the inner square at the middle of each side of the main square, and a square diagonally from the additional squares at the head and bottom of the board, substantially as herein shown and described.

3. A game-board provided with a square formed of small squares, and with additional squares outside of the main square, substantially as set forth.

4. A game-board provided with a square formed of small squares, with additional squares outside of the main square at the middle of each side of the same, and with lines uniting the centers of the outside squares, and forming a large square figure, substantially as herein shown and described.

5. The combination, with the game-board A, provided with a large square formed of smaller squares, *a b*, and the additional squares, *b' f*, of two sets of men or stones of nine each, of which stones one in each set is marked C or "catcher," one P or "pitcher," three B or "base-men," three F or "fielders," and one S S or "short-stop," substantially as herein shown and described.



292,710. COMBINED JAR-WRENCH AND CAN-OPENER. ALEXANDER VAN SLYKE, Fort Plain, N. Y. Filed July 19, 1883. (No model.)

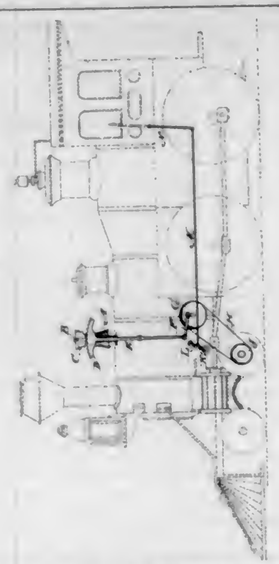
Claim.—1. A jar-cover wrench composed of the two jaws *a b*, having semicircular members *c d*, recessed interiorly and lined with frictional material, the handles *e f*, and the hinging members, substantially as shown and described.

2. The combination, with the jar-wrench, of the can cutting or opening blade *n*, arranged thereupon, substantially as set forth, to admit of the use of the wrench as an operating handle or lever for such blade, as set forth.

292,711. SOLE FOR RUBBER BOOTS AND SHOES. HENRY A. WATTSON, Granite, Colo. Filed June 4, 1883. (No model.)

Claim.—A rubber heel or sole formed of the inner part, B, the concave studs C, and the molded rubber D, substantially as shown and described.

292,712. BELL-RINGING ATTACHMENT FOR LOCOMOTIVES. PENNOCK M. WAY, Thurlow, Pa. Filed June 12, 1883. (No model.)



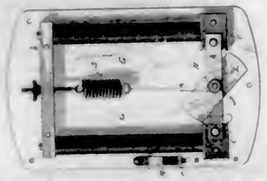
Claim.—1. The combination, with a locomotive and its bell, of a rocking lever acting on the bell, a belt-pulley on one locomotive axle or wheel, a belt-pulley connected by a connecting-rod with the rocking lever, and a belt or analogous device for transmitting motion from the pulley on the wheel or axle to the pulley connected with the rocking lever, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with a locomotive and its bell, of the semicircular rack C on the bell-yoke or bell-shaft, the working-lever E, the segmental rack D on the same, the connecting-rod F, the pulley G, the belt H, and the pulley J, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with an axle, an upper roller, and a locomotive-bell, of a rocking lever adapted to swing the bell, a belt for operating the rocking lever from one of the locomotive wheels or axles, the belt-supporting mechanism, and a device for tightening the belt, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with an axle, an upper roller, and a locomotive-bell, of a rocking lever adapted to swing the bell, a belt, H, for operating the rocking lever from one of the locomotive wheels or axles, the belt-supporting mechanism, the arm L, carrying the pulley or roller K, the connecting-rod M, and the lever N, substantially as herein shown and described, and for the purpose set forth.

292,712.



292,713. FUSIBLE SAFETY-STRIP FOR ELECTRIC CIRCUITS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 12, 1883. (No model.)

Claim.—1. A safety-strip for electric circuits, having electro-deposited caps or jackets of harder metal on its ends, as and for the purpose set forth.

2. The combination, with a fusible safety-strip, of protecting caps or jackets of harder metal, surrounding or inclosing its ends, substantially in the manner described.

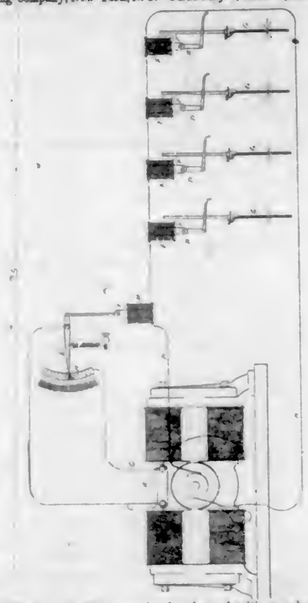
292,714. ELECTRICAL INDICATOR. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 12, 1883. (No model.)

Claim.—1. In an apparatus of the kind described, the combination, with magnets having pole-pieces with curved faces, of an armature consisting of a magnetic plate mounted to turn between the poles, a retractile spring, and a pointer or index arm, all substantially as set forth.

2. The combination, with the magnet having long parallel cores and pole-pieces with curved faces, of an armature mounted to turn between the pole-pieces, and consisting of a thin magnetic plate with rounded ends, a retractile spring, and an index-arm.

3. The combination, with the magnet having parallel cores and pole-pieces with curved faces, of an armature mounted to turn between said poles, a retractile spring, a flexible contact-arm in the path of the armature, and an alarm-circuit adapted to be closed by the contact of the armature and the flexible arm, all as set forth.

4. The combination, with opposing magnetic poles, of an armature whereby the retractile force of the spring is applied tangentially to the axis of the armature, as specified.



5. The combination, with the movable armature of a current-indicator, of an adjustable plate or bar, a flexible contact-arm attached thereto and extending into the path of the armature or a projection therefrom, an electric alarm, and circuit-connections, substantially as described.

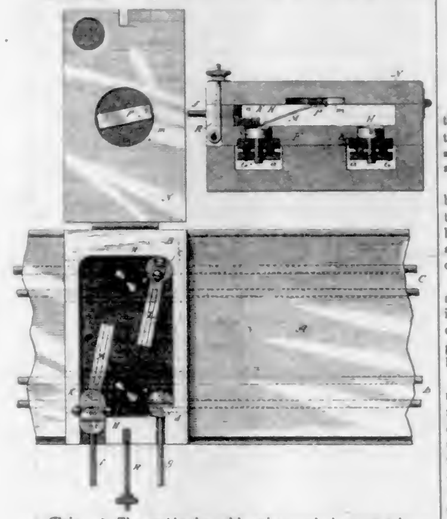
6. The combination of the base A, the raised and insulated plate F, the magnets and movable armature secured to the back of said plate, the pin *v*, carried by the armature, the adjustable and flexible contact-arm O, secured to the face of the plate, and alarm mechanism arranged to be brought into operation by the contact of the pin *v* and arm O, as set forth.

7. The combination of the magnets G G, having poles with curved faces, the armature L, spindle H, pointer M, and retractile spring S, connected to the spindle by a cord running over a grooved wheel, N, all as set forth.

8. The combination, with the dial-plate, the magnets G G, and armature L, having a pin or part, *v*, projecting through a slot in the plate, of the adjustable plate or bar T, arm O, formed of a spiral spring, and provided with prongs *o* in the path of the pin *v*, and alarm mechanism adapted to be brought into operation by the contact of the arm and pin, as and for the purpose set forth.

292,715. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed July 2, 1883. (No model.)

Claim.—1. The combination in and with an electric circuit of electro-magnetic devices for utilizing and for regulating the current flowing, the electro-magnets of the said devices being of like construction or capacity, whereby all are equally and similarly affected by the current, as and for the purpose specified.



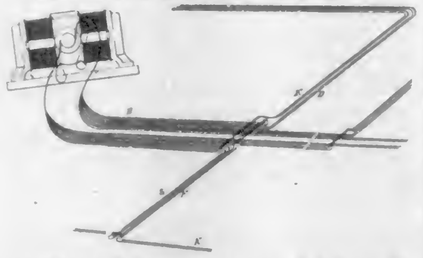
2. The combination of a generator, a circuit from the same, an electro-magnetic regulator, and electro-magnetic translating devices included in and operated by said circuit, the magnet or magnets of the regulator, and those of the translating devices being of like construction or capacity, whereby all are equally and similarly affected by the current, as and for the purpose specified.

3. The combination of a generator, a main circuit, electro-magnetic devices included therein in series, a derived field-circuit, devices for varying the current flowing through the derived field-circuit, and an electro-magnet in the main circuit for controlling the said devices, the magnet being of the same construction or capacity as those of the other devices in the circuit, whereby all are equally and similarly affected by the current, for the purpose specified.

4. The combination of a generator, a main circuit, electro-magnetic devices included therein in series, a derived field-circuit, a variable resistance therein, and an electro-magnet in the main circuit for varying

the resistance of the field-circuit, the said magnet being of the same construction or capacity as those of the other devices in the circuit, whereby all are equally and similarly affected by the current, as and for the purpose set forth.

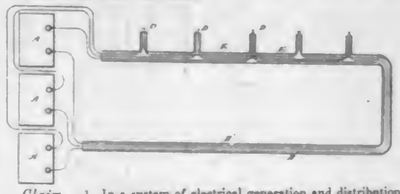
292,716. DEVICE FOR CONNECTING SAFETY-STRIPS IN ELECTRIC CIRCUITS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)



Claim.—1. The combination, with spring terminal contact strips or plates, of a fusible safety-strip and a holder or support for the same, the contacts and holder being movable with reference to one another, and so arranged that when brought together for use the safety-strips will be connected with the circuit by spring-pressure, as and for the purpose specified.

2. The combination, with a box or case and spring and terminal strips or plates therein, of a fusible safety-strip for bridging the said terminals, and a movable lid or cover for holding the strip in contact with the springs, substantially as set forth.

3. The combination, with a box or case and spring terminal plates or strips therein, of a fusible safety-strip for bridging the terminals, a movable lid or cover for holding the strips in contact with the springs, and a catch for securing the cover, all substantially as set forth.



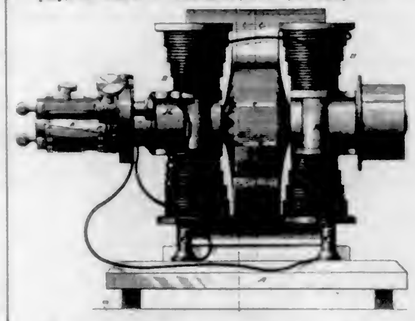
4. The combination, with the connection-box B and spring-terminals E F, of the hinged or movable lid N and the safety-strip secured thereon in position to bridge the terminals E F when the lid is closed.

292,717. CONDUCTOR FOR ELECTRIC CIRCUITS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 10, 1883. (No model.)

Claim.—An electric circuit for multiple-arc distribution, consisting of mains composed of a number of assembled conductors or wires in electrical contact with one another, and which in the aggregate are capable of conveying the total current generated, and branches or divisions composed of portions of said wires bent and led off from the mains, the number of wires in the said branches or divisions being proportionate to the current to be used therein, as set forth.

292,718. ELECTRIC CIRCUIT. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 31, 1883. (No model.)

Claim.—1. In a system of electrical generation and distribution, the combination, with the conductors of round wire circuits, connecting the generator or generators with the devices for utilizing the current, of separate underground tubes or inclosing-conduits for both the leading and the return conductors, as and for the purpose set forth.



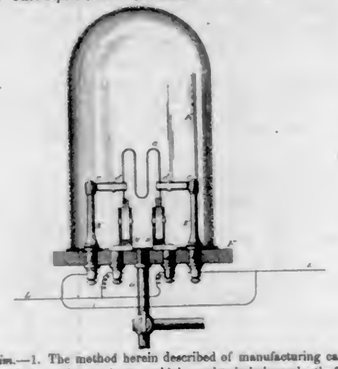
2. In a system of electrical generation and distribution, the combination, with underground tubes or conduits, of conductors composing the leading or the return main conductors of separate round wire circuits, branch or surface conduits containing one or more of the conductors, and aerial loop-circuits made from the said conductors, and including lamps or similar devices, as set forth.

3. In a system of electrical generation and distribution, the combination, with the generator or generators, of a group of conductors extending to a given point in the district to be lighted, and then branched and carried back to the generators, a single tube or conduit inclosing the group of conductors, and independent tubes or conduits inclosing the branched or return conductors, as and for the purpose set forth.

4. In a system of electrical generation and distribution, the combination, with the generator or generators and devices for utilizing the current, of underground round wire circuit conductors connecting the generators with such devices, separate tubes or inclosing-conduits for both the leading and return conductors, and separate branch tubes or conduits for inclosing those portions of the conductors that are led up to and back from the surface of the ground, as and for the purpose set forth.

5. In systems for the electric illumination of cities and towns, the combination, with underground tubes or conduits and conductors, all of separate round wire circuits contained therein, of junction-boxes located at one or more given points on the blocks or squares, and aerial loop or connecting circuits made from the junction-boxes and including lamps or other devices, as described.

292,719. ELECTRICAL GENERATOR OR MOTOR. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 31, 1883. (No model.)



Claim.—1. In a dynamo-electric machine or motor, an armature-core in the form of a disk, as described, in combination with coils wound thereon in a direction parallel with the axis of rotation of the core, substantially as set forth.

2. In a dynamo-electric machine or motor, an armature-core in the form of a disk, having peripheral recesses or grooves, in combination with coils wound thereon in a direction parallel to the axis of rotation, as set forth.

3. The combination, in a dynamo-electric machine or motor, with field-magnets, substantially as described, of a flat or disk-shaped armature mounted between the said magnets in bearings formed or set in the cores of the same, as set forth.

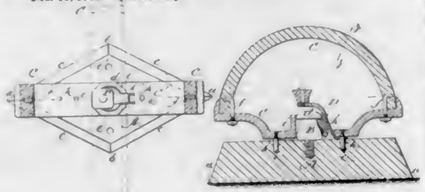
4. In a dynamo-electric machine or motor, the combination, with parallel field-magnets and pole-pieces bridging the cores of the same, of a flat or disk-shaped armature mounted in bearings formed or set in the cores of the magnets, as and for the purpose set forth.

292,720. INCANDESCENT LAMP. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 15, 1883. (No model.)

Claim.—1. The method herein described of manufacturing carbon conductors for incandescent lamps, which consists in independently forming and carbonizing the stripe or filaments and the stubs or enlarged clamping ends, and then uniting them by the deposition of carbon, substantially as set forth.

2. The method herein described of manufacturing carbon conductors for incandescent lamps, which consists in independently forming and carbonizing the stripe and the stubs, placing the same in contact in a receiver containing an atmosphere of hydrocarbon, and passing a current through them, whereby carbon is deposited, and a permanent union effected in the manner described.

3. A carbon conductor for incandescent lamps, consisting of a strip or filament, enlarged clamping ends, and connections of deposited carbon uniting the clamping ends to the strip, as herein set forth.

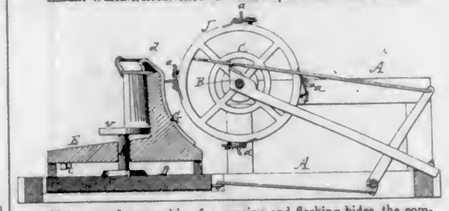


292,721. SYSTEM FOR THE ELECTRICAL TRANSMISSION OF POWER. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed July 31, 1883. (No model.)

Claim.—1. In a system for the electrical transmission of power, the combination of a prime motor, a dynamo-electrical generator, a working-circuit, a single motor included therein at a distance from the generator, and adapted to perform work, as in driving machinery or the like, and devices for varying the speed or effect of the prime motor in driving the generator in proportion to variations in the load imposed upon the motor, said devices being controllable at or by the motor, as and for the purpose specified.

2. In a system for the electrical transmission of power, the combination of a steam-engine, a dynamo-electric generator driven thereby, a working-circuit, a motor included therein, an independent regulating-circuit, and means included therein for varying the speed of the engine, in substantially the manner set forth.

3. The combination, with a main line, a generator of electricity, and a motor included in the same, of an independent regulating-line parallel to the main line, devices therein for regulating the current produced by the generator, and a variable resistance at or near the motor for controlling the action or effect of such devices, as set forth.

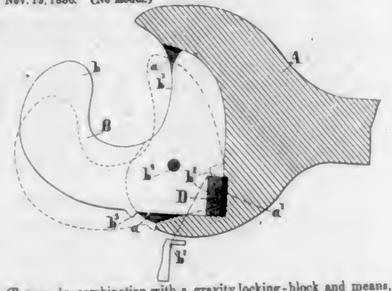


292,722. SAD-IRON. ALFRED R. WHITE, Stevens Point, Wis. Filed Feb. 19, 1883. (No model.)

Claim.—1. The base A, provided with post B and holes *e e e' e'* at equidistance from the post, in combination with the handle having a base-plate provided with a hub to receive the post and dowel-pins *h h*, as described, and means for fastening the hub to the post, substantially as set forth.

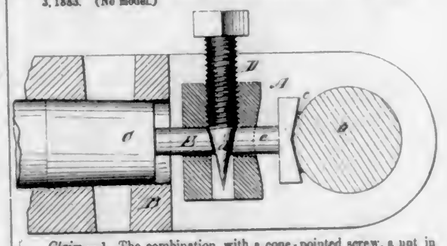
2. The combination, with the ironing-block having post B, head *d*, and holes *e e e' e'*, of the face-piece C', having socket *i*, and dowel-pins, as described, and the spring-pressed catch D, hinged to said face-piece, as and for the purpose specified.

292,723. APPARATUS FOR SCOURING AND FLESHING HIDES. ALBERT WHITING, Rochester, N. Y. Filed Apr. 2, 1883. (No model.)



Claim.—1. In a machine for scouring and fleshing hides, the combination, with the vertically-revolving scouring-wheel J, of the platform E, and bed G, mounted on a pivot, *b*, to turn horizontally, the bed being circular in plan, presenting all parts of its face to the wheel as it is turned, and concave in vertical section, corresponding with the curve of the wheel, so that as the wheel revolves it sweeps over the whole vertical width of the bed to scour the hide, as herein shown and described.

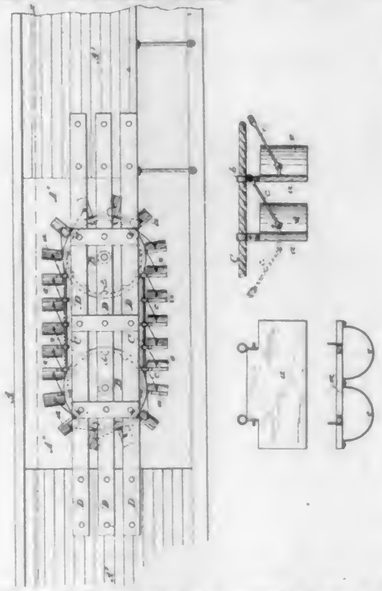
2. The combination, with the revolving platform provided with the segment-gear *n*, of the pinion *z*, the shaft *k*, the pulleys *g h i*, one fast and the others loose, the bands *l m*, connecting with the main pulley *f*, the shifter *w*, the rock-lever *o*, the arm *r*, and the studs *t t*, all arranged to operate in the manner and for the purpose specified.



3. The combination, with the turning platform E, of a stationary foot-rest, *v*, extending up from the pivot on which the platform turns, as herein shown and described.

292,724. CAR-COUPLING. PARKER WINEMAN, Chicago, Ill. Filed Nov. 19, 1880. (No model.)

Claim.—In combination with a gravity locking-block and means, substantially as described, for supporting the same, a pivoted hook, having its heel adapted, substantially as described, to swing in beneath the block and remove it from its support.

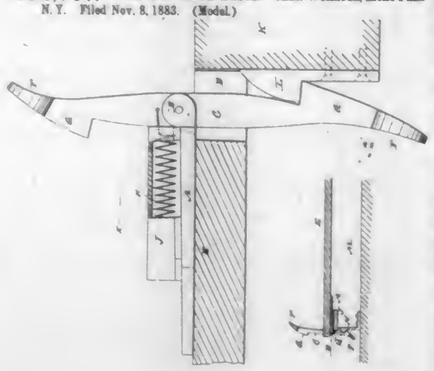


292,725. JACK. SAMUEL J. WISDOM, Montgomery, Ala. Filed Oct. 3, 1883. (No model.)

Claim.—1. The combination, with a cone-pointed screw, a nut in which it works, and means to take the wedge-strain, substantially as described.

7. The combination of the screw D, having the conical point *d*, the internally-threaded metallic block A, having a hole in one side, and the movable plug E, fitting in said hole, whereby the whole device may be arranged between the cross-head pin and piston-rod of a steam-engine, to operate as described.

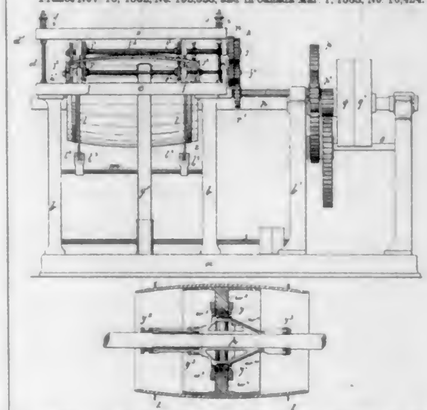
292,726. PROPULSION OF VESSELS. CHRISTIAN WORCH, Washington, D. C. Filed June 5, 1883. (No model.)



Claim.—1. A double oblong wheel consisting of double set of wheels B, two endless wire ropes, C, and a series of paddles, *a*, arranged substantially as set forth.

2. A double oblong wheel consisting of double set of wheels B, two endless wire ropes, C, and a series of paddles, *a*, provided with corrugated pieces *c* and braces *c*, arranged substantially as specified.

3. A double oblong wheel consisting of double set of wheels B, two endless wire ropes, C, a series of paddles, *a*, secured to said ropes by clamps *b*, and provided with corrugated pieces *c* and braces *c*, in combination with wheels B, having depressions *d*, as and for the purpose specified.



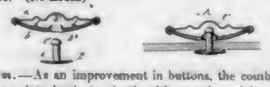
4. In a vessel, the combination of the double set of wheels B, endless wire ropes C, provided with a series of paddles, *a*, secured to said ropes by clamps *b*, with the protecting-bars D, arranged over the sides of the space A'', substantially as and for the purpose set forth.

292,727. DOOR AND GATE LATCH. CHAS. WORMUTH, Little Falls, N. Y. Filed Nov. 8, 1883. (Model.)

Claim.—In a latch, the attaching-plate A, provided with lugs B, between which and at right angles to said plate A is pivoted the reversely-hooked latch C, the said plate A being further provided with a removable spring-containing case, to one end of which the spring is secured, said spring being secured at its other end to the latch, in combination with the catches L N on the door-post and wall, respectively.

292,728. BARREL-MAKING MACHINE. SAML. WRIGHT, Egremont, County of Chester, England. Filed Feb. 24, 1883. (No model.) Patented in England May 12, 1882, No. 2,250, and July 23, 1882, No. 3,589; in France Nov. 10, 1882, No. 152,023, and in Canada Mar. 1, 1883, No. 16,424.

Claim.—1. The frame *e*, provided with hanging brackets for supporting the upper feed-rollers, f^3 f^3, and upper guide-bars, *h h*, in combination with the standards *d d*, provided with springs *i i*, adjusting-bolts *j j*, and regulating-nuts d^2 d^2, substantially as and for the purpose set forth.

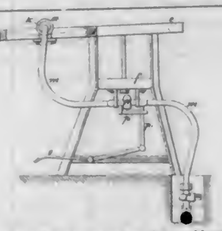


2. The upper feed-rolls and guide-bars supported by brackets depending from the frame *e*, which has a free vertical movement on the standards *d d*, in combination with the lower feed-rolls and guide-bars, substantially as and for the purpose set forth.

3. In a barrel-making machine, the combination, with a collapsible barrel form or drum, of guide-hoops, each made in two parts, one jointed to the other and to the horizontal guide or table, along which the staves are fed to the barrel form or drum, said hoops being operated by cranks and levers to open them, as and when required, substantially as described.

4. In a barrel-making machine, the combination of guides, adjustable feed-rollers, means for cutting the staves to length, grooving, and beveling, a collapsible barrel-form and jointed guide-hoops encircling same, the whole constructed, arranged, and operating substantially as described.

5. In a barrel-making machine, a collapsible form or drum composed of segments, mounted on suitable brackets and friction-rollers, in combination with a sleeve or collar, having a sliding horizontal movement on the barrel-drum shaft, and formed with inclined and horizontal sides, upon which the segments comprising the collapsible drum rest when the drum is expanded, adjacent horizontal sides being of different lengths, all arranged and operated so that the segments resting on the shorter horizontal sides may travel in advance of the segments resting on the longer horizontal sides, and the drum thereby be collapsed without interference of adjacent segments, substantially as described.



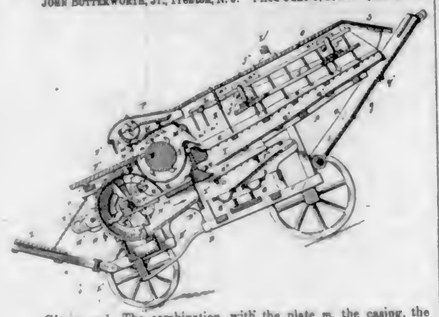
292,729. BUTTON. ERNEST WUERPEL, Brooklyn, N. Y. Filed May 7, 1883. (No model.)

Claim.—As an improvement in buttons, the combination, with a shoe or base-plate having a shank with an enlarged head, of a button-head composed of a cap or face-plate, a bottom plate having a central aperture and an inwardly-bent rim around said aperture, and an intermediate recessed or slitted spring-plate having radial spring-teeth with upwardly-bent inner ends, substantially as set forth.

292,730. APPARATUS FOR THE APPLICATION OF COMPRESSED AIR TO THE MANUFACTURE OF GLASS. ADRIEN ANTOINE APPERT and LÉON ALFRED APPERT, Paris, France. Filed Oct. 13, 1883. (No model.) Patented in France June 3, 1882, No. 149,370, and in Belgium June 24, 1882, No. 58,294.

292,730.

Claim.—1. In a glass-blowing apparatus, the combination, with a glass-maker's chair and a compressed-air reservoir, of a blowing-sleeve mounted on a carriage having a horizontal movement on the arm of said chair, a pipe connecting said sleeve with the reservoir, and a valve in said pipe for regulating the supply of air to the blowing-sleeve, substantially as herein shown and described.



2. In a glass-blowing apparatus, the combination, with the blowing-sleeve, of the yielding tube *b*, secured within said sleeve, substantially as herein shown and described.

3. In a glass-blowing apparatus, the combination, with the blowing-sleeve *a*, having the yielding tube *b* secured therein, of a hollow tube connected to said sleeve, and a carriage upon which said tube is supported, having a horizontal to-and-fro movement, substantially as herein shown and described.

4. In a glass-blowing apparatus, the combination, with the sleeve *a*, having the yielding tube *b* secured therein, of the tube *i*, the carriage *k*, and the vertical axis *l*, to which the carriage is connected, substantially as herein shown and described.

5. In a glass-blowing apparatus, the combination, with a blowing-sleeve and a compressed-air reservoir, of a pipe connecting said sleeve and reservoir, the tap *n* in said pipe, the levers *p*, and treadle *o*, substantially as herein shown and described.

292,731. THRASHING-MACHINE. WILLIAM H. BUTTERWORTH and JOHN BUTTERWORTH, Jr., Trenton, N. J. Filed June 5, 1883. (No model.)

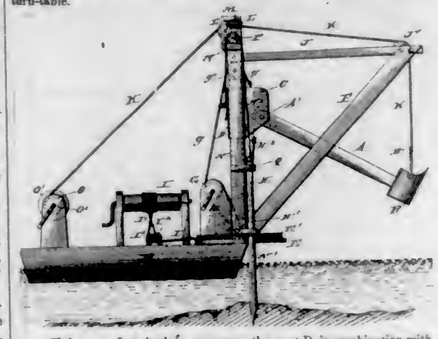
Claim.—1. The combination, with the plate *m*, the casing, the thrashing-cylinder, and the concave, of the beveled dust-deflecting tongue *s* on the feed-table, and the dust-deflector *n*, hinged to the plate in front of the toothed concave E, substantially as and for the purposes specified.

2. The combination of the side rake-bars, J^3, the rake-bar L, secured to the side rake-heads by narrow strips, the straight and hooked teeth secured to said bar L, the thrashing-cylinder, and the hinged slotted deflector M at the rear of the thrashing-cylinder, substantially in the manner and for the purposes described.

3. The combination, with the flue-duster F, arranged over the concave of the thrashing-cylinder, of the fan, the lipped deflector p', and the hinged dust-deflectors *n g'*, substantially as described.

4. The combination of the hinged dust-deflector, the lipped deflector, and the fan with the flue-duster P and the thrashing mechanism, substantially as described.

5. In a thrashing-machine, the combination, with the shouldered shaft and the thrashing-cylinder, of the journal-boxes therefor, adjustable in a direction with the length of said cylinder, and the retaining bolts and nuts, whereby the thrashing-cylinder is endwise but not vertically adjustable, substantially as and for the purpose described.



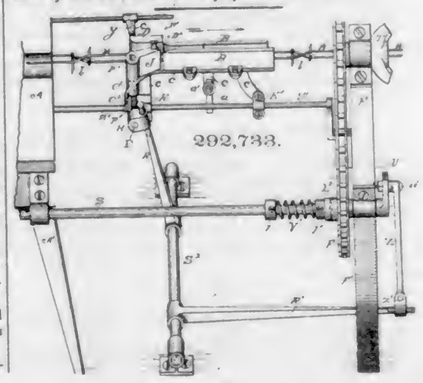
6. The combination, with the front ends of the sills of a thrashing-machine, of a hinged platform, X, provided with suspension-chains, and constructed with a pocket, *z*, substantially as and for the purpose described.

7. The combination of the stacker-frame made in sections, the slotted hinge-connections *h'*, and the pivot-bolts or set-screws, substantially as described.

8. In combination with the removable section T^2 of the divided fan-drum, the movable slides T', provided with loop-racks W', the hand-wheel shaft W, having its journal-bearings attached to said sections T^2 of the fan-drum, and provided with pinions of a diameter to work snugly in said loop-racks, for the purpose of holding the slides parallel with their guides, and moving them in a straight line thereby, substantially as specified.

292,732. DREDGING-MACHINE. HENRY CLAY CARTER, Fairfield, N. C. Filed Dec. 14, 1883. (No model.)

Brief.—A turn-table rotated by chains reversely wound on a windlass carries a mast on which slides a block, to which is pivoted a dipper-handle having a strap embracing the mast, and adjusted by means of cords run up and down around pulleys on the mast to a windlass on the turn-table.



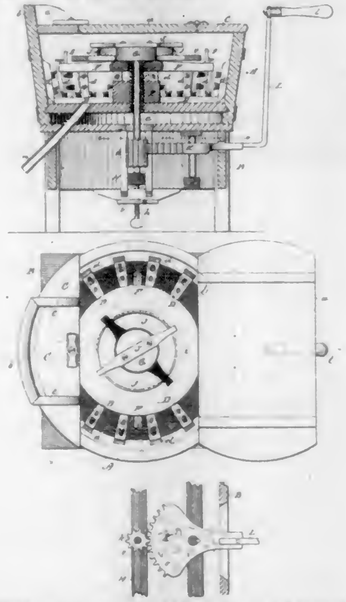
Claim.—1. In a dredging-machine, the mast D, in combination with the sliding block C, and the dipper-handle A, pivoted to said block, said block being secured to the mast by means of the strip D', whereby said block and strip and the rear end of the dipper-handle may be raised and lowered, substantially as described, and for the purposes set forth.

2. In a dredging-machine, the mast D, provided with top and bottom pulleys, *g'* and H', in combination with the windlass G, chains *g* and H, and the block C, having the guide-strip D', whereby said block may be elevated and lowered to suit the convenience of the operator, substantially as described, and for the purposes specified.

3. The mast D, mounted on the rotary table E, said mast being provided with the top pulley, *g'*, and bottom pulley, H', in combination with the windlass G, having chains *g* and H, the block C, and guide-strip D', said block having the rear end of the dipper-handle A pivoted thereto, substantially as described, and for the purposes specified.

4. In a dredging-machine, the rotary table E, provided with the circumferential groove E', mast D, and windlass G, said mast being provided with top and bottom pulleys, the chains *g* and H, secured to the windlass G, and the sliding block C, in combination with the windlass I and chain I', said chain being secured to the table E, whereby said table and its mast and the block may be rotated, substantially as described, and for the purposes set forth.

5. In a dredging-machine, the mast and windlass G, said mast having top and bottom pulleys, as specified, and the chains *g* and H, the block C, and guide-strip D', in combination with the dipper B, handle A, pivoted in the block C, and the chain K, suitably secured to the dipper, said chain passing over suitable pulleys and the windlass O, substantially as described, and for the purposes set forth.



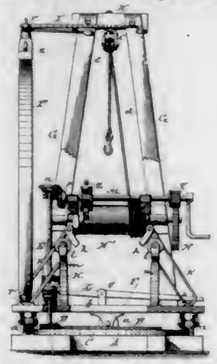
292,733. TAKE-UP FOR WIRE-BARBING MACHINES. GEORGE CARR, Joliet, Ill., assignor to Andrew Dillman and Edward R. Knowlton, both of same place. Filed Dec. 15, 1883. (No model.)

Brief.—A device put between the barber and the twister to intermittingly feed forward the cable. A rocking arm actuated indirectly from the power-shaft operates first to close the movable jaw upon the wires and then to move forward the sliding carriage. A reverse movement first opens the jaw and then moves back the carriage.

Claim.—1. The combination of the shaft S, slotted crank V, stud-bolt *d*, pitman Z, knuckle Z', arms R and R', rock-shaft S², knuckle H, bent shaft P, jaws D and J, carriage C, having the guide-plates B B, and tension-plate *a* and screw *a'*, and shaft S', and boxes K and K', arm *y*, and stem *r*, as and for the purpose set forth.

2. In the barbed-wire take-up described, the combination of the arms R and R', crank V, pitman Z, shaft S, knuckle-joints Z' and H, and bent shaft P, for the purpose of opening and closing the jaws D and J, and to reciprocate the carriage C, for the purpose set forth.

292,734. WASHING-MACHINE. LARS CHRISTIANSEN, Council Bluffs, Iowa. Filed Mar. 27, 1883. (No model.)

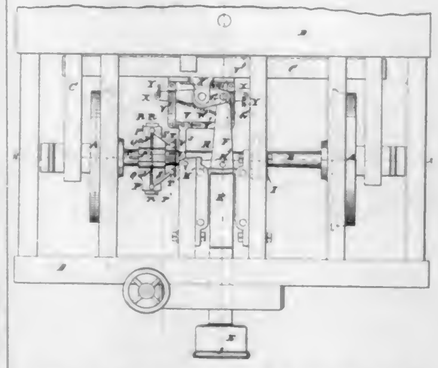


Claim.—1. A suds box or tub having a series of brushes whose bodies are secured radially to the tub-bottom and whose bristles stand vertically, another series of brushes whose bodies are secured vertically to the sides of the tub and whose bristles stand radially, toward center, a hub fixed permanently to stand in the center of the tub, having a series of brushes secured to its circumference, whose bristles stand radially therefrom, in combination with a vertical shaft revolving in the center of the tub, radial arms secured to said shaft within the tub, a cover and means for holding it upon said arms, whereby portions of clothes may be held between said cover and arms, and the remaining portions of the clothes rubbed against the stationary brushes described, by rotating the arms, as specified.

2. The combination, with the tub, the shaft *e* therein, the hub G on said shaft, and the arms F and J, attached to said hub, of the perforated cover *i*, provided with the annular wedges *j*, as described, whereby clothes may be held and rotated, as described.

3. The combination, with the tub and rotary arms described, of the shaft *e*, carrying said arms, the step H, for shaft *e*, and means for adjusting the same vertically, the pinion *k*, on shaft *e*, of a thickness greater than the range of vertical adjustability of said shaft, and the toothed gear-segment K, having the upward-bent arm L secured to it, and the handle I on said arm, as and for the purpose specified.

292,735. WELL-BORING MACHINE. WM. W. CURTIS, Stanberry, Mo. Filed Feb. 15, 1883. (No model.)



Brief.—A centrally-open "derrick-frame" running on a circular track has a vertical sectional shaft with section-coupling clutch, and pinions at each end gearing, respectively, with a circular rack on the bed, and a horizontal shaft driving a drum, and carries two auger-driving arms slotted to run on rollers, and with hinged forked heads.

Claim.—1. A machine for turning and raising earth augers and drills, consisting of a bed carrying a circular track and centrally open-toothed circle, a rotary derrick thereon, having an opening in the center of its platform, the vertical sectional shaft carrying pinions at its upper and lower ends, the horizontal shaft, its pinions and drum, and the clutch-lever operating to connect the upper and lower sections of the vertical shaft, substantially as specified.

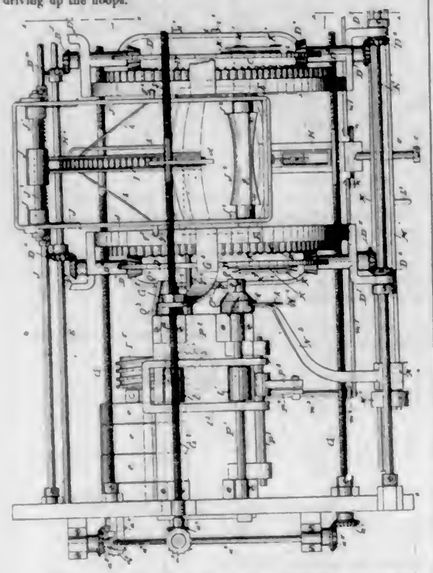
2. The combination, with the rotary derrick-frame, of the slide-arms having the hinged fork-heads designed to engage the square stem or shank of an earth auger or drill, substantially as specified.

292,736. AUTOMATIC CAR-BRAKE. JOSEPH C. DANE, La Crosse, Wis., assignor of two-thirds to Lucinda S. Card and Forrest J. Smith, both of same place. Filed Apr. 13, 1883. (No model.)

Claim.—1. The combination, with the draw-head of a car, of a push-bar held in contact with the rear end or an abutment of the draw-head by a spring, and connected to a crank upon a shaft carrying a cross-bar, whose ends are connected by any suitable means to the brake-bars at the opposite ends of the truck.

2. The combination of draw-head E, push-bar F, crank G, with clutch tooth or teeth thereon, clutch-collar L, feather-keyed to shaft J and sliding thereon, any suitable means for raising the clutch-collar, cross-bar X, rods or chains Y, and brake-bars Z, all constructed and connected substantially as set forth.

3. The combination, with the clutch-collar L, of the lever M, having a pin M', entering a groove, L', in the collar L, the swing-frame V, with arm V⁴, actuating lever M, and itself actuated by a spring, W, and by a governor and shield upon the axle, substantially as set forth.



4. The combination, with the governor upon the car-axle, swinging frame V, lever M, and clutch-collar, of the spring-latch N, substantially as and for the purpose set forth.

5. The combination of a car-brake mechanism, a governor having slotted wings P', constructed to form guides for the weights R, the links S, hinged to said weights and to the shield T, and the springs U, constructed to draw the weights toward the axle.

6. The combination of draw-head E, push-bar F, spring-lever H, crank G, with clutch-tooth thereon, clutch-collar L, with tooth thereon, shaft J, cross-bar X upon shaft J, connected to the brake-bars, frame V, and a governor upon the axle actuating the frame, all constructed and operating substantially as set forth.

292,737. BARREL-FINISHING MACHINE. ROBERT O. DOBBIN, Waterloo, Ontario, Canada. Filed Sept. 28, 1882. (No model.)

Brief.—The barrel skeleton is held interchangeably in a non-rotating chuck with radially-moving dogs at its center, or in two rotating end chucks having similar dogs. Mechanism is provided for operating the chucks and dogs, for planing the outer surface of the barrel, for beveling and chamfering and crozing the staves, for inserting the heads, and for driving up the hoops.

Claim.—1. Two chucks having radially-adjustable jaws, means for rotating said chucks, and means for setting said jaws, substantially as described, in combination with a stationary chuck and radially-adjustable jaws therein, whereby a barrel may be centrally compressed and held until the end chucks are secured, and then the jaws of the central chuck radially withdrawn, so that the barrel may revolve within said central chuck, as described.

2. A stationary chuck having radially-adjustable dogs to hold a barrel by its center, and mechanical means for advancing and withdrawing said dogs, in combination with two end chucks having radially-adjustable dogs, substantially as described, for holding the barrel by the circumference of its ends, and means, substantially as described, for advancing the end chucks upon the barrel while the same is held in the stationary chuck, as specified.

3. In a barrel-machine, a head-holding plate and means, substantially as described, for moving the same longitudinally to engage a barrel-head out of line of the axis of the barrel, in combination with means, substantially as described, for moving said holder into said axial line and along the same to thrust the head into the barrel, as specified.

4. The combination of a chuck adapted to compress and hold a barrel at its middle with two revolable end chucks concentric with the axis of the middle chuck, and means, substantially as specified, for removing the middle chuck, whereby the barrel will be compressed and held by the middle chuck while closing the end chucks on it, and may then be freed from the middle chuck, to revolve concentric with the line which was the axis of the middle chuck when closed for turning or planing the barrel, as set forth.

5. The combination, with the fixed chuck-section H', the section H², hinged thereto, and the shaft G, located above section H², of the hook *d*, pivoted to section H², and adapted to hook over shaft G when said section H² is raised to hold the same suspended, as shown and described.

6. In a barrel-machine, the combination, with the chucks for holding barrels, of rocking frames carrying cutter-heads for acting on the inner surfaces of the ends of the staves, and cutter-heads for acting on the outer surfaces of the ends of the staves, substantially as herein shown and described, and for the purpose set forth.

7. The combination, with the revoluble barrel-holding chucks B, the planer described, pivoted to swing between said chucks, and adapted to plane the body of a barrel held and revolved thereby, of the planer raising and lowering device, consisting of the foot-treadle A⁵, the shaft A³, rocked thereby, the beveled-gear wheel A⁴ on said shaft, engaging a similar wheel, A², the shaft A², carrying said wheel A², the arm A' on shaft A², and the connecting-rod A, communicating motion from arm A' to the planer, as shown and described.

8. The arms N², provided with means, substantially as described, for holding barrel-heads, the rock-shaft L, supporting said arms, the bars M and M', provided with toothed racks, the pinion L', mounted on a stud projecting from shaft L and engaging said racks, the crank L² on pinion L', and the blocks N' and N², connecting the arms N² with the rack-bars, as shown and described.

9. In combination with the barrel-rotating chucks described, the rocking plate I², the shafts P and P', journaled therein, and carrying cutters adapted, respectively, to shape the outer and inner faces of the ends of the staves at the same time, the rocking of the plate bringing both sets of cutters into action at once, as shown and described.

10. The combination, with the barrel-rotating chucks described and the rocking plate I², carrying cutters for crozing and planing the barrel, of the foot-treadle I⁴, the shaft I³, supporting the same and rocked thereby, the arm I⁴ on said shaft, and the rod I⁵, connecting said arms with plate I², whereby said plate may be rocked by the foot of the operator to bring said cutters into action, and to so hold them as long as may be required, for the purpose specified.

11. The combination, with chucks for holding and revolving barrels, of means for revolving said chucks, dogs in said chucks moved radially upon the barrel, a toothed ring to move said dogs, gearing to rotate said ring, and means, substantially as described, for disconnecting said gearing when the chucks are to be revolved, for the purpose specified.

12. The combination, with the stationary ring E, of the radially-grooved plates B' and B², the screw-threaded non-rotating spindles B³ in said radial grooves, the internally-threaded cog-wheels B⁴, mounted to rotate thereon, the ring D, provided with teeth on both its flat faces and engaging the cog-wheels B², and the cog-wheels D⁴, engaging the ring D, as shown and described.

13. The combination, with the main frame A, the rings E, the chucks B, revolving therein, and the planer-frame J', pivoted to frame A to swing vertically between chucks B, of the spring *j*, secured on shaft J, and engaging the planer-frame to lift it, substantially as specified.

14. In a barrel-machine, the combination, with the chucks for holding barrels, of frames adapted to be moved toward and from the chucks, and carrying separate shafts provided with cutter-heads for acting on the inner surfaces of the ends of the staves, and cutter-heads for acting on the outer surfaces of the ends of the staves, substantially as herein shown and described, and for the purpose set forth.

15. In a chuck for holding barrels, the combination, with a fixed outer ring, of rotating inner plates, radial screw-spindles held in the said plates and provided with cog-wheels, and of a loose cog-ring acting on the said cog-wheels on the screw-spindles, substantially as herein shown and described, and for the purpose set forth.

16. In a barrel-machine, the combination, with an outer ring, of rotating plates within the same, radial screw-spindles in the said plates, cog-wheels mounted on the said spindles, dogs on the inner ends of the said spindles, a cog-ring engaging with the cog-wheels on the spindles, and of devices for rotating the said cog-ring, substantially as herein shown and described, and for the purpose set forth.

17. In a chuck for holding barrels, the combination, with the outer ring, E, of the plates B' and B², provided with radial grooves *b* and apertures B³, of the screw-spindles B³, the cog-wheels B⁴ thereon, the dogs B⁵, and devices for rotating the cog-wheels B⁴, whereby the dogs and the spindles on which they are mounted will be moved toward and from the middle of the chuck, substantially as herein shown and described, and for the purpose set forth.

18. In a chuck for holding barrels, the combination, with the ring E, of the plates B' B², the screw-spindles B³, the cog-wheels B⁴, mounted thereon, the ring D, provided with teeth on both the inner and outer flat surfaces, and engaging with the cog-wheels B⁴, the cog-wheels D⁴, engaging with the ring D, of longitudinal shafts on the front and rear of the machine-frame, of longitudinally-movable cog-wheels on the said shafts, and engaging with the cog-wheels D⁴, and of devices for rotating the said shafts, substantially as herein shown and described, and for the purpose of permitting the movement of the dogs B⁵ in all the positions of the chuck, as set forth.

19. In a chuck for holding barrels, the combination, with the ring E, of the plates B' B², the screw-spindles B³, the cog-wheels B⁴, mounted thereon, the ring D, provided with teeth on both the inner and outer flat surfaces and engaging with the cog-wheels B⁴, the cog-wheels D⁴ and D², the shafts E', on which the sliding cog-wheels D² are mounted, the cog-wheels E² on the shafts E', the cog-wheels E³, the inclined shafts

E^4, the worm-wheel E^5, and the worm E^6, mounted on the same shaft with the driving-pulleys, substantially as herein shown and described, and for the purpose set forth.

20. In a barrel-machine, the combination, with the worm E^6, mounted on the same shaft with the belt-pulleys, of the worm-wheels E^5, engaging therewith, and mounted on shafts which are connected in such a manner as to operate the barrel-holding dogs, the pivoted arms F, in which the shafts E^4 are journaled, and of devices for raising the upper ends of the arms F to disengage the worm-wheels E^5 from the worm E^6, substantially as herein shown and described, and for the purpose set forth.

21. In a barrel-machine, the combination, with the worm E^6, mounted on the same shaft with the belt-pulleys, of the worm-wheels E^5, engaging therewith, and mounted on shafts which are connected in such a manner as to operate the barrel-holding dogs, the pivoted arms F, in which the shafts E^4 are journaled, the box F', in which the upper ends of the arms F are held, the lever F^3, connected with the box F' by the stirrup F^2, and the locking-lever F^4, substantially as herein shown and described, and for the purpose set forth.

22. In a barrel-machine, the combination, with the separable chuck-sections H' and H^2, of the circular rack I, extending along the periphery, of the cog-wheels within the chuck, engaging with the rack, and of dogs connected with the said cog-wheels, substantially as herein shown and described, and for the purpose set forth.

23. In a barrel-machine, the combination, with the chuck-sections H' and H^2, of the rack I along the periphery of the same, the cog-wheels H^3, the connecting-bars H^6, the radially-movable rods H^5, and the dogs H^4 on the said rods, substantially as herein shown and described, and for the purpose set forth.

24. In a barrel-machine, the combination, with the separable chuck-sections H' and H^2, of the circumferential rack I, acting upon the dogs of the chucks, the cog-wheel I', engaging with the rack I, and of devices for rotating the said cog-wheel, substantially as herein shown and described, and for the purpose set forth.

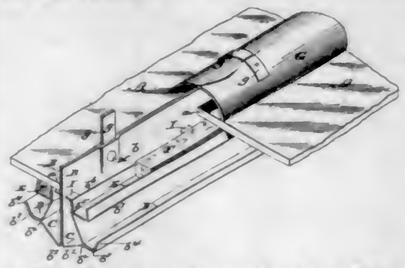
25. In a barrel-machine, the combination, with the rocking shaft I_1, of the rack-bars M and M', the head-holding arms N^2, attached to the said rack-bars, the guide-stud k' on the bar M, and the plate O, provided with slots for guiding the stud k', substantially as herein shown and described, and for the purpose set forth.

26. In a barrel-machine, the combination, with the rocking shaft I_1, of the rack-bars M and M', the pinion L', the head-holding arms N^2, the plates K, attached to the rings D', and the clamping-springs K' on the plates K, substantially as herein shown and described, and for the purpose set forth.

27. In a barrel-machine, the combination, with the chuck B, having radially-movable screw-spindles B^2, on the outer ends of which beveled plates b^2 are secured, the rack R^3, provided with a fork, R^4, and the pinion R^2 on the same shaft, R, with the cog-wheel S, which acts on a rack for releasing the automatic belt-shifting device, substantially as herein shown and described, and for the purpose set forth.

28. In a barrel-machine, the combination, with a series of pulleys and a sliding box carrying elongated loops, through which the belts pass, of springs for moving the bar in such a manner that the belts will be on the loose pulleys, of a latch for holding the bar in such a manner that the belts will be on the fixed pulleys, of a vertically-movable bar provided with a series of beveled projections for acting on the lower end of the angle-lever which locks the bar carrying the belt-shifters in the desired position, and of a cog-wheel acting on the said bar and mounted on the same shaft with a pinion which is acted upon by a rack, which in turn is acted upon by the radially-movable spindles of a barrel-holding chuck, substantially as herein shown and described, and for the purpose set forth.

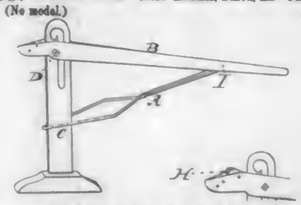
29. In a barrel-machine, the combination, with the rod S', of devices for automatically shifting the belts, the beveled projections r on the rod S', the nuts r', for locking the projections r in the desired positions, and of devices for transmitting motion to the rod S' from the barrel-holding chuck, substantially as herein shown and described, and for the purpose set forth.



30. In a barrel-machine, the combination, with a series of pulleys, of the sliding bar U', provided with the apertures t and t', the beveled angle-lever, T, provided at its upper end with a projection, s', and at its lower end with a spur, s, the vertically-movable rod S', provided with beveled projections r, and of devices for transmitting motion to the said rod S' from the barrel-holding chuck, substantially as herein shown and described, and for the purpose set forth.

31. In a barrel-machine, the combination, with the pulleys e' e^2 e^3, of a sliding bar provided with belt-shifters, an angle-lever adapted to catch in apertures in the said bar, and of a sliding bar connected with one of the laterally-movable barrel-holding chucks, and provided with beveled projections which act on the lower end of the lever for holding the said sliding bar in position, substantially as herein shown and described, and for the purpose set forth.

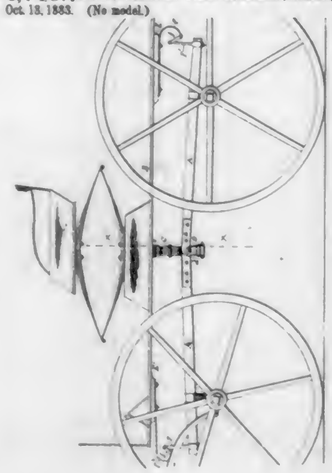
32. In a barrel-machine, the combination, with a chuck, B, of a cross-piece, i, having a chuck-lug, i', against which the end of the sliding plate P^3 strikes, substantially as herein shown and described, and for the purpose set forth.



292,738. SKYLIGHT. JOHN EHRHARDT, St. Louis, Mo., assignor of two-thirds to Herman Hopmann, Sr., and Charles Hopmann, same place. Filed Aug. 7, 1883. (No model.)

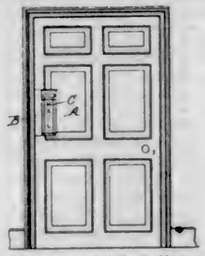
Brief.—A skylight consisting of plates bent to form supports and gutters for carrying off the drip from the panes. In gutters separated from the vertical rib by tie-strips are placed continuous rubber strips, upon which the panes rest.

Claim.—The combination of the panes A A, the plates B B, bent to form the gutters C C and D D and the grooves E E, the packing-strips F F, and the cap G, the strips g g, secured to the plates B B, and the ties I I, whereby double gutters are afforded, as well as a free space for the descent of the moisture between the packing and the skylight-bar plates, substantially as described.



292,739. LIFTING-JACK. EZRA EMMERT, Dixon, Ill. Filed Oct. 2, 1882. (No model.)

Claim.—1. In a wagon and carriage jack, link A, placed on the under side of lever B, V-shaped at the front end, and so that it will catch at any point on standard C, said link having an extension the end of which is pivoted at or near the handle of lever B, in combination with lever B and standard C, substantially as shown and described.

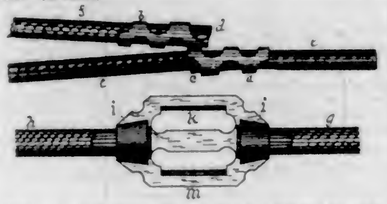


2. Standard C, lever B, pipe F, bolt D, and opening J, substantially as shown and described.

292,740. SPRING-VEHICLE. PHILIP ENGLEHART, Modesto, Cal. Filed Oct. 13, 1883. (No model.)

Claim.—In a road-vehicle, the combination of the side reach-sections, A A, hinged together by irons a a, as shown, yoke D, attached at its lower ends to jaws d, hung to pins of hinge-irons a a, and having block D', attached to and resting upon it, and attached to spring C, and spring C, attached to block c beneath body-bottom B, substantially as and for the purposes shown and described.

292,741. MAIL-BOX. FRANCIS E. FREY, Springfield, Ohio, assignor of one-half to James W. McRoberts, same place. Filed Nov. 6, 1883. (No model.)



Claim.—1. A mail-box composed of front, sides, and ends, extended past the sides in a pointed form forming open sides of the box, as set forth.

2. A mail-box formed with an open back and extended pointed ends, and adapted to be secured to the jamb or frame in an angle made by a door or other moving part and its jamb or frame, so that the open back of the box shall be closed by the jamb and door when the door is closed, and one part of the back of the box be opened when the door is opened, as set forth.

3. A mail-box having open back and pointed ends, provided with ribs having screw-holes formed therein, substantially as set forth.

4. A mail-box consisting of a slotted front, C^2, sides c' c', ends D D, having extended inclined edges d' d', and ribs d d, provided with openings as described, and for the purpose set forth.

292,742. HARNESS. SAMUEL FUNT, Decatur, Ill. Filed Nov. 26, 1883. (No model.)

Claim.—1. In combination with two parts of a harness, the tubular receptacles and the locking-wedge, all arranged to operate substantially as shown and described.

2. The combination of receptacles i i, bars k m, tags g h, and wedges d d, as and for the purpose set forth.

292,743. INTERLOCKING-SWITCH APPARATUS. OSCAR GASSETT, Boston, Mass., assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed Dec. 4, 1882. (No model.)

Brief.—The switch-throwing engines are controlled by electric circuits, and are arranged in sets as needed. A circuit completing and selecting device and a pole-changer for operating the engines interlock with each other, so that no two sets of switches can be simultaneously thrown from normal position. The entire apparatus is placed under the control of an approaching train by means of track-circuits.

Claim.—1. An interlocking-switch apparatus consisting of a series of railway-switches, actuating mechanism for each switch, and electro-magnetic controlling device for the said actuating mechanism, and a series of circuits, each including the controlling-magnets of a series or group of switches that have to be operated simultaneously to direct a train as desired, substantially as described.

2. In an interlocking-switch apparatus, the following elements, namely: a series of switches, actuating mechanism therefor, controlling electro-magnets for the said actuating mechanism, a series of circuits, each including the controlling-magnets of a group of switches that are to be operated simultaneously, and a circuit-selecting and circuit-controlling device, whereby the flow of an electric current through the desired circuit is insured, substantially as described.

3. The combination, with a series of railway-switches, their actuating mechanism, electro-magnetic controlling device, and circuits therefor, of the circuit-selecting and circuit-controlling devices, and interlocking mechanism, whereby the movements of one are dependent on the condition of the other, substantially as described.

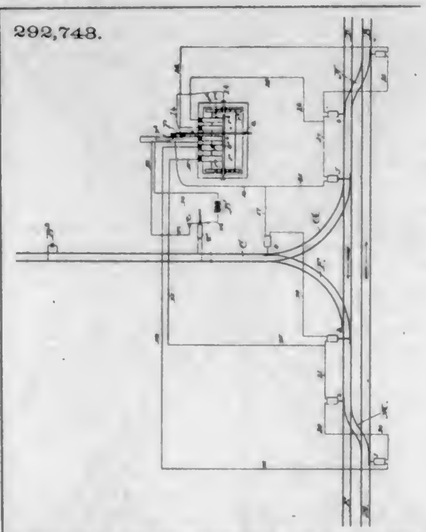
4. The combination of a railway-switch, its actuating mechanism, and electro-magnetic controlling device therefor, with a circuit-controlling instrument in circuit with the controlling electro-magnet and itself controlled by the block-section of track leading to the said switch, whereby a change in condition of the said switch is prevented after a train has entered the section leading to it, substantially as described.

5. The railway-switches, their electro-magnetic controlling mechanism, and series of circuits, each including the controlling-magnets of a group of switches that are to be operated simultaneously, combined with the circuit-selecting device consisting of a drum having a series of studs connected with one pole of the battery, and a series of springs, one connected with each circuit, and means to force any one of the said springs into contact with its corresponding stud when in the proper position, substantially as described.

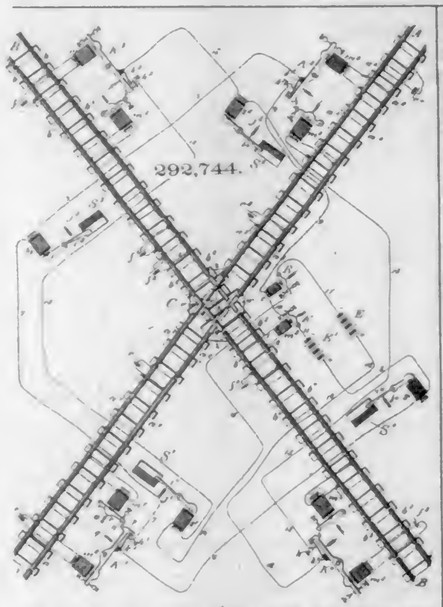
6. The switch-actuating apparatus, electro-magnet, and polarized armature controlling it, and series of circuits, each including the controlling-magnets of a group of switches, combined with a circuit-selecting device for closing any desired one of the said circuits, and a pole-changing device common to all the said circuits, and interlocking mechanism for the said pole-changing and circuits-electing device, whereby a new circuit can be selected only when the pole-changing device is in normal position, and the said pole-changer can be moved only after a circuit is completed, substantially as described.

7. The combination of the drum having notched flanges and a series of studs all connected with the battery, and of a series of springs, one co-operating with each stud, and the spring-actuating lever controlled by the notched flanges of the drums, substantially as described.

8. The cylinder b and its main valve, and valve-actuating pistons e e', working in open-ended cylinders f f'', and each operating a valve, d^2, in combination with exhaust-passages g g', valves h h', alternately opening and closing the same, and electro-magnetic apparatus for operating said last-named valves, substantially as set forth.



9. The polarized vibratory magnet m and electro-magnet n n', in combination, by rod k and levers i i', with valves h h', as a means of alternately opening and closing the exhaust-ports of a valve-moving piston, substantially as described.



10. A circuit-controlling or pole-changing mechanism consisting of connected levers p p', provided with a stud, p^3, in combination with recessed or notched disks r^2, substantially as set forth.

292,744. ELECTRIC SIGNALING APPARATUS FOR RAILWAY-CROSSINGS. OSCAR GASSETT, Boston, Mass., assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed Mar. 26, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of four insulated sections of railway-track extending radially in different directions from a crossing-point and forming parts of two intersecting or crossing lines of railway, and electrical connections uniting the insulated sections of the respective lines of railway, whereby the presence of a lo-

292,743.

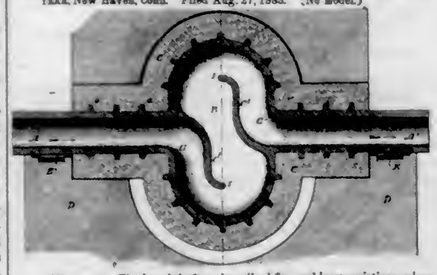
comotive, car, or train upon an insulated section of either line will cause signals to be given in both directions upon the intersecting line.

2. The combination, substantially as hereinbefore set forth, of four independently-insulated sections of railway-track extending radially in different directions from a crossing or intersection, a battery having one of its poles connected with one insulated line of rails of each of said sections, and its remaining pole with the other insulated line of rails of each section, an electro-magnet having its opposite terminals connected with the respective lines of rails of each section in the same manner as the poles of the battery, and signaling apparatus guarding each one of said radial sections of track at a suitable distance from the common point of crossing or intersection and controlled by such electro-magnet, whereby the establishment of a direct electric connection between the opposite insulated lines of rails of one or more of said insulated sections will cause said electro-magnet to actuate said signaling apparatus.

3. The combination, substantially as hereinbefore set forth, of four insulated sections of railway-track extending radially in different directions from a crossing or intersection, an electro-magnet circuit-controller, which is actuated by the establishment of an electric connection between the opposite ends of rails of either of said insulated sections, signaling apparatus guarding each one of said radial sections of track, an electro-magnet for controlling each of said signal apparatuses, and one or more electric circuits traversing said electro-magnets and under control of said circuit-controller, whereby the presence of a locomotive, car, or train upon either of said insulated sections will actuate said circuit-controller, and thereby operate said signaling apparatuses.

4. The combination, substantially as hereinbefore set forth, of two intersecting or crossing railway-tracks, signaling-points upon each track guarding the approach to the crossing from each direction, an electro-magnet-controlling signaling apparatus at each of said signaling-points, two independent electric circuits, one of which circuits includes the electro-magnets controlling the signaling apparatuses of one of the intersecting tracks, and the other the electro-magnets controlling the signaling apparatuses of the other intersecting track, and a circuit-controller actuated by locomotives, cars, or trains passing over either or both said tracks at or near their common point of intersection, whereby both sets of signaling apparatus may be simultaneously actuated through their respective circuits by a locomotive, car, or train approaching the crossing upon either track and from any direction.

5. The combination, substantially as hereinbefore set forth, of two intersecting or crossing railway-tracks, signaling-points upon one of said intersecting tracks, guarding the approach to the crossing from each direction, an electro-magnet-controlling signaling apparatus at each of said signaling-points, an electric circuit including both of said electro-magnets, and two circuit-controllers, which are themselves controlled by locomotives, cars, or trains passing over the other intersecting track, respectively placed at a suitable distance from the crossing in opposite directions, each of which independently controls said electric circuit, whereby a locomotive, car, or train approaching the crossing in either direction upon one intersecting track will actuate or cause to be actuated signaling apparatus at the signaling-points upon the other intersecting track, guarding the approach to the crossing in both directions.



6. The combination, substantially as hereinbefore set forth, two of intersecting or crossing railway-tracks, signaling-points upon one of said intersecting tracks, guarding the approach to the crossing from each direction, an electro-magnet-controlling signaling apparatus at each of said signaling-points, an electric circuit including said electro-magnets, two circuit-controllers actuated by locomotives, cars, or trains passing over the other intersecting track, respectively placed at a suitable distance from the crossing in opposite directions, each of which circuit-changers independently controls said electric circuit, and locking devices whereby the action of either of said circuit-changers is continued after the locomotive, car, or train has passed by it in the direction of the crossing.

7. The combination, substantially as hereinbefore set forth, of two intersecting or crossing railway-tracks, signaling-points upon one of said intersecting tracks, guarding the approach to the crossing from each direction, an electro-magnet-controlling signaling apparatus at each of said signaling-points, an electric circuit including said electro-magnets, two circuit-controllers actuated by locomotives, cars, or trains passing over the other intersecting track, and respectively placed at a suitable distance from the crossing in each direction, each of which independently controls said electric circuit, locking devices whereby the action of either of said circuit-changers is continued after the train has passed by it in the direction of the crossing, and means for releasing said locking devices after the train has reached or passed the crossing.

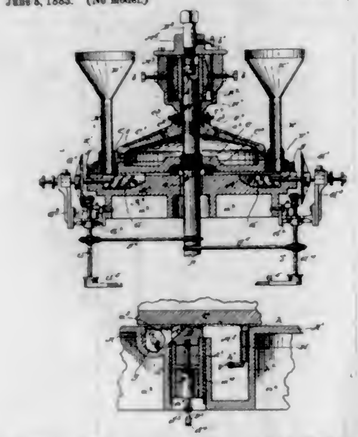
8. The combination, substantially as hereinbefore set forth, of two intersecting or crossing railway-tracks, signaling-points upon one of said intersecting tracks, guarding the approach to the crossing from each direction, an electro-magnet-controlling signaling apparatus at each of said signaling-points, an electric circuit including said elector-magnets, two keys, each independently controlling said circuit, and two independent electro-magnets controlling the position of each of said keys according to the order in which they are respectively acted upon by circuit-controllers, according to the direction of movement of a train, whereby the electric current which actuates the signaling apparatus upon one intersecting track will be interrupted when a train on the other intersecting track is approaching the crossing, but not when the train is receding from the crossing.

9. The combination, substantially as hereinbefore set forth, of signaling apparatus, an electro-magnet for actuating or controlling said signaling apparatus, an electric circuit in which said electro-magnet is included, a key for controlling said circuit, a second electro-magnet, whereby said key is normally kept closed, a spring for opening said key when the second electro-magnet ceases to act, a locking-lever, which, when thrown into the path of said key, acts to retain it either in its open or its closed position, a third electro-magnet which normally holds said locking-lever out of engagement with said key, and a spring which acts to throw said locking-lever into the path of said key when released by its own actuating electro-magnet, whereby said key is locked in an open or a closed position, to display or conceal the signal, according to the order of time in which the second and third electro-magnets are respectively actuated.

292,745. HEAT AND FIRE RESISTING VALVE. WATSON A. GOODYEAR, New Haven, Conn. Filed Aug. 27, 1883. (No model.)

Claim.—1. The hereinbefore-described fire and heat resisting valve, consisting of a cast or wrought iron or other metal shell, coated with fire-clay or other fire and heat resisting material, constructed to rotate upon a hollow axis through which a continuous stream of water may be forced, substantially as hereinbefore shown and described.

2. In a fire and heat resisting valve, a hollow valve-shell, the shape and size of which are determined by the shape and size of the flue or conduit-pipe in which the valve is to be placed, and constructed to rotate upon a hollow axis through which a stream of water may be forced, substantially as herein shown and described, for the purposes specified.



3. A heat or fire resisting valve consisting of a hollow valve-shell constructed to rotate upon its axis, with a coating of fire-clay.

4. In a heat or fire resisting valve, the combination, with the hollow valve-shell, of a diaphragm of metal forming a part of the same, substantially as herein shown and described, and for the purposes specified.

5. In a heat and fire resisting valve, the combination, with the hollow rotating valve-shell, of the projections *e*, forming a part of the same, and the coating of fire-clay, substantially as described.

6. In a heat and fire resisting valve consisting of a cast or wrought iron or other metal shell coated with fire-clay or other fire and heat resisting material constructed to rotate upon an axis, the combination, with the valve, of friction-rollers, substantially as shown and described, and for the purposes specified.

292,746. GRINDING-MILL. WILLIAM E. GORTON, Chicago, Ill. Filed June 8, 1883. (No model.)

Claim.—1. The combination, with a runner of a grinding-mill, of a series of separate stationary grinding-plates opposed to a grinding-surface of the runner, a corresponding series of feed passages or devices for delivering materials to be ground to the several grinding-plates, and means for separately discharging the product of each of the grinding-plates from the mill, substantially as described.

2. The combination, with a runner of a grinding-mill, of a series of separately-adjustable stationary grinding-plates opposed to a grinding-surface of the runner, means for feeding the materials to be ground separately to the several grinding-plates, and means for discharging the products of the several grinding-plates from the mill, substantially as described.

3. The combination, with a runner of a grinding-mill, of a series of separate dissimilarly-dressed grinding-plates opposed to a grinding-surface of said runner, means for feeding material or materials to be ground from separate sources to the several plates, and means for separately discharging the products of the several grinding-plates from the mill, substantially as described.

4. The combination, with a runner of a grinding-mill, arranged with its working-face downward, of a series of separate stationary grinding-plates opposed to said runner, a corresponding series of feed-spouts exterior to the periphery of the runner, ducts constructed to convey the material to be ground from the spouts to the several grinding-plates, and means for discharging the products of the several plates separately, substantially as described.

5. The combination, with a runner of a grinding-mill and a series of separate stationary grinding-plates opposed to the runner, of a series of feed-spouts located exterior to the periphery of the runner, a part or parts provided with a passage extending from each feed-spout to the space between the runner and a grinding-plate, and means constructed to force material through said passage into position to be ground, substantially as described.

6. The combination, with a runner of a grinding-mill, the stationary grinding-plates, and the feed-spouts exterior to the periphery of the runner, of the stationary plate A', provided with upwardly-opening recesses anterior and adjacent to the grinding-plates, and in communication with the feed-spouts, and with recesses following the grinding-plates for the discharge of the ground products, substantially as described.

7. The combination, with a runner of a grinding-mill, a series of separate grinding-plates opposed thereto, and feed-passages leading inward from the periphery of the runner to the grinding-surfaces, of feed-worms located in the feed-passages, and suitable means for operating said worms, substantially as described.

8. The combination, with the friction-disk G' on the feed worm-shaft and the pulley G^4 and its shaft, of the post G^5 and movable arm G^7, constructed to engage with the pulley, substantially as described.

9. The combination, with the feed worm-shaft and the disk G' thereon, of the splined shaft G^4, the pulley G^4, movably fitted to said shaft, the post G^5, the movable arm G^7, engaged with the pulley, and means for securing said arm at a desired elevation, substantially as described.

10. The combination, with the adjustable frictional drive-pulley G^6 and its shaft, of the feed worm-shaft *g*, the disk G' thereon, and devices for adjusting the pressure of the friction-surfaces, substantially as described.

11. The combination, with the stationary plate A', provided with the recess *a'*, and the runner C, parallel with said plate, of the grinding-plate D, and means for adjusting said plate, constructed to yield automatically when a hard substance enters the space between the grinding-faces, substantially as described.

12. The combination, with a runner of a grinding-mill, of a series of separate grinding-plates opposed to the runner, and means for holding said grinding-plates in proper relation to the runner, constructed to allow said grinding-plates to separately and automatically yield when a hard substance enters the space between either of the grinding-plates and the opposing runner, substantially as described.

13. The combination, with a runner of a grinding-mill and a plate, A', opposed to said runner, and provided with the recess *a'*, of a grinding-plate fitted to said recess so as to move vertically therein, a lever, D^2, pivoted to the frame, and constructed to support the grinding-plate, a threaded rod, D^3, stop-nut D^4, and adjusting-nut D^5 thereon, and a spring, D^6, interposed between the plate A' and nut D^5, substantially as described, and for the purpose set forth.

14. The combination, with the plate A', provided with a recess, *a'*, and an opposing grinding disk or runner, of a grinding-plate consisting of a working-plate, D, a casting, D', and means for securing the parts D and D' to each other, said casting being fitted to and constructed to slide freely in the said recess *a'*, substantially as described.

15. The combination, with the working-plate D, of the chambered casting D', provided with the cross-plate *d'* and bolt or bolts d^2, the plate D and the casting D' being constructed to preserve their relation laterally, substantially as shown and described.

16. The combination, with a runner of a grinding-mill and a series of separate grinding-plates opposed to the runner, of a part or parts forming feed-passages which have their side walls adjacent to the working-faces of the grinding-plates inclined, and means constructed to force the material to be ground through the said passages, substantially as described.

17. The combination, with a runner of a grinding-mill and a plate, A', provided with feed-passages, of a series of separate grinding-plates located contiguous to said passages, and having their upper faces adjacent to the passages inclined, and means constructed to force the material to be ground inwardly through said passages, substantially as described.

18. The combination, with a runner of a grinding-mill and a series of grinding-plates opposed to the runner, of a plate, A', constructed to retain said grinding-plates, and provided with feed-passages whose inner ends are curved toward the grinding-plates, and devices for forcing the feed radially inward toward said curved ends of the passages, substantially as described.

19. The combination, with a runner of a grinding-mill and with a grinding-plate opposed to said runner, of a plate, A', constructed with a feed-passage leading to the grinding-surfaces, and a plate, a^3, cutting off a portion of the feed-passage from the runner, substantially as and for the purpose set forth.

20. The combination, with the runner, of the opposing stationary plate A', provided with radial pockets extending from points beneath the runner outward beyond the runner, a part or parts covering the part of the pockets exterior to the runner, feed-spouts communicating with the outer ends of the pockets, grinding-plates whose working-faces communicate with the pockets, and means for separately discharging the products from the several grinding-plates, substantially as described.

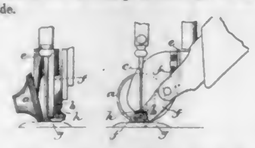
21. The combination, with a runner and a series of separate grinding-plates opposed to said runner, of means for supporting said grinding-plates, constructed to afford feed and discharge passages leading to and from the several grinding-plates, and means for removing substances adhering to the runner after passing the several grinding-plates, and delivering the substances so removed into the next adjacent discharge-opening, substantially as described.

22. The combination, with the runner, the grinding-plates, and the discharge-openings, of brushes set in the discharge-openings, constructed to operate on the face of the runner, substantially as and for the purpose set forth.

23. The combination, with the runner, the separate grinding-plates, and the discharge-openings, of movable brushes H, set in the discharge-openings, and automatic devices for causing them to bear against the opposing disk, substantially as described.

24. The combination, with a sectional grinding-plate and an opposing disk, of a brush, H, hinged or pivoted outside a plane at right angles with the opposing disk at the line of its bearing upon said disk, and a spring operating to throw the brush against said disk, substantially as described.

25. The combination, with the runner and with a series of detached and separately movable grinding-plates, of a plate, A', provided with recesses *a'* for the grinding-plates, and constructed to afford feed and discharge passages leading to and from the grinding-surfaces, substantially as described.



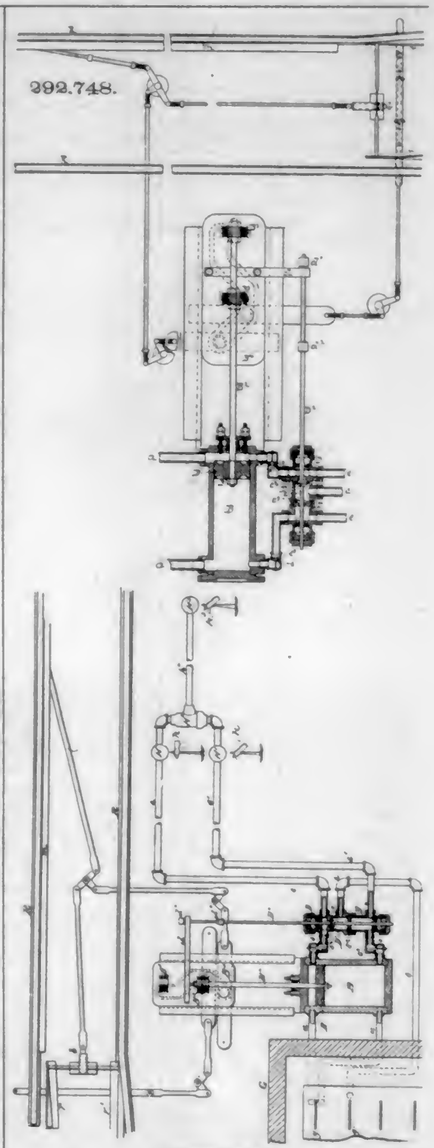
26. The combination, with the shaft B, provided with the screw-thread *b*, of the runner-disk C, centrally apertured and fitted to said thread, the plate C', secured to the shaft B, and means for holding the plate C' in opposition to the runner, substantially as described.

27. The combination, with the disk-runner and the plate A', provided with recesses or feed-passages *a'*, extending beyond the periphery of the runner, of a ring, F, arranged exterior to the runner, substantially as and for the purpose set forth.

28. The combination, with the runner and the opposing stationary plate A', of the ring F, exterior and adjacent to the runner, and the packing F', interposed between the vertical faces of the runner and ring, substantially as described.

292,747. PRESSER FOOT AND GUIDE FOR USE WITH SEWING-MACHINE TRIMMERS. JOHN H. GRIFFIN, Brockton, Mass., assignor to the Standard Trimmer Company, Portland, Me. Filed May 14, 1883. (No model.)

Brief.—The small roll bears on the scrap to prevent its flying. It is attached to the bent end of the central bearing-piece, which latter is fastened by screws to the main shank of the presser-foot. This auxiliary presser-foot bears on the work between the needle and the trimming-knife, the small roll thereof bearing on the scrap or waste edge near the trimming-blade.

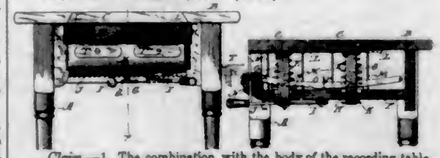


Claim.—1. The combination, with the presser, as *a*, of a separate detachable presser secured thereto, substantially as described, said presser having a bearing, as *f*, between the knife and needle-aperture, and a roll, A, adapted, as described, to bear on the scrap cut from the work, the same being adapted for use in the prescribed relation to the needle and knife, substantially as set forth.

2. As a new article of manufacture, a presser-foot attachment having a shank adapted for attachment to the main presser-foot, substantially as described, and having a bearing-surface, *f*, arranged at an angle with said shank, as shown, and having a roll, A, at the extremity of a curved arm, which is a continuation of the plate forming said bearing-surface *f*, there being a space between the surface *f* and roll A, substantially as described.

292,748. FLUID-PRESSURE SIGNALING APPARATUS. FREDK. S. GUERNER, Pittsburg, Pa., assignor to the Union Switch and Signal Company, same place. Filed June 24, 1882. (No model.)

Brief.—A fluid-pressure apparatus designed for operating railway switches and signals. Said pressure is so employed by proper mechanism that all signals remain at "danger" until the movable rails of the switch are fully in position, or so nearly so that a train may safely proceed, and the operator in the cabin will know at once if there is any obstruction.



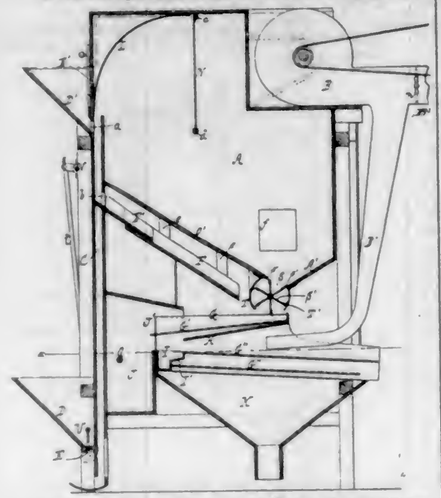
Claim.—1. In an apparatus of the class referred to, the signal-pipes *e e'*, connected with the opposite ends of the main operating-cylinder B, in combination with check-valves arranged in such connection, substantially as set forth.

2. The valve D', seating in either direction at and only at the completion of the piston-stroke, in combination with a valve-governed escape-port, *e*² or *e*³, leading through the main cylinder to the waste, substantially as set forth.

3. The valve-case D, having in combination a valve, D', a pipe-connection, *c*, for alternately supplying and discharging fluid-pressure, a signal-pipe connection, through which to operate a signal or signals, and a connection from such signal-pipe through the port of a check-valve and through the main cylinder to the waste, substantially as set forth.

4. The valve-case D, having in combination a pipe-connection, *c*, for alternately supplying and discharging fluid-pressure, two signal-pipe connections, *e e'*, through which to operate the signal or signals of different track-lines, and valve-governed connections from such signal-pipes to the main cylinder, substantially as set forth.

292,749. RECORDING TABLE OR DESK. MATHEW S. HOLT, Weston, W. Va. Filed Mar. 24, 1883. (Model.)



Claim.—1. The combination, with the body of the recording-table, of the leaves C C, the spiral springs E, supporting said leaves independently of each other, the straps G, attached to the leaves and passed

through openings in the bottom of the table, the friction-rollers K, the levers I, connected to said straps, and the rack-bar J for retaining the levers in any desired position, substantially as shown and described.

2. The combination, with the table having slots Q and plates S, of the supplemental leaf N, the curved bars O, provided with notches R, and carrying said leaf, and the guides P, located in the table, substantially as shown and described, and for the purpose set forth.

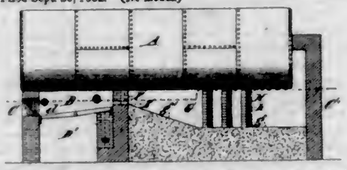
292,750. MACHINE FOR CLEANING AND GRADING COFFEE, &c. GEO. S. HUNGERFORD, New York, N. Y., assignor, by mesne assignments, to Helen E. Hungerford, same place. Filed July 5, 1883. (No model.)

Claim.—1. A machine for cleaning coffee and other material, constructed with a suction-chamber, A, having an inclined bottom, A', provided with a discharge-opening, S, a vertical flue, C, communicating with the suction-chamber at its upper end, and provided with an intermediate opening, *b*, two hoppers connecting, respectively, with the upper and lower ends of the vertical flue, and an inclined chute having a sliding section adapted to move into and out of the flue at a point between the two hoppers, substantially as described.

2. The combination of the suction-chamber A, having an inclined bottom, A', the vertical flue C, communicating with the suction-chamber at its upper end, and provided with the intermediate opening, *b*, a hopper connecting with the upper end of the flue, a gate for opening and closing the connection between the hopper and flue, an inclined chute arranged below the inclined bottom of the suction-chamber, and a sliding section at the upper end of the chute, capable of moving into and out from the flue, substantially as described.

3. The combination of the suction-chamber, having an inclined bottom, A', provided with a discharge-opening, S, the bucket-wheel S', arranged to project into said opening, the vibrating shoe G, located below the wheel, and provided with screens, the vertical flue C, the inclined chute F, arranged between the shoe and the inclined bottom of the suction-chamber, a hopper for delivering the material into the flue, and a device for directing the material from the flue to the chute, substantially as described.

4. The combination of the suction-chamber A, having a bottom provided with a discharge-opening, S, the bucket-wheel S', having flexible flaps *s'*, and a shaking-screen beneath the wheel, substantially as described.

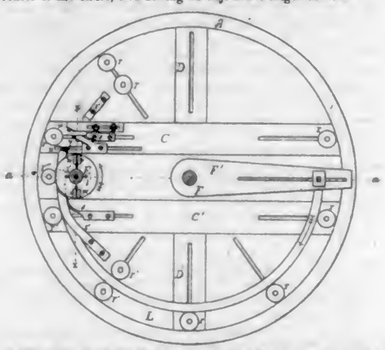


5. The combination, substantially as hereinbefore set forth, with the suction-chamber and the vertical flue communicating with such chamber at the upper end, of the deflector in the suction-chamber, extending upward and inward from the upper end of the vertical flue, and the pendent cloth apron at the inner end of such deflector, said apron being in the suction-chamber, and weighted at its lower edge to keep it taut.

6. The combination, substantially as hereinbefore set forth, with the shaking screen-shoe, of the inclined feed-board, the stone-trap, arranged at a point below the delivery end of the feed-board, and the screens extending outward from the stone-trap, one at the level of the mouth of such trap and the other below that level.

7. The combination, substantially as hereinbefore set forth, with the shaking screen-shoe, of the inclined feed-board, the stone-trap, arranged at a point below the delivery end of the feed-board, and constructed with a transversely-inclined sill and longitudinally-inclined bottom, and the screens, one arranged at the level of the mouth of the stone-trap.

8. The combination, substantially as hereinbefore set forth, with the suction-chamber, and with the shaking screen-shoe and its screens, of the dust-box, arranged at one end of such shoe, and constructed with an inlet-opening opposite to the screens, the fan connecting with the suction-chamber, the air-blast pipe extending from the fan into the screen-shoe at a point opposite to said opening of the dust-box, the air-exhaust pipe extending from the dust-box to the exit-pipe at a point outward from the blast-pipe, and the damper arranged in the exit-pipe intermediate of the blast-pipe and exhaust-pipe.



292,751. BOILER-FURNACE. THOMAS E. JONES, Cincinnati, Ohio. Filed Sept. 29, 1882. (No model.)

Claim.—In a boiler-furnace having a fire-place and a combustion-chamber separated from each other by a transversely-arranged bridge-wall, and having an expanding-chamber having an inclined bottom and located between the bridge-walls and the pillars H, the herein-described set up upright refractory pillars H, unconnected at their upper ends, and placed in a cluster under the boiler at or about the center of the combustion-chamber, between the rear end of said chamber and the bridge-wall, these pillars being arranged in zigzag lines, and the boiler being exposed to the tortuous passages formed through the cluster of pillars, whereby the products of combustion are retarded, and at the same time the boiler subjected to the direct action of the heat in the passages, substantially as described.

292,752. MACHINE FOR PLANING FELLIES. SIDNEY T. KENNAN, Menasha, Wis. Filed July 17, 1883. (No model.)

Brief.—The felly is fed between guide-rollers in a circle-past rotary and fixed cutters and pressure-springs by means of an arm rotated from the center of the circle, and having an adjustable finger thereon.

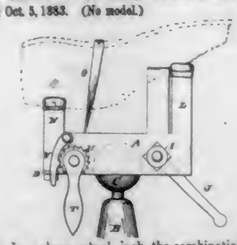
Claim.—1. A planer feeding device for fellies of wagons and material of similar form, consisting of an arm and means for revolving it in a plane parallel with the fixed table of the planer, upon which is supported the material to be planed, said arm extending nearly at right angles from a shaft which is supported in suitable bearings, and having a projecting finger adjustable for different diameters, for engagement with and presentation of the material to the action of cutters, substantially as described.

2. The combination of an arm and means for revolving it in a plane parallel with the fixed table of a planer, upon which is supported the material to be planed, said arm extending nearly at right angles from a shaft which is supported in suitable bearings, and having a projecting finger adjustable for different diameters, for engagement with and presentation of the material to the action of cutters, and non-yielding anti-friction guiding-rolls secured to the table in a circular form, with means for their adjustment for different diameters of material, said material being kept firmly in contact with the table and with the rolls upon its convex side by means of springs, substantially as described.

3. The combination of a cutter head or heads with cutters acting upon the concave and two adjacent sides of the material, and an arm revolving in a plane parallel with the fixed table, upon which is sup-

ported the material to be planed, said arm extending nearly at right angles from a shaft which is supported in suitable bearings, and having a projecting finger adjustable for different diameters, for engagement with and presentation of the material to the action of cutters, and non-yielding anti-friction guiding-rolls secured to the table in a circular form, with means for their adjustment for different diameters of material, said material being kept firmly in contact with the table, and with the rolls upon its convex side by means of springs, substantially as shown and set forth.

4. The combination of the cutter head or heads with cutters acting upon the concave and two adjacent sides of the material, and an arm and means for their revolution, the arm revolving in a plane parallel with the fixed table, upon which is supported the material to be planed, said arm extending nearly at right angles from a shaft which is supported in suitable bearings, and having a projecting finger adjustable for different diameters, for engagement with and presentation of the material to the action of cutters, and non-yielding guiding-rolls secured to the table in a circular form, with means for their adjustment for different diameters of material, said material being kept firmly in contact with the table and with the rolls upon its convex side by means of springs, and the scraping-knives *u*, *v*, and *w*, so located and adjusted as to lightly scrape the material upon its concave surface and the sides adjacent thereto after action thereon by the knives of the cutter-head, substantially as set forth.



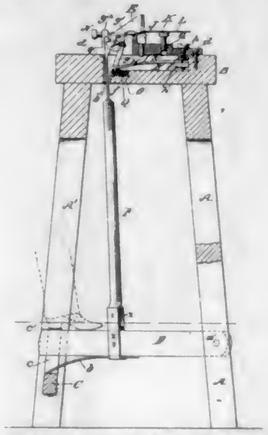
5. The combination of a cutter head or heads with cutters acting upon the concave and two adjacent sides of the material, and an arm and means for their revolution, the arm revolving in a plane parallel with the fixed table, upon which is supported the material to be planed, said arm extending nearly at right angles from a shaft which is supported in suitable bearings, and having a projecting finger adjustable for different diameters, for engagement with and presentation of the material to the action of cutters, and non-yielding guiding-rolls secured to the table in a circular form, with means for their adjustment for different diameters of material, said material being kept firmly in contact with the table and with the rolls upon its convex side by means of springs, and also mechanism, substantially as described, for producing to the cutter-head a reciprocating motion in a transverse direction to the line of travel of the material at the cutting-point thereon for the production of fellies, with spoke-seats of the desired form, and rounded or beveled intermediate spaces, substantially as described.

6. The combination of a cutter head or heads with cutters acting upon the concave and two adjacent sides of the material, and an arm and means for their revolution, the arm revolving in a plane parallel with the fixed table, upon which is supported the material to be planed, said arm extending nearly at right angles from a shaft which is supported in suitable bearings, and having a projecting finger adjustable for different diameters, for engagement with and presentation of the material to the action of cutters, and non-yielding anti-friction rolls secured to the table in a circular form, with means for their adjustment for different diameters of material, said material being kept firmly in contact with the table and with the rolls upon its convex side by means of springs, and also mechanism, substantially as described, for producing to the cutter-head a reciprocating motion in a transverse direction to the line of travel of the material at the cutting-point thereon, for the production of fellies with spoke-seats of the desired form, and rounded or beveled intermediate spaces, and with the scraping-knives *u* and *w*, so located and adjusted as to lightly scrape the material upon the surface in contact with the table and its opposite side after action thereon by the knives of the cutter head or heads, substantially as described.

292,753. PROCESS OF MAKING SPONGE-LEAD. JOHANN KARL KESSLER, Milwaukee, Wis., assignor to himself, Morris Roth, and George Sylvester, all of same place. Filed Mar. 17, 1883. Renewed Jan. 7, 1884. (No specimens.)

Claim.—In the manufacture of white lead or other commercial salts of lead, the process of making sponge-lead which consists in passing an electric current, by means of a lead anode, through a solution of the acetate of an alkali, substantially as described.

292,754. SHOE-MAKER'S JACK. GEORGE KUHN, Eureka Springs, Ark. Filed Oct. 3, 1883. (No model.)



Claim.—1. In a shoe-maker's jack, the combination of the body in two parts hinged together, a nut secured in one of the parts, and a bolt provided with a crank, the bolt to work through the parts and engage the nut to draw the parts together, the body having suitable toe and heel supports.

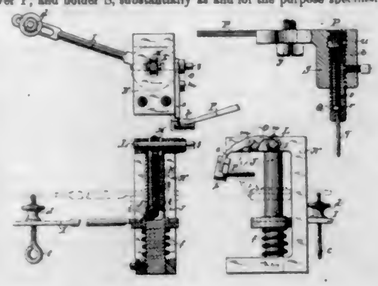
2. The combination of a body having toe and heel supports, a windlass to turn in an opening in the body, having a handle, a strap secured to the windlass through the opening, a ratchet-wheel at one end of the windlass, and a pawl to engage the ratchet.

3. The combination of the body in two parts, hinge to connect the parts together at one end, a bolt to connect the parts together at the other end, a post having a ball to which the parts are clamped, means to support the shoe on the body, and a strap to hold the shoe thereto.

292,755. SAW-SET. JOHN SHANNON LOWE, Murphysborough, Ill., assignor to himself and Joseph Bastien, same place. Filed Sept. 4, 1883. (Model.)

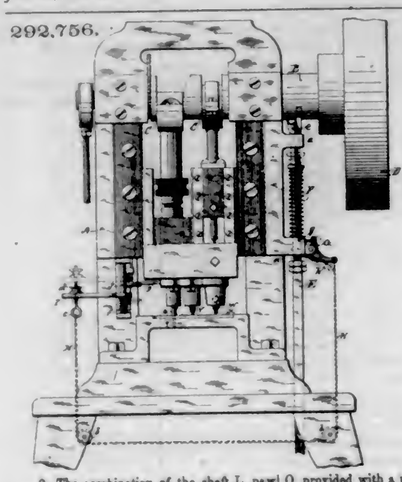
Claim.—1. The combination, in a saw-set, of the hammer E, spring H, cushion Q, and connecting-link *g*, substantially as and for the purposes set forth.

2. The combination, with the hammer E, spring H, cushion Q, and link *g*, of the treadle D, rod F, and spring-hook *f*, substantially as and for the purposes set forth.



3. The combination, with the spring-hammer E *e*, of the rod F, provided at its upper end with the hooked spring-plate *f*, and at its lower end with a loop through which passes the lever D, provided with a spring, *b*, extending from within the loop to the bottom of the covered slot *c c'* in cross-piece C, in which the lever D works, said lever being pivoted at its other end to an upright, A', of the frame, substantially as set forth.

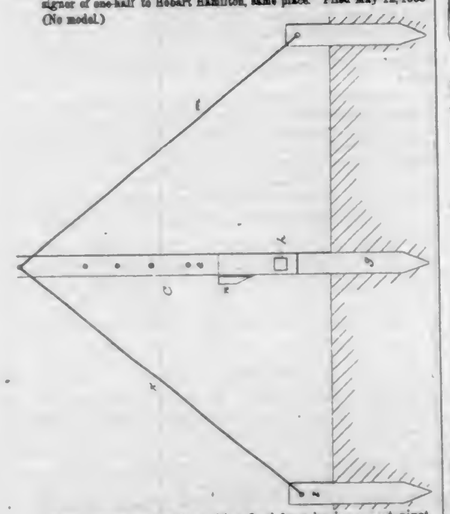
4. The combination of the hammer E, pivoted in a vertical recess, with plate G, the link *g*, and spring H, pivotally connected to said link at its inner end, and secured at its outer end, within guides *i i*, on the under side of plate G, by an adjusting-screw and nut, A A', and the table B, recessed, as at B', for the reception of said spring and its connections, substantially as set forth.



292,756. AUTOMATIC STOP-MOTION FOR PUNCHING AND FORMING PRESSES. WILLIAM I. MACOMBER, Providence, R. I., assignor to George L. Voss, same place. Filed Aug. 31, 1883. (No model.)

Brief.—The sticking of the article being formed upon spindle *q* causes the latter to raise the end of the lever P and set the stop mechanism in operation.

Claim.—1. The combination of the tool Q, spindle *q*, spring *s*, pivoted lever P, and holder S, substantially as and for the purpose specified.

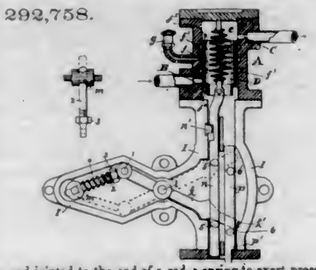


292,756.

2. The combination of the shaft L, pawl O, provided with a projecting lip, *p*, eccentric M, bar K, spring *k*, bolt *i*, and spring *j*, with a sliding arm, I, spring *f*, connecting-chain H, pivoted pawl G, and spring-operated clutch-shipper E, substantially as described.

292,757. FLOOD-FENCE. ISAAC MCDOUGALL, Petersburg, Ill., assignor of one-half to Hobart Hamilton, same place. Filed May 12, 1883. (No model.)

Claim.—The combination, with a flood-fence having a post pivotally connected to a stub which is driven into the ground, of the stop-lug *n*, secured to one side of the said stub, as shown, to prevent the fence from going in one direction, the brace *m*, secured to a stub on the opposite side of the fence, and the brace *k*, secured to the stub *l*, which is driven in the ground and adapted to be drawn out when a great pressure is applied to the fence, substantially as specified.

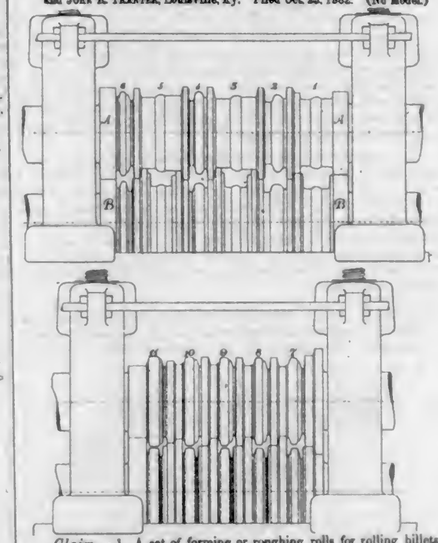


292,758. AUTOMATIC SPRING-VALVE CUT-OFF. JONAS L. MITCHELL, Logan, Ohio. Filed Aug. 2, 1883. (No model.)

Claim.—1. Cut-off mechanism for valves, consisting of a pivoted trip-lever, a rod jointed to one end of the trip-lever and adapted to play endwise, and a spring whereby the trip-lever may throw each side of the dead-center point, substantially as set forth.

2. Cut-off mechanism for valves, consisting of a pivoted trip-lever, a tumbler or rock-shaft, a rod jointed to one end of the lever and passing freely through the tambler, and a spring, substantially as set forth.

3. The combination, with a valve, of a pivoted trip-lever having



292,758.

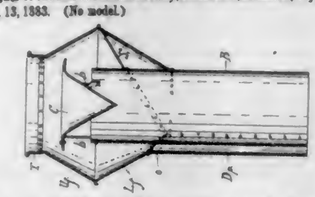
one end jointed to the end of a rod, a spring to exert pressure on the rod toward the lever, and means to connect the other end of the trip-lever with the valve, as set forth.

4. The combination of a water-chamber having an inlet and outlet, each guarded by a valve, a compressed-air supply-pipe, an inlet and outlet port for the air, a valve adapted to alternately open and close the said air inlet and outlet ports, a float in the water-chamber, a trip-lever jointed to a spring-rod and adapted to throw both ways, and rods to connect the valve and float with the trip-lever, substantially as set forth.

292,759. ROLL FOR ROLLING CAR-RAILS. ARTHUR J. MOXHAM and JOHN R. TRANTER, Louisville, Ky. Filed Oct. 23, 1882. (No model.)

Claim.—1. A set of forming or roughing rolls for rolling billets or ingots into bars for flanged girder-rails, provided with three edging-passes and three flattening passes or dummies of the respective forms described, whereby the billet is transformed into the desired form of bar, with the flange of the proposed rail thrown below its head, ready for the finishing-rolls, so that all necessity of flat-rolling in the finishing operation is avoided, substantially as set forth.

2. A set of rolls for rolling flanged girder-rails, having flattening-passes of unequal draft laterally, in which passes the tendency of the metal being rolled to curve sidewise, due to said unequal draft, is obviated by tongues in the upper grooves of said passes and straight delivery thereby secured, substantially as set forth.

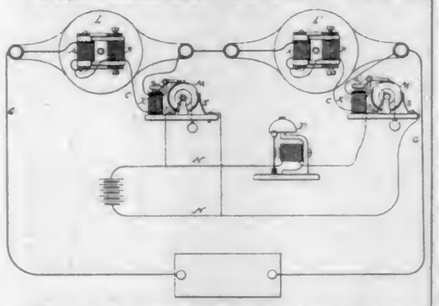


3. A set of rolls for rolling flanged girder-rails, provided with a flattening-pass of unequal draft laterally, in which straight delivery is secured by a tongue in the upper groove of said pass, and also with an edging-pass, in which straight delivery is secured by means of the rolls' difference in diameter in said edging-pass, substantially as set forth.

4. A set of finishing-rolls for edge-rolling flanged girder-rails, (without flat-rolling the same,) having parting-lines located at their respective passes, as described and shown, and a series of grooves of differential diameter each, whereby the draft in said passes is caused to vary at each of said diameters in inverse ratio to said diameters, so that the rail is delivered from said passes without tearing or overstraining its metal, substantially as set forth.

5. A set of finishing-rolls for edge-rolling iron or steel bars of irregular forms of cross-section into flanged girder-rails, (without flat-rolling the same,) said rolls having parting-lines located at their respective passes relatively to the difference in diameters of the several grooves in said passes, as described and shown, by means of which locations and differences in diameter a long and deep flange of rail can be passed out of the bottom grooves, free from the bottom roll, substantially as set forth.

6. A set of finishing-rolls for rolling iron or steel bars of irregular forms of cross-section into flanged girder-rails, said rolls having equal diameters in their last pass, and their parting-lines at said pass located as described and shown, whereby the finished rail is delivered straight or uncurved and free from tendency to curve toward either roll, thereby dispensing with the usual straightening operation after rolling, substantially as set forth.

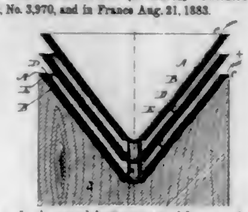


292,760. SPARK-ARRESTER. PETER MURRAY, Indianapolis, Ind., assignor of one-half to Patrick Murray, Alma Mine, Evanston, Wyo. Filed Aug. 13, 1883. (No model.)

Claim.—1. A smoke-stack for locomotive-engines, having a double-flaring head, wherein the barrel extends slightly above the line of union of the upper and lower flares, and is provided with a cone-cover of greater diameter, so arranged and sustained by braces at such a point above the mouth of the barrel that the upgoing draft diverted by the cone will strike the upper flare at a point about midway between the junction of the flares and the top, substantially as described.

2. In a smoke-stack for locomotives, a barrel extending above the line of union of the flares, an inverted cone of greater diameter, sustained by braces at such a point above the mouth of the barrel that the draft diverted by the cone will strike about middle of the upper flare, a top composed of two flaring parts connected at their widest bases, an inclined shelf surrounding the barrel and connected to the sides of the lower flare, and a discharge-pipe outside the barrel and opening above into the bottom of the lower flare and below into the smoke-arch, all combined substantially as described.

292,761. ALARM FOR ELECTRIC LAMPS. JOSEPH OLMSTED, New York, N. Y., assignor to the Olmsted Electric Light and Power Company, same place. Filed June 22, 1882. Renewed Nov. 27, 1883. (No model.)



Claim.—1. The combination, with an electric lamp having a shunt or derived circuit, as described, of an electrical device included in said derived circuit, and adapted to give, directly or indirectly, an audible signal, substantially as and for the purpose set forth.

2. The combination, with an electric lamp having a shunt or derived circuit, as described, of a signaling device included in said derived circuit, adapted to operate on a predetermined increase in the flow of current in the derived circuit, as set forth.

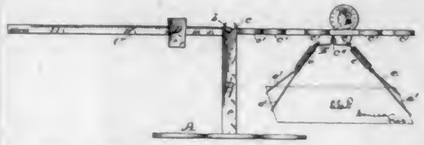
3. The combination, with an electric lamp having a shunt or derived circuit, as described, of a signaling device included in said derived circuit, and adapted on a predetermined increase of the flow of current in said circuit to operate without breaking the circuit, as set forth.

4. The combination of a main circuit containing electric lamps, shunt-circuits around each lamp, a local circuit containing an alarm or indicating mechanism, and means, substantially as described, included in or connected with the shunt-circuits, and adapted to operate on a predetermined increase of the current flowing therein, and thereby bring into action the alarm or indicator, as and for the purpose set forth.

292,762. ELECTRIC ACCUMULATOR. GUSTAVE PHILIPPART, Paris, France. Filed Oct. 30, 1883. (No model.) Patented in England Aug. 16, 1883, No. 3,970, and in France Aug. 31, 1883.

Claim.—1. A second battery comprising tapering hollow vessels set one within another and held apart, so as to form a series of cells, each vessel having closely-set peroxidized lead projections on the inside and an applied coating of reduced lead on the outside, substantially as described.

2. An element of secondary battery provided with a series of symmetrical projections of cast metal in one piece with their support, and set so close together that they by their juxtaposition constitute, when peroxidized, substantially a layer of active material on said support, substantially as described.

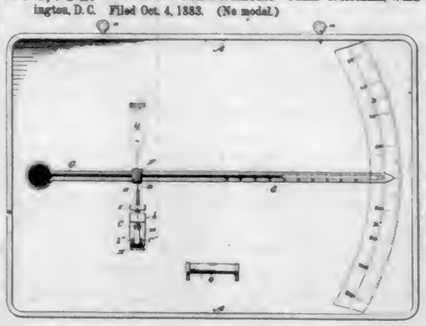


3. The improvement in the manufacture of secondary batteries, consisting in casting the body of an element with a series of symmetrical closely-set projections in one piece with their support, and peroxidizing the same, the said projections forming in virtue of their juxtaposition substantially a layer of active material, as set forth.

4. An element of a secondary-battery cell in the form of a cup or vase, provided with projections and active material applied thereto between said projections, substantially as described.

5. An element of a secondary cell in the form of a cup or vase, provided with a series of symmetrical projections set close together and adapted to form the active material of the element, substantially as described.

6. A cup or vase provided on one surface with projections and active material applied between the same, and on the other with a series of symmetrical projections set close together, substantially as described, whereby it is adapted to form the positive element of one cell and the negative element of an adjacent cell, as set forth.



292,763. COMBINED LETTER-SCALE AND COIN-TESTER. EDWARD C. PURNELLE, Seneca, Kans. Filed July 18, 1883. (No model.)

Claim.—1. The combination of the beam C, provided with silver-coin weight-graduations and gold-coin receptacles, spaced as described, and the weight D, substantially as specified.

2. The combination of the beam C, provided with the hook c^4, the yoke E, coiled springs e, and grapples d', substantially as specified.

292,764. BALANCED THERMOMETER. PHILIP G. RUSSELL, Washington, D. C. Filed Oct. 4, 1883. (No model.)

Claim.—1. In a balanced thermometer, the holder adapted to receive and hold a thermometer tube or bar, and supported upon a spring-fulcrum suitably supported from the thermometer box or casing, substantially as and for the purpose set forth.

2. In combination with the clamp or holder adapted to receive and hold a thermometer tube or bar, a flat spring-fulcrum suitably supported at one end from the thermometer box or casing, and at the other fastened to the clamp, substantially as and for the purpose set forth.

3. In combination with the thermometer-tube, the spring-fulcrum supporting it and tending to keep it normally horizontal, and a suitably-graduated scale for measuring the deviation of the tube from its normal position, substantially as and for the purpose set forth.

4. In combination with a thermometer-tube supported by and rocking on a spring-fulcrum tending to resist such rocking, a scale suitably placed and graduated to indicate the different points at which the end of the tube will come to rest as such tube is caused to rock against the stress of its spring-fulcrum by the expansion and contraction of the contents of the tube under the influence of different degrees of temperature, substantially as shown and described.

5. In combination with the thermometer-tube, the spring-fulcrum therefor supported in a suitable bracket, substantially as and for the purpose described.

6. In combination with the spring-fulcrum provided at one end with means for receiving and holding a thermometer tube or bar, and supported at or near the other in a suitable bracket, means for adjusting the stress of said spring-fulcrum against bending, substantially as and for the purpose described.

7. In combination with the spring-fulcrum for a balanced thermometer, the bracket supporting the fulcrum, the supporting-screw passing through the vertical portion of the bracket and attaching it to the thermometer-inclosing box, and means for adjusting the bracket upon this screw as a pivot, substantially as shown and described.

8. In combination with the spring-fulcrum for the thermometer tube or bar, the bracket to which the fulcrum is fastened, the screw passing through the upright portion of the bracket and serving to attach it to the thermometer-inclosing box, the curved slot in this upright portion, and the screw passing through this slot and into the support for the bracket, substantially as and for the purpose set forth.

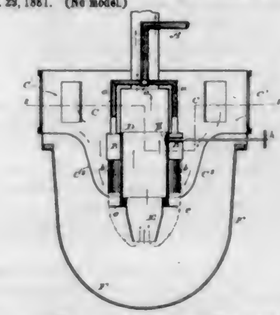
9. In combination with the spring-fulcrum for a balanced thermometer, automatic means for compensating for the expansion and contraction of such fulcrum under the influence of heat and cold, whereby the length of the effective portion of the spring or springs forming the fulcrum, and consequently the stress of such spring or springs, against the tilting of the thermometer tube or bar will be maintained substantially unchanged by any change in temperature, substantially as shown and described.

10. In combination with the spring-fulcrum for a balanced thermometer, means for adjusting the stress of such fulcrum against the tilting of the thermometer tube or bar, and for automatically compensating for changes in the length of the spring or springs forming such fulcrum under the influence of changes in temperature, whereby the stress of the spring-fulcrum will be maintained constantly at substantially the point to which it is adjusted, substantially as and for the purpose set forth.

11. In a balanced thermometer, the supporting-bracket, the flat springs fastened to and extending from the horizontal arm of the bracket, and attached at their other ends to a clamp or holder for the thermometer-tube, in combination with the screw working through the horizontal arm of the bracket, and carrying on its end a follower guided on suitable guide-pins and embracing the springs in slots provided therefor, substantially as and for the purpose set forth.

292,765. MANUFACTURE OF ORNAMENTAL GLASSWARE. WM. F. RUSSELL, Wheeling, W. Va., assignor to Hobbs, Brockunier & Co., same place. Filed Feb. 26, 1883. (No model.)

Claim.—1. The method herein described of ornamenting the exterior surface of glassware in the operation of forming the same, consisting of pressing the hot plastic glass of which the article is to be formed upon a ribbed or corrugated surface, twisting or bending the ribs or flutes thus formed in inclined or circumferential directions around the body of glass, and again pressing the glass upon a ribbed or corrugated surface, to impart a second set of ribs or flutes upon and across the first, substantially as set forth.



2. The method herein described of forming ornamented articles of glassware, consisting in first gathering the glass upon a blower's pipe; second, pressing such glass while attached to the pipe upon a corrugated wall or surface; third, bending or twisting the ribs thus made on the body of glass; fourth, again pressing the glass upon a corrugated wall or surface forming a second set of ribs crossing the former ones, and then blowing and shaping the glass thus ribbed into the desired article, substantially as set forth.

3. The method herein described of ornamenting articles of glassware, consisting in forming upon the exterior surface of the partially-formed article inclined ribs, flutes, or corrugations, then pressing or imprinting upon such ribbed surface a second set of ribs, flutes, or corrugations, crossing those first formed, and finally shaping the glass thus impressed into the desired article, substantially as set forth.

4. The method herein described of ornamenting articles of glassware, consisting in forming upon the exterior surface of the glass one or more sets of ribs, flutes, or corrugations, the different sets being impressed or formed one upon another and inclined around the body of glass in different directions, then impressing another and larger set of corrugations upon and across those previously made, and finally shaping the glass thus impressed into the desired article, substantially as set forth.

5. The method herein described of ornamenting glassware, consisting in forming two or more sets of ribs or corrugations on the exterior surface of the glass article, one set being impressed upon and across another, substantially as set forth.

292,766. GAS-BURNER. J. GARDNER SANDERSON, Scranton, Pa. Filed Sept. 29, 1881. (No model.)

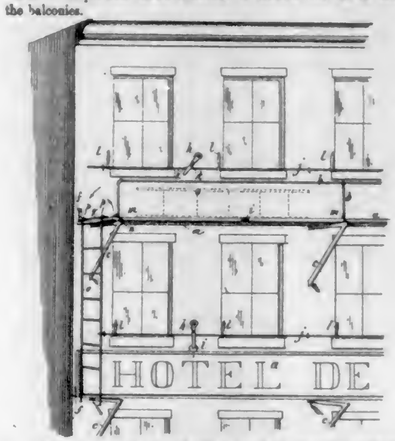
Claim.—1. The combination, substantially as hereinbefore set forth, of the suspended air-heating chamber or conduit, the gas-heating chamber through which the gas descends to the jets or burners, the draft tube, chimney, or conduit, the combustion-thimble depending therefrom, and the conical dependent shield for deflecting a current of air downward from said air-heating chamber to the combustion-thimble and flame.

2. The combination, substantially as hereinbefore set forth, of the air-heating chamber or conduit, its inclosing regulating-valve and dependent shield, the inclosed gas-heating chamber, the draft tube, chimney, or conduit, and the combustion-thimble depending therefrom.

3. The combination, substantially as hereinbefore set forth, of the draft tube, chimney, or conduit, the gas-heating chamber, the downwardly-directed jets or burners, the air-heating chamber or conduit, the regulating-valve, and the vertically-adjustable combustion-thimble.

4. The suspension gas-lamp hereinbefore described, consisting of the combination of the air-heating chamber or conduit, its inclosing regulating-valve, the conical depending shield for deflecting a current of air downward from said chamber and toward the flame, the inclosed gas-heating chamber, and the downwardly-directed jets or burners, the draft tube, chimney, or conduit, the combustion-thimble depending therefrom, and the shade depending from the air-heating chamber or conduit.

5. The combination, substantially as hereinbefore set forth, of the gas-heating conduit, the jets or burners, the air-heating conduit, the regulating-valve, and the conical dependent shield for deflecting a current of air downward from said air-heating conduit to the flame.



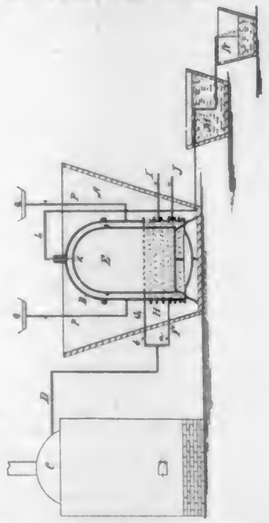
6. The combination, substantially as hereinbefore set forth, of the gas-heating chamber or conduit, the jets or burners, the air-heating chamber, the regulating-valve, the conical dependent shield for deflecting a current of air downward from said air-heating chamber to the flame, and the conduit for conveying away the hot products of combustion.

7. The air-heating chamber or conduit, substantially as hereinbefore described, consisting in the combination of the draft-tube, the perforated cylindrical adjustable valve, and the conical dependent shield for deflecting a current of air downward to the flame.

292,767. FIRE-ESCAPE. ROBERT STEVENSON, Perrysburg, Mich., assignor of part to Charles Stroebe, same place, and Abel Peck, Newburg, N. Y. Filed Mar. 16, 1883. (No model.)

Brief.—The balconies are provided with folding spring-balusters, and are themselves folded up against the building when not in use and secured by catches connected by a rod which extends substantially the width of the building, so that the balconies may be released from any

window. A portable ladder is hooked to suitable rods on the ends of the balconies.

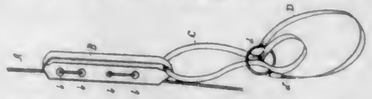


Claim.—1. The combination of a folding balcony, consisting of floor *a*, hinged to the wall of the building, and balustrade *b*, hinged to the floor, with supporting-brackets *c*, permanently attached to the building, substantially as described.

2. A folding balcony, *a b*, one or more latches, *h*, and a rod, *j*, extending along the windows for working the latches, in combination with the side wall of a building, substantially as described.

3. The folding balcony *a b*, having rod *q*, and the portable ladder *o*, having hooks *p*, in combination with the side wall of a building, substantially as described.

4. A folding balcony-floor, *a*, and balustrade *b*, hinged to the side of a building, and having springs *m*, and eye-clips *n*, or equivalent means, for automatically raising the balustrade, substantially as described.



292,768. STEAM-HEATED EVAPORATOR. ROBERT W. TURNER, Thornton, TEX. Filed June 12, 1883. (No model.)

Claim.—The combination of the receptacle E, the chest B, inclosing the receptacle, the coil H, surrounding the chest, the vat A, containing the chest and coil, the pipe D, having branches F G, communicating, respectively, with chest B and coil H, and cocks *a b*, for controlling the passage of steam to the chest and coil, and the pipe L, for condensing the vapor from the receptacle, substantially as shown and described.

292,769. FIRE-ESCAPE. FLAVIUS J. UNDERWOOD, North Springfield, Mo. Filed May 21, 1883. (No model.)

Brief.—The body-harness attached to the perforated friction-block consists of an endless body-strap passed through a ring on the seat-strap in such manner as to become self-tightening when adjusted.

Claim.—1. In a fire-escape, an adjustable self-tightening harness, C D, substantially as and for the purpose set forth.

2. In a fire-escape, the combination of a tension with holes *b* upon a rope, A, having the piece B, and an adjustable self-tightening harness, C D, all substantially as shown and described.

292,770. MANUFACTURING A ROT-PROOF COVERING FOR UNDERGROUND TELEGRAPH-CABLES. PETER H. VANDER WEYDE, New York, N. Y. Filed Apr. 29, 1882. (No specimens.)

Claim.—1. As a new article of manufacture, an electrical conductor consisting of a metallic thread inclosed within an envelope of fibrous material permeated or saturated with elaterite or other equivalent pliable inorganic material, substantially as described.

2. The combination, with an envelope of fibrous material inclosing a metallic conducting-wire, of a compound of elaterite or mineral wax and bitumen, made to permeate and saturate the fibrous envelope, substantially in the manner and for the purpose herein set forth.

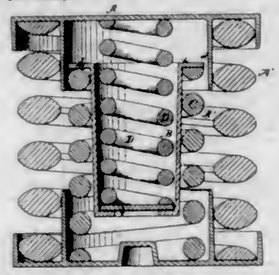
292,771. CHECK-ROW ATTACHMENT FOR SEED-PLANTERS. ALFRED VAN FLEET, Joliet, Ill., assignor to Andrew H. Shreffler, same place. Filed Nov. 13, 1883. (No model.)

Claim.—1. In the check-row attachment described, the combination of the forked lever *a*, jointed connecting-rods R and R′, frame J, having a slot in its upper face to guide said levers, and slotted oscillating plate P′, as and for the purpose set forth.

2. In the check-row attachment described, the bed-plate D, having the raised guide-sides *z z* formed thereon, as shown in Fig. 7.

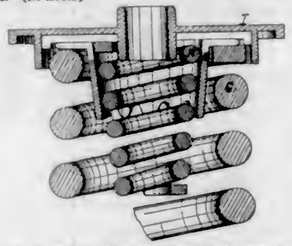
3. In the check-row attachment described, the combination of the latch *r*, frame H′, barrel F, plunger *t*, and coil-spring *t′*, as and for the purpose set forth.

4. The combination of the frame B, having the cross-heads B′ B′, forked lever *a a′*, track *a²*, crank *c*, coil-spring S, connecting-rods R R′, slotted guide-frame J, slotted plate P′, bed-plate D, having the elevated guide-sides *z*, and covering-plate P, as and for the purpose set forth.



292,772. COMPOUND ELECTRIC CABLE. HENRY VAN HOEVENBERGH, Elizabeth, N. J., assignor to Richard S. Waring, Pittsburg, Pa. Filed Feb. 21, 1883. (No model.)

Claim.—1. A compound electric cable having, in combination, a central core or body, A, formed of radially-divergent metal plates or blades *a*, with intermediate channels, *a′*, insulated conducting-wire *c* within such channels, a yielding packing, *e*, filling the channels around the wires, and an exterior wrapping or case, *i*, substantially as and for the purposes set forth.



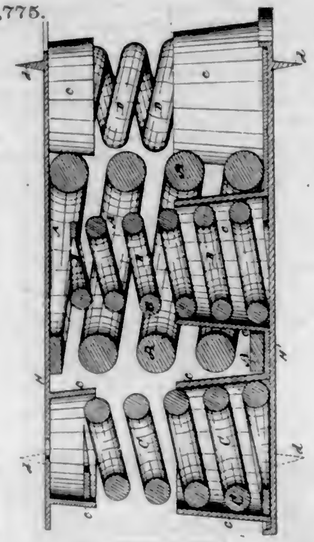
2. In a compound electric cable, the central body or core, A, of metal, having an axial passage, *r*, radially-divergent plates or blades *a*, and intermediate channels, *a′*, in combination with core-wire *r′*, insulated conductors *c* in the channels *a′*, packing *e*, and exterior case or wrapping, *i*, substantially as and for the purposes set forth.

292,773. CAR-SPRING. REMD. VOSS, New York, N. Y. Filed May 24, 1883. (No model.)

Claim.—The combination, in a spiral spring composed of three or more spirals, with the cap A, having projections *d*, of cup B, having movable bottom *b* and rim A, the said spirals of unequal length, or of equal length resting on uneven bases, substantially as described, and for the purpose specified.

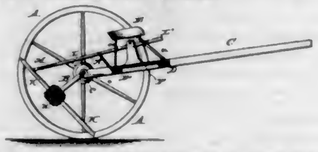
292,774. CAR-SPRING. REMD. VOSS, New York, N. Y. Filed Sept. 14, 1883. (No model.)

Claim.—1. A cup for holding inner spiral springs, constructed with a rim divided into sections by means of cutting away part of the metal in the rim and sides of said cup, substantially as shown, and for the purpose specified.



2. A cup for holding springs, having the rim B divided into sections F, cut-aways E E′, and scallops F F, or serrated lower edge on end of side C, substantially as described, and for the purpose specified.

292,775. CAR-SPRING. REMD. VOSS, New York, N. Y. Filed Oct. 22, 1883. (No model.)



Claim.—1. A spring for railroad-cars, composed of a spiral coil-bar having in its interior a conical-shaped spiral coil, in combination with two or more conical spiral coils which act as collateral springs, and which singly are weaker than said spiral coil A, all so arranged that the spiral coil having the greatest bearing capacity is first acted on, and then action is brought to bear upon the weaker spiral conical coils, substantially as described, and for the purpose specified.

2. A group of spiral coiled springs for railroad-cars, composed of two or more spiral coils conically shaped, of less bearing capacity than the center spiral coil, A, all graduated as described, whereby the heavier spiral coil first receives the weight, and the weight being increased, said spiral is assisted by the differently-graduated conically-shaped spirals, which singly have less bearing capacity than the spiral coil, substantially as described, and for the purpose specified.

292,775.

292,776. HORSE HAY-RAKE. JOHN N. WALLIS, Fleming, and THEODORE WALLIS, Scipio, assignors of one-half to Washington S. Chamberlain, Auburn, N. Y. Filed Aug. 4, 1883. (No model.)

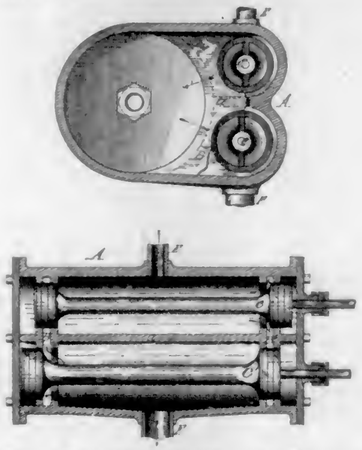
Claim.—1. In a two-wheel horse hay-rake, the combination of a revolving rake, the cranked axles on which the rake-head is journaled, thills connected by eye-bearings to said axles, and devices for holding the rake to its work and tripping it, all constructed and adapted to operate substantially in the manner, and for the purposes described.

2. The combination of a revolving rake, cranked axles affording bearings therefor, the feathers formed on the said axles, and grooves formed in the eyes of the thill-irons to limit the vertical vibration of the axles, all constructed and adapted to operate substantially in the manner, and for the purposes described.

292,777. BUCKLE. CHAS. S. WELLS, Boston, Mass., assignor to himself and Alvin M. Cushing, same place. Filed May 19, 1883. (No model.)

Claim.—1. A suspender-buckle consisting of two parts, a body and a clamping-lever, jointed or hinged together substantially as described—that is to say, one of the parts is provided with projections clinched between double flanges formed on the other part, the hooks prevent the ears or flanges from spreading, and the outer thickness of the flange covers or incloses the bent ends, as specified.

2. The improved suspender-buckle herein described, the same consisting of the body A, provided with the inwardly-curved flanges *x*, having the holes *i*, and the lever B, provided with the studs *f*, said studs being inserted in said holes and bent down within the flanges, to prevent their withdrawal therefrom, substantially as specified.



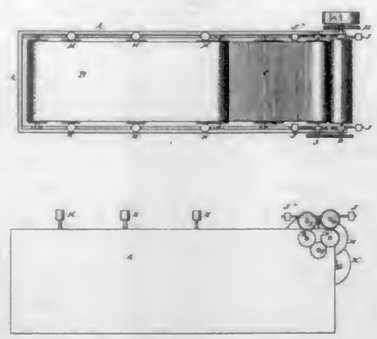
3. In a suspender-buckle, the body A, provided with the inwardly-curved flanges *x*, in which the lever B is journaled, said flanges having their ends closed to house the bent ends of the studs *f* and prevent the flanges from interfering with the clothing of the wearer, substantially as described.

4. In a buckle, the frame provided with side ears or bearings con-

sisting of double flanges, in combination with the tongue or lever having studs the ends of which are inclosed and protected within the folds, substantially as described.

5. In a suspender-buckle, the combination of a body and lever, one of which is provided with side ears or flanges, and the other with inwardly-bent studs upset or clinched inside the ears to secure the body and lever together, and prevent the withdrawal of the studs from their bearings, substantially as described.

292,778. PISTON-VALVE. HENRY WHITING, Cedar Rapids, Iowa. Filed July 30, 1883. (No model.)



Claim.—1. The combination of a steam-engine cylinder, a steam-chest having two chambers communicating with a common port at each end, and balanced double-headed valves C C', applied in said chambers, and adapted to operate substantially as described.

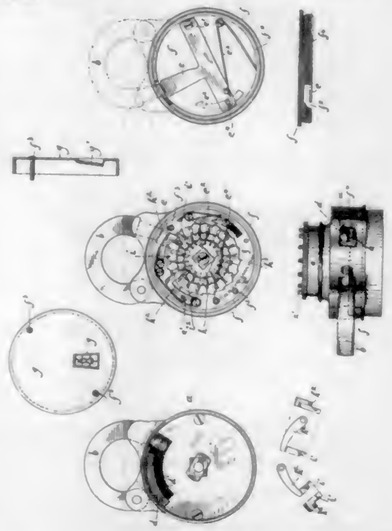
2. A steam-chest provided with chambers separated by an intermediate diaphragm and opening into a common induction and eduction port communicating with the cylinder of the engine, in combination with balanced piston-valves operating alternately in said chambers, substantially in the manner and for the purposes described.

3. The steam-engine cylinder provided with a steam-chest having two chambers separated by a diaphragm, and also provided with end passages and balanced piston-valves, in combination with the double-inclined bottom of the lower chambers and the exhaust-pipe E, substantially as described.

REISSUES.

10,439. MACHINE FOR SCOURING AND CLEANSING WOOLEN YARN. LYMAN A. UPSON, Thompsonville, Conn. Filed Oct. 12, 1883. Original No. 241,571, dated May 17, 1881.

Claim.—1. In a dye-vat, the combination of the wringing-rolls G, with the aprons B and C, the guiding-rolls D, and pressure-rolls E, substantially as set forth.



2. The combination of tank A and wringing-rolls G, with guiding-rolls E' and two endless aprons, guided by suitable rolls to carry said aprons from rolls E' below the liquid-line, substantially as set forth.

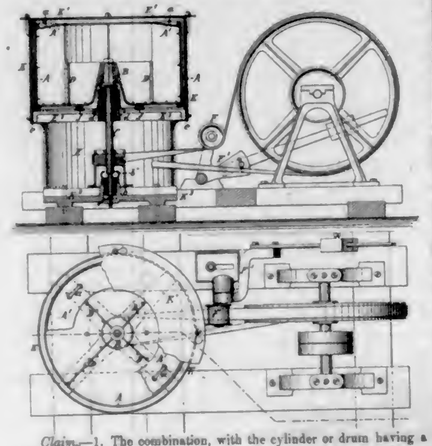
3. The combination of a tank and wringing-rolls with two endless aprons and guide-rolls, to guide said aprons from above the liquid, then below the same, and finally up to but not around the wringing-rolls, substantially as set forth.

4. The combination of a tank and wringing-rolls with two endless aprons, one of which is longer than the other, and guide-rolls for said aprons to guide the longer of said aprons above the liquid, to receive the yarns, &c., and then cause it to pass between said aprons below the liquid, and finally raised by said aprons and led to the wringing-rolls, substantially as set forth.

5. The combination of the tank A, wringing-rolls G, with aprons B and C, guide-rolls E', the guiding-rolls, and suitable devices to create a pressure between said aprons, substantially as set forth.

10,440. INDICATOR-PADLOCK. ANDREW JACKSON, San Francisco, Cal., assignor of two-thirds to Albert B. Pullman and Morris E. Ward, both of Chicago, Ill. Filed Jan. 4, 1884. Original No. 287,028, dated Oct. 23, 1883.

Claim.—1. In an indicator-padlock, the combination, with the ordinary lock mechanism, of the indicator mechanism distinct therefrom, but detachably connected to the casing of the lock, and means, substantially as described, for operating the indicator mechanism, projecting within the path of the lock-shackle, whereby movement is imparted to the indicator mechanism from the lock-shackle, substantially as set forth.

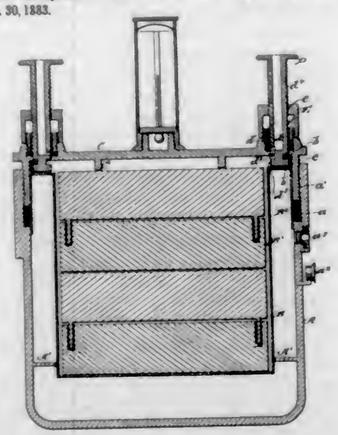


2. In an indicator-padlock, the combination, with the lock-shackle, of the indicator mechanism, having means, substantially as described, for operating the same, lying in the path of the end of the lock-shackle, and arranged to be operated thereby to move the indicator mechanism, substantially as set forth.

3. In an indicator-padlock, the lock-casing having mounted thereon indicator mechanism provided on its outer side with a series of wheels, and upon its inner side with a lever for operating said wheels, located in the path of the shackle, and so arranged with relation thereto that the action of closing the shackle will move the indicator mechanism, substantially as described.

4. In a padlock, an indicator mechanism consisting of a series of superposed wheels having detent edges and suitable designating-characters on the faces thereof, in combination with mechanism, substantially as set forth, for operating the wheels of the series each time the lock is closed, substantially as described.

5. The combination, with the shackle-bar *b*, of the indicator mechanism having the spring-lever *e*, the pawl e^3, and the indicator-wheel, substantially as described.



10,441. CENTRIFUGAL MACHINE FOR CREAMING MILK. WILHELM C. L. LEFELDT and CARL G. O. LENTSCH, Schöningen, Germany, assignors to Theodore Bergner, Philadelphia, Pa. Filed May 18, 1879. Original No. 195,515, dated Sept. 25, 1877. Patented in France Mar. 13, 1877, No. 117,499; in England Mar. 16, 1877, No. 1,074; in Italy May 25, 1877, No. 9,246; in Germany July 4, 1877, No. 3,212; in Denmark Aug. 13, 1877, and in Austria Aug. 21, 1877, No. 24,486.

Claim.—1. The combination, with the cylinder or drum having a conical center bearer, solid bottom and sides, and a top ring or flange, of removable radial partitions extending from the center to the circumference, but higher toward and at the circumference than at the center, substantially as and for the purposes described.

2. The combination of the revolving drum, the cushioned driving-spindle, the surrounding safety-jacket, having cushioned arms with center bearing, and a base-plate with supporting base-step, substantially as described.

10,442. VULCANIZING AND CELLULOID APPARATUS. GEORGE P. RIMMEL, Hornellsville, N. Y., assignor of one-half to Thomas B. Welch & Son, Philadelphia, Pa. Filed Dec. 11, 1883. Original No. 287,723, dated Oct. 30, 1883.

Claim.—1. In a vulcanizing and celluloid apparatus, two concentric cylinders, and a cap secured to the outer cylinder to form a steam-tight joint, the space between the two cylinders being formed into a boiler, and the inner cylinder being adapted to serve as a piston to press the material between its closed bottom and the cap as it is impelled by the steam generated in the boiler, combined with means for automatically allowing egress of gas, &c., from the inner chamber, substantially as described.

2. In a vulcanizing apparatus, the combination, with an inner chamber or piston-cylinder for pressing the flasks or molds, of a suitable steam-escape for the steam in the inner chamber or piston-cylinder, for relieving the pressure and obtaining the full stroke of the piston to insure closed flasks.

3. In a vulcanizing apparatus having an inner movable chamber or piston-cylinder for containing and pressing the flasks or molds, a passage or exit permitting the escape of steam to relieve the steam-pressure and obtain the full stroke of the chamber or piston cylinder, thereby insuring closed flasks.

4. A vulcanizing apparatus having a steam-escape from the inner chamber or piston-cylinder, for relieving pressure, obtaining the full stroke of the piston-cylinder, and insuring closed flasks.

5. In a vulcanizing apparatus such as described, means whereby steam escapes from the inner chamber or piston-cylinder as the latter moves to press the flasks, for obtaining the full stroke of the chamber or piston cylinder and insuring closed flasks.

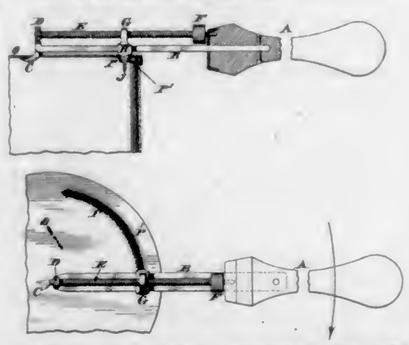
6. The combination, in a vulcanizing apparatus, of an outer cylinder, an inner piston-cylinder moved by generated steam to press the flasks, and means for permitting the escape of steam as the piston-cylinder moves to press the flasks, for obtaining the full stroke of the piston-cylinder and insuring closed flasks.

7. In a vulcanizing and celluloid apparatus, and in combination with the cylinder A, having guide-flange A', and the cap C, the piston-cylinder B, composed of the portions B' and B², and the web *b'*, as and for the purpose set forth.

8. In a vulcanizing apparatus as described, a hollow locking-bolt connecting the interior of the piston-cylinder with the outer air, combined with such piston-cylinder, and adapted to serve substantially as set forth.

9. In combination with the cylinder B, having flange *b*, the bolt D, having passages *d d'* and plate d^4, and the cap C, as set forth.

10. In combination with the piston-cylinder, the cap, and the bolt D, the nut E, adapted to lock the cap and piston together, as set forth.



11. In a vulcanizing and celluloid apparatus substantially as described, the cap C, having projections C', whereby the stroke of the piston may exceed the height of the flasks, as set forth, for the purposes described.

12. The combination of the boiler-cylinder A, having blow-off a^2, located as described, and the piston having cylindrical portion B², as set forth.

13. In combination with the boiler A, having packing-chamber *a* and guide-ring A', the piston-cylinder B, as shown, the cap C, having projection C' and flange *c*, and blow-off a^2, as set forth.

14. In combination with the boiler-cylinder, piston-cylinder, and cap, as described, the bolt D, and locking-nut E, as shown, all adapted to serve as and for the purpose set forth.

10,443. CAN-OPENER. FRANK SHARP, Los Angeles, Cal. Filed Dec. 1, 1883. Original No. 253,432, dated Feb. 7, 1882.

Claim.—1. The combination, with a can-opener of the class specified, of a screw that engages with and passes through the female-threaded shank of the cutter, whereby said screw serves not only to advance and retract said cutter, but to hold the latter to any desired adjustment with-

out employing a special retaining device, substantially as herein described.

2. A can-opener constructed substantially as herein shown and described, consisting of the handle A, the bar B, having a curved point, C, and a perforated lug, D, upon its forward end, the swiveled screw E, having thumb-wheel F upon its inner end, and the cutter H, having in its shank G a screw-hole to receive the screw E and a perforation to receive the bar B, as set forth.

3. A can-opener knife having an arrow-shaped point, J, whose shoulders K K' merge into the cutting-edges L L' at the front and rear of said knife, respectively, as and for the purpose specified.

4. A can-opener knife whose sides N N' are rounded or concaved for the purpose of bending inwardly the opposite edges of the slit made in the vessel, as at P P', herein described.

PHOTO-LITH. NORRIS PETERS WASHINGTON, D.C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE BUELL.

Decided January 11, 1884.

1. PRACTICE IN PATENT OFFICE—DUTY OF EXAMINER IN DIVISIONAL APPLICATIONS.

When an application is filed as a division of a former application, the first duty of the Examiner is to determine whether the one is a continuation of the other application under the law.

2. PRACTICE—FAVORABLE JUDGMENT OF EXAMINER EXPRESSED BY FORWARDING CASE TO ISSUE DIVISION.

It is not until the Examiner signs the file-wrapper and forwards the application to the Issue Division that he can be considered as having rendered a favorable judgment upon it. He may have formed an opinion in its favor, or expressed an oral or even a written suggestion in the same direction; but these do not constitute his formal favorable judgment.

3. PRACTICE—EXAMINER NOT BOUND BY CONCLUSIONS OF HIS PREDECESSOR.

An Examiner is not obliged to adhere to a favorable conclusion which his predecessor formed or expressed in regard to the admission of certain matter into a particular application, unless such expression took the form of a favorable judgment.

4. PRACTICE—DIVISIONAL APPLICATION CANNOT BE BASED ON NEW MATTER.

An application based upon matter unwarrantably introduced into a former application cannot be considered as a division of the prior application.

APPEAL from the Primary Examiner.

TRANSMITTING AND SIGNAL TELEGRAPHS.

Application of Charles E. Buell, filed June 26, 1883.

Messrs. Church & Church for the applicant.

BUTTERWORTH, *Commissioner:*

In 1876 Buell filed an application for transmitting and signal telegraphs, in which he showed and described a certain system. In the same year the Examiner called upon him to amend the drawings so as to show "the system as applied to the uses to which it is particularly adapted." Thereafter Figure 5 was added to the drawings, which illustrated a clock-dial, and a simultaneous amendment was made to the specification, which gave a brief description of such figure. No claim was made to the invention shown in the added figure until 1882 or 1883, when not only claims were made thereto, but a separate application was filed, claiming to be a division of the 1876 application, and therefore to relate back to it, so as to get the benefit of the earlier date of filing.

The 1883 application belongs to a different division of the Office from the 1876 application, and is within the jurisdiction of another Examiner. The first duty of the latter officer was to determine whether the 1883 application was a proper division of the old application, and was entitled to be regarded as a continuation thereof. In the performance of this duty he found that the new application was based upon matter introduced into the old application after the latter was filed, and held that this could not be done under the practice of the Office and decisions of the courts, and consequently the new application must stand alone, and could derive no aid from the old application. To this holding the applicant takes exception, because he thinks the admission of the matter into the old application had been decided to be proper by another Examiner, and was therefore *res adjudicata*.

Under the rules of the Office now and at the time of the filing of the 1876 application, an Examiner had jurisdiction of a case until it was passed and allowed. It is not until the Examiner signs the file-wrapper and forwards the case to the Issue Division that he can be considered as having rendered a favorable judgment upon it. He may have formed an opinion in its favor, or expressed an oral or even a written suggestion in the same direction; but these do not constitute his formal favorable decision. (See *ex parte* Starr, C. D., 1879, page 91.) If the case shall at any time be transferred to another Examiner, the latter must be regarded as standing in the shoes of his predecessor in respect to that particular case, and entitled to pass upon and determine the question absolutely. So it must be held that the present Examiner is not obliged to adhere to the favorable conclusion which the former Examiner formed or expressed in respect to the propriety of admitting Fig. 5 and the description thereof. In reality, the former Examiner's attention was not drawn to the precise point now under discussion, for the amendment was called for and admitted by way of illustration and explanation, and no claim was then founded thereon. Amendments explanatory in their nature are not viewed with the same strictness as those the purpose of which is to serve as a basis for a new claim. (See *ex parte* Snyder, 22 O. G., 1975, and *ex parte* Howe, 25 O. G., 1189.)

I think the Examiner is correct in holding that Fig. 5 and the descriptive matter referring thereto is new matter, and should not have been introduced in the old application. This being so, then a patent granted claiming such matter and based upon said old application would be invalid, in view of the doctrine announced in *Sayles* v. *Chicago & North Western Railroad Company* (16 O. G., 349) and *Eagleton Manufacturing Company* v. *The West Bradley & Carey Manufacturing Company*, (18 Blatch., 218.)

The Examiner is sustained.

EX PARTE HENTZ.

Decided January 23, 1884.

JOINDER OF INVENTION—SEVERAL CLAIMS TO A "COMPOSITION" PERMISSIBLE.

If several claims to a "composition of matter," though distinct, cover associations of elements which contribute to the

production of a single beneficial result, and do not fall under different classes, they, properly speaking, cover but a single invention, and hence may be included in the same application.

APPEAL from the Primary Examiner.

COMPOUND FOR REMOVING CORNS AND WARTS.

Application of Albert Hentz filed September 14, 1881.

Mr. A. M. Tanner for the applicant.

BUTTERWORTH, *Commissioner:*

The application presents three claims for a compound for removing corns and other callosities. The first claim enumerates two elements, the purpose of which is to effect a cure of the disease. The second claim enumerates the elements embraced in the first claim and a third element, the office of which is to alleviate the pain incident to the application of the curative agent, and the third claim includes the same elements as the second, but is somewhat more specific in its terms.

The question to be determined is, whether these claims may all be included in one, or shall each form the subject-matter of a separate application.

The statute provides that—

> Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, * * * may obtain a patent th refor.

It will be observed that the statute does not in terms prescribe nor in anywise limit the number of claims that may be included in a single patent. But it has been urged that, as only the singular number is used, the statute by implication prohibits the inclusion of more than one invention in a patent. The courts hold that the matter is left largely to the discretion of the Commissioner. In view, therefore, of the ruling and practice of the Office, I will consider the proposition that a patent should include only a single invention. On that hypothesis a patent may not contain two or more "arts," two or more "machines," two or more "manufactures," or two or more "compositions of matter." But does it follow that an "art," or a "machine," or a "manufacture," or a "composition of matter" which requires more than one claim in order to effectually cover the whole invention may not be included in one patent?

In regard to an "article of manufacture," this precise question was under discussion in the cases of *E. R. Sumner* (C. D. 1869, p. 180) and *Augustus Adams*, (*ibid.*, 1873, p. 18,) and in deciding the question in the former case the language of the Commissioner is:

> While in the present case the various improvements are not so related to each other that the functions of the one cannot be brought into full play without the co-operation of the other, yet there is no such classification of inventions in the Office as would bring the several improvements under different sub-classes. Inasmuch, therefore, as their union in a single application does not impose upon the Office any extra labor of examination, this course may properly be permitted, and the application now pending will be proceeded with.

In one sense each claim in the Sumner case covered a distinct invention, (and, indeed, every claim must do so in order to be patentable,) for the function of each of the several combinations could be brought into full play without the co-operation of its fellows, but they united in contributing to a single result, and did not fall under different classes in the Office. The case of Adams is of the same tenor and effect, and since these decisions the practice of the Office has on this point been uniformly in accord with them.

In regard to an "art," in the cases of *Smith* (16 O. G., 630) and *McDougall* (18 O. G., 530) the following doctrine is announced:

> Although each of the several "acts" or the "series of acts" constituting a process may be capable of performing separately its own peculiar function, and may be used independently of the others, yet if they all contribute in producing the final result they may be joined in a single application, and a claim may be made to the entire process, and separate claims can also be made to the sub-processes which go to make up the same.

With reference to a "machine," the propriety of presenting several claims covering a general combination and various sub-combinations is too well established and recognized to require the citation of authority in its support.

It is manifest from the above that a single invention, whether it be an "art," "manufacture," or a "machine," may be covered by divers claims, even though each claim embraces, in a sense, a distinct thing capable of performing separately its own peculiar function, and is susceptible of a practical use independently of the others, provided the several things covered by said claims all contribute to produce the ultimate result, and do not, as suggested above, fall under different classes in the Office. When several claims cover inventions having different purposes or effecting the same end by different means they can no longer be considered as embracing a single invention.

No good reason is seen why the doctrine as to joinder of invention which is announced as governing the other classes is not equally applicable to "compositions of matter." A party may make a "composition" containing a certain number of ingredients, all of which enter into and form part of the complete compound, and aid in making its operation perfect for the purpose intended, and yet a substance containing a less number of ingredients may constitute the essence of the invention and contribute most largely in producing the desired result. It is manifest that to fully protect the interests of the inventor several claims would be required, and it would be a hardship to compel him to file separate applications to cover each claim of what is in reality a single complete invention. The statute does not require it, the decisions of the courts do not require it, the practice of the Office in regard to the other classes of invention does not afford a precedent for, nor does the convenience of the Office require it, so long as the several distinct things are not differently classified. It is true that in several decisions of the Office (notably *Loeser and Lippincott*) it was held that a "composition of matter" needs but a single claim. But the course of reasoning in those cases does not justify the conclusions reached. If they are correct, it is difficult to see why the principle announced would not include and apply to other classes of inventions, such as machines. But the cases last cited have not been approved and followed in all cases. On the contrary, in the case of *Hugh Burgess*, (MS. vol 21, p. 462,) my predecessor, in a well-considered opinion, held that several claims on a compound might be included in the same application.

It is said that the introduction of each additional ingredient forms a *new* composition. This is in a sense true, but palpably no more so with reference to a composition of matter than a machine. The addition of a feed or guide to a sewing-machine to that extent changes the character of the machine, but it is still a sewing-machine. So with the addition of the anodyne in the composition of matter under consideration. It

is still a medicine for the cure or removal of callosities, and, as in the case of the sewing-machine, it is rendered more complete by the addition of the element mentioned; and as under the sub-classification of the bureau there exists no obligation to divide, the composition with all the claims presented must be covered in one and the same application and be included in one Letters Patent.

It has been urged that the applicant might go on adding ingredients until he included the whole range of drugs. In the case of a machine, it may with equal force be urged that new devices might be added *ad libitum*, and so they might so long as the *character* of the machine remains unchanged, and so with the composition of matter under consideration. After the addition of each new ingredient the Examiner will determine whether the compound is in character the same, to wit, a medicine for removing or curing callosities. It will not be assumed that ingredients will be added without reference to their use or utility as a part of the curative agency employed. Certainly, devices will not be added to machines or ingredients to compounds simply because such addition can do no harm. If the claims, though distinct, cover associations of elements which contribute to the production of a single beneficial result, and do not fall under different classes, they, properly speaking, cover but a single invention, and hence may be included in the same application.

Viewed in the light of these suggestions, the case at bar does not require division. The third claim covers the compound in its perfect form, the others embrace combinations tending toward the same end, and not falling under different classes. All three of the claims are necessary in order to fully protect the invention.

The decision of the Examiner is reversed.

EX PARTE BORDEN.

Decided January 17, 1884.

1. PRIOR PUBLICATION—A DRAWING OF A PATENT A PUBLICATION.

   Even without any description, if a published drawing fully and clearly exhibits and discloses an invention sought to be patented, it is an adequate and complete reference of itself alone. It is to be considered as a publication.

2. ABANDONMENT BY PUBLICATION INURES TO THE BENEFIT OF THE PUBLIC.

   A novel thing, the invention of a patentee, fully shown and published in the drawing of his patent, even though not belonging exclusively to him as not being included in his claims, and even if estopped from being set up in a claim upon reissue, may not be donated to an individual. If the patentee has lost it—if it is abandoned—it has gone to the public, and is the property of the public.

3. APPEALS—PERTINENCY OF A REFERENCE APPEALABLE TO EXAMINERS-IN-CHIEF.

   Whether or not a reference cited by the Examiner is entirely different from the invention claimed by an applicant is a question affecting the merits of the case, and as such is appealable in the first instance to the Examiners-in-Chief, and not to the Commissioner direct.

APPEAL from the Primary Examiner.

MECHANICAL MUSICAL INSTRUMENTS.

Application of George E. Borden filed April 21, 1882.

Mr. J. McC. Perkins attorney for the applicant.

BUTTERWORTH, *Commissioner:*

This case comes up on objection of the attorney to the citation by the Examiner of certain matter in reference—that is, as constituting a bar to the grant of a patent. In refusing the applicant's claim, the Examiner directed attention to a certain United States patent, citing one figure of the drawing thereof as exhibiting precisely the invention for which a patent is now sought. Attention was also directed to another United States patent, but the question is not connected with the latter, this patent having been put into the record merely to show how the devices to which the improvement of the applicant is to be attached act, the applicant not having shown the device with full relation of the parts with which it is to operate.

The objection appears to be in the nature of a demurrer, it being admitted, it seems, that the figure of the drawing cited *does* show the invention of the applicant, but contended that the citation is not legal or proper, upon the ground that inasmuch as the description of what is illustrated by this figure of the drawing was erased from the specification as originally written and filed, the printed specification of the patent not containing it, the matter cited must be treated as if exhibited in a rejected and abandoned application.

The objection is bad, and the reasoning, or rather the ground, is manifestly fallacious. Because the Examiner alludes to language which was in the original specification, the attorney insists that the rejection is on the erased description. This is not so. The rejection is on the graphic representation of the invention as exhibited by the drawing, and if language which was originally in the specification describes the drawing as the Examiner sees it, it is only the more certain that his eye is not deceived. But even without any description, if a published drawing fully and clearly exhibits and discloses an invention sought to be patented, it is an adequate and complete reference of itself alone. It is to be considered a publication. A good, clear, and distinct drawing of an invention is a higher order of evidence of the existence of the invention than any mere description thereof in words. Language is elastic and may mislead. The most carefully-considered language, in the light of subsequent experience, is often found to be ambiguous. But the graphic representation or embodiment of a thing, whether as a drawing or picture, or in tangible form, is unmistakable. As to the attorney's reasoning, it is not perceived how the Examiner's citation can be likened to the citation of a rejected and abandoned application. It is true that in the Supreme Court case of *Brown* v. *Guild*, (6 O. G., 392,) as interpreted by the Commissioner's decision in *Rouse* v. *Stoddard*, (7 O. G., 169,) which may be the cases to which the attorney refers, it is held that a mere application of one party, as a rejected and abandoned application for a patent, is not a bar to the grant of a patent to another, and some allusion is made in the case of *Brown* v. *Guild* to a certain rejected and withdrawn application being merely part of an abandoned experiment; but there is great difference between the abandonment of a mere application (both as regards the inventor himself and as regards others) and the abandonment of something in a patent—between a mere abandoned experiment and the abandonment of an invention. An abandoned application is hidden in the secret archives of the Patent Office, and another application for the

same thing may at any time be made by the same inventor or by another inventor. Something abandoned in a patent is published, (a patent in all its parts being open to public inspection,) and hence goes to the public. An *experiment* when abandoned may be picked up and carried to completion and to the reward of a patent by any individual. The public cannot be said to have acquired anything, for there was no certain achievement, no result, or production to take. An *invention* when published and abandoned is abandoned to the public, and becomes the property of the public, and no individual has the right to monopolize it.

The attorney argues that because in the patent the description of the figure of the drawing cited in reference is erased, and, under existing interpretations of the law in numerous decisions of the courts, the patentee would be estopped from claiming on reissue the matter erased, his client should be allowed his claim to the invention. It need not be considered whether the patentee would or would not be entitled to a reissue describing and claiming the matter shown. A novel thing, the invention of a patentee fully shown and published in the drawing of his patent, even though not belonging exclusively to him as not being included in his claims, and even if estopped from being set up in a claim upon reissue, may not be donated to an individual. If the patentee has lost it—if it is abandoned—it has gone to the public, and is the property of the public. It is not easy to understand how it can be seriously argued that although an invention is shown in a patent, because a description thereof has been canceled and the patentee is estopped from reissue, it should be presented to some one else.

I have refrained from considering the question whether or not the figure of the drawing cited (although, as said above, it seems to be admitted that it does) really does or does not fully show the invention of the applicant, or show it at all, since this is a question going to the merits of the case, and as such is properly appealable in the first instance to the Examiners-in-Chief, and not directly to the Commissioner. I only decide that whether there be or be not language in the specification descriptive of the figure; whether there has been such language and it has been canceled, or there has never been any language bearing upon the figure, if the figure of the drawing cited adequately discloses the applicant's invention, it is a good and sufficient reference in and of itself alone. Upon this point the decision of the Examiner is affirmed.

Erratum.

OFFICIAL GAZETTE, February 5, 1884, volume 26, page 333, in title, after residence of inventor insert *assignor to the Mechanical Organette Company, same place.*

Quarterly Volumes of the Official Gazette.

The great increase in the number of patents issued annually has so enlarged the illustrated portion of the OFFICIAL GAZETTE that the numbers covering a period of six months make a volume too unwieldy for convenient use. To remedy this the GAZETTE, from July 1, 1883, will be published and bound in *quarterly* instead of *semi-annual* volumes. Title pages, digests of decisions, &c., will be prepared *quarterly* for each volume. The subscription price will remain the same—$5 per annum to all subscribers in the United States and Canada, and $7 to foreign subscribers other than Canadian. The price of the *bound* quarterly volumes will be duly announced.

Issue of February 5, 1884

DESIGNS.

14,602.—SEWING-MACHINE COVER.—*Peter L. Donato*, Newark, N. J. Application filed December 5, 1883. Term of patent 7 years.

14,603.—SPOONS AND TABLE-WARE.—*Henry Ghee*, Syracuse, N. Y. Application filed October 12, 1883. Term of patent 14 years.

14,604.—COVERED DISH.—*Joseph Heap*, Burslem, county of Stafford, England, assignor to *Mellor Taylor & Co.*, same place. Application filed December 1, 1883. Term of patent 3½ years.

14,605.—SLIPPER-UPPER.—*Michael L. Hiller*, New York, N. Y. Application filed December 26, 1883. Term of patent 7 years.

14,606.—BUCKLE.—*Mortimer N. Judd*, New Britain, Conn., assignor to *The North & Judd Manufacturing Company*, same place. Application filed October 3, 1883. Term of patent 7 years.

14,607.—CAKE OF SOAP.—*John Henry Keller*, New Orleans, La. Application filed December 10, 1883. Term of patent 14 years.

14,608.—SPOON OR FORK HANDLE.—*Myron H. Kinsley*, Niagara Falls, N. Y. Application filed November 26, 1883. Term of patent 7 years.

14,609.—DISH.—*Carl F. Lauber*, Philadelphia, Pa. Application filed October 12, 1883. Term of patent 14 years.

14,610.—CARPET.—*Milton R. Loudon*, Jersey City, N. J., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Application filed December 21, 1883. Term of patent 3½ years.

14,611 and 14,612.—CARPET.—*William McCallum*, Yonkers, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Applications filed December 21, 1883. Term of patents 3½ years.

14,613 to 14,616, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed December 26, 1883. Term of patents 3½ years.

14,617.—LADY'S WALKING-SKIRT.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited,*) same place. Application filed December 26, 1883. Term of patent 3½ years.

14,618.—CHILD'S COAT.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited,*) same place. Application filed December 26, 1883. Term of patent 3½ years.

14,619.—SCONCE-FRAME.—*Albert Patitz*, Meriden, Conn., assignor to *The Bradley & Hubbard Manufacturing Company*, same place. Application filed July 16, 1883. Term of patent 7 years.

14,620.—FOUNDATION-FRAME FOR A FLORAL ORNAMENT.—*Henry F. Reed*, New York, N. Y. Application filed December 10, 1883. Term of patent 7 years.

14,621.—LAMBREQUIN.—*John Quincy Reed*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited,*) same place. Application filed December 26, 1883. Term of patent 3½ years.

14,622.—LADY'S COSTUME.—*John Quincy Reed*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited,*) same place. Application filed December 26, 1883. Term of patent 3½ years.

14,623 to 14,629, inclusive.—CARPET.—*Fred F. Ricker*, Philadelphia, Pa., assignor to *Bromley Brothers*, (*Limited,*) same place. Applications filed January 2, 1884. Term of patents 3½ years.

14,630 to 14,634, inclusive.—CARPET.—*Oscar Righter*, Philadelphia, Pa., assignor to *Dornan Bros. & Co.*, same place. Applications filed December 18, 1883. Term of patents 3½ years.

14,635.—GIRL'S CLOAK.—*Catherine Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited,*) same place. Application filed December 26, 1883. Term of patent 3½ years.

14,636 and 14,637.—CARPET.—*Frank E. Smith*, New York, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Applications filed December 21, 1883. Term of patents 3½ years.

14,638.—SHADE-HOLDER.—*William B. Stewartson*, Pittsburg, Pa. Application filed November 22, 1883. Term of patent 14 years.

14,639.—LADY'S OVERSKIRT.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited,*) same place. Application filed December 26, 1883. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

10,909.—CUTLERY AND CUTTING IMPLEMENTS FOR MANUAL USE.—*Friedrich Wilhelm Beckmann*, Solingen, Prussia, Germany. Application filed December 1, 1883.

"The arbitrary representation of two men, the arms and legs of which are united."

10,910.—MUSTARD.—*James Collier & Sons*, Spitalfields, London, county of Middlesex, England. Application filed November 10, 1883.

"A mustard pot and spoon, with a calf's head on the left and a pig's head on the right."

10,911.—FEATHERS IN A CLEAN AND ODORLESS CONDITION.—*Louis H. Feerts*, Philadelphia, Pa., and Chicago, Ill. Application filed December 21, 1883.

"The words 'COLD BLAST.'"

10,912.—PRUNE-JUICE EXTRACT OR PRUNE-JUICE.—*Martin M. Goldsmith & Co.*, New York, N. Y. Application filed December 27, 1883.

"The word 'IMPERIAL,' in connection with a device consisting of a shield or coat of arms divided into two parts or sections by a vertical line, and showing in one section the representation of a Greek cross resting on or arising from a base of rocks, and in the lower portion of the other section an inverted triangle or V-shaped figure, and above the same a bunch of fruit."

10,913.—CIGARETTES AND SMOKING-TOBACCO.—*Kinney Tobacco Company*, New York, N. Y. Application filed December 12, 1883.

"A jockey upon a horse, a radiance of light, and the word 'SPORT.'"

10,914.—CIGARETTES.—*Kinney Tobacco Company*, New York, N. Y. Application filed December 12, 1883.

"A figure of a cupid, a Turkish fez, a radiance of light, and the words 'EXTRE NOUS.'"

10,915.—CIGARETTES.—*Kinney Tobacco Company*, New York, N. Y. Application filed December 12, 1883.

"The word 'SOLITAIRE,' a radiance of light, and a Turkish fez."

10,916.—ALL HATS OR HEAD-COVERINGS FOR MALES.—*Daniel D. Youmans*, New York, N. Y. Application filed December 31, 1883.

"A design with scrolls and inscriptions thereon, and the monogram 'Y D D.'"

10,917.—GIN.—*John De Kuyper & Son*, Rotterdam, Netherlands. Application filed January 12, 1884.

"An outline representation of a heart on a label of corresponding shape."

10,918.—JEWELRY.—*Fowler Brothers*, Providence, R. I. Application filed January 12, 1884.

"A shield having a diagonal band of crape, an urn on top of the same, and two burning torches."

10,919.—TOILET-PINS.—*Thomas Porter*, New York, N. Y. Application filed January 14, 1884.

"A representation of a lion with a cupid at its side holding a pin as if in the act of thrusting it into the lion's head."

10,920.—WATCHES AND CLOCKS.—*The Waterbury Watch Company*, Waterbury, Conn. Application filed July 21, 1883.

"A watch or clock dial from which a section of the outer graduated portion has been removed."

10,921.—WATCHES AND CLOCKS.—*The Waterbury Watch Company*, Waterbury, Conn. Application filed July 21, 1883.

"A monogram composed of the letters 'W W C o.'"

10,922.—WATCHES AND CLOCKS.—*The Waterbury Watch Company*, Waterbury, Conn. Application filed July 21, 1883.

"A representation of a ribbon having a portion curved upward into horseshoe shape and graduated to represent a portion of a clock or watch dial."

10,923.—PURE RYE AND BOURBON WHISKIES.—*H. Webster & Co.*, New York, N. Y. Application filed January 9, 1884.

"The word 'CONSOLATION.'"

LABELS.

3,868.—Title: "E. & J. B. DUBLIN," (FOR GUINNESS' EXTRA FOREIGN STOUT.)—*Edward & John Burke*, New York, N. Y., Dublin, Ireland, and Liverpool, England. Application filed January 7, 1884.

3,869.—Title: "COMPOUND QUININE LINIMENT."—*Charles F. Fish*, Saratoga Springs, N. Y. Application filed January 12, 1884.

3,870.—Title: "SAENGERBUND" (FOR CIGARS.)—*J. Heimann & Co.*, New York, N. Y. Application filed January 4, 1884.

3,871.—[Withdrawn.]

3,872.—Title: "JACK ROSE" (FOR CIGARS.)—*Fred Kronsbein*, Rochester, N. Y. Application filed January 7, 1884.

3,873.—Title: "PINOCLE" (FOR PLAYING CARDS.)—*Ferdinand Luthin*, Hoboken, N. J. Application filed January 11, 1884.

3,874.—Title: "SEPTINE." (FOR A MEDICAL REMEDY.)—*John J. Murphy*, New York, N. Y. Application filed January 14, 1884.

3,875.—Title: "LALOR'S ANTIDOTE FOR INTOXICATION OR ALCOHOLIC POISONING."—*David R. O'Lalor*, Boston, Mass. Application filed January 5, 1884.

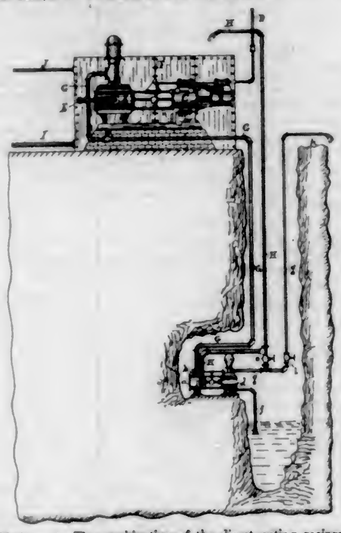
3,876.—Title: "OLD MOTHER HUBBARD'S THROAT AND LUNG BALSAM."—*Benjamin F. Raymond*, Essex, Mass. Application filed January 14, 1884.

3,877.—Title: "NOURSE'S ELIXIR OF YERBA SANTA COMPOUND."—*Harry Standiford*, Washington, D. C. Application filed January 16, 1884.

3,878.—Title: "J. M. WALKER'S ANDERSON COUNTY HAND MADE SOUR MASH. DISTILLED SPRING 1869."—*Strauss, Fritz & Co.*, Cincinnati, Ohio. Application filed January 11, 1884.

3,879.—Title: "GLASSBORO' IMPROVED" (FOR PRESERVE JARS.)—*Thomas W. Synnott*, Wenonah, N. J. Application filed January 9, 1884.

3,880.—Title: "DAIRY BUTTER LABEL."—*The United States Dairy Butter Label Company*, Boston, Mass. Application filed January 14, 1884.



3,881.—Title: "THE WHITE'S TAR MEDICATED TOILET PAPERS."—*Charles C. White*, Brooklyn, N. Y. Application filed January 11, 1884.

3,882.—Title: "BI-METALLIC." (FOR MEN'S FURNISHING GOODS.)—*Wilson Brothers*, Chicago, Ill. Application filed December 29, 1883.

PATENTS

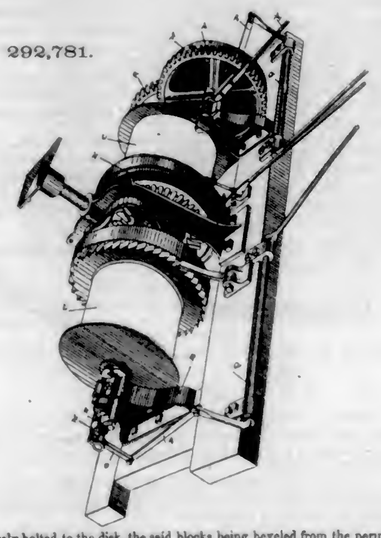
GRANTED FEB. 5, 1884.

292,779. RECIPROCATING HYDRO-TRANSMITTER. WM. BAXTER, Jersey City, N. J., assignor to the Hydrodynamic Transmitter Company, New York, N. Y. Filed Mar. 20, 1883. (No model.)

Claim.—1. The combination of the direct-acting reciprocating steam-pump A with the pipe E, tank F, and reciprocating pump consisting of the cylinders *a* and *d*, the motor-cylinder *a* being supplied with water by automatic valves contained in valve-chest *b*, and the pump A being connected with said valve-chest by a pipe, G, and the motor *a* discharging its spent water into the tank F by pipe H, as and for the purpose set forth.

2. The combination, with the discharge-pipes H and *g* from the motor and drainage-cylinders *a* and *d*, of the connecting-cock *s* and stop-cock *i*, arranged and operated as and for the purpose set forth.

292,780. BUTTON. WILLIAM W. BEACH, New York, assignor of one-half to Charles V. Goddard, Brooklyn, N. Y. Filed June 8, 1883. (No model.)



Claim.—A button whose shank is provided with a head at one end, a suitable attaching device at the other, and an intermediate opening, as and for the purpose specified.

292,781. HOISTING-MACHINE. WILLIAM L. BEATTY, HARVEY L. BEATTY, and ALVIN O. BEATTY, Welland, Ontario, Canada. Filed Nov. 7, 1883. (No model.)

Claim.—1. In a hoisting-machine in which the motion of the axle is conveyed to the rope-drum by a friction-clutch, a disk, E, having a flange, *e*, extending at right angles from its surface a short distance below its periphery, in combination with a series of wooden blocks, *f*, wedge-shaped in cross-section, arranged endwise around the flange *e* and securely bolted to the disk, the said blocks being beveled from the periphery of the disk E toward the outer edge of the flange *e*, and touching each other to form an unbroken periphery, substantially as and for the purpose specified.

292,781.

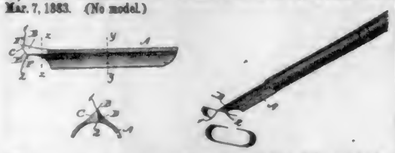
2. In a hoisting-machine in which the motion of the axle is conveyed to the rope-drum by a friction-clutch, a disk, E, having an octagonal flange extending at right angles to its surface a short distance from its periphery, in combination with a series of wooden blocks, *f*, arranged endwise around the flange, one block for each octagonal side, the said blocks being securely bolted to the disk and beveled off from the periphery of the disk toward the outer edge of the flange, substantially as and for the purpose specified.

3. In a hoisting-machine in which the drums are journaled on the driving-axle, a disk or disks, E, keyed to the said axle, and having an octagonal flange, *e*, extending outwardly from its periphery, with blocks of wood arranged around the disk and bolted to the octagonal sides, the said blocks being beveled, as shown, in combination with the drum C, journaled on the axle A, and having a conically-recessed head to fit over the beveled flange *e*, with mechanism for adjusting the drum longitudinally on its axle, substantially as and for the purpose specified.

4. In a hoisting-machine, a disk, E, keyed to the axle A, and having an octagonal flange, *e*, extending outwardly from its periphery, with blocks of wood arranged around the disk and bolted to the octagonal sides, the said blocks being beveled, as described, to fit into the conically-recessed head D of the drum C, which is journaled on the axle A, in combination with a key fitting into an elongated keyway made in the axle A at the outer end of the drum C, and actuated by a screw arranged to butt against a spindle fitting into a hole extending from the end of the axle to the keyway, substantially as and for the purpose specified.

5. In a hoisting-machine in which the rope-drum is adjustably connected to its axle by a friction-clutch formed by the end of the drum being brought in contact with a disk keyed to the axle, the said adjustment of the drum being effected by a spindle and screw through a nut in the frame and acting against the end of the drum, an arm, O, fastened

to the outer end of the screw, in combination with a rock-shaft, Q, journaled in the frame of the machine and connected to the arm O, substantially as and for the purpose specified.



6. In a hoisting-machine in which the rope-drum is journaled on its axle and derives motion through a friction-clutch adjustably connecting it to a disk keyed to the axle, a pinion fastened to the drum and gearing with a wheel journaled on a counter-shaft, the face of the disk being conically recessed to fit over an inversely-shaped flange on a disk keyed to the counter-shaft, in combination with a pinion, also fastened to the counter-shaft, and gearing with a wheel keyed to the axle, the connection between the loose and tight disks on the counter-shaft being adjustable, so that the rope-drum may be driven or not by the gearing specified, substantially as and for the purpose specified.

7. In a hoisting machine in which the rope-drum is adjustably connected to its shaft by a friction-clutch, a counter-shaft having a pinion keyed to it, which pinion gears with a larger wheel keyed to the rope-drum's axle, so that the counter-shaft shall revolve at a higher speed than the axle, a gear-wheel, F, journaled on the counter-shaft and engaging with a pinion fastened to the rope-drum, in combination with a friction-connection formed between the gear-wheel F and counter-shaft, and operated by a cam, substantially as and for the purpose specified.

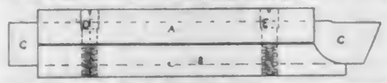
8. In a hoisting-machine, a friction-clutch formed by a conically-recessed disk having a paper lining pressed into it, in combination with a metal disk having a conical flange formed on it to fit into the paper-lined disk, as specified.

9. In a hoisting-machine in which the rope-drum is so connected to its shaft that it may revolve freely on it, the combination of speeded gearing arranged to connect the rope-drum to its shaft, so that the speed of the drum shall be greater than its shaft, the said gearing being provided with clutches, so that the connection between the drum and shaft may be disconnected at pleasure.

292,782. SHADING-PEN. ROBERT H. BRADLEY, Fayetta, Mo. Filed Mar. 7, 1883. (No model.)

Claim.—1. An improved shading-pen consisting of the herein-described semi-cylindrical body, having nibs thickened at their outer ends between the points 1 and 2, and cut off diagonally, so as to form a writing-edge, E, as set forth.

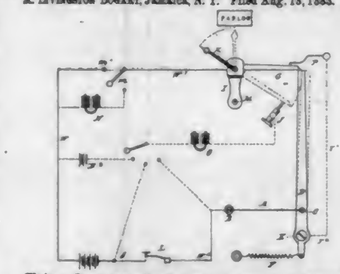
2. The improved shading-pen having the herein-described semi-cylindrical body, provided with nibs of unequal length, thickened vertically between the points 1 and 2, as set forth.



3. The improved shading-pen comprising the herein-described body A, having slit B, and nibs C D, of unequal length, thickened vertically between the points 1 and 2, the ends of said nibs being cut off diagonally, so as to form the writing-edges, and rounded, as and for the purpose set forth.

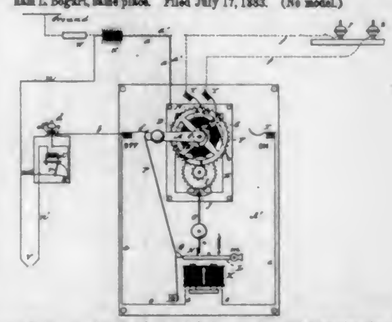
292,783. PACKING FOR STUFFING-BOXES. ASPLAN BELDAM, London, County of Middlesex, England. Filed Sept. 13, 1883. (No model.) Patented in England May 29, 1876, No. 2,254.

Claim.—In a packing for stuffing-boxes of steam engines and pumps, and for other joints required to be made steam, air, or water tight, the combination of a thin sheet of corrugated, plaited, or folded metal with a layer of canvas, felt, or other fibrous material and interlayered with lubricating-grease, the whole being rolled up in a lateral direction across the corrugations or plaits until the packing attains the requisite thickness, substantially as herein set forth.



292,784. HOLDER FOR CUTTING-OFF TOOLS. CHAS. E. BULLENS, Hartford, Conn. Filed June 30, 1883. (No model.)

Claim.—1. The combination of the cutter plate or blade C with the stock or holder, consisting of two segments, A and B, connected together by the screws or pins D and E, substantially as shown, and for the purpose specified, and operating substantially as set forth.



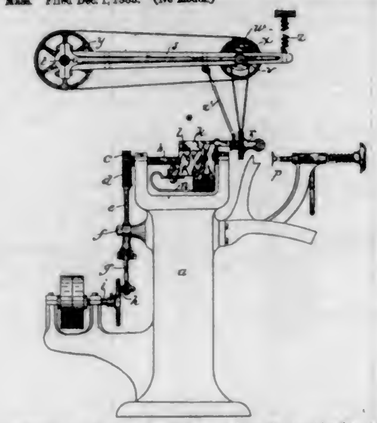
2. The improved tool-holder consisting of the two separable segments A and B, provided with the two screws or pins D and E, for holding said segments in their proper relative positions of contact or juxtaposition, as the case may be, said screws having their heads countersunk in A and their points within the body of B, in combination with the blade or cutter-plate C, all constituting a combined cutting-off tool and holder thereof having a uniform cross-section and a convenient external form for insertion in and withdrawal from the tool-post of a lathe.

292,785. APPARATUS FOR OPERATING ELECTRICAL DEVICES. A. LIVINGSTON BOGART, Jamaica, N. Y. Filed Aug. 18, 1883. (No model.)

Claim.—In an open-circuit electrical apparatus, a circuit-conducting resistance, A, consisting of a thin ribbon or wire, in combination with a drop-lever or equivalent device, as described, for permanently breaking the circuit, said resistance A and said circuit-breaking devices constructed and operating conjointly as described, to break the circuit at and not before the expiration of a prescribed and adjustable interval of time after the closure of the circuit by the expansion of said resistance A, resulting from the passage of the normal current through the same, as and for the purposes set forth.

292,786. ELECTRIC GAS-LIGHTING ATTACHMENT FOR BURGLAR-ALARMS. A. LIVINGSTON BOGART, Jamaica, N. Y., assignor to Abraham L. Bogart, same place. Filed July 17, 1883. (No model.)

Claim.—1. An electric gas-lighting attachment for burglar-alarms, consisting of an automatic switch, A, constructed as described, and operated by a clock-work mechanism, which is set in motion and stopped by the armature of an electro-magnet, K, in the manner set forth, and is provided with a series of circuit-closers adapted, as described, to turn the battery-current upon each burner separately to ignite the same, in combination with electrical connections consisting of a separate circuit for each burner, and another separate circuit including an ordinary burglar-alarm instrument, the whole being constructed to operate as described, so that no one of said circuits interferes with the action of any other of said circuits, and each burner is ignited separately, and immediately thereafter is cut out of circuit, as set forth.



2. An electric burglar-alarm and gas-lighting apparatus composed of the following parts in combination—namely, the automatic switch A, constructed and operated by clock-work mechanism, as described, the escapement I, and pendulum O, the armature L, provided with the stop-pin N, a burglar-alarm instrument, the springs S and T, and the burglar-alarm circuit and separate gas-burner circuits, including the circuit-closers H and X Y, the whole constructed and operating, as described, to first sound the alarm, then to divert the current to each burner successively, and then to divert the current again to the burglar-alarm for the purpose of effecting a continuous alarm after the last burner-circuit has been made and broken.

3. The combination, with the magnet K and its armature L, lever A, spring D, and train of clock-work, of the catch Q, mounted upon the spring P, as shown and described, for the purpose set forth.

4. The burglar-alarm and switch-circuit, composed of the battery U, wire *a*, clock-work frame E, lever A, spring T, wire *s*, magnet K, wire c, spring S, and burglar-alarm instrument, as shown and described.

5. The combination, as shown and described, of the burglar-alarm circuit, magnet K, gas-lighting circuit, indicated by dotted lines, and the clock-work movement.

292,787. HEEL-BURNISHING MACHINE. HIRAM BOND, Haverhill, Mass. Filed Dec. 1, 1883. (No model.)

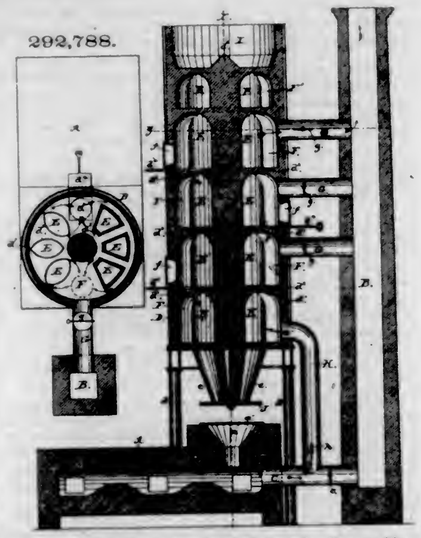
Claim.—1. In a heel-burnishing machine, the combination, with the oscillating tool-carrying mechanism shown, adapted to conform in its oscillating movements to the shape of a boot or shoe heel, of a rotary tool supported by said carrier and an arbor, and means for rotating the tool while the carrier is oscillating, as set forth.

2. The combination of the block *j*, secured to an oscillating shaft, the tool-carrying arm *k*, pivoted to said block, means for exerting an inward pressure on said arm, a rotary tool pivoted or journaled on said arm, and provided with a pulley, 4, swinging frame *s*, pivoted upon a driving-shaft, and provided with a pulley, 10, belted to a pulley on the driving-shaft, and with a pulley, *x*, belted to the pulley on the rotary tool, and a link connecting said frame with the tool-carrying arm *k*, and caneing the latter to follow the upward and downward movements of said arm, as set forth.

3. The improved tool composed of the burnishing portion 2, shank 3, and pulley 4, formed in one piece, and relatively arranged as shown, and provided with the longitudinal cavity 5 and vent 8, combined with the non-rotating stud or arbor 6, on which said tool is rotated, and a gas-pipe extending through said arbor into the burnishing portion of the tool, as set forth.

292,788. APPARATUS FOR DEOXIDIZING IRON ORES. JOHN BRIDGFORD, Albany, N. Y. Filed Mar. 6, 1883. (No model.)

Claim.—1. A deoxidizing-furnace containing a series of vertical retorts provided with means for separately controlling the discharge of ores from any one of said retorts, and having a series of communicating horizontal heat-chambers arranged one above another and surrounding said retorts, in the manner and for the purpose specified.



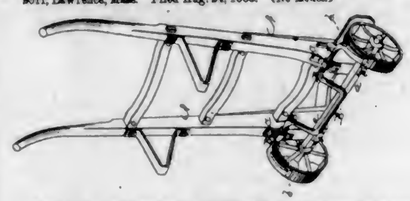
2. In a deoxidizing-furnace containing a series of vertical retorts provided with means for separately discharging part or all of the contents of any one of said retorts, and a series of horizontal heat-chambers arranged one above another, and provided with connecting openings for the passage of heat from one chamber to the one next above it, the said openings being placed alternately at opposite sides of the furnace, as and for the purpose specified.

3. In a deoxidizing-furnace containing a series of vertical retorts, and a charging-hopper that is common to all of said retorts, as herein set forth, a dead-air chamber or other heat-retarding device surrounding the upper part of said retorts for the purpose of preventing the ignition of carbonaceous matter contained in the upper part of the retorts and the charging-hopper, as herein specified.

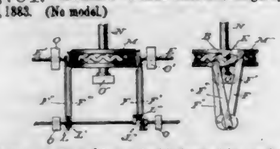
4. In a deoxidizing furnace, the combination, with a series of vertical retorts provided with means for controlling the discharge of ore from any one of said retorts, as herein set forth, of a series of horizontal heat-chambers arranged one above another, and adapted to cause a circulation of the heat-currents around all of said retorts, the said chambers being provided with communicating openings placed alternately at opposite sides of said furnace, for forcing the heat-currents in a zigzag direction, and cut-offs for optionally throwing the uppermost chamber or chambers out of service, as herein specified.

5. In a deoxidizing-furnace provided with a series of horizontal heat-chambers, F, having openings d^3 from one chamber to the next above, cut-offs d^4, substantially as described, for optionally controlling said openings, and means, substantially as specified, for conducting the spent heat from each chamber into the smoke-stack B, as herein described.

292,788.



292,789. TICKET-CASE. ALVIN R. BURDICK, Aurora, Ill. Filed June 8, 1883. (No model.)



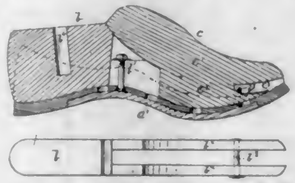
Claim.—A ticket or card case composed of solid ends, bottom, and sides, and a hinged cover, one end of the box being made narrower for withdrawing the cards, and the middle portions of the tops of the sides provided with narrow inwardly-turned flanges F, with spaces between the flanges and the hinged end of the cover, whereby cards placed on the under side of the cover will at their ends pass between the sides of the box, and be forced past the flanges, and lie flat in the box, by the shutting of the cover, as specified.

292,790. HAND-TRUCK. JOHN BURLEIGH and JAMES GARDNER ABBOTT, Lawrence, Mass. Filed Aug. 24, 1883. (No model.)

Claim.—In a hand-truck, the combination, with the frame thereof, of the bent bar B, swung at C from said frame, and provided with the dropped portion B', and brake-shoes *b*, constructed and arranged substantially as and for the purpose set forth.

292,791. GEARING. ROBERT CAMPBELL, Allegheny, Pa. Filed Apr. 12, 1883. (No model.)

Claim.—1. In gearing, a double lever, fulcrumed, connected, combined, and engaged in the form, manner, and for the purpose set forth.



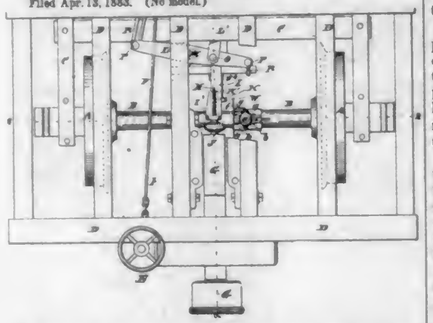
2. In gearing, grooves or slots engaging a double lever, in combination with a connecting-rod or piston-rod when the grooves or slots and lever are engaged and of construction and bearing as described and set forth.

3. In gearing, a driving-head, substantially as shown and connected.

4. In gearing, the combination of a pitman or connecting-rod with a crank and with a double lever, substantially for the purposes set forth.

5. In gearing, an apparatus employing hypocycloidal curves, engaged and operated for the purposes substantially as set forth.

292,792. LAST. ARTHUR W. COX, Auburn, Me., assignor of one-half to John T. Sullivant, Newark, N. J. Filed Sept. 15, 1881. (Model.)

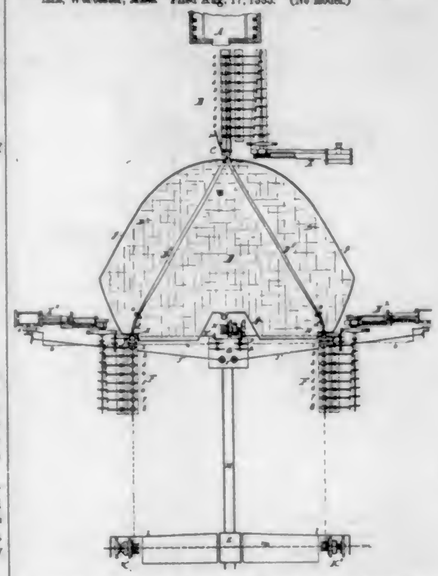


Claim.—1. In a shoe-last, the combination of a metallic base or sole having side flanges rounded on their outer sides, and extended from the toe nearly to the heel, leaving a vertical opening between their rear ends, and a wooden upper or instep-block forked at its forward end, and having its rear end projected through the vertical opening between the rear ends of the side flanges of the sole, and secured in place by a suitable bolt, substantially as set forth.

2. The combination, in a shoe-last, of the rib or center piece, *b*, having its forward end slotted, and forming the parallel arms b^2 b^2, connected by the bolt b^3, and an instep-block, *c*, having the lip or flange c^2, with its extension c^3, adapted to pass down into the slot of the rib or center piece, *b*, and be held by its extension catching under the bolt b^3, substantially as set forth.

3. The combination, with the metallic base or sole having upwardly-projecting flanges formed along its sides, and extended from the toe nearly to the heel, leaving an opening between the rear ends of said flanges, of a narrow forked instep-block, the tines whereof are connected by cross-bolt, and a top removable instep-block provided with a downwardly-projecting hooked lip adapted to engage the cross-bolt on the lower block and lie between the tines of said block, substantially as described, and for the purposes set forth.

292,793. CAR-BRAKE. JOSEPH C. DANE, La Crosse, Wis., assignor of two-thirds to Lucinda S. Card and Forrest J. Smith, both of same place. Filed Apr. 13, 1883. (No model.)



Claim.—1. The combination of the draw-head, push-bar I, connected to its inner end, horizontal lever L, fulcrumed upon one of the draft-timbers and connected to the brake-beams by the top rods, governor upon the axle, and a lever-frame having bearing on the vertical lazy-bar V, movably connected to the car body and truck.

2. The combination of a draw-head, rod H, springs J and K, push-bar I, lever L, fulcrumed to the car-body, lazy-bar connected to the car body and truck, lever-frame W, connected to the lazy-bar, and a governor with movable shield *f*, acting on the frame W, substantially as and for the purpose set forth.

3. The combination of a brake mechanism and a brake-governor consisting of the sleeve *a*, toggle-arms *c* and *d*, weights *e*, disk *f*, and spring or springs *g*, substantially as set forth.

4. The frame W, secured to the lazy-bar V, and having an arm, W^3, with elongated fork W^7, engaging the push-bar I, substantially as set forth.

292,794. APPARATUS FOR MAKING WIRE RODS. FRED H. DANIELS, Worcester, Mass. Filed Aug. 17, 1883. (No model.)

Claim.—1. The distributing-table D, constructed, as shown, with divergent guiding-channels D′, terminating in the curved funnels or tubes *d*, and provided with laterally-extended wings or platform-surfaces D^2, and the standing border or guard flange *g*, substantially as and for the purposes set forth.

2. In a rolling-mill for making wire rods, the combination of a single primary train or series of pairs of rolls arranged for operating in continuous order, and two secondary trains or series of pairs of rolls likewise arranged for operating on the continuous system, for alternately completing the rods partially formed in said primary train, and an intermediately-located platform or table for receiving and permitting the distribution of the over-feed of the rod between the said trains, as set forth.

3. In a rolling-mill comprising a primary series or train of rolls supplemented by double series or trains of rolls arranged for alternately receiving the partially-reduced rods from said primary train, a distributing-table located between said primary train and the following rolls, and provided with means for automatically guiding the ends of the rod to the leading-rolls of the secondary or supplemental series of rolls, and for permitting the over-feed to distribute itself upon the table-surface, substantially as hereinbefore set forth.

4. The combination, in a rolling-mill, of a primary series or train of rolls, as B, arranged for operating in continuous order, a distributing-table provided with divergent guide-channels, an adjusting-switch for deflecting the rod into either channel, and two or more secondary series or trains of rolls arranged for operating in continuous order, adapted for receiving the rods from the respective guide-channels of said distributing-table, substantially as hereinbefore set forth.

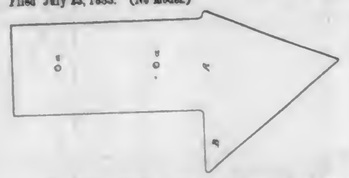
5. In a rolling-mill, the combination, with a primary train of rolls arranged to operate in continuous order, a distributing-table with divergent guide-channels, and two secondary trains of rolls, as F F′, provided with independent motors or engines E′ E^2, of a mechanism, substantially such as described, for varying the speed of said engines, operating from a stand, G, at a position overlooking said distributing-table and roll-trains, as set forth.

6. In a rolling-mill mechanism, the combination, with an intermediately-located distributing-table having guiding-channels terminating in funnels or tubes, as *d*, of guiding or friction rolls, as *a*, arranged at the entrance of said tube, for the purpose set forth.

7. In a wire-rod-rolling mill having intermediate distributing-table, a rod-shearing mechanism, I, located between the delivery-guides of said table and the leading-rolls of the secondary train F or F′, for the purpose set forth.

8. In a rolling-mill having two or more series of rolls and an intermediately-located distributing-table, the combination, with the secondary series of rolls, of a pair of feeding-rolls, as H, adapted to be brought into action for forcing the end of the rods into the leading-bite of the reduction-rolls in said second train, substantially as set forth.

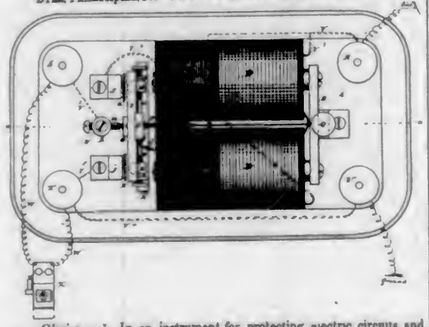
9. The combination, with the table D, guides *d*, and train of rolls F F′, of the feeding-rolls H, one of which is mounted for vertical action, as described, and the operating-cams and shaft H′, substantially as and for the purpose set forth.



10. The combination, in a rolling-mill, of the primary train of rolls B, the two completing-trains F and F′, the table D, with guides D′ *d*, the feed-rolls H, engines F F′, the stand G, and the controlling-connections O and H′, and actuating-levers P and R, substantially as and for the purposes set forth.

11. In a rolling-mill having a primary train of rolls and a distributing-table and second trains of rolls, as described, a reeling apparatus, N, located adjacent to said distributing-table for reeling waste pieces, partially reduced or damaged rods directly from said intermediate table, as set forth.

12. In a rolling-mill plant for making wire rods, the combination and arrangement, as herein shown and described, of the furnace A, the primary train B, the switching-guide C, the distributing-table D, the feed-rolls H, the secondary trains of rolls F and F′, the reeling devices K and K′, the motors E E′ E^2, and operator's stand G, with connections for controlling the mechanism, as set forth.



13. The guide-tube *d*, provided with the longitudinal flanged slot *f*, in combination with a distributing-table and pair of rolls in a rod-rolling mill, for permitting the rod to be entered in the rolls and then drawn into the tube, as set forth.

292,795. CULTIVATOR-SHOVEL. WILLIAM F. DICKSON, Mossville, Ill. Filed July 23, 1883. (No model.)

Claim.—The shovel-blade A, with a point formed with unequal sides, as shown, having the spur B, the upper side of which is approximately horizontal, and a shorter extension on the opposite side, and extending from each corner in a straight line to a central point, forming working-edges of different angles, to the upper portion of the shovel, substantially as shown and described.

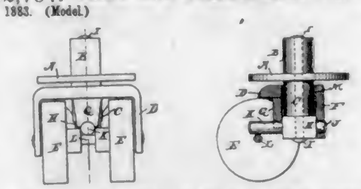
292,796. PROTECTOR FOR ELECTRIC CIRCUITS. JOSIAH W. DYER, Philadelphia, Pa. Filed Oct. 8, 1883. (No model.)

Claim.—1. In an instrument for protecting electric circuits and their receiving-instruments from damage by lightning or excessive electrical charges generally, two coils of wire of different resistances carried upon the same core, and acting upon an armature, in combination with a line-wire in circuit with the coil of highest resistance, and having receiving-instruments thereon, and mechanism controlled by the armature to first shunt said receiving-instrument and throw the low-resistance coils into circuit, and then break the original line-circuit close to the receiving-instruments when the said line becomes overcharged with electricity, substantially as and for the purpose specified.

2. The combination of a line-circuit, coils C and D, of different resistances, located upon the same core, with armature E and its lever, contact-springs, and circuit-closing devices actuated by said armature to first make contact with said springs to complete the line-circuit through the low-resistance coil, and simultaneously therewith shunt the coil of high resistance, and then make a solid contact to insure the grounding of the line through said low-resistance coil, substantially as and for the purpose specified.

3. The combination of a line-circuit, coils C and D, of different resistances, located upon the same core, with an armature, E, and its lever, contact-springs, and circuit-closing devices actuated by said armature to first make contact with said springs to complete the line-circuit through the low-resistance coil and simultaneously shunt said coil of high resistance, and also said receiving-instruments, to ground, and then make a solid contact to insure the grounding of the line through said low-resistance coil, substantially as and for the purpose specified.

4. The combination of a line-circuit having receiving-instruments located therein, coils C and D, of different resistances, located upon the same core, with an armature, E, and its lever, contact-springs, circuit-closing devices actuated by said armature to first make contact with said springs to complete the line-circuit through the low-resistance coil and shunt said receiving-instruments to ground, and then make a solid contact to insure the grounding of the line through said low-resistance coil, and means to finally break said original line-circuit close to the receiving-instruments, and devices to regulate the time of said break, substantially as and for the purpose specified.



5. In an instrument for protecting electric circuits and their receiving-instruments from damage by lightning or excessive electrical charges generally, two coils of wire of different resistances carried upon the same core and acting upon an armature, in combination with a line-wire in circuit with the coil of highest resistance, and having receiving-instruments thereon, mechanism controlled by the armature to first shunt said receiving-instruments and throw the low-resistance coils into circuit, and then break the original line-circuit close to the receiving-instruments when the said line becomes overcharged with electricity, and means to regulate the time of said break in the line close to said receiving-instruments, substantially as and for the purpose specified.

6. The combination of electro-magnet B, having coils C and D, of different resistances, armature-lever F, armature E, contact-spring O, contact-screw M, means to put said coil D in circuit upon moving said armature, receiving-instruments X, and connecting-circuits, substantially as shown.

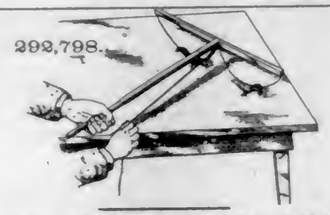
7. The combination of electro-magnet B, having coils C and D, of different resistances, armature-lever F, armature E, contact-spring O, contact-screw M, means to put said coil D in circuit, contact-bar I, contact-standards J J′, receiving-instruments X, and connecting-circuits, substantially as shown.

8. The combination of electro-magnet B, having coils C and D, of different resistances, armature-lever F, armature E, contact-spring O, contact-screw M, means to put said coil D in circuit, contact-bar I, contact-standards J J′, springs K, receiving-instruments X, and connecting-circuits, substantially as shown.

292,797. CASTER. AUGUST EWERT, Hamilton, Ohio. Filed July 5, 1883. (Model.)

Claim.—1. The housing D, having the two curtains pendent from its roof, and the vertical pin I, provided with means for connection to furniture, and joined to the foot of the curtains by a horizontal axle of oscillation, combined substantially as and for the purpose specified.

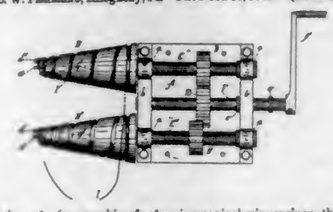
2. The housing D, having curtain F and curtain G, with a half-bearing, the block H, with its journals, and the pin I, combined substantially as and for the purpose specified.



3. The housing D, with its curtains F G and slot M, the block H, with its journals, the pin I, provided with means for attachment to furniture, and the boss C, resting on the block, combined substantially as and for the purpose specified.

4. The housing D, the wheel-axle L, the two wheels E, the pin I, provided with means for connection to furniture, the curtains F G, pendent from the roof of the housing, and the axle of oscillation prolonged to the rear between the wheel-hubs and over the wheel-axle, combined substantially as and for the purpose specified.

5. The flange A, having bosses B and C, the housing D, having curtains F and G, the block H, having journals J and K, and the riveted pin I, combined substantially as and for the purpose specified.

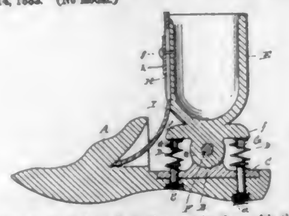


292,798. TOY. LOUIS F. FALLON, St. Louis, Mo. Filed Nov. 8, 1883 (No model.)

Claim.—The combination of two sticks transversely joined in the shape of the letter T, with strings and loosely-depending roosters, substantially as and for the purpose hereinbefore set forth.

292,798.

292,799. MACHINE FOR FORMING CONICAL WIRE SPRINGS. GEO. W. FERRING, Allegheny, Pa. Filed Oct. 10, 1883. (No model.)

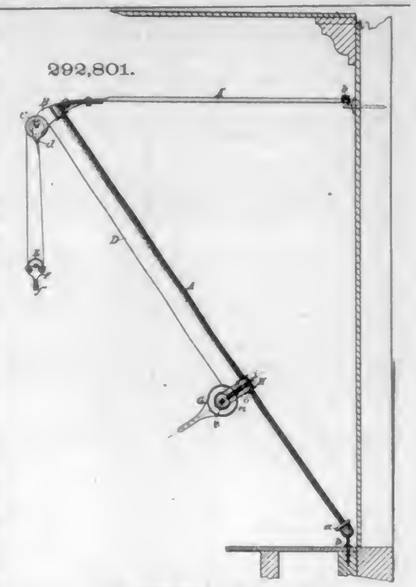


Claim.—1. In a machine for forming conical wire springs, the combination, with the conical grooved mandrels B B′ and shafts C C′, having pinions, respectively, D D′, of the shaft F, having spur-pinion E and guards c c, and arranged to slide backward and forward longitudinally, whereby one or each of said mandrels may be rotated independently of the other to form both coils of a conical spiral twin spring from one drive-shaft, substantially as described, and for the purpose specified.

2. In a machine for forming conical wire springs, the combination, with the conical grooved mandrels B B′ and shafts C C′, having pinions respectively, D D′, and sliding shaft F, of the hinged bar G, having upright tooth *f*, secured thereto, adapted to enter between the teeth of the pinion D, substantially as described, and for the purpose specified.

3. In a machine for forming conical wire springs, the combination, with the conical grooved mandrels B B′ and shafts C C′, having pinions, respectively, D D′, and sliding shaft F, of the bar G, having a press-block, *g*, secured to the end, adapted to press the wire in the groove of the mandrel D, substantially as described, and for the purpose specified.

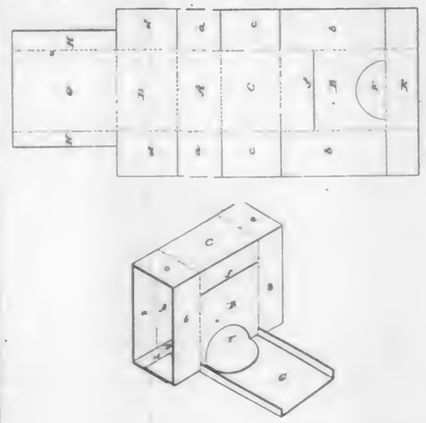
292,800. ARTIFICIAL LEG. JOSEPH FURBER, Toledo, Ohio. Filed July 14, 1883. (No model.)



Claim.—In an artificial limb, the combination, with the foot provided with the fixed base-piece and journal-blocks, and the cushion-spring, of the socket journaled to the blocks, the springs interposed and secured between and to the foot and socket, and the curved slotted spring fastened to the foot and working and held in the way in the socket, substantially as described.

292,801. INVALID-LIFT. GEORGE J. GOODHUE, Jr., Stevens Point, Wis. Filed Sept. 3, 1883. (No model.)

Claim.—1. A lift for invalids, mounted with universal joint on its floor attachment, and having its head connected to wall of room by a long hinge, whereby the elevating mechanism can be operated so as to safely and quickly move a patient from one bed to another or to a chair, or vice versa, as set forth.

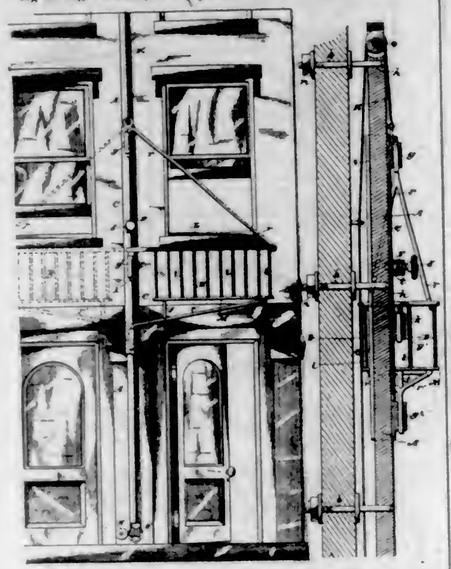


2. In a lift for invalids, the combination, with jib A, having union *a*, with recess for head of screw *b*, and head-hanger B, with tail end *a′*, of the band-iron hinge A′ and hook *b′*, substantially as shown and described, and for the purpose set forth.

3. In a lift for invalids, the combination, with the crank-reel G, belt D and attachments, flanged roller C, and flanged pulley E of block F, of the stretcher J, band or belt K, and suspender L and attachments substantially as shown and described, and for the purpose set forth.

292,801.

292,802. PAPER BOX. EDSON GOWDY and CHARLES B. RUSSELL, Birmingham, Conn. Filed Dec. 17, 1883. (No model.)



Claim.—1. The herein-described paper box, made from a blank cut to be folded to form the several sides, one of said sides having an opening, F, cut therein, and the flap G cut as an integral part of the blank, and so as to form a flap to be turned over and cover the said opening, or turned down therefrom to form a receptacle for the contents of the box, substantially as described.

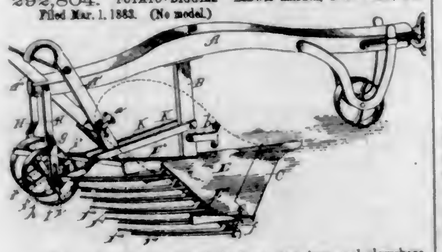
2. A paper box, substantially such as described, constructed with an opening, F, upon one side, combined with a flap, G, hinged to the box below the opening, and so as to be turned upon that side of the box and cover the opening, and fitted, substantially as described, to be secured in its closed position, substantially as specified.

3. A paper box, substantially such as described, constructed with the opening F in one side, combined with the flap G, hinged to the box below the opening, its edges constructed with guards H H, its free end constructed, substantially as described, to be secured, when turned upon the side of the box, to close the opening, substantially as specified.

292,803. FIRE-ESCAPE. JAMES T. GUTHRIE, Leesburg, Ohio. Filed Oct. 30, 1883. (No model.)

Brief.—An elongated sleeve embraces the rod, which is permanently secured to the building. A cage or basket is secured to said sleeve, so as to be swung laterally in a horizontal plane, and is provided with a boss having a set-screw therein, for forcing it against the rod and holding the cage stationary at any point.

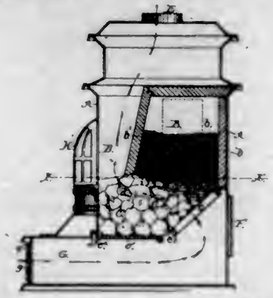
Claim.—1. In a fire-escape, the combination, with a rod permanently secured to a building, of an elongated sleeve partly embracing the rod and provided with a basket, and a set-screw passing through the sleeve and adapted to be forced against the rod, substantially as set forth.



2. In a fire-escape, the combination, with a rod permanently secured to a building, of a sleeve having a basket secured thereto, the said sleeve partly embracing the rod and provided with a boss and a set-screw secured in the boss, and adapted to be forced against the rod, substantially as set forth.

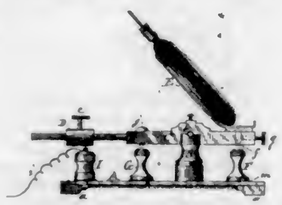
3. In a fire-escape, the combination, with a rod attached to a building, of a vertically-movable sleeve embracing the rod, and a basket pivotally secured to the sleeve, the said basket adapted to be moved laterally in a horizontal plane, substantially as set forth.

4. In a fire-escape, the combination, with a rod permanently attached to a building, of an elongated sleeve partly embracing said rod and adapted to slide thereon, a basket hinged to said sleeve and adapted to move laterally in a horizontal plane, and braces rigidly secured at their outer ends to the basket and pivotally secured at their inner ends to the sleeve, substantially as set forth.



5. In a fire-escape, the combination, with a rod attached to a building, of a sleeve fitted to slide on said rod, and a basket connected with the sleeve by braces connecting the outer end of the basket with the sleeve at points above and below the basket, substantially as set forth.

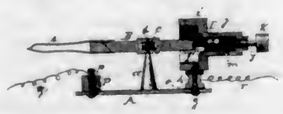
292,804. POTATO-DIGGER. LUDWIG HAMEK, Town Lake, Wis. Filed Mar. 1, 1883. (No model.)



Claim.—In combination with the beam, post, base, and plowshare, the wheel I, with sleeves *f*², braces H and K, platform E, shaking-bar F, with prongs F′ F², and rod G, with notch *g*, all substantially as set forth.

292,805. STOVE. CHARLES A. HAMLIN, Greenbush, assignor to the Ransom Stove Company, Albany, N. Y. Filed May 1, 1883. (No model.)

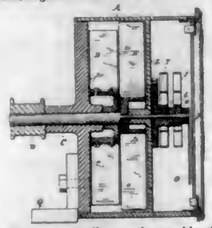
Claim.—The combination, with a retorting-chamber, B, a combustion-chamber, C, lying directly underneath said retorting-chamber, and a flame-chamber, D, separated from said retorting-chamber by means of the bridge-wall *b′*, whereby the egress-draft opening *d* is formed, as herein described, of the inclined rear grate, *c*, fixed under the retorting-chamber B, and the imperforate fire-bed *c′*, arranged to form a close joint with the combustion-chamber C at the ends and one side of said chamber, as and for the purpose herein specified.



292,806. ELECTRIC BURGLAR-ALARM. JAMES P. HANSON and JAMES P. CHRISTENSEN, Chicago, Ill. Filed May 10, 1883. (No model.)

Claim.—1. In a burglar-alarm, the balance-beam C, carrying shelf E, and having counter-weight D, in combination with contact-posts F and G, both connected with one of the poles of an incomplete electric circuit, all substantially as described, to operate as specified.

2. In a burglar-alarm, the balance-beam C, with shelf E and counter-weight D, and mounted upon shaft *b*, pivoted on posts B B′ of plate A, in combination with contact-posts F and G and circuit-wire connecting posts H and I, all constructed and arranged to operate substantially as and for the purpose set forth.



292,807. ELECTRIC BURGLAR-ALARM. JAMES P. HANSON and JAMES P. CHRISTENSEN, Chicago, Ill. Filed May 10, 1883. (No model.)

Claim.—1. In an electric burglar-alarm provided with suitable circuit-connections, the bar B, universally pivoted between posts *a a′* of plate A, and having insulating-cup *f*, in combination with tube I, insulated from plate A, and having expanded rim *i* and spring-stem J, all substantially as described, to operate as specified.

2. In an electric burglar-alarm provided with suitable circuit-connections, the bar B, universally pivoted between posts *a a′* of plate A, having spring-jaws *e* and insulating-cup *f*, in combination with tube I, insulated from plate A, and having expanded rim *i* and spring-stem J, all substantially as and for the purpose described, to operate as specified.

292,808. SPEED-INDICATOR. THOMAS WALTER HARDING, Leeds, County of York, England. Filed Dec. 16, 1882. (No model.)

Claim.—1. In a speed-indicator, the combination, with the spindle having a pointer and a cam connected therewith, of a spring or springs arranged to engage the cam and equalize the sensitiveness of the pointer in its operation, and a lever for regulating the adjustment of the spring, substantially as set forth.

2. In a speed-indicator, the combination of two cam-shaped bosses, each provided with a spiral spring, and each also provided with projections for engaging each other, and so constructed that the second boss will not move except by engagement with the first boss, and so adjusted that such engagement will not occur until the pointer has advanced some distance from the zero-point and has reached a desired point on the said scale, substantially as shown and described.

3. In an air-friction speed-indicator, the combination, with a circular scale, of two series of figures, the one series of greater value than the other series, and made preferably of different colors, substantially as and for the purpose set forth.

4. In an air-friction speed-indicator, the combination, with a circular scale provided with two series of figures of different values, of two driving-pulleys whose respective diameters are to each other as the respective values of the two figures at any given point of the said scale, substantially as and for the purpose shown and described.

5. In a speed-indicator, the combination, with the spindle F, the pointer O, and the spring J, of the cam-shaped boss H, substantially as and for the purpose set forth.

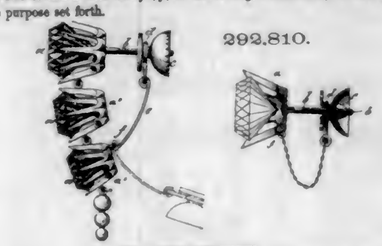
6. In a speed-indicator, the combination, with the cam-shaped boss H and the attached spring J, of the cam-shaped boss G and the attached spring I, engaging each other only at a desired point, substantially as shown and described.

7. In a speed-indicator, the combination, with the spring J and the spring I, of the lever K, extending through the casing, and provided with a pointer and scale outside of the said casing for adjusting the said springs, substantially as and for the purpose shown and described.

8. In a speed-indicator, the combination, with the spindle F, the pointer O, the cam-shaped bosses H and G, and the springs I and J, of the cam L and the spring M, substantially as set forth.

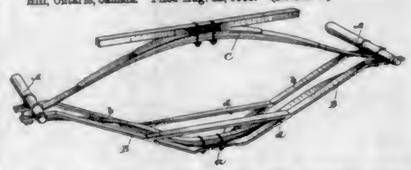
292,809. SAW-TOOTH. ENOCH HARRER, Quincy, Ill. Filed Dec. 20, 1883. (No model.)

Claim.—1. In a saw, the blade A, having the solid teeth B, formed with the dovetailed projection *a*, in combination with the insertible teeth C, formed with a dovetailed slot, *c*, the projection *a* gradually decreasing in size in an outward direction, and the slot *c* corresponding with the projection, as set forth.



2. In a saw, the blade A, having the solid teeth B and the depressions *f*, said teeth being formed with a dovetailed projection, *a*, having a recess, *b*, in combination with the insertible teeth C, formed with the dovetailed slot *c*, and the ears or lugs *d*, as set forth.

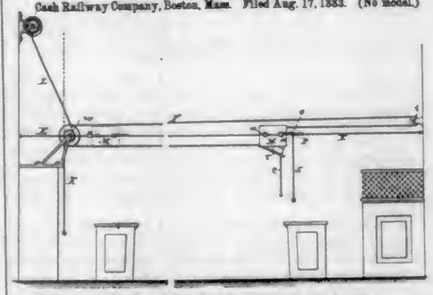
292,810. EAR-RING. BERNHARD HARTMANN, New York, N. Y. Filed Sept. 26, 1883. (No model.)



Claim.—1. The combination, with one or more settings, *a a*, suspended one below the other, the uppermost setting having a fixed screw-threaded shank or puncture-bar, *b*, of a screw-nut *c*, adjustable on said shank, and of an intermediate link or chain, *e*, that is swiveled at one end to said screw-nut and pivoted at the other end to one of the settings, substantially as set forth.

2. The combination of a setting, *a*, having a fixed and screw-threaded puncture-bar, *b*, a screw-nut, *c*, having a contracted portion, a link, *d*, swiveled to the contracted portion, and a link or chain, *e*, that connects the swivel-link *d* with an eye, *f*, of the setting, substantially as and for the purpose set forth.

292,810.



292,811. SPRING-GEAR FOR BUGGIES. JOHN R. HAWLEY, Park Hill, Ontario, Canada. Filed Aug. 22, 1883. (No model.)

Claim.—The plate *a*, having bifurcated arms *b* extending obliquely from either side of it, in combination with the braces *d*, substantially as and for the purpose specified.

292,812. STORE-SERVICE APPARATUS. HARRY H. HAYDEN, New York, N. Y., and EDWIN L. GILES, Lowell, Mass., assignors to the Lamson Cash Railway Company, Boston, Mass. Filed Aug. 17, 1883. (No model.)

Claim.—1. In a store-service apparatus provided with ways extending between the several counters or stations and the main desk, a carrier traveling upon each way, and a cord extending to the terminal station and to the main desk, and serving as a means for propelling the carrier to or from either the station or desk, substantially as set forth.

2. The combination, with the stations or counters and desks of a store, of the several ways, one extending from the desk to each counter or station, and a carrier traveling upon each way, and a cord extending in opposite directions from each carrier, whereby to move it in opposite directions, substantially as described.

3. The combination of a carrier traveling between the stations of a store, terminal drums, a cord extending from each end of the carrier and round one of said drums, and a cord wound upon the drum-shaft and extending to the desk or counter, substantially as set forth.

4. A carrier of a store-service apparatus provided with a cord for drawing it in one direction, and with means whereby power is thus stored up to move the carrier in the opposite direction, substantially as set forth.

5. A store-service apparatus in which the carrier is combined with means whereby to propel it in one direction by the attendant, and for returning it automatically by power created by the force first applied to propel the carrier, substantially as set forth.

6. The combination, with a carrier, of a traction-cord, drum upon or round which the said cord is wound, and a spring or weight arranged to operate on said drum, whereby power is stored upon moving the carrier in one direction to automatically move it in the opposite direction, substantially as specified.

7. The combination, in a store-service apparatus, of a fixed way, a carrier moving thereon, and a draft-cord extending from opposite ends of the carrier and round pulleys, substantially as set forth.

8. The combination of the carrier, draft-cord, drums H *I* W, and cord K, substantially as set forth.

9. The combination of the carrier, draft-cord, winding-drum H, and spring or weight connected to operate said drum after the carrier has been moved in a direction to store up the power of the spring, as specified.

10. The combination of the carrier, draft-rope, device for storing up power to retract the carrier on the outward movement of the carrier, and a catch whereby the carrier is retained against the action of the power thus stored up, substantially as specified.

11. The combination of the carrier, draft-cord, spring, or its equivalent, catch, and one or more cords, S, substantially as described.

12. The combination, with the main desk and counters of a store, of a series of permanent ways, each provided with a carrier, and draft-cords extending to the terminal stations, whereby said carriers may be moved back and forth between the stations, substantially as set forth.

13. A traveling carrier upon the way of a store-service apparatus, provided with a pendent cord or rod, whereby it may be opened while supported by the way, substantially as specified.

292,813. SEWING-MACHINE RUFFLER. JOHN HEBERLING, Mount Pleasant, Ohio. Filed Oct. 13, 1883. (Model.)

Claim.—1. The combination, with the pivoted ruffling-blade lever, of two cams pivoted independently to the said lever, and means, substantially as described, whereby they may be simultaneously and correspondingly adjusted on their pivots to any suitable angle relative to the blade-lever, substantially as and for the purposes specified.

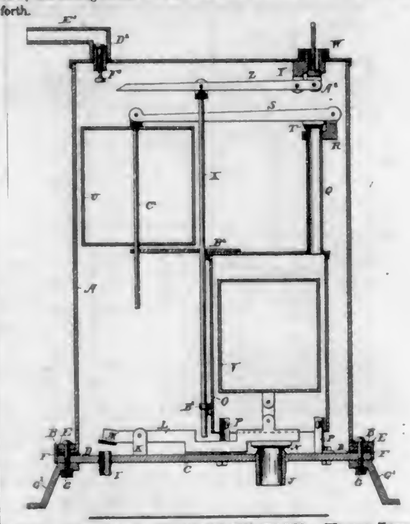
2. In a ruffler or gatherer, the combination of the pivoted ruffling-blade lever, the cams C D, pivoted to said lever, both said cams being adjustable independently of the lever, and means for adjusting the cams, substantially as specified.

3. The combination, in a ruffler or gatherer, of a pivoted lever and cams pivoted to the said lever, and connected substantially as described, whereby the adjustment of one accomplishes a corresponding adjustment of the other cam, as set forth.

4. In a ruffler or gatherer, the combination, as set forth, of the pivoted ruffling-blade lever provided with a suitable rack, the cams pivotally held thereto and connected as described, and the adjusting arm or lever extended from one of the cams, and adapted to engage the rack, all as and for the purposes set forth.

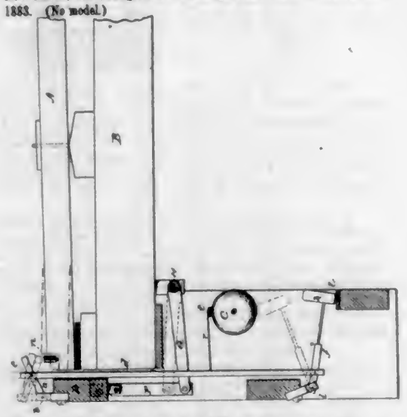
5. In a ruffler or gatherer, the pivoted ruffling-blade supporter provided with a suitable rack, *b'*, in combination with the cams C D, pivoted to the supporter, and having lip c^2 and notch d^2, and the extension C', forming an adjusting-lever, and suitably arranged to engage rack *b'*, for the purpose specified.

6. The ruffler or gatherer, substantially as described and shown, composed of the standard A, base A', the shield *a'*, the pivoted ruffler-blade supporter, having extension B', the pivoted cam C, having extension or arm C' and lip c^2, and the cam D, having extension D', provided with notch d^2, engaging with lip c^2, all as and for the purposes specified.



7. In a ruffler or gatherer, the combination, with the pivoted ruffling-blade lever, of two cams, each secured directly to and adjustable independently of said lever, and arranged the bearing-surface of the one above and the bearing-surface of the other below the pivotal center thereof, substantially as and for the purposes set forth.

292,814. HYDRAULIC AIR-COMPRESSOR. CHARLES HORACE HILL, Scranton, Pa. Filed July 16, 1883. (No model.)

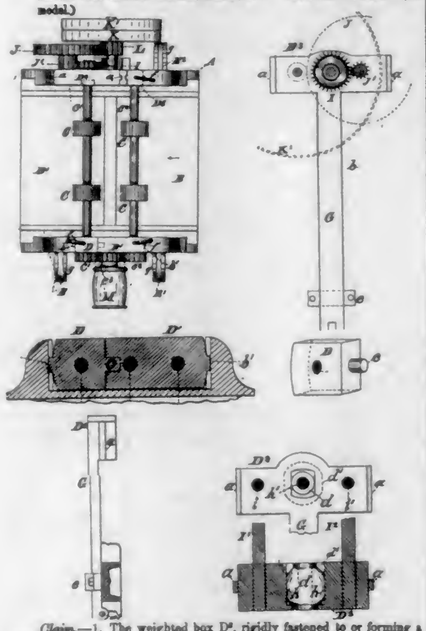


Claim.—1. In a hydraulic air-compressor, the combination of a closed cylinder or tank provided in its bottom with a water-inlet and a waste-pipe, a lever provided at its respective ends with valves adapted to close the said inlet and waste pipe, a closed inverted tank placed within the said main cylinder, a float located within the said tank, and connected with and adapted to operate the lever controlling the inlet and waste openings, means for automatically establishing communication between the inverted tank and the main tank when the water rises in the latter, and means for automatically opening an air-inlet valve at the top of the main tank, substantially as set forth.

2. The combination of the closed main tank, provided at its bottom with inlet and waste pipes, an inverted tank arranged within the said main tank, with the bottom of which it is securely connected by means of suitable supporting-legs, a float located within the said inverted tank, a lever connected with and operated by the said float, and provided at its ends with valves adapted to close the inlet and waste openings, and tank U, with connected valve T, substantially as set forth.

3. In a hydraulic air-compressor, the combination of the closed main tank, provided in its bottom with inlet and waste pipes, an inverted tank placed within the main tank, and having a pipe extending nearly to the top of said main tank, a lever provided at its ends with valves adapted to close the inlet and waste pipes, a float located within the inverted tank and connected with and operating the said lever, a lever fulcrumed at the upper end of the pipe, extending upwardly from the inverted tank, and having a valve adapted to close the said pipe, a float at the end of the said lever, an air-inlet in the upper part of the main tank, a lever having a valve adapted to close the said air-inlet, and provided with a rod extending downwardly to within a short distance of the lever controlling the water-inlet and waste-pipe, said air-inlet-controlling lever being extended over and adapted to be operated by the lever fulcrumed at the top of the pipe, extending upwardly from the inverted tank, and an air-outlet arranged in the upper part of the main tank, and having a check-valve, substantially as and for the purpose set forth.

292,815. BELL ATTACHMENT FOR PIANOS. WILLIAM HOPER, New Haven, Conn., assignor to B. Shoninger, same place. Filed Aug. 13, 1883. (No model.)



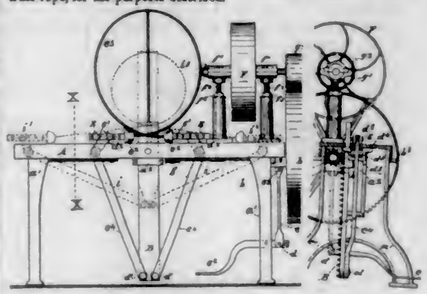
Claim.—1. The herein-described bell attachment for pianos, consisting of the vertically-sliding bar D, arranged for connection with the pedal of the instrument, levers *a* hung to said bar, each corresponding to one of the keys of the instrument, and extending forward to a position over the respective keys, a series of bells, C, their hammers A, and rods *d*, extending from said levers *a* into connection with the respective hammers, said parts being combined and arranged so that said hammers may be brought into engagement or action with the keys or not, at the pleasure of the player, substantially as described.

2. In a bell attachment for pianos, the combination of the vertically-sliding bar D, levers *a*, rods *d*, hammer-levers *f*, series of bells C, and the rock-shaft H, in connection with the pedal of the instrument, and with the sliding bar D, substantially as and for the purpose described.

3. The herein-described bell attachment for pianos, consisting of the vertically-sliding bar D, arranged for connection with the pedal of the instrument, levers *a*, hang to said bar, each corresponding to one of the keys of the instrument and extending forward to a position over the respective keys, a series of bells, C, their hammers A, and rods *d*, extending from said levers *a* into connection with the respective hammers, said parts being combined and arranged so that said hammers may be brought into engagement or action with the keys or not, at the pleasure of the player, and with the adjusting-screw *s* in the rear end of the key, substantially as described.

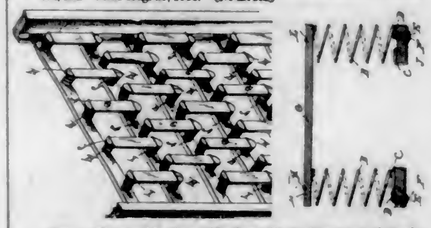
292,816. MACHINE FOR PLANING BARREL-HEADS. EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y. Filed Feb. 11, 1881. (No model.)

Claim.—1. The weighted box D^2, rigidly fastened to or forming a part of a vertical bar, G, and arranged to slide in grooves in the frame of the machine, the bar G being secured in a box near the bottom, and provided with the gearing I J J' L K K', for operating the feeding mechanism, in combination with the shaft C', its feeding-rollers, rocking box *d*, and the weighted box D, for supporting the opposite end of the shaft C', and its connecting-gearing for operating the shaft C' and its feeding-rollers.



2. The feeding-roller shaft C', its operating mechanism, and weighted movable box D^2, in combination with the connected movable boxes D D', having an independent oscillating movement one way and a connected movement the other way, substantially as specified, and the pinions c', c^2, and c^3, for giving the necessary feeding movement to the shafts C' C^2 and their feeding-rollers without interfering with the upward or downward movements of the said pressure and feeding rollers by reason of the action of the gear-wheels upon each other, substantially as described.

292,817. WINDLASS FOR COMPRESSING BARRELS. EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y. Filed Jan. 29, 1883. (No model.)



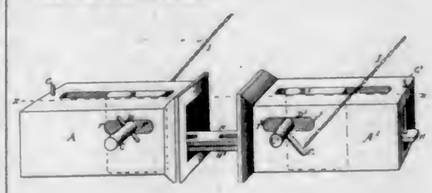
Claim.—1. The pulley b^2, secured to a shaft, *b*, having a pinion, a^2, in combination with the rack B, toggle-joint c^4, and cable c^5, substantially as and for the purposes described.

2. The pulley b^2, secured to a shaft, *b*, having a pinion, a^2, in combination with the rack B, arms c^4, adjustable perforated bars E, and truss cable or rope c^5, substantially as set forth.

3. A windlass for barrels, consisting of the frame, the pulleys F *g'*, and the pulley b^2, arranged in a shaft having a pinion, a^2, and capable of a vertical movement, substantially as specified, in combination with the movable rack B, toggle-joint, arms c^4, holding-bars E, and the cable or truss-rope, for the purposes described.

292,818. SPRING BED-BOTTOM. WILLIAM A. HORRALL, Washington, Ind. Filed Aug. 25, 1883. (No model.)

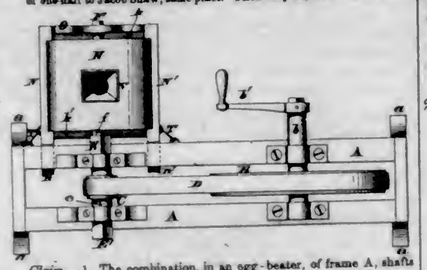
Claim.—The combination, with the ordinary transverse slats of a bed, of a series of coiled springs, having their lower ends, C, bent around and under the slats, staples driven through the slats and having their projecting points or nibs bent over the ends C, in opposite directions and curved around each other, and the short auxiliary strips or slats disposed transversely in relation to the slats, and on top the pairs of springs, and provided in their under side with a groove corresponding to and receiving the top coil of the springs, substantially as set forth.



292,819. LEGGIN. JOHN H. HOWARTH, Jr., New Haven, Conn. Filed Sept. 24, 1883. (No model.)

Claim.—1. The herein-described spring for leggins, consisting of the divided ring-shaped spring B, with the stays D C, extending, respectively, from the ends of the spring, the ends of said stays free or disconnected, substantially as described.

2. A leggin open at the side, having a divided ring-shaped spring, B, introduced at its upper end, and with stays D C, extending from the respective ends of the spring down the edges of the leggin, the ends of said stays disconnected except by the material of the leggin itself, combined with lacing devices on the two sides extending from the bottom upward to near the ends of the stays, substantially as described.

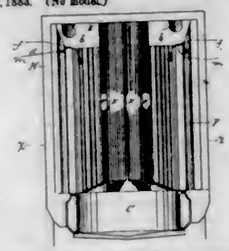


292,820. CAR-COUPLING. WILLIAM HUNTER, Grindstone City, Mich. Filed Oct. 16, 1883. (No model.)

Claim.—A double-link car-coupler consisting of the combination of coupling-pins B B', arms C C', sockets D D', having elongated openings

partially filled with rubber packing F F', short levers E, controlling-pins G G', and double links H H', all arranged and operating substantially as shown and specified.

292,821. EGG-BEATER. WILLIE JOHNSON, Cincinnati, Ohio, assignor of one-half to Jacob Shaw, same place. Filed July 20, 1883. (No model.)



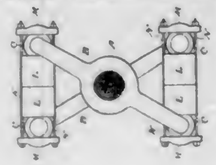
Claim.—1. The combination, in an egg-beater, of frame A, shafts *b c*, power-transmitters B C D, clutch E, and detachable rack N N' L, which latter carries the cylinder H H' J J' K K', having journaled within it the beater-shaft F G, as set forth.

2. The combination, in an egg-beater, of frame A, shafts *b c*, power-transmitters B C D, clutches E E', detachable racks N N' L P P' L, and cylinders H H' J J' K K' I I', said cylinders having journaled in them, respectively, the beater-shafts F F', for the purpose specified.

3. A mixing-machine consisting of the shells H H' A, attached to the semicircular heads J J' K K', and having journaled in it the beater-shaft F G, as herein described.

4. The combination of detachable tray N *s* N' *s'* L O *o* and cylinder H H' J J' K K' *k k'*, the latter having journaled within it the beater-shaft F G, for the purpose stated.

292,822. STEAM-GENERATOR. THADDEUS C. JOY, Titusville, Pa. Filed Jan. 26, 1883. (No model.)

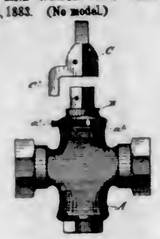


Claim.—1. In a circular segmental steam-generator, the inward projections K from the segments B, constructed as described, and with free water communication with the water-chamber D, and the steam-drum E, the inner ends of said projections forming the walls of the central fuel-reservoir, L, substantially as described, and for the purposes herein set forth.

2. In a segmental steam-generator, the hollow segment having guttered sides and provided with a radial steam-drum at its top, and hollow projections forming a part of the wall of the fuel-reservoir, having corrugated sides, substantially as shown and described.

3. In a circular steam-generator, the combination, with the outer casing having a smoke-pipe leading therefrom, and an annular water-chamber located above the grate-bars, of a series of hollow segments having guttered sides which form return-flues, radial steam-drums at the upper ends, and the corrugated projections which rest upon said annular chamber, forming the wall of the fuel-reservoir and direct flues between their opposite sides, substantially as described.

292,823. COUPLING FOR PROPELLER AND OTHER SHAFTS. JOHN KELLY, Peoria, Ill. Filed Nov. 26, 1883. (No model.)

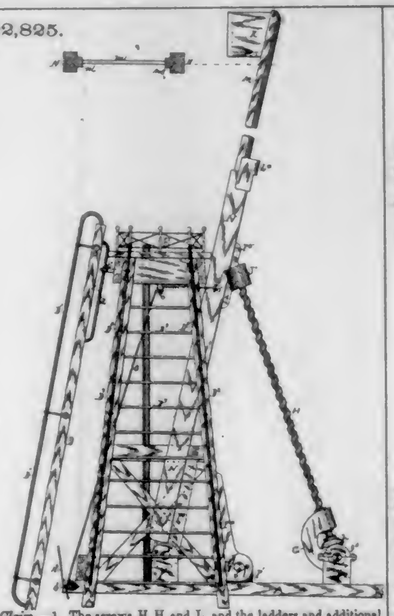


Claim.—1. In a shaft-coupling, arms fast on the contiguous ends of sections of shafting, and provided with spherical knobs at their extremities, in combination with sockets clasping said knobs, and means for connecting the sockets of one set of knobs to the sockets of the other set, substantially as shown, and for the purpose described.

2. In combination with the sections of shafting A A', the arms B B, having spheres C C at their ends, the blocks L L, caps M M, and bolts N N, substantially as and for the purpose specified.

3. In combination with the sections of shafting A A', the arms B B, having spheres C, spherical socket D, ring E, blocks L, caps M, and bolts N, substantially as and for the purpose set forth.

292,824. STOP AND WASTE COCK. JOHN H. KENNEDY, Cleveland, Ohio. Filed Aug. 2, 1883. (No model.)



Claim.—The combination, with the valve-body constructed as described, and provided with the laterally-projecting stops and a plug-valve, of the cap adapted to be removably secured to the projecting end of the plug-valve, and provided with an angular upper end for the attachment of a removable key or other suitable device, and with an arm, C', all of the above parts combined and adapted to operate as described.

292,825. FIRE-ESCAPE. GEO. M. KIN, Allegheny, Pa. Filed Mar. 1, 1883. (No model.)

Brief.—The structure is elevated to a vertical position by screws set in adjustable housings and operated by an arrangement of shafts, bevel-gear, and pulleys and belts. The upper section of the ladder, which has the box on its upper end, is extended by a screw having a head upon its upper end. A ladder having sliding bearings and side rails is secured upon one side of the main structure.

292,825.

Claim.—1. The screws H H and L, and the ladders and additional extension-ladder M, operated thereby, in combination with bevel-wheels mounted on shafts turning on bearings on the carriage and gearing with bevel-wheels on said screws, substantially as set forth.

2. In a fire-escape apparatus, the extension-ladder M, and box K, operated by the screw L in the V-slides m' m', substantially as described and shown.

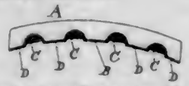
3. In a fire-escape apparatus, the sliding ladder D D, having the railings D′ D′, and slides *d d*, fixed to the tower, substantially as shown and set forth.

4. In a fire-escape apparatus, the tower B B, the fixed ladder D^2 D^2, sliding ladder D D, and guides attached to said fixed ladder for the said sliding ladder, in combination substantially as described and set forth.

5. In a fire-escape apparatus, the combination of the shaft f^2, wheels *f f*, screws H H, wheels *h h*, shaft J, screw-head L^2, with wheels *l l*, the head L, and ladder M, substantially as described and shown.

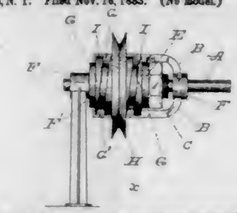
6. In a fire-escape apparatus, the combination of the pulleys T T′, clutch-pulleys *t t*′, belts T^2 T^3, and crank T^4, operated by hand-power or by steam, with the bevel-gear wheels on shafts that turn in bearings on the floor of the carriage, screws H H and L, operated by said bevel-gear wheels, and the extension-ladders operated by said screws, substantially as described and shown.

292,826. BUNG. JOSIAH KIRBY, Cincinnati, Ohio. Filed Nov. 5, 1883. (No model.)



Claim.—1. A bung having a circular recess or incision, or both, in its top face, and two incisions in its bottom face, the wood between the incisions in the bottom face of the bung remaining intact, the incisions in the opposite faces not penetrating to a common plane, substantially as and for the purposes specified.

2. A bung having a circular recess or incision, or both, in its top face, and two semicircular incisions in its bottom face, the wood between the incisions in the bottom face of the bung remaining intact, the incisions in the opposite faces not penetrating to a common plane, substantially as and for the purposes specified.



3. In combination, a bung having a circular recess or incision, or both, in its top face, and two incisions in its bottom face, the wood between the incisions in the bottom face remaining intact, and a disk of uncut wood, of the diameter of the bung and parallel to the faces of the bung, remaining intact between the inner ends of incisions in the opposite faces of the bung, substantially as and for the purposes specified.

292,827. BRAKE-SHOE. JOHN JOSEPH LAPPIN, Toronto, Ontario, Canada. Filed May 25, 1883. (No model.)

Claim.—A brake-shoe with chilled portions C in the face thereof, and soft projecting portions D between the chilled portions, which soft portions will wear and bring the shoe to an exact bed on the rim of the wheel before the chilled portions come in contact therewith, and thereby protecting the shoe, substantially as described, as a new manufacture.

292,828. MECHANICAL MOVEMENT. MICHAEL J. LAWLOR, Poughkeepsie, N. Y. Filed Nov. 16, 1883. (No model.)

Claim.—1. The mechanical movement, as described, comprising an automatic brake to hold the pinion-wheel, pulley, or drum, or an equivalent part, which give motion to the load on any lift, hoist, elevator, dumb-waiter, and all other lifting, hauling, and winding machinery at rest, whenever motion ceases to be communicated to the driving-shaft, and only then, substantially as described.

2. The described mechanical movement, consisting of the driving-shaft A, carrying a fixed dog or stud, B B, or their equivalents, stationary frame, tube, or sleeve F, a pinion-wheel, pulley, or drum, H, the annulars G G, and the intermediate rings, I I, and the connecting-rods G′ G′, substantially as described.

3. The described mechanical movement, consisting of the driving-shaft A, carrying a fixed dog or stud, B B, or their equivalents, stationary frame, tube, or sleeve F, a pinion-wheel, pulley, or drum, H, the annulars G G, and intermediate rings, I I, substantially as described.

4. The described mechanical movement, consisting of the driving-shaft A, carrying the dog or stud B B, or their equivalents, stationary frame, tube, or sleeve F, pinion-wheel, pulley, or drum H, the annular G, and wabbling ring I, substantially as described.

5. The retained non-revolving wabbling ring I, fixed to the stationary frame, tube, or sleeve by socket and stud resting between revolving surfaces inclined to the axis of motion of the shaft, substantially as shown and described.

6. The two retained non-revolving wabbling rings I I, fixed, as described, to the frame, tube, or sleeve by socket and stud resting between two revolving surfaces inclined to the axis of motion of the shaft, substantially as shown and described.

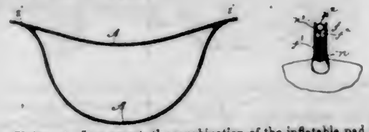
7. The loosely-mounted pinion-wheel, pulley, or drum, constructed with beveled side or sides, as described, so arranged as to clutch the non-revolving rings whenever said pinion-wheel, pulley, or drum revolves independently of the annulars G G.

8. The loosely-mounted annular G or annulars G G, provided with slots J J, corresponding with the slots J J in the pinion-wheel, pulley, or drum H, the said parts made as shown and described, and for the purposes set forth.

9. The combination of the shaft A and its dog or stud B B with the stationary frame, tube, or sleeve F, pinion-wheel, pulley, or drum H, annulars G G, wabbling rings I I, with the heads F′, E, and C, substantially as shown and described, and for the purposes set forth.

10. The combination of the dog or studs B B on the driving-shaft A with the sides of the slots J J in the pinion-wheel, pulley, or drum H, and the annular G or annulars G G, as described and shown, and for the purpose set forth.

11. The combination of the loosely-mounted pinion-wheel, pulley, or drum H with the annular G or annulars G G and the non-revolving wabbling ring or rings I I, substantially as shown and described, and for the purposes set forth.



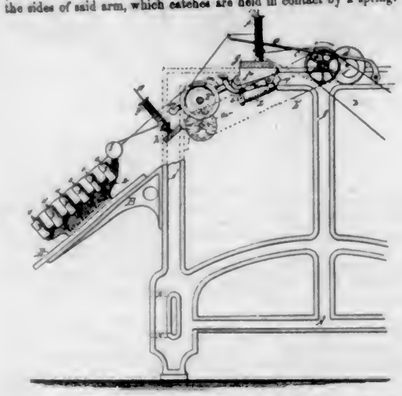
12. The combination of the wabbling ring I or rings I I with the stationary frame, tube, or sleeve F by the studs or bolts I′ and sockets, as shown and described, and for the purposes set forth.

13. The described non-revolving wabbling ring I or rings I I, for the purpose of locking the pinion-wheel, pulley, or drum H to the stationary frame, tube, or sleeve F, to which the wabbling ring I or rings I I are fixed, as shown and described, and for the purposes set forth.

14. An automatic brake or clutch mechanism for lifts, hoists, elevators, and all other lifting, hauling, and winding machinery operated by the resistance of the load upon the pinion-wheel, pulley, or drum, and liberated only by the action of the driving-shaft through its dog or studs B, substantially as herein shown and described.

15. The pinion-wheel, pulley, or drum H, the stationary frame, tube, or sleeve F, the annular G or annulars G G, wabbling ring I or rings I I, retained from revolving by socket and stud I′, operated by the resistance of the load, combined, substantially as shown and described, to hold the load from ascending or descending, as hereinbefore set forth.

292,829. CORSET-PAD. ZENOWE LEDOCHOWSKI, La Salle, Ill. Filed Feb. 19, 1883. (No model.)

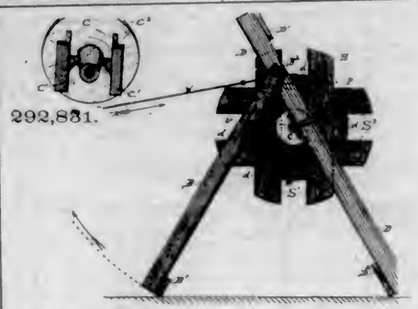


Claim.—1. In a corset, the combination of the inflatable pad having tube *f*, constructed with the inner valve-seat *f′*, and the outer socket, f^3, and the valve *n*, movable to and from the seat *f′*, and having its stem *n′* extended through the tube *f*, with its outer end or hand-hold, n^3, incased in socket f^3, substantially as described and shown, and for the purposes specified.

2. In a corset, the inflatable pad, substantially as described and shown, molded in one piece, and provided with the lateral flange *i* and the tube *f*, formed with valve-seat *f′* at its inner end, and socket f^3, incasing the hand-hold n^3 of the stem *n′* at its outer end, as and for the purposes specified.

292,830. SILK-CLEANING MACHINE. JOHN N. LEONARD, Northampton, Mass. Filed June 7, 1883. (No model.)

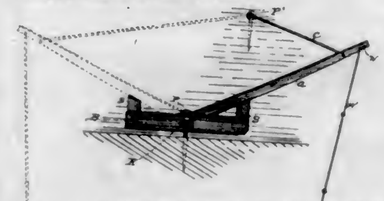
Brief.—The thread passes from the supply-bobbin between a tension-regulating shaft and arm, is thence coiled around a series of spindles placed in parallel rows upon an inclined frame, where it is cleaned of projections by the rubbing of the coils upon each other, thence around the drawing-roller and onto the take-up bobbin. The drawing-roller is supported in an arm pivoted to the front of the frame supporting the take-up bobbin, and may be held out of contact with its driving means by an arm pivoted to the back of said frame, the arms being engaged by catches on the sides of said arm, which catches are held in contact by a spring.



Claim.—1. The combination of drum *c*, pulley *w*, shaft w^2, spindles 17 and 18, and means for driving said shaft and for rotating spindle 17 from said drum *c*, with the drawing-roller *v*, having pulley 6 thereon, and means for supporting the latter over pulley *w*, the series of spindles 4, and the rotatable tension-regulating device, consisting of shaft 9 and arm 10, supported side by side, substantially as set forth.

2. The combination, with mechanism, substantially as described, for drawing a line of silk over a series of cleaning-spindles, of a series of spindles arranged in two parallel rows, a guide-roller, 12, located between said rows, and a rotatable tension-regulating device consisting of the shaft 9 and hand-wheel 5, having an arm, 10, said shaft and arm supported side by side, substantially as set forth.

3. The combination of the pulley *w*, frame *n*, drawing-roller *v*, and the pulley 6, with the arms *m* and *x*, having the catches *z* and 14 thereon, and the spring *z*, connecting said arms, substantially as set forth.



292,831. REEL FOR CHECK-ROW WIRES. CHARLES S. LOCKE, Joliet, Ill. Filed Oct. 20, 1883. (No model.)

Claim.—1. The reel S for check-row wires described, having the heads *c*, hubs c^2, and hooked lugs *c′ c′*, in combination with a supporting-frame, as and for the purpose set forth.

2. In a reel for check-row wires, the head *c*, having the hub c^2 and hooked lugs *c′ c′*, in combination with the reel S, as and for the purpose set forth.

292,832. ANCHOR FOR CHECK-ROW WIRES. CHARLES S. LOCKE, Joliet, Ill. Filed Oct. 20, 1883. (No model.)

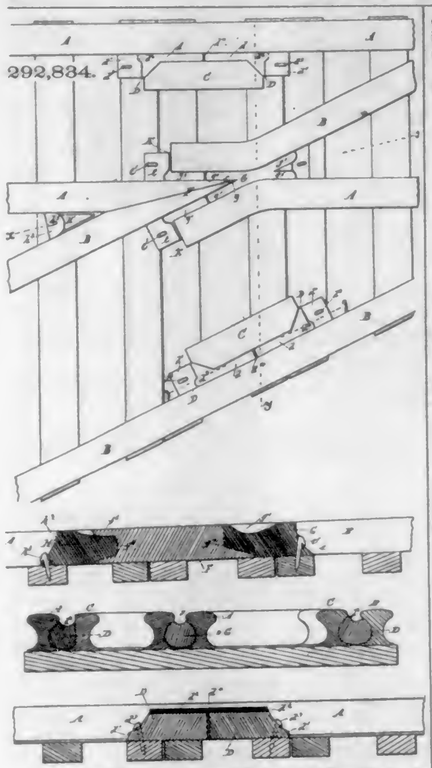
Claim.—In the anchor for check-row wires described, a beam, B, having a tongue, *a*, pivoted thereto, and a pin, P, for securing it in a horizontal position in the earth, and provided with an upturned arm or rest, S, secured to its outer end or ends, forming a support for said pivoted tongue, for the purpose set forth.

292,833. FOLDING BOX. GEORGE LUETY, Brooklyn, N. Y. Filed Mar. 1, 1883. (No model.)

Claim.—1. A folding box consisting of a bottom having a narrow piece attached to it at two sides, to which are hinged side pieces, and with a cover or covers hinged to one or more of the side pieces, and with two end pieces hinged to the bottom and rising up a short distance above the side pieces, the said end pieces being cut partly through at the top to make a binding-seat for the cover and end of the box, substantially as shown and described.

2. In a folding box, the combination of the following parts: the bottom and pieces B B, base F, the side pieces, C C, and end pieces, E E, both arranged to fold inward, the stops G, bars or hooks and eyes H, and cover D, substantially as and for the purpose set forth.

292,834. SAFETY-GUARD FOR RAILROAD-FROGS. JOHN LYNCH, New Haven, Mich. Filed June 27, 1883. (No model.)

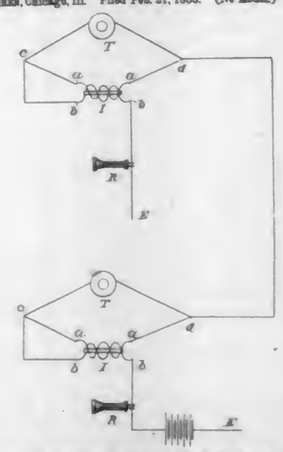


Brief.—A railroad-frog consisting of a divided flanged guard placed between the check-rails of the main and side rail. Flanged blocks, together with a flanged guard-block, are placed between the toe of the frog and the main and side track rails. A V-shaped guard is also placed at the heel of the frog. All the guards have grooves for the flanges of the wheels.

Claim.—1. The combination of the divided flanged guard D with a main rail, A, and check-rail C, substantially as and for the purpose described.

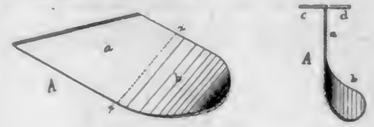
2. The combination of the divided flanged guard D with a branch or side track rail, B, and a check-rail, C, substantially as described.

3. The combination of the flanged guard-blocks E and the doubly-flared guard-block G with the frog F, and the rails A and B, substantially as and for the purpose described.



292,834.

4. The solid rigid V-shaped guard H, beveled at h^2, provided with a spike-hole at h^2, and formed with a point, f^9, in combination with the frog F and rails A and B, substantially as and for the purpose described.



5. The frog-section of a railroad-track, provided with the rigid divided guards D D G E, and the rigid guard H, all constructed, combined, and arranged substantially as described.

292,835. APPARATUS FOR TELEPHONIC TRANSMISSION. JACOB F. MILLER, Chicago, Ill. Filed Feb. 21, 1883. (No model.)

Claim.—The combination, substantially as described, of a telephone-transmitter, an inductorium, a receiver, and a charged main line, one coil of the inductorium and the receiver being in the main line and the other in one branch of said main line, the other branch of which includes the transmitter, substantially as set forth.

292,836. HARROW-TOOTH. FREEMAN C. MERRILL, South Paris, Me. Filed July 30, 1883. (No model.)

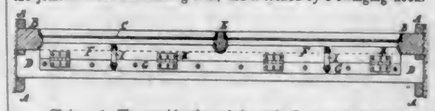
Claim.—A harrow-tooth formed of sheet metal, having the colter part inclined backward edgewise, and the working part *b* turned or bent laterally in the form of a section of a cylinder starting from the colter part at a forward inclination of approximately forty degrees and extending one-sixth of a circle, or thereabout, substantially as and for the purpose herein specified.

292,837. NECKTIE HOLDER AND FASTENER. HENRY F. MILLER, New York, N. Y. Filed Nov. 19, 1883. (No model.)

Claim.—1. An improved necktie holder and fastener consisting of the elastic bar B, provided with end arms, U, the latter terminating in a projecting point, F, all arranged substantially as shown, and for the purpose described.

2. An improved necktie holder and fastener consisting of the elastic bar B, having a central depression, C, and provided with end arms, U, the latter terminating in a projecting point, F, all arranged substantially as shown, and for the purpose described.

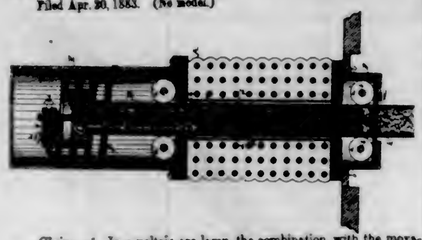
292,838. WATCH-WINDING MECHANISM. ROBERT F. MITCHELL, New Haven, Conn. Filed Oct. 22, 1883. (No model.)



Claim.—1. A stem-winding device for watches, consisting of the case-stem D and case-ring C, being adapted to move upon the case in an arc concentric with the watch-case, said case-ring C being provided with a projection, *b*, to which are attached the pawl *c* and spring *d*, which operate upon the ratchet E, gear *e*, and mainspring barrel or post *g*, the case B being provided with the opening *k* in the flange *a*, substantially as described and shown, all being arranged to operate as and for the purpose set forth.

2. In a stem-winding device for watches, the combination of the case-stem D and movable case-ring C, pawl *c*, spring *d*, ratchet E, gear *e*, plate *h*, mainspring barrel or post *g*, and journal *i*, all arranged to operate substantially as and for the purpose set forth.

292,839. COMBINED DUST-EXCLUDER AND WINDOW-FASTENER. FREDERIC H. MOORE, Boston, Mass. Filed Oct. 6, 1883. (No model.)



Brief.—Combined dust-exceleder and window-fastener, consisting of a piece hinged to the top rail of lower sash, which falls and covers the joint between the meeting-rails, and is locked by a swinging hook.

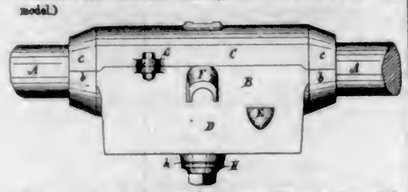
Claim.—1. The combination of the strip G, secured to the top of the meeting-rail of the lower sash, D, of a window, with the hinged flap F, as shown and described.

2. The combination, with the meeting-rails D D′ in a window-sash, of a hinged cover, F, and hooks I I, the latter pivoted to the strip G, and engaging with pins on the hinged flap F, substantially as and for the purpose set forth.

292,840. VOLTAIC-ARC LAMP. OTTO A. MOSES, New York, N. Y. Filed Apr. 20, 1883. (No model.)

Claim.—1. In a voltaic-arc lamp, the combination, with the movable carbon-carrier and the regulating magnet or solenoid, of a magnetic clamp consisting of oppositely-attracted parts, and operating to lift said carbon-carrier by contracting and shortening upon it, substantially as set forth.

2. In a voltaic-arc lamp, the combination, with the movable carbon-carrying tube and the divided core or armature within said tube, of two oppositely-attracted intensifiers, substantially as set forth.

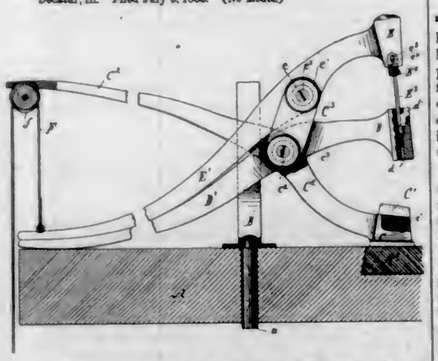


3. In a voltaic-arc lamp, the divided core or armature having a body tapering from one end to the other, substantially as set forth.

4. In a voltaic-arc lamp, the divided core or armature having a tapered body and straight springs or wires in contact with the carbon-carrying tube near their lower ends only, substantially as set forth.

5. In a voltaic-arc lamp, the combination, with the divided core or armature within the tube, of the disk attached below said core or armature, substantially as set forth.

6. In a voltaic-arc lamp, the combination, with the cage holding the intensifier, of the loose ring or washer placed therein, substantially as set forth.



292,841. COMBINED SHAFTING-BOX AND OIL-RESERVOIR. CLAUDIUS B. MOULTON, North Cambridge, Mass. Filed Oct. 5, 1883. (No model.)

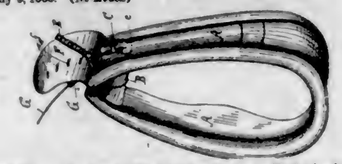
Claim.—1. In a shafting-box, the upper and lower portions, C B, constructed with conically-shaped converging ends *c b*, substantially as and for the purpose set forth.

2. In a shafting-box, the lower portion, B, constructed with the inclined ends *b b*, in combination with the guides J J, converging at their lower ends, the passage *d*, and the reservoir D, substantially as and for the purpose set forth.

292,842. TOOL FOR DRIVING STAPLES. FRANKLIN W. NEVIUS, Decatur, Ill. Filed July 5, 1883. (No model.)

Claim.—1. In a staple-fastening instrument, the combination of a driving-jaw, a clinching-jaw, a compressing-jaw, and means for forcibly depressing said compressing-jaw, substantially as described.

2. In a staple-fastening instrument, the combination of a driving-jaw, a clinching-jaw, and a compressing-jaw having guide-channel therein, and having means for forcibly depressing said compressing-jaw, substantially as described.



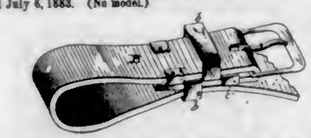
3. In a staple-fastening instrument, the combination, with the clinching-jaw and the driving-jaw having the driving-plate, of the compressing-jaw having a feed-channel extending through the same, and a delivery-channel for staples leading into said feed-channel, substantially as described.

4. The combination, with a clinching-jaw and a compressing-jaw, of a driving-jaw having a driving-plate swiveled thereto, substantially as described.

5. The combination, with the clinching-jaw, the compressing-jaw, and the driving-jaw and handles for operating said jaws, of the strap F and pulley *f*, substantially as described.

6. The combination, with the several jaws of the instrument, of the swiveled guide for sustaining said jaws in position, substantially as described.

292,843. HORSE-COLLAR. FRANKLIN W. NEVIUS, Decatur, Ill. Filed July 5, 1883. (No model.)



Claim.—1. In a horse-collar, the combination, with the hook C and chain E, of the staples holding said hook and chain, and passing through the ends of the collar, substantially as described.

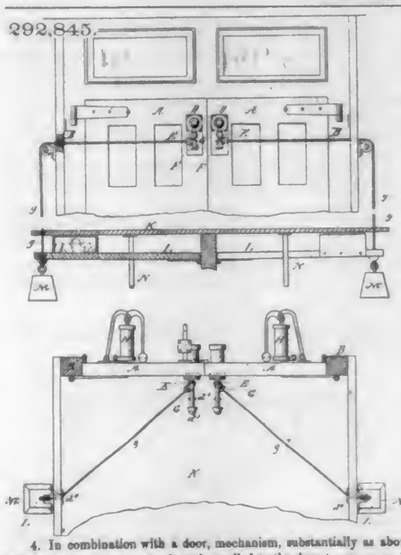
2. In a horse-collar, the combination of the hook, the hook-chain, and the housing having openings for the hook, substantially as described.

3. In a horse-collar, the combination of the broad hook C, the flat hook-chain E, the housing F, the strip G, and guard-wire G′, the several parts being connected with the collar by means of staples passing through the ends of the collar and clinched upon its under side, substantially as described.

292,844. HARNESS-LOOP. EDMOND R. NORTHCUTT, Columbus, Ohio. Filed July 6, 1883. (No model.)

Claim.—The combination of the plate A, side lugs, *c* and *c′*, adjoining the ends of said plate, a loop above and a loop under said plate, and made integral therewith, substantially as and for the purpose described.

292,845. METHOD OF AUTOMATICALLY OPERATING DOORS AND GATES. LEWIS C. NORTON and JOHN A. SHERMAN, Boston, Mass.; said Sherman assignor to said Norton. Filed Jan. 5, 1883. (No model.)



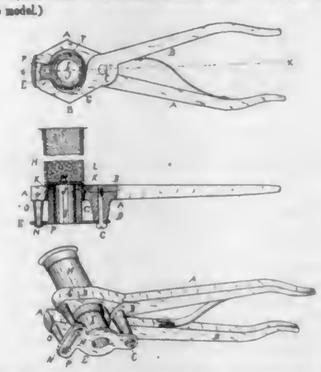
Brief.—The doors are fastened by an automatic spring-catch. They are opened, when unfastened, by a cord and weight, the end of the cord having a ring slipped over a pivoted latch on the door. The pivoted latch engages a pivoted spring-catch, through an arm of which slides the piston-rod of an air-cushioning buffer. The cord and weight are released from the door by an arm on the piston-rod striking the arm of the pivoted spring-catch, which releases the pivoted latch from the ring on the cord. The doors are each closed by a spring-buffer. The initial opening of the doors is accelerated by a weighted arm acting upon the counter-weight, and limited in its movement by a stop.

Claim.—1. In a door-operating device, the combination, with a door and a suitable stop or wall, of a weight suitably attached to the door, whereby it may be opened, and a releasing mechanism substantially like that above described, whereby the said weight at the proper time will be detached from the door, all as and for the purposes set forth.

2. In a door-operating device, the combination of suitable mechanism for opening the door, means whereby such mechanism may be attached to the door, and a buffer adapted to yield slowly to any pressure brought to bear upon it, and at the proper time to operate the attaching mechanism and disconnect the door and opening mechanism, substantially as set forth.

3. The releasing mechanism above described, consisting of a buffer provided with a suitable stop, d^3, adapted to engage with and operate the latch E, as and for the purposes set forth.

292,845.

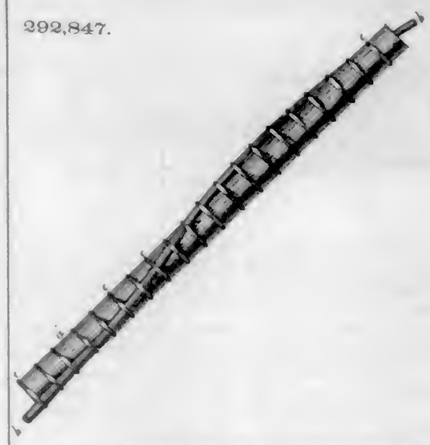


4. In combination with a door, mechanism, substantially as above described, whereby an extra force is applied to the door to overcome its first inertia, for the purposes set forth.

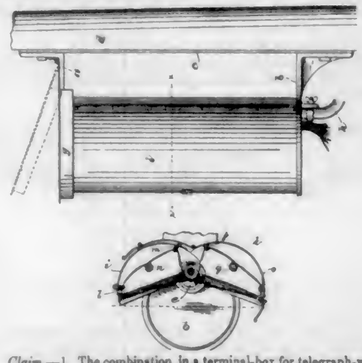
5. In a door-operating device, the hinged weighted arm L and its stop N, in combination with the weight M and suitable means for attachment to the door, substantially as described.

6. In a door-operating device, the combination of a suitable weight for opening the door, the buffer D and its releasing-latch, and a suitable weight or spring for closing the door, substantially as set forth.

292,846. CARTRIDGE-SHELL CREASER. FRED. E. NYE, WILLIAM E. NYE, and JOHN W. MATTHEWS, Monmouth, Ill. Filed Aug. 29, 1883. (No model.)



Claim.—In cartridge-shell creasers which are composed of lever-jaws and a gage-post, the frame E, extending past the post and over the jaws, and provided with a segment-slot, P, in combination with studs O O, which are attached to the ends of the jaws and project through the slot to serve as a guide automatically to center the post between the jaws by the opening of them, as specified.



292,847. AERIAL CABLE. WILLIAM R. PATTERSON, Chicago, Ill., assignor, by mesne assignments, to the Western Electric Company, same place. Filed Dec. 5, 1881. (No model.)

Claim.—The combination, with the flexible lead pipe of a telegraph-cable, of the spirally-wound suspending-wire and the exterior spirally-wound tie-wire, whereby the suspending-wire is held in place and the lead pipe of the cable protected from external injury, substantially as and for the purpose specified.

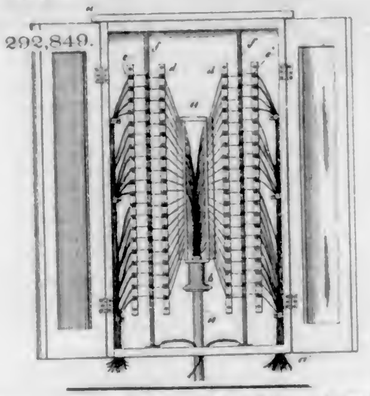
292,847.

292,848. TERMINAL-BOX FOR TELEGRAPH-CABLES. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 9, 1883. (No model.)

Claim.—1. The combination, in a terminal-box for telegraph-wires, of one or more pairs of strips provided with corresponding binding-posts, and a lightning-arrester rod between the strips of each pair, said strips and rod being substantially parallel, whereby the wires may be distributed, substantially as set forth.

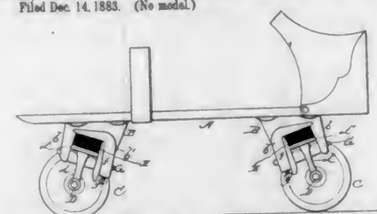
2. The combination, with the brackets, of the semi-cylindrical pieces, the pivots or hubs, one of said hubs being hollow, and the flap hinged to one of said cylindrical pieces, whereby the binding-posts and lightning-arresters are protected, substantially as and for the purpose specified.

3. The cable extending toward the top of the case, in combination with the lightning-arresters and distributing-wires and the eccentrically-pivoted segmental semi-cylindrical pieces, as and for the purpose specified.



4. The disks attached to the support, in combination with the parts of the case pivoted eccentrically, the pipe of the cable and distributing-wires passing through the hollow hub, and the pairs of strips for the binding-posts and the lightning-arresters, as described.

292,849. TELEPHONE-CABLE TERMINAL. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 22, 1883. (No model.)

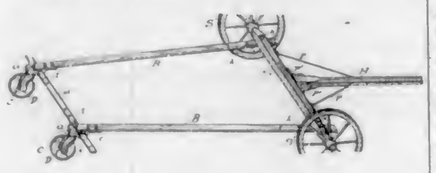


Claim.—1. The combination, with an electric cable, of a stuffing-box placed about the end of the pipe, a box provided with perforations for the different wires, and binding-posts exterior to the perforated box, whereby the wires of the cable may be carried out singly, and moisture prevented from penetrating the fibrous covering between the wires at the end of the pipe, substantially as and for the purpose specified.

2. The box provided with perforated sides of non-conducting material, placed at the end of a telegraph-cable, in combination with the conductors of said cable drawn through said perforated sides, whereby said conductors are carried out singly toward the binding-posts, while moisture is prevented from being drawn by capillary attraction to the contiguous conductors at the end of the cable, substantially as and for the purpose specified

292,849.

292,850. ROLLER-SKATE. ELWOOD C. PHILLIPS, Richmond, Ind. Filed Dec. 14, 1883. (No model.)

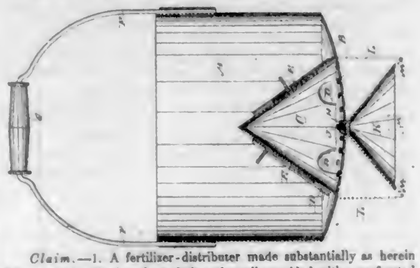


Claim.—1. In a roller-skate, the combination of the plate B, having downwardly-projecting hangers *b b'*, the plate F, having slotted flange *f*, the seat *d'*, elastic cushion E, and pin G, constructed and arranged substantially as described, and for the purpose set forth.

2. In a roller-skate, the combination of the plate B, having downwardly-projecting hangers *b b'*, the plate F, having slotted flange *f*, the seat *d'*, elastic cushion E, pin G, and screw *g*, substantially as and for the purpose described.

3. In a roller-skate, the combination of the plate B, having downwardly-projecting hangers *b b'*, the plate F, having slotted flange *f*, and provided upon its under side with a spur, *f'*, the elastic cushion E, having a depression to receive said spur, the seat *d'*, the pin G, having a recess near one end, and the screw *g*, all constructed and arranged in the manner described, and for the purpose set forth.

4. In a roller-skate, the combination of the plate B, having downwardly-projecting hangers *b b'*, the plate F, having side wings, F', and slotted flange *f*, the seat *d'*, elastic cushion E, and pin G, constructed and arranged substantially as described, and for the purpose set forth.



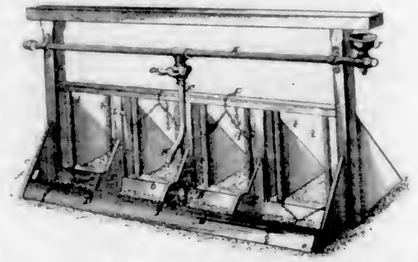
292,851. HARVESTER-TRUCK. ARTHUR E. POTTER, Joliet, Ill. Filed Sept. 22, 1883. (No model.)

Claim.—1. The combination of the reaches B B, having the row of holes *h h*, axle S, cross-bar *a'*, having the row of holes *i i*, casting *a*, having the eye *a''* and lug *i*, provided with the hole *i'*, wheels S' S', and casters D D, all adapted to operate as and for the purpose set forth.

2. In an independent harvester-truck, the reaches B B, pivoted to the front axle, S, so their rear ends may have horizontal motion, in combination with the perforated cross-bar *a'*, as and for the purpose set forth.

292,852. FERTILIZER-DISTRIBUTER. AUGUSTINE REGER, Somerville, N. J. Filed Feb. 27, 1883. (No model.)

Claim.—1. A fertilizer-distributer made substantially as herein shown and described, and consisting of a pail provided with a perforated bottom, over which perforations a cone is fastened, which is provided with apertures in its lower edge, as set forth.



2. In a fertilizer-distributer, the combination, with the pail A, having a concave bottom, B, provided with perforations in the middle, of the cone C, secured on the bottom and provided with apertures D at its lower edge, substantially as herein shown and described, and for the purpose set forth.

3. In a fertilizer-distributer, the combination, with the pail A, having a perforated bottom, of the cone C, having apertures D in its lower edge, and of the slides E, substantially as herein shown and described, and for the purpose set forth.

4. In a fertilizer-distributer, the combination, with the pail A, having a perforated bottom, B, of the cone C, having apertures D at its lower edge, and the cone K, having a screw, J, at its apex, which screw is adapted to be screwed into the bottom of the pail from below, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the vessel A, having a perforated bottom, of the cone K and the band L, surrounding it, substantially as herein shown and described, and for the purpose set forth.

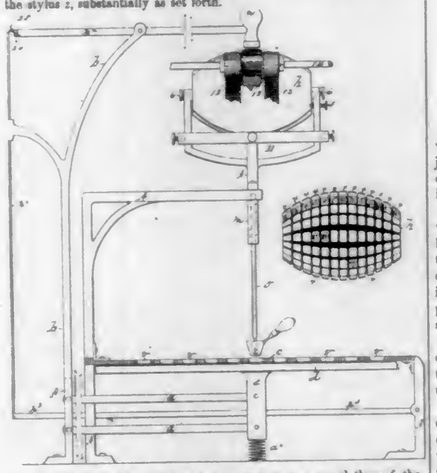
292,853. ANIMAL-TROUGH. CARVER REMINGTON, Hion, N. Y. Filed June 21, 1883. (No model.)

Claim.—1. The water-trough D, pivoted by links *f* at its ends, in combination with the notched or shouldered supports P, said parts being arranged to operate substantially as described, whereby said trough, when elevated, can be used for supplying cattle with water, and when swung down and turned over is made to form the outer side of the manger, as set forth.

2. In combination with the trough D, pivoted to links which are in turn pivoted at their opposite ends to the manger or frame-work, supports P, for retaining the trough with its open side up when elevated, and the water-pipe E, arranged to deliver water to the trough, substantially as described.

3. The pivoted and swinging trough D, provided with a spout or opening, I, in combination with a drain-pipe, H, the said parts being arranged substantially as shown, whereby when said trough is elevated it shall be in position to deliver its surplus water to the drain-pipe, as set forth.

4. The combination and arrangement, in connection with animal-stalls, of the pivoted and swinging trough D, the pipe F, for delivering water to the trough, and the drain-pipe H, for receiving and conducting the surplus water from the trough, as and for the purpose set forth.



292,854. TYPE WRITING MACHINE. HENRY B. RICHARDSON, Amherst, Mass. Filed July 17, 1882. (No model.)

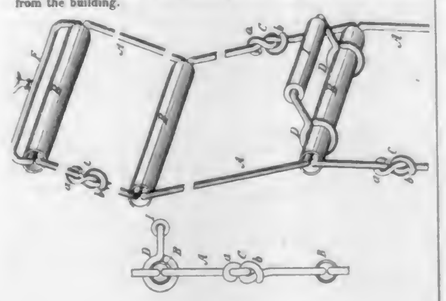
Claim.—1. In a type-writing machine, a gimbal-frame pivotally supported therein, a letter-block hung in said frame and bearing a series

of printing-characters upon one or more surfaces thereof, and adapted to be rotated on its bearings, a hammer to strike upon said block, and operating mechanism, a movable letter-plate bearing a series of letters and characters upon its surface, the stylus *z*, and appliances, substantially as described, connecting said gimbal-frame and stylus, whereby the latter is permitted to be moved to different positions over the surface of said letter-plate and to be pressed thereupon and moved downward with the latter, combined and operating substantially as set forth.

2. The stylus *z*, of conical form, a movable letter-plate, and a stylus-plate located over said letter-plate and provided with dissimilar perforations, combined and operating substantially as set forth.

3. In combination, the movable letter-plate *d*, the perforated stylus-plate *c*, the gimbal-frame D, having the tube *m* thereon, the rod *o*, and the stylus *z*, substantially as set forth.

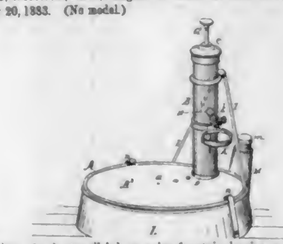
4. The pivoted bar n^3, bearing hammer *n* on one end thereof, the movable letter-plate *d*, lever n^2, rod n^1, and the stylus *z*, capable, by means substantially as described, of lateral and vertical movements, and adapted to be pressed upon various parts of said letter-plate, combined and operating substantially as set forth.



5. In combination, the letter-plate *d*, having the slotted posts *e e* thereon, the parallel bars *a*, and the springs a^2, substantially as set forth.

6. The combination, in a type-writing machine, of a paper-carriage provided with the rack *s*, having two serrated edges, of the stylus *z*, the stylus-plate *c*, provided with dissimilar perforations, the movable letter-plate *d*, and mechanism, substantially as described, interposed between said letter-plate and rack *s*, whereby the latter is allowed to move along to a degree proportionate to the deflective movement of said letter-plate, substantially as set forth.

7. The combination, with the movable table *d* and lever n^2, and with the rack *s*, of the lever 26, the lever 15, the sliding bar 16, provided with pin 19, the dog 20, adapted to engage with said bar, and springs 18, 22, and 30, substantially as set forth.



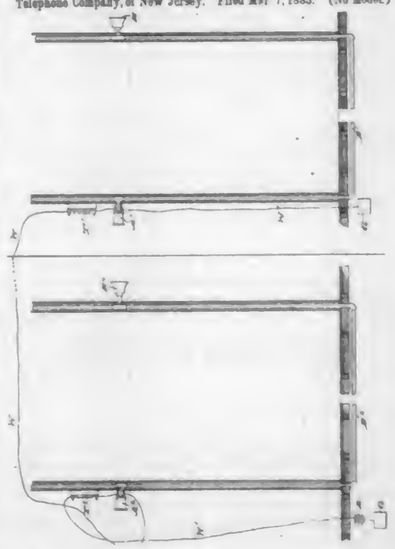
292,855. FIRE-ESCAPE. JOHN C. RICHBERG and DAN BROBSTON, Chicago, Ill. Filed Mar. 26, 1883. (No model.)

Brief.—The bail attached to the rungs may be loose on the rung and hang in front of the ladder for a hand-hold, or turned to the back side of the ladder and rigidly fastened to the rung for spacing the ladder from the building.

Claim.—In a metallic flexible ladder, the combination, with the rungs thereof, of the handles consisting of the horizontal portion I and the portion D, embracing the said rungs, substantially as set forth.

292,856. STENCIL INK OR COLOR FOUNTAIN. LEVI R. ROCKWOOD, Worcester, Mass., assignor to Mason M. Flint, same place. Filed July 20, 1883. (No model.)

Claim.—1. A stencil ink or color fountain having a reservoir provided with a flexible top plate, in combination with a tube or column projecting therefrom and adapted to be used as a lever for depressing the central portion of said top plate, substantially as and for the purpose hereinbefore set forth.



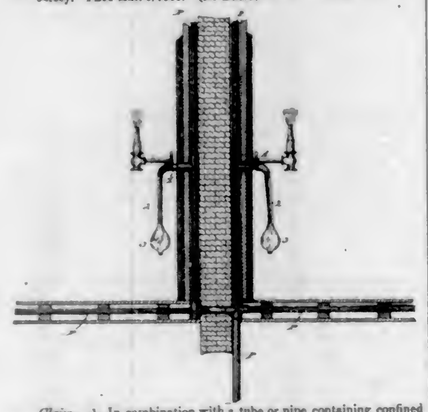
2. A stencil ink or color fountain having a flexible top plate provided with a delivery-orifice communicating through a tube with the lower part of the reservoir, and a column or tube projecting above said top plate, in combination with a re-enforce piece rigidly attached to said column, and provided with an arm extended along the top plate, to which it is attached, to act in connection with said column as a lever for depressing said top plate, substantially as and for the purpose hereinbefore set forth.

3. In a stencil ink or color fountain, the combination, with the reservoir having the flexible top plate, A', and the tube or column B, of the re-enforce lever D, attached to and connecting said plate and column, substantially as and for the purpose set forth.

4. In a stencil ink or color fountain, the combination, with the reservoir having depressible top plate, A', internal tube, E, and tubular column B, adapted for depressing said top plate, as set forth, of the air-valve G, adapted for automatically admitting air to the interior and for preserving the air-pressure therein, substantially as hereinbefore set forth.

5. The stencil ink or color fountain constructed with the palette-surface A', reservoir A, and tubular column B, arranged as described, and provided with the detachable bath-reservoir L, and means for securing the same to the reservoir A, in the manner shown and for the purpose set forth.

292,857. GAS AND MAGNETIC TELEPHONE SYSTEM. JAMES HARRIS ROGERS, Washington, D. C., assignor to the American Electro-Gas Telephone Company, of New Jersey. Filed Mar 7, 1883. (No model.)



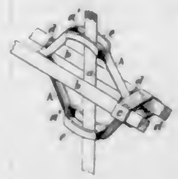
Claim.—1. The combination, with two or more electro-magnetic telephones connected in circuit, of a gas or other pipe and gas-telephones, consisting of diaphragms stretched or placed over suitable apertures in said pipe or in pipes connected therewith, so as to confine the gas or aeriform fluid in the pipe or pipes, while permitting the passage of sound-waves, and causing said sound-waves to act upon the diaphragm of the electro-magnetic-telephone instrument, substantially as herein set forth.

2. The combination, with a gas or other pipe or pipes provided with gas-telephone receiving and transmitting instruments, as described, of a diaphragm acted on by vibrations in the gas or aeriform fluid confined in said pipes, and an electric circuit closed and broken by the vibrations of said diaphragm, and serving to actuate an electric or other call signal, substantially as set forth.

3. The combination of a pipe or pipes containing gas or aeriform fluid, an electro-magnetic receiving and transmitting instrument having a hollow magnet, through which sound-waves in the fluid of the pipes will act on the telephone-diaphragm, and a second electro-magnetic receiving-instrument connected in circuit with the first substantially as and for the purposes set forth.

4. The combination of a system of pipes containing gas or aeriform fluid and provided with gas-telephone receiving and transmitting instruments, with a system of electro-magnetic-telephone receiving and transmitting instruments connected in circuit and adapted to receive sound-vibrations from the pipes, as and for the purposes set forth.

292,858. PIPE-TELEPHONE. JAMES HARRIS ROGERS, Washington, D.C., assignor to the American Electro-Gas Telephone Company, of New Jersey. Filed Mar. 6, 1883. (No model.)



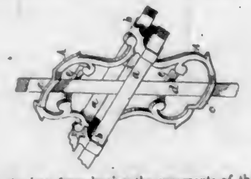
Claim.—1. In combination with a tube or pipe containing confined air or gas, a projecting elastic tube closed at its outer end to confine the fluid, and provided with a sensitive diaphragm consisting of a stretched portion of the elastic tube, whereby the said diaphragm is adapted to receive and transmit sound vibrations, as described.

2. In combination with a system of pipes containing confined air or gas, a projecting tube closed at its outer end to confine the aeriform fluid, and provided with a sensitive diaphragm consisting of a stretched portion of the said elastic tube, and adapted to receive and transmit audible sounds, as described, and a second tube and diaphragm for reproducing the sounds, as set forth.

3. In combination with a system of pipes containing confined air or gas, projecting elastic tubes closed at their outer ends, and provided with sensitive diaphragms consisting of stretched portions of the said elastic tubes, as described, whereby audible sound may be transmitted and reproduced by means of the diaphragms and the aeriform fluid confined between them.

292,859. IRON FENCE. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 24, 1883. (No model.)

Claim.—1. The combination, with the double or parallel rails lying in the same horizontal plane, of the ornament having the ends of its sections adapted to engage with the inner surfaces of said rails, and the transverse clip-band adapted to slip over the ends of said sections and secure the whole together.



2. In an iron fence having double rails, an ornament having a vertical longitudinal opening or slot in each of its two opposite arch-bars, said slot or opening being for the purpose of allowing the picket-rod to extend therethrough and to admit of the adjustment of the ornament and rails without disturbing the relative position of the picket-rod.

3. In a double-rail iron fence, an ornament in two opposite sections, having its ends shaped to conform to the space between the rails upon either side of the same, and confined therein by an encircling band, as hereinbefore set forth.

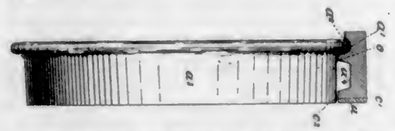
4. The combination, with the double parallel rails and the picket, of the ornament and the clip-band, the former having the vertical oblong slot through the middle of its bars extending in the central longitudinal line of the fence, whereby said ornament is adapted for the insertion of the picket, and the necessary adjustment of said rails and ornament to the latter allowed, as set forth.

5. The combination, with the square parallel rails *b*, the intermediate pickets, *a*, and the band *c*, of the ornament-sections A, having the angular ends *d*, said ornament-sections being vertically slotted to admit the picket and permit of the adjustment of the rails and ornament thereto, as specified.

292,860. IRON FENCE. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 24, 1883. (No model.)

Claim.—1. An iron fence having the ornaments of the pickets secured to the clips, which connect the rails by notches engaging with said clips upon either side of the same, whereby they are made independent in their adjustment of the picket-rod, as set forth.

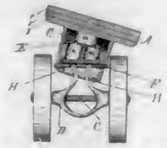
2. In a double-rail iron fence having the ornaments and rails made to adjust to the picket, the ornament A, composed of an upper and lower section, each provided with bent bars extending around the picket-rod above and below the rail in separate horizontal planes, and having their ends provided with means for securing them in position to the clip or band which connects the rails together, substantially as and for the purpose set forth.



3. An ornament for the picket of an iron fence, which is adjustable independently of the rod, and having an outer arched frame and a cross-bar between the arch and its engaging ends, both the arch and the cross-bar being bent outward in opposite directions, to allow of the adjustment of the ornament and rails irrespective of the line of the picket-rod, as set forth.

4. The ornament-sections A, formed with the alternate opposite bends, e and *c*, in its frame-bars, to adapt it for adjustment over the picket-rod *d*, and having the slots *i* in its ends, to secure it to the clip *b* midway between the rails *a*, substantially as set forth.

5. An ornament for a picket-rod, having alternate frame-bars, bent outward around said rod in opposite directions, to form space for the adjustment of the same across the line of the picket, substantially as set forth.

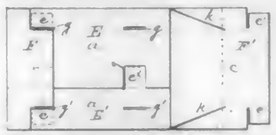


6. A clip-band for a double-rail fence, having notches upon its edges to adapt it for engagement with the ends of the frame-bars of the ornament, in combination with the ornament-sections A, having the slots *i* in the ends of its lower limbs, the rails *a*, and the picket-rod *d*, all arranged as and for the purpose hereinbefore set forth.

292,861. BRAKE-SHOE. GEORGE B. ROSS, Buffalo, N. Y. Filed Sept. 12, 1883. (No model.)

Claim.—A brake-shoe provided with the grooves a' a^4 and the wearing portions c c', the portion or rib c projecting down to the wheel, substantially as and for the purposes specified.

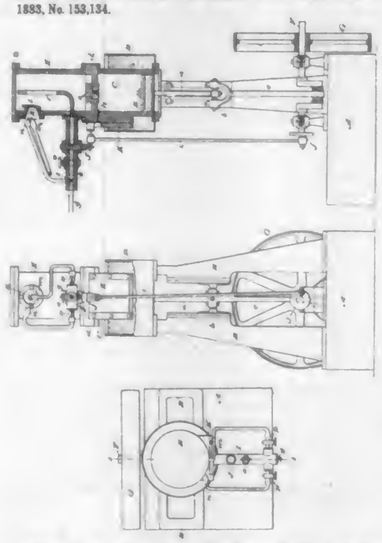
292,862. ROLLER-SKATE. JACOB V ROWLETT, Richmond, Ind. Filed Aug. 24, 1883. (No model.)



Claim.—1. The housing G, composed of vertical walls open at top and bottom, and provided with a semicircular projection, *x*, in the manner and for the purposes set forth.

2. The truck-hanger D, provided with plate E', shaft F, and carrying-axle C, in the manner and for the purpose set forth.

3. The springs *m n n'*, in combination with plates E E' and shaft F, as herein set forth.

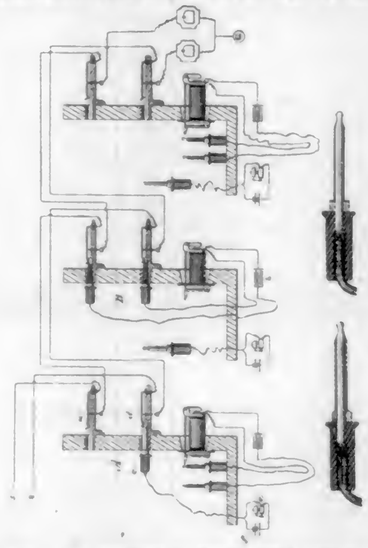


4. The combination of the housing G, the springs *m n n'*, the frame H, the shaft F, with the truck-hanger D, all arranged and operating as described.

292,863. PACKAGE-BOX. THEODORE SCHMIDT, Dayton, Ohio. Filed Sept. 15, 1883. (No model.)

Claim.—A package-box creased for folding, as specified, having side laps, E, with tucks e^2 e^2 and slots *g g*, lap E', with slots *g' g'* and *i i*, and laps F F', with each two tucks *e e* and *e' e'*, and four end laps, *k*, substantially as set forth.

292,864. GAS-MOTOR ENGINE. JAKOB SCHWEIZER, Solcure, Switzerland. Filed Mar. 2, 1883. (No model.) Patented in France Jan. 16, 1883, No. 153,134.



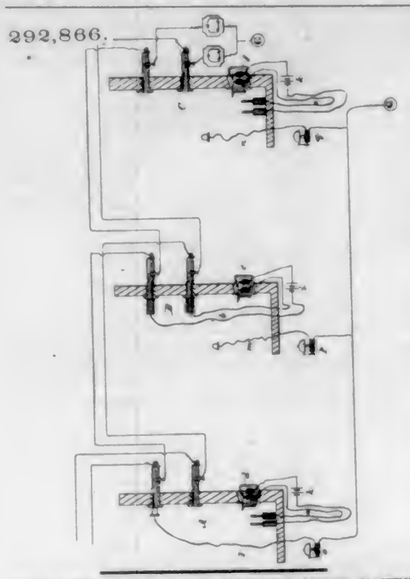
Claim.—1. In a gas-motor engine, the combination, with the vertically-arranged cylinder of the engine and the piston of the same, of a chamber, H, arranged on the top of the engine-cylinder, means for admitting a charge of a mixture of explosive gases to the upper part of said chamber, a valve, *l*, arranged to open into the upper part of said chamber to permit air to enter the latter, an automatic valve, *q*, in the partition separating the chamber H from the engine-cylinder, and arranged to open into said cylinder, a jet, *m*, arranged opposite to the valve *l*, and adapted to be drawn into chamber H by the rarefaction of the gases in the latter, and means, substantially as shown, for admitting the explosive charge to the chamber H, whereby, when the charge explodes in the upper part of the chamber, the heavier products of combustion in the lower part of same will be compressed and forced into the engine-cylinder, substantially as set forth.

2. The combination, in a gas motor or engine, of the engine-cylinder, piston-rod, piston, cross-head, connecting-rod, cranked shaft, and fly-wheel, with the vessel H, provided with the valved air-inlet *k*, the valved aperture between it and the engine-cylinder, and the pipe *f*, the valve J, arranged to control the ingress of gas, the valve K, arranged to control the exhaust-port of the engine-cylinder, means, substantially as described, for actuating said valves J and K, and the jet *m*, for igniting the gaseous mixture in the vessel H, all arranged to operate substantially as set forth.

3. The combination, with the cylinder and piston of a gas-motor engine, of a closed chamber to receive an explosive mixture of air and inflammable gas at its upper part, provided with an aperture or passage in its lower part leading into the engine-cylinder above the piston, a check-valve opening downward into the engine-cylinder to control said passage, an aperture at the upper part of said explosion-chamber, and a check-valve to control said aperture, arranged to open into said chamber, whereby when the charge is exploded it may force the heavier gases in the lower part of said chamber down into the engine-cylinder, and whereby the rarefaction produced by the first portion of the downward stroke of the piston, prior to the explosion, may draw in the flame of the igniting-jet, substantially as set forth.

292,865. CONDENSER AND TEST-CIRCUIT FOR MULTIPLE SWITCH-BOARDS. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 11, 1883. (No model.)

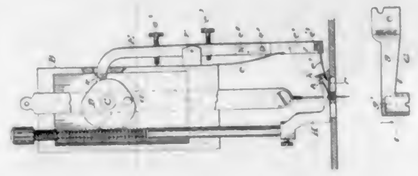
Claim.—1. The combination, in a multiple system of switch-boards, of pairs of conducting-cords and condensers, a condenser being in the circuit of each pair of cords, and testing apparatus at the different boards, substantially as specified.



2. A switch provided with a frame and spring, said spring being insulated from the frame, a contact-point or lug upon said frame, upon which said spring normally rests, and a connecting-plug provided with insulating material, said plug being adapted to be inserted in said switch, whereby said spring is lifted from said lug or contact-point and connected to the point of the plug, substantially as and for the purpose specified.

3. The combination, with two connected telephone-lines, with a condenser in circuit at the central office, of a testing-circuit containing a battery and signaling device adapted to be looped into the circuit of the connected telephone-lines, substantially as and for the purpose specified.

292,866. TESTING APPARATUS FOR MULTIPLE SWITCH-BOARDS. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 11, 1883. (No model.)



Claim.—The combination, with multiple switch-boards, of pairs of conducting-cords, each pair including a polarized annunciator and battery, and a normally-open earth-circuit at different boards, whereby current may be directed through a signal-instrument from the battery in the pair of cords connecting two lines, substantially as specified.

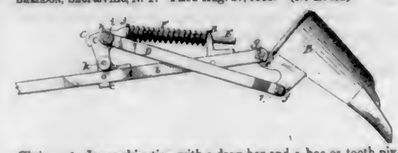
292,866.

292,867. RUFFLING ATTACHMENT FOR SEWING-MACHINES. CHARLES C. SEEBOLD, Middleburg, Pa. Filed Nov. 13, 1883. (No model.)

Brief.—A cam on the end of the main shaft in the head of the machine operates the ruffler-lever. The lower portion of the said lever may be detached, and then the upper part fixedly secured to the head of the machine by set-screws, whereupon said upper part may serve as an attachment-holder. The separator-plate is recessed to avoid friction tion and wear on the teeth of the feed-dog.

Claim.—1. The combination, with the needle-operating shaft arranged above the bed-plate of the machine, of a cam on the forward end of said shaft, within the head of the machine, a ruffler bar or lever having a pivotal support on the said head, a ruffling-blade carried by said bar or lever, and a spring for forcing the latter toward said cam, substantially as described.

2. The combination, with the head B, shaft C, and disk-cam D, of the bracket F, screw *f*, ruffler bar or lever E, having a ruffling-blade at its lower end and an anti-friction roller at its upper end, regulating-screw e^3, and spring *e'*, substantially as described.

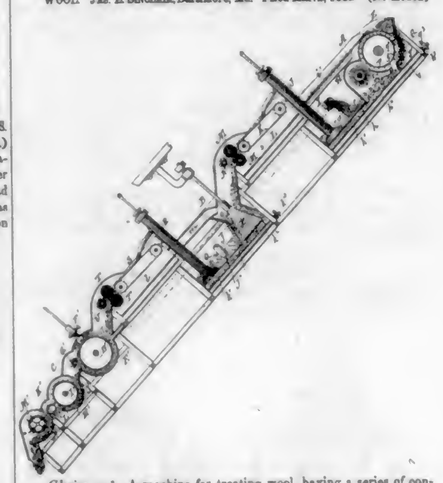


3. A ruffler bar or lever having a detachable portion carrying the ruffling-blade, combined with means for rigidly holding said bar or lever in a fixed position away from its operating-cam, whereby said bar or lever is adapted to serve as a support for other attachments, substantially as described.

4. The combination, with the head B, of the bracket F, means for securing said bracket to said head, the lever E, pivoted to said bracket, and the screws e^2 and e^3, arranged on opposite sides of the pivotal point of said lever, substantially as described.

5. A separator-plate provided with a recess for the feed-dog, whereby the latter will be prevented from coming in contact with the under surface of the said plate, combined with a ruffling-blade and means for operating the same, substantially as described.

6. The combination, with the ruffler bar or lever and the ruffling-blade, of a separator-plate provided with a recess for the feed-dog, whereby the latter will be prevented from coming in contact with the under surface of the said plate, substantially as described.



292,868. SPRING-HOE FOR SEEDING MACHINES. RICHARD B. SHELDON, Shortsville, N. Y. Filed Aug. 27, 1883. (No model.)

Claim.—1. In combination with a drag-bar and a hoe or tooth pivoted thereto, a block pivoted to the upper side of the drag-bar and extending forward in advance of its pivot, a draw-bar connecting the forward end of said block and the hoe or tooth, a rod bearing against or jointed to the block and extending backward through a guide, and a spring encircling the rod, all combined and arranged to operate substantially as set forth.

2. In combination with a drag-bar and a hoe or tooth pivoted thereto, a block pivoted to the upper side of the drag-bar at its rear end, and connected by a draw-bar with the tooth below the pivot of the latter, a sliding rod connected to the forward upper end of the block, and extending thence backward through a fixed guide on the drag-bar, and a spring encircling the rod, all substantially as and for the purpose set forth.

292,869. MACHINE FOR WASHING, SCOURING, AND BURRING WOOL. JAS. E. SINCLAIR, Baltimore, Md. Filed Mar. 2, 1883. (No model.)

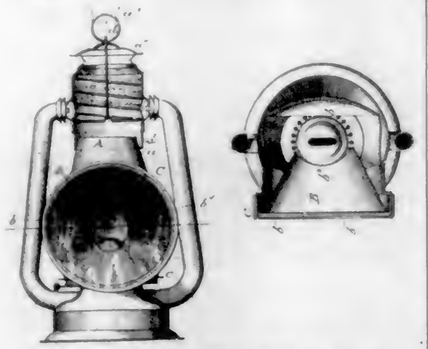
Claim.—1. A machine for treating wool, having a series of connected receptacles in which the wool is successively treated, and which receptacles are combined with one or more pumps for elevating the wool and water from one receptacle to another, and aprons and troughs for returning the elevated water to the receptacle from which it was drawn, whereby a circulation of the water in said receptacle will be produced to assist in carrying the wool through the machine, substantially as specified.

2. A machine for treating wool, having a series of receptacles in which the wool is successively treated, which receptacles are combined with pumps adapted to elevate the wool, traveling aprons, wringers, and brushes, the latter delivering the wool from the wringers, and pipes or troughs for returning the elevated water for repeated use, substantially as specified.

3. The machine herein described, consisting of the washing apparatus comprising a receptacle and revolving toothed drum and elevating-pumps, the scouring apparatus connected to the washing apparatus by a traveling apron and wringers, and comprising a corrugated conical drum and corresponding receptacle and elevating-pumps, and the burring and picking apparatus connected to the scouring apparatus by a traveling apron and wringers, and comprising a receptacle and a series of toothed drums, all arranged and adapted to operate substantially as shown and described.

4. The apparatus consisting of the toothed drum, the wool and water receptacle, the concave apron formed of movable toothed bars, and the rotary brush, all combined and adapted to operate substantially as shown and described.

5. The combination of a pump adapted for elevating the wool and

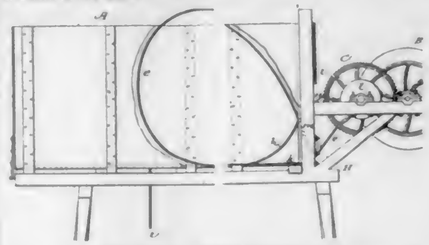


water with the wool and water receptacle, a trough for returning the water, and a wringer for separating the water from the wool, substantially as shown and described, whereby a circulation of the water shall be obtained, for the purpose specified.

292,870. ESCAPEMENT FOR TORSION-PENDULUMS. CHARLES STAHLBERG, Cornicana, Tex. Filed June 12, 1883. (No model.)

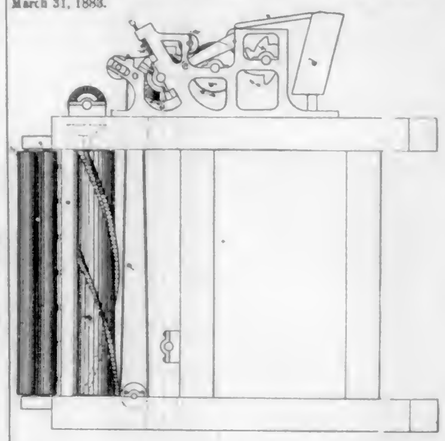
Claim.—In combination with the torsion-pendulum of a clock, the levers F and F', the escape-wheel H, and the spindle G, consisting of a cross-piece *d*, arms *k*, and the repose-plate *i*, substantially as and for the purpose set forth.

292,871. COMBINED REFLECTOR AND GLOBE FOR LAMPS AND LANTERNS. BENJAMIN D. STEVENS, Burlington, Vt. Filed Jan. 4, 1883. (Model.)



Claim.—1. In an organized lamp or lantern, the metal globe A, provided with side reflectors, B *b*, and the glass *b*', all adapted to be removably attached to the lamp or lantern frame, substantially as and for the purposes set forth.

2. As a new article of manufacture, a metallic reflecting-globe consisting of the body A, provided with the reflectors B *b*, and the glass *b*', all as described, and adapted to be used with a lamp or lantern frame, substantially as and for the purposes set forth.



292,872. BALING-MACHINE. DANIEL TARR, Wellsville, Ohio. Filed June 7, 1883. (No model.)

Claim.—In baling-machines, a box, A, in the front end and at the bottom of which are attached, as described and shown, the end of ropes or straps *o o o*, from where the ropes or straps extend back along the bottom of the box, up over the rear end of the box, then, when the box is filled with the material to be baled, to be brought forward and over the material baled down through the opening described in the front end of the box, under the roller H, then up and attached to the axle, to be used as described and shown.

292,873. METHOD OF AND MACHINERY FOR TREATING RAGS FOR PAPER-STOCK. CHARLES F. TAYLOR, Springfield, Mass. Filed Mar. 23, 1883. (No model.)

Brief.—Improvement on applicant's application No. 89,872, filed March 31, 1883.

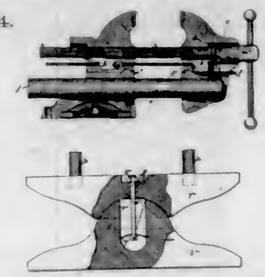
Claim.—1. The method of treating rags for paper-stock, consisting of stripping the same by machinery and depositing the strip on a feed, which presents the strips to the cross-cutting device in such manner that they are cut into small pieces, substantially as shown.

2. In a rag-dressing machine, two cutting devices having a means of conveying the material from the first to the second, substantially as shown.

3. In a rag-cutting machine, the combination of feed *a*, cutters *b o*, feed *p*, and cutters *c x*, constructed and operating substantially as shown.

4. In a rag-dressing machine, the combination of a stripping device and a cross-cutting device with a feed-apron adapted to move in a direction parallel with the axis of the stripping-knife, substantially as shown.

5. The combination, in a rag-cutting machine, of a stripping device and cross-cutting device, each consisting of a rotary and fixed blade, a means to feed the material to the cutting devices, a means to hold the material while being cut, and a means to separate foreign matter from the material, all constructed and operating substantially as shown.



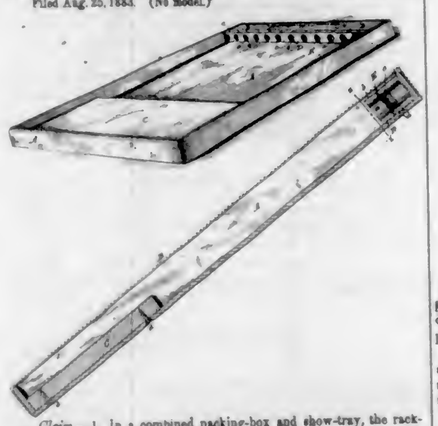
292,874. BENCH-VISE. JOHN THOMSON, Brooklyn, N.Y. Filed July 25, 1883. (No model.)

Claim.—1. In a quick-adjusting parallel bench-vise, the combination, with the ratchet-shaft having a flattened portion and a cylindrical portion, of the flattened pin *d*, adapted to engage with the flattened portion of said shaft, and thus prevent the rotation thereof, and to impinge against the end of the cylindrical portion of said shaft, and thus limit its longitudinal movement, substantially as described.

2. The nut *m*, having the interiorly-arranged threaded bushing *k*, substantially as described.

3. In a vise, the combination, with the stationary and movable jaws thereof, of the ratchet-shaft *h*, pawl *b*, and disengaging-rod *s*, substantially as described.

292,874.



4. In a vise, the combination, with the stationary and movable jaws and means for operating the latter, of the ratchet-shaft A, pawl *b*, disengaging-rod *s*, and spring *i*, substantially as described.

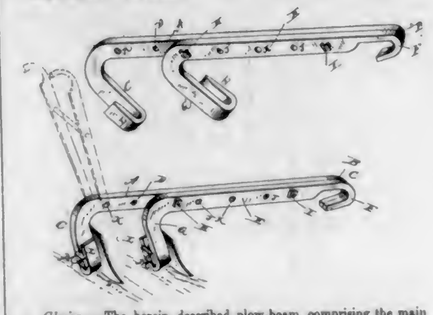
5. In a quick-adjusting parallel bench-vise having a tail-piece rigidly attached to the front jaw and sliding in the back jaw, and a ratchet-shaft, as A, having a sliding bearing in both jaws, and means for operating the same, the relieved or tapered bearing *t*, for the purpose of throwing the weight of the front jaw mainly upon the ratchet-shaft, thereby cramping said ratchet-shaft and holding it in position against the back-thrust of the screw.

6. The combination, with the piece *r*, having a concave socket, and the swiveling jaw *v*, having a ball or rounded projection adapted to said socket, of the retaining-bolt *x'* and the keeper *y'*, substantially as described.

7. The combination, with the socket-piece *r* and swiveling jaw *v*, having a ball-and-socket connection, of the retaining-bolt *x'*, the keeper *y'* for said bolt, the dowel-pins *p p*, secured to said socket-piece, and a jaw of a vise, having holes or bearings *p' p'*, adapted to receive said pins, substantially as described.

292,875. SHOW BOX AND TRAY. EDWARD TODD, Madison, N. J. Filed Aug. 25, 1883. (No model.)

Claim.—1. In a combined packing-box and show-tray, the rack-block D, constructed with holes *a*, in combination with rubber strip E, provided with holes *e*, as and for the purposes set forth.

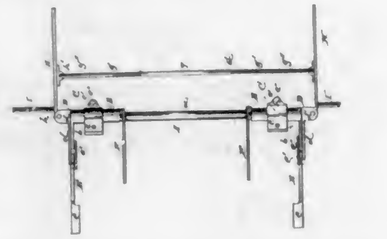


2. In a combined packing-box and show-tray, the combination of the rack-block D, constructed with holes *a*, the strip E, provided with holes *e*, and the supplemental strip E', provided with holes *e'*, the holes *a*, *e*, and *e'* registering with each other throughout the length of the rack-block, as and for the purposes set forth.

3. In a combined packing-box and show-tray, the rack-block D, constructed with holes *a*, and provided with perforated rubber strips E E', as hereinbefore described, in combination with the wood-veneer or other polished strip *b*, as and for the purposes set forth.

4. In a combined packing-box and show-tray, the rack-block D, constructed substantially as described, in combination with the silicate, ground-glass, or porcelain strip *c*, as and for the purposes set forth.

5. As a new article of manufacture, the wooden box and card or other top, in combination with the velvet or other covered wooden rest-block C, the wooden rack-block D, constructed substantially as described, and secured in place by the screws *d d*, whereby the blocks may be readily removed and others substituted, as set forth.



292,876. PLOW. WILLIAM ESTEEL VENABLE, Nicholson, Ga. Filed Sept. 15, 1883. (No model.)

Claim.—The herein-described plow-beam, comprising the main beam formed of a metallic rod having its rear end turned down and forming a plow-standard, in combination with the corresponding short beam secured against one side of the main beam, and having its rear end also turned down to form a plow-standard, the lower ends of these standards being bent up at one side of their main portions to form integral hooks adapted to receive the heel-bolts of a plow-blade, which hooks project at opposite sides of the standards, so as to be in the same longitudinal plane, substantially as set forth.

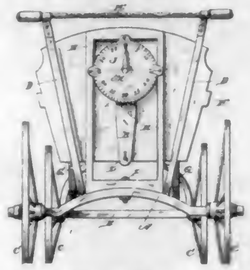
292,877. CULTIVATOR. FRANK T. VERHAREN, Spencer, Iowa. Filed May 28, 1883. (No model.)

Brief.—By means of connections between the plow-beam couplings and the supports or runners, the lifting of the plow-beams lowers the runners, and vice versa. By similar connections the lifting of the beams automatically lowers the suspension-bars to receive them.

Claim.—1. A drag-bar or runner and a connection therefor with a plow-beam, by which movements of the plow-beam vertically will produce a reverse movement to the drag-bar, substantially as and for the purposes specified.

2. A drag-bar, E, pivoted at its upper end and provided with an arm, *d'*, in combination with a link, *c''*, and arm *b*, actuated by the movements of the plow-beam for raising and lowering the drag-bar, substantially as specified.

3. A drag-bar, E, pivoted at its upper end and provided with an arm, *d'*, in combination with the link *c''*, arm *b*, pipe-box B, and a plow-beam attached to the pipe-box, for automatically raising and lowering the drag-bar, substantially as specified.

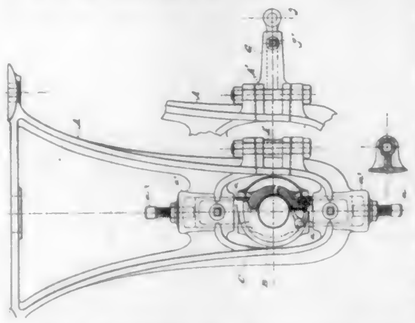


4. An arm or support, F, and a connection with a plow-beam and devices connecting the beam with the arm or support, for automatically operating the arm or support as the beam is raised or lowered, substantially as and for the purpose specified.

5. An arm or support, F, link *f''*, and arm *b'*, operated from the plow-beam, for automatically raising and lowering the arm or support F, substantially as and for the purposes specified.

6. An arm or support, F, and link *f''*, in combination with the arm *b'* and pipe-box B, having a plow-beam attached thereto, for automatically operating the arm or support by the movements of the plow-beam, substantially as and for the purposes specified.

7. An arm or support, F, link *f''*, arm *b'*, pipe-box B, arm *b*, link *c''*, arm *d'*, and drag-bar E, in combination with a plow-beam attached to the pipe-box, for automatically operating the arm or support and the drag-bar by the movements of the plow-beam, substantially as and for the purposes specified.



292,878. WEIGHING ATTACHMENT FOR BABY-CARRIAGES, &c. JOHN J. VINTON, Youngstown, Ohio. Filed Nov. 23, 1883. (No model.)

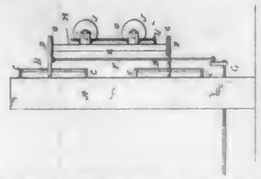
Claim.—1. The combination, with a baby-cab or other vehicle, of a frame extending up from the rear axle in rear of the body, a scale secured to said frame, and a strap or other suitable means connecting the scale to the body of the vehicle, whereby the weight of the body will draw the strap downward, so as to cause the scale to indicate the proper weight, as set forth.

2. The combination, with a baby-cab or other vehicle, of a frame supported upon the rear axle of said vehicle, a spring-scale secured to said frame, a strap or chain secured to the said spring-scale, and a button or stud secured to the vehicle-body and adapted to be engaged by the said strap or chain, substantially as and for the purpose set forth.

292,879. SHAFT-HANGER. JOHN WALKER, Cleveland, Ohio. Filed Feb. 21, 1883. Renewed Jan. 2, 1884. (No model.)

Claim.—1. The combination, with a shaft-hanger having one of its sides divided, of the block secured in the opening thus formed by a bolt, and provided with an extension-arm for supporting the belt-shifting or other device, and capable of being adjusted lengthwise, substantially as shown and described.

2. The combination, with a shaft-hanger having one of its sides divided, of the block secured in the opening thus formed by a bolt, and provided with a hollow outer arm, and the inner arm fitting therein and adapted to be longitudinally adjusted, substantially as and for the purpose described.

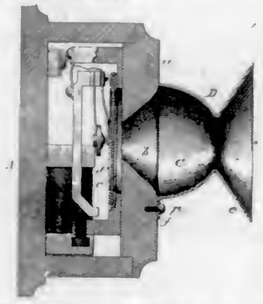


3. In a shaft-hanger, the oil-pan having a boss resting on a vertically-adjustable tubular seat below, the oil-box having a ring-like projection on its under side, adapted to rest upon the inner side of said boss, the upper side of the box being provided with a support, and the pan adapted to fit around said support, whereby the box and the pan may adjust themselves to the line of the shaft, substantially as described.

4. The combination, in a shaft-hanger, of the oil-pan, constructed, substantially as described, with the journal-box located within the same, having a ring-like projection adapted to be supported by the pan, and the pan constructed in a cylindrical form, whereby the box is inclosed, substantially as described.

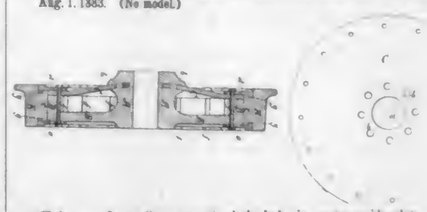
5. The combination, in a shaft-hanger, of a cylindrical-like oil-pan, and an inclosed journal-box having a ring-like projection adapted to be supported by the pan, with a scraper constructed to normally bear against the shaft and scrape the oil therefrom, substantially as described.

6. The combination, with the weighted handle D, terminating in a bent rod, of the arm *d*, so arranged that either end of the said arm or its attached scraper may be applied to the shaft substantially as described, and for the purpose set forth.



292,880. STONE-DRESSING MACHINE. HOWARD DOUGLAS WALLACE, St. George, New Brunswick, Canada. Filed Apr. 26, 1883. (No model.)

Claim.—1. In a stone-cutting machine, the combination of suitable guides secured to suitable uprights or supports, a reciprocating frame attached to the guides, a rotating standard to which the cutting-disks are connected, and a screw placed in the frame for regulating the distance between the cutting-disks, substantially as shown.

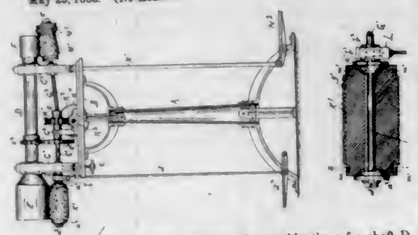


2. In a stone-cutting machine, the combination of the posts A, having suitable guides secured to them, the vertically-reciprocating frame attached to the guides, the end pieces, D, of the reciprocating frame, having suitable recesses in their inner sides, the partially-rotating rod H, having the disks G secured to its ends, and fitting in the recesses in the parts D, the cutting-disks, and a screw for regulating the distance between them, substantially as described.

292,881. SPEAKING-TELEPHONE. FRANCIS WARE, Boston, Mass. Filed Aug. 23, 1883. (No model.)

Claim.—The combination, with the diaphragm of a telephone and a box or casing therefor, so applied as to leave a thin inclosure or chamber between the face of the said diaphragm and the said box or casing, of a substantially oval or globular chamber communicating with said thin inclosure or chamber, substantially as described.

292,882. CAR-WHEEL. NATHAN WASHBURN, Allston, Mass. Filed Aug. 1, 1883. (No model.)



Claim.—1. In a railway-car wheel, the hub, rim, and one side plate of cast iron or metal founded in one piece, and upon and with the other side plate of wrought-iron extended around and into the hub and resting against one edge of the rim.

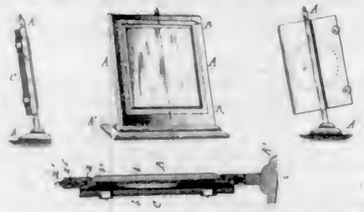
2. The hub, rim, and one side plate of cast iron or metal founded in one piece, and upon and within the other side plate of wrought-iron extended around and into the hub, and provided with holes for the metal of the hub to pass through, all being substantially as represented.

3. The improved railway-car wheel, constructed substantially as described, viz: with the hub, rim, and one side plate of cast-iron and founded in one piece, and upon and with the other side plate of wrought-iron extended around and into the hub and resting against one edge of the rim, in combination with the dovetailed tire and its connecting flanged ring, and the series of bolts arranged with and applied to the said rim and side plates, as set forth.

292,883. IRONING-MACHINE. CLARENCE OTIS WHITE, Minneapolis, Minn., assignor of one-half to Hastings H. Johnson, same place. Filed May 25, 1883. (No model.)

Claim.—1. In an ironing-machine, the combination of a shaft, D, having an internally-heated ironing-roll, E, thereon, a shaft, G', permanently geared to the shaft D, a padded roll, K', loose on the shaft G' and in frictional contact with the ironing-roll E, and a clutch, whereby the roll K' is made to revolve with the roll E or with the shaft G', substantially as and for the purpose specified.

2. The combination of a shaft, D, having two internally-heated ironing-rolls, E F, thereon, shafts G' G^2, having a cylindrical padded roll, K', on one, and a conical padded roll, M', on the other, and the supporting-frame, substantially as and for the purpose herein specified.



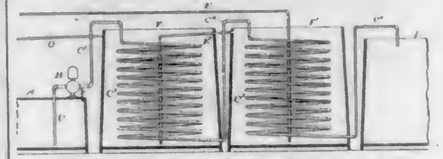
3. In an ironing-machine, a roll having channels around its ends, and spring-rings m', having spurs m^2, and suitable padding covering said rolls, substantially as shown.

4. The combination of the supporting-frame, the shaft D, having an ironing-roll, E, thereon, shaft G', gears H^1 H^2, padded roll K', conical collars a' a^2, wedge-surfaced collars b' b^2, frame L, having wedge-ribs *g g*, and means for moving the said frame, substantially as and for the purpose herein specified.

5. The combination of the hollow shaft D, having ironing-rolls E F thereon, shaft G', shaft G^2, having padded rolls K' M' thereon, connecting-gear H^3 H^6, damping-rolls K' R^2, the shaft H^4 at right angles to the shaft G', and worm-gear H' H^5 connecting the shafts G' and H^4, substantially as and for the purpose herein specified.

6. The roll E, provided with channels encircling its ends, and a longitudinal groove in the surface of the roll connecting said channels, in combination with a strip to fit into said longitudinal groove, spring-rings to fit into said channels, and the padding fabric, substantially as and for the purpose specified.

292,884. COMBINED TOILET-MIRROR AND PHOTOGRAPHIC ALBUM. LEOPOLD WOLF, New York, N.Y. Filed May 31, 1883. (No model.)



Claim.—1. The combination, with an upright supporting-frame, of a centrally-pivoted and reversible panel having a mirror at one side and a photograph-album attached at the other side, the album being centrally-pivoted to the back of the mirror-panel, substantially as and for the purpose set forth.

2. The combination, with an upright supporting-frame, A, of a centrally-pivoted and reversible panel, B, having a mirror at one side and a photograph-album, C, at the other side, the rear cover of said album being connected by a fixed disk, *b*, having a circular flange, *b'*, to an annular guide-groove of the mirror-frame, substantially as set forth.

3. The combination of the upright supporting-frame A and a centrally-pivoted and reversible mirror-panel, B, with a locking device applied to one of the pivots, said pivot being provided with a laterally-extending locking-bar, d^4, button d', and interposed spiral spring, d^3, the locking-bar being guided in recesses d^1 and d^5 of the supporting-frame and mirror-panel, substantially as described.

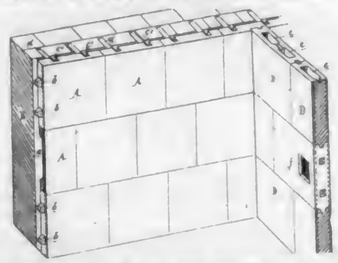
4. The combination, with an upright supporting-frame, A, of a reversible mirror-panel, B, turning on center pivots, *d* and *e*, the upper pivot, *d*, being provided with a spring-pressed locking device, while the lower pivot, *e*, is provided with a torsion-spring, e^2, by which the turning of the mirror in the supporting-frame is facilitated when the locking device of the upper pivot, *d*, is released, substantially as and for the purpose set forth.

292,885. APPARATUS FOR COOLING MASH. JACOB WOOLNER, Peoria, Ill. Filed Nov. 23, 1883. (No model.)

Claim.—1. In a mash-cooling apparatus, two or more tubs, only one of which is adapted to receive fresh supplies of cold water, each of the others being filled from the overflow of the tub before it, in combination with a coil of pipe in each tub, and connections whereby a continuous stream of mash may be pumped through them all, substantially as shown and described.

2. The tub F', having water-supply pipe E and overflow E^2, terminating at the bottom of the tub F, in combination with said tub F and the coils C^2 C^3, continuous from one to the other, and having suitable supply-pump, substantially as and for the purpose specified.

3. The pump B, having suction-pipe C, coils C^2 C^3, having connecting-pipes C' C^3, and exit-pipe C^4, in combination with the tubs F F', supply-pipe E, having a T-shaped discharge end, E', at the bottom of the said tub F', overflow-pipe E^2, having a T discharge end, E^2, and the overflow-pipe O, substantially as and for the purpose set forth.

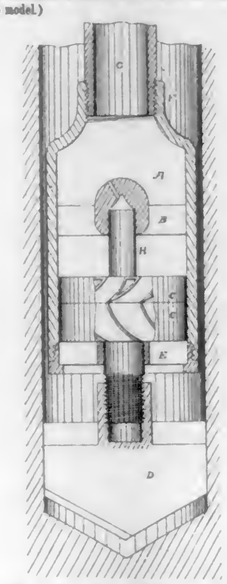


292,886. NECK-YOKE. COLUMBUS D. ZELLNER, Delta, Ohio. Filed Oct. 23, 1883. (No model.)

Claim.—1. In a neck-yoke ring, the combination, with a body-plate made of metal and having annular flanges on its front and rear sides, of a leather packing-ring seated in an opening in the said body-plate, and having flanges fitting within the flanges of the latter, as set forth.

2. In a neck-yoke ring, the combination of a metallic body-plate having a securing flange or band, and provided with an opening surrounded by annular flanges on its front and rear sides, a packing-ring seated in the said opening, and having flanges fitting within the flanges of the body-plate, and transverse fastening bolts or rivets, as set forth.

292,887. TILE OR BLOCK FOR FINISHING INSIDE WALLS. JAMES AUSTIN, Detroit, Mich. Filed Aug. 1, 1883. (No model.)



Claim.—1. A block for inside walls, formed of cheap plastic material, with an outer facing of calcined plaster, substantially as herein described.

2. A block for inside walls, formed of cheap plastic material faced with calcined plaster, and provided with projecting lugs and recesses, substantially as and for the purpose specified.

3. The block A, formed of plastic material, provided with lugs *b b* and recesses *c c* and *c' c'*, the latter opening into the rear face of the blocks to receive the binding-stripe *d* in addition to the lug on the adjacent tile, substantially as described.

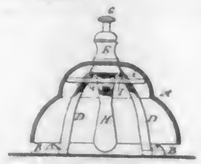
4. The block D, formed of cheap plastic material faced on both sides with calcined plaster, with vertical channels *e*, lugs *b*, and recesses *c*, substantially as and for the purposes specified.

292,888. MACHINE FOR OPERATING DRILLS. MORRIS CUTLER BAKER and CLARENCE EDWARD BAKER, Mitchell, Dak. Filed July 12, 1883. (No model.)

Claim.—1. The rotating of the drill D by means of the wheel C C, or its equivalent, by the use of water, steam, compressed air, or gas, without imparting motion to the drill-rod G or casing A, for the purposes herein set forth.

2. The casing A, containing spider and water bearing B, the wheel C C, shaft H, and screw-section E, all combined and connected to drill D, to operate substantially as herein described.

3. The screw-section E E, containing web arranged vertically, to allow free egress of fluid, substantially as described.



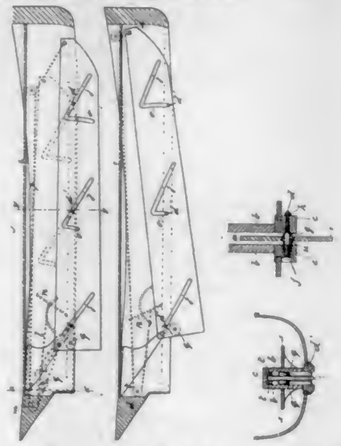
4. The spider B, with water bearing for shaft H, for purpose as before described.

5. The combination of the casing A, the spider B, wheel C C, drill D, screw-section E E, drill-rod connection F, drill-rod G, and shaft H, all combined to operate for the purposes herein set forth and described.

6. The constant rotation of the drill D by the means herein described, regardless of any motion otherwise imparted to drill-rod G.

7. The use of the escaping motor-fluid for removing the drillings from around the drill D.

292,889. CALL-BELL. ABNER W. BARTON, East Hampton, Conn. Filed June 15, 1883. (Model.)



Claim.—1. The combination, with a call-bell and its push-pin and hammer, of a frame having a base or feet within the bell and extending but slightly below its lower edge, whereby the support for the bell is not exposed to view and the ordinary projecting base is dispensed with.

2. The combination, with the call-bell and its push-pin and hammer, of a frame having jaws with openings cast in them, a pivot-pin passing through the said openings, and a base or feet to the frame within the bell, substantially as set forth.

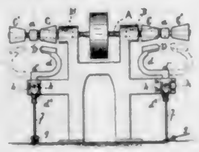
292,890. CENTER-BOARD FOR VESSELS. JOHN S. BIRCH, New York, N. Y. Filed Dec. 29, 1882. (No model.)

Claim.—1. A center-board arranged, substantially as hereinbefore set forth, on two or more inclined ways, for being raised and lowered thereon, said ways being arranged in the center-board trunk, and ranging fore and aft of the ship on about forty-five degrees of inclination, for supporting about half the weight of the center-board while being raised and lowered, in combination with a cord or chain connected to said center-board and stretched upward in about the same inclination as said ways, for raising and lowering said center-board by pulling about half the weight of the board, substantially as described.

2. A center-board arranged, substantially as hereinbefore set forth, on two or more inclined ways, for being raised and lowered, said ways being suitably inclined for supporting about half the weight of the board throughout the range of its travel, the aft ways having greater inclination than the forward ways, and being varied with relation to said forward ways, to cause the center-board to extend more aft than forward, and also to cause the said greater extension to be proportionately the same for any extension of said center-board, substantially as described.

3. A center-board arranged on two or more inclined ways of about forty-five degrees, whereon about half its weight is supported, and being provided with curved ways or slots *o*, intersecting the inclined ways that are forward of the sternmost way, to allow the center-board to be swung up at the forward end on the sternmost way, whereon it rests as a pivot, substantially as described.

4. In a center-board arranged on two or more inclined ways of about forty-five degrees, whereon about half its weight is supported, the rollers *q* and ways *t*, in combination with the center-board, and located at one end of the center-board, to resist the thrust of the overbalance of the other end when the board shifts along said inclined ways, substantially as described.



292,891. PROCESS OF TREATING FIBROUS RUBBER WASTE. AUGUSTUS O. BOURN, Bristol, R. I. Filed May 4, 1881. (No specimens.)

Claim.—1. The process of treating rubber waste containing cotton fiber for the recovery of rubber from said waste by boiling the waste in a solution containing about three or four per cent. of sulphuric acid, substantially as described, whereby the fibrous matter is rendered soluble in water, and is readily removed from the waste with said solution, as set forth.

2. The process of treating rubber waste containing cotton fiber for the recovery of the rubber by chopping or grinding said waste and boiling the same in solutions containing about three or four per cent. of sulphuric acid, substantially as described, whereby the fiber is well exposed to the action of said solution, is rendered soluble in water, and is readily separated from the rubber, as set forth.

3. The process of treating rubber waste containing cotton fiber, substantially as hereinbefore described, by subjecting said waste to the action of sulphuric-acid solutions of sufficient strength to operate as a solvent of the fiber, and enable its removal from the waste with said solvent.

292,892. HAT-POUNCING MACHINE. FREDERICK F. CAMPBELL, Newark, N. J. Filed Dec. 10, 1883. (No model.)

Claim.—1. A hat-pouncing machine provided with a shaft or shafts, having attached thereto one or more pairs of pouncing-blocks placed approximately together.

2. A hat-pouncing machine provided with a shaft, having attached at or near each end thereof pouncing-blocks arranged in pairs.

3. A hat-pouncing machine provided with a shaft, having secured at or near each end thereof conical pouncing-blocks arranged in pairs.

4. A hat-pouncing machine provided with a shaft, having secured at or near each end thereof conical pouncing-blocks arranged in pairs, placed with their truncated portions facing each other or more nearly adjacent.

5. A hat-pouncing machine provided with shafting, having attached thereto pouncing-blocks arranged in pairs, with the driving mechanism placed between said pairs.

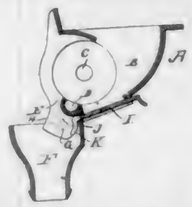
6. A hat-pouncing machine provided with shafting, having attached thereto pouncing-blocks arranged in pairs, with the driving mechanism and bearings placed between said pairs.

7. A hat-pouncing machine provided with shafting, having attached thereto pouncing-blocks arranged in pairs, with the driving mechanism and bearings placed between said pairs, and also having a supplemental bearing, as *a*, between the pouncing-blocks of each pair.

8. A hat-pouncing machine provided with mechanism adapted to press the hat-body against the pouncing-surfaces, and to reverse the position of the hat-body with relation to said pouncing-surface.

9. In combination, in a hat-pouncing machine, pouncing-blocks arranged in pairs, driving mechanism placed between said pairs, and means adapted to press the hat-bodies against said pouncing-blocks.

10. In combination, in a hat-pouncing machine, pouncing-blocks arranged in pairs, and mechanism adapted to press the hat-bodies against said pouncing-blocks.



11. A hat-pouncing machine provided with pouncing-blocks arranged in pairs, and mechanism adapted to press the hat-body against both of said blocks at different times without removing said hat-body.

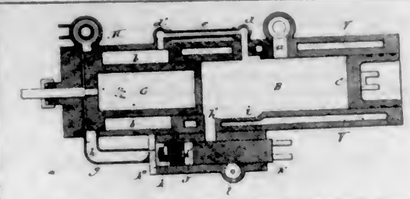
12. In combination, in a hat-pouncing machine, pouncing-blocks arranged in pairs, a single presser-block adapted to press the hat-bodies against said pouncing-blocks, and mechanism whereby said presser-block may be changed from one pouncing-block to the other.

13. In combination, in a hat-pouncing machine, pouncing-blocks arranged in pairs, an arm, *d*, guide-piece *e*, and mechanism adapted to raise said block and arm.

14. In combination, in a hat-pouncing machine, pouncing-blocks arranged in pairs, a presser-block, arm *d*, provided with a pin, d^3, slotted guide-piece *e*, treadle-bar *f*, and treadle *g*.

292,893. CUP FOR SEEDING-MACHINES. ROBERT S. CARR, Hamilton, Ohio, assignor to John W. Sohn, same place. Filed Oct. 15, 1883. (No model.)

Claim.—1. In a force-feed seed-cup arranged to carry a body of grain below the seed-wheel, and having an opening in its bottom, the combination of side walls of the cup, provided with grooves at the bottom, and a bottom gate fitted to slide in said grooves and close the opening in the bottom of the cup, substantially as and for the purpose set forth.



2. The combination of a seed-cup provided with open slots for supporting the pivoted mouth-piece, hung by pivots to the seed-cup, and a sliding piece fitted to the bottom of the seed-cup, and having a latch-piece projecting into the mouth-piece to prevent the accidental disengagement of the mouth-piece, substantially as set forth.

3. In a seed-cup arranged to carry a body of grain below the seed-wheel, the combination of a bottom opening for draining the cup, a mouth-piece hung to the nose of the cup, and a sliding gate at said opening, provided with a latch-piece projecting downward into the mouth-piece, substantially as and for the purpose set forth.

292,894. GAS-ENGINE. JOHN CHARTER, Starling, Ill. Filed Apr. 19, 1883. (No model.)

Claim.—1. In a gas-engine, the combination of the cylinder B, transferrer G, and piston C, arranged and operating substantially as shown, and for the purpose described.

2. The cylinder B, provided with the annular recess *b*, the tube *e*, tube *g*, transferrer G, and piston C, arranged and operating in combination, substantially as shown, and for the purpose specified.

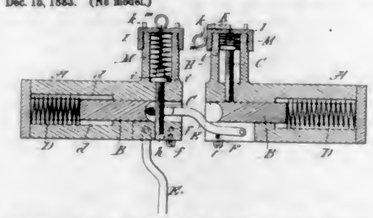
3. The transferrer G, in combination with the cylinder B, piston C, tube *e*, ignitor K, and tube *g*, substantially as shown, and for the purpose named.

4. The cylinder B, having the recess *b*, and the tube *e*, provided with valves *d* and *d'*, and communicating at each end with the interior of such cylinder, in combination with the transferrer G, whereby outer air is drawn in at the sides of the transferrer G at one stroke of such transferrer, and transmitted to the face of the latter on the opposite stroke thereof, substantially as shown, and for the purpose specified.

5. The combination of the rod I, lever L, toggle M, shaft O, having crank P, rod S, and transferrer G, substantially as shown, and for the purpose herein named.

6. The cylinder B, having inlet-port H, tube *g*, having communications *h* and *h'* with such cylinder, and the transferrer G, in combination, substantially as shown, and for the purpose described.

7. The cylinder B, having the recess *i* and inlet-port H, the tube *g*, having communications *h* and *h'* with such cylinder, and the transferrer G, in combination, substantially as shown, and for the purpose specified.



8. The tube *g*, having ports *h* and *h'*, ignitor K, having hole *k*, and transverse hole *j*, arranged to register with the port *h'* and cylinder B, in combination, substantially as shown, and for the purpose herein described.

9. In a gas-engine, the rod I, lever L, toggle M, shaft O, and rod S, substantially as shown, by means of which the transferrer G is operated in the same cylinder with the piston C, and such transferrer is caused to make a full motion during the inward stroke of said piston C, whereby such transferrer alternately expels the residuum of explosion and charges the working-cylinder.

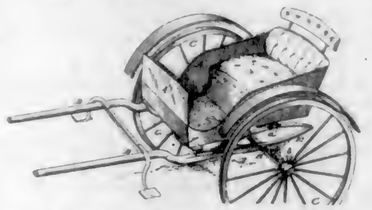
10. In a gas-engine, shaft D, rod I, lever L, toggle M, shaft O, rod S, and transferrer G, in combination, substantially as shown, whereby a full motion of such transferrer, alternated with intermittent rests, is produced at each revolution of the shaft D, for the purpose hereinbefore described.

11. In a gas-engine, the cylinder B, piston C, shaft D, piston-rod D', rod I, lever L, toggle M, shaft O, rod S, and transferrer G, substantially as shown, whereby such transferrer, coincidently with expelling the residuum of combustion, draws into the cylinder the charge for the next explosion, for the purpose specified.

292,895. CAR-COUPLING. JAMES W. CHILDS, Cedar Run, Pa. Filed Dec. 15, 1883. (No model.)

Claim.—1. In a car-coupling, the combination of a recessed and slotted draw-head, an adjustable open-ended link pivoted in the slotted end of said draw-head, a spring-actuated coupling-pin, and a sliding block for supporting said pin, substantially as described.

2. The combination of the recessed draw-head A, having open-ended slots *e e*, the adjustable open-ended link E, pivoted in said slots, the sliding block B, having spring D, and the pin C, having collar *i*, spring M, and chain K, substantially as described.



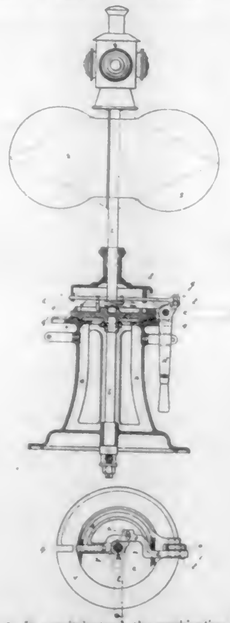
3. The combination of the recessed draw-head A, having open-ended slots *e e*, the sliding block B, the spring-actuated coupling-pin C, the adjustable link E, pivoted in the slotted end of the draw-head, and means for supporting said link, substantially as described.

4. The combination of the draw-heads A, having recesses *a*, slots *e e*, and tubular bosses H, provided with detachable caps I, the shouldered coupling-pins C, and springs M, inclosed in said bosses, the pins being provided with operating chains or cords K, the sliding blocks B, and springs D, inclosed in the draw-heads, the open-ended links E, pivoted in the slotted ends of the draw-heads, and means for supporting the links, substantially as described.

5. The combination, with the draw-head A, having slots *e e* and openings *f*, and the link E, pivoted in said slots, and provided with an arc or extension, *g*, of thumb-screws G G, for supporting said link at any desired height, substantially as described.

6. The combination, with a draw-head, of a backing of timber of suitable thickness interposed above said draw-head between it and the car-body for the purpose of securing the draw-heads of different cars at a uniform height above the track, substantially as described.

292,896. TWO-WHEELED VEHICLE. FREDRIK COLEMAN, Ilion, N. Y. Filed Sept. 14, 1883. (No model.)



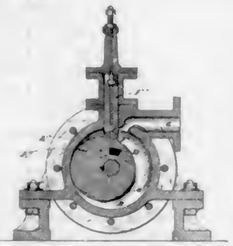
Claim.—1. The herein-described vehicle, consisting of body A, axle B, wheels C, shafts D, connected to the axle, side springs, E, supporting the body and connected with the axle by hinge-joints, springs F, secured to the shafts, and cross-spring G, attached to the body, and having its ends connected with the springs F, all substantially as shown and described.

2. In combination with the body and shafts of a vehicle, intermediate connecting-springs, F G, applied substantially as shown and described.

3. In a two-wheeled vehicle, the combination of two supporting-wheels, an axle therefor, a body above and supported by said axle, shafts for drawing the vehicle, a cross-spring secured to the fore part of the body, and springs running lengthwise of the shafts and having their forward ends connected with the ends of the cross-spring and their rear ends attached to the shafts, substantially as shown and described.

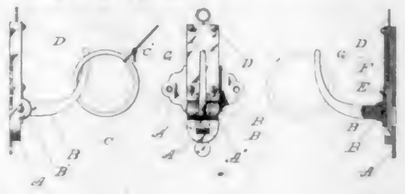
292,897. SWITCH-STAND. PRESSLEY COLEMAN, Haysville, Pa. Filed Oct. 15, 1883. (No model.)

Brief.—The signal-target is mounted upon a shaft that rotates independently of the signal-shaft. The switch-lever shifts the signal by its first movement and before it turns the switch.



Claim.—1. In a switch-stand, the combination of a rotating stem or shaft for operating the switch, an independently rotating or oscillating target or signal, a lever for operating the switch-stem, and devices for actuating the independently-rotating target from the switch-lever, whereby the movement of the lever causes the shifting of the signal before the switch is turned, substantially as and for the purpose specified.

2. In a switch-stand, the combination of a rotating stem or shaft for operating the switch, an independent rotating or oscillating target or signal, a lever for operating the switch-stem, devices for actuating the independently-rotating target from the switch-lever, whereby the movement of the lever causes the shifting of the signal before the switch is turned, and the locking mechanism, whereby the signal mechanism remains locked until the lever is returned to its original position, substantially as and for the purpose specified.



3. In a combined switch and signal-setting mechanism, the combination of a rotating stem for actuating the switch, an independent rotating stem for actuating the signal, a lever for actuating the switch-stem, a slide-bar actuated by the switch-lever, and adapted to actuate the signal mechanism, and locking mechanism adapted to lock the slide during the rotation of the switch-stem, substantially as and for the purposes specified.

292,898. ROTARY STEAM-ENGINE. LOUIS D'ANDRÉE, Riga, Russia, assignor to himself and Ludwig Loewe & Co., Berlin, Germany. Filed June 22, 1883. (No model.)

Claim.—In a rotary steam-engine, the combination of the eccentric-piston B, having the radial slot D, leading from the side face of the piston, and the channel E, extending from said slot to the periphery of the piston, with the cylinder A, the cut-off slide F, fitted in the latter, the steam-inlet port H, and steam-outlet port G, all constructed and relatively arranged as herein set forth, for the purpose specified.

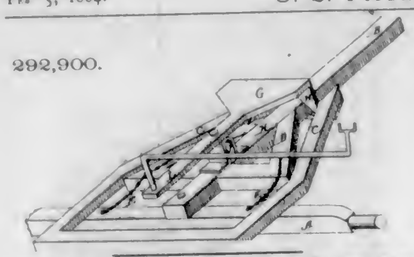
292,899. GAME APPARATUS. THOS. DAVIES, Poughkeepsie, N. Y. Filed Dec. 13, 1883. (No model.)

Claim.—1. The game apparatus consisting of the hook B, wedge E, frame A, spring F, rod D, cord D′, ring C, and cord C′, substantially as described and shown, and for the purposes set forth.

2. The combination of the wedge E, frame A, and hook B, with the ring C and cords C′ D′, and spring F, substantially as described and shown.

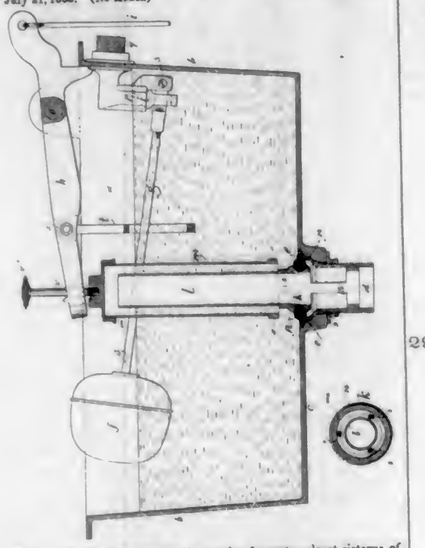
3. The combination of the adjustable hook B with the wedge E, spring F, and rod D and cord D′, substantially as described and shown.

4. The adjustable hook B, in combination with the wedge E, substantially as described and shown.



5. The combination of the frame A, hook B, ring C, wedge E, rod D, spring F, and cords C′ and D′, substantially as described and shown.

292,900. RUNNING-GEAR FOR VEHICLES. WILLIAM A. DAWSON, Stony Point, Cal., assignor of one-fourth to E. K. EVANS, same place. Filed May 3, 1883. (No model.)



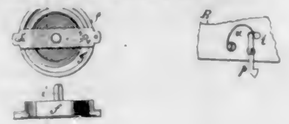
Claim.—1. In a vehicle having a front and rear axle, the tongue B, loosely pivoted to the front axle, A, in combination with the hounds C and D and chains E, all constructed to operate substantially as and for the purpose set forth.

2. In a vehicle having a front and rear axle, the tongue B, loosely pivoted to the front axle, A, in combination with hounds C and D, chains E, plate G, provided with the lugs H, and lever-arm I, all constructed to operate as and for the purpose set forth.

292,900.

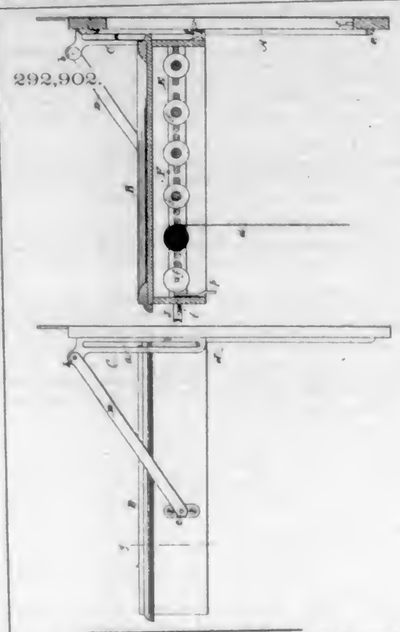
292,901. CISTERN FOR WATER-CLOSETS. JOHN DEMAREST, New York, N. Y., assignor to the J. L. Mott Iron Works, same place. Filed July 21, 1883. (No model.)

Claim.—1. The combination, in a valve for water-closet cisterns, of the tube *l*, a ring, of rubber or other elastic material, at the lower end of said tube, and the tube *m*, supported by and surrounding the tube *l*, and made with an open lower end and closed top, substantially as and for the purposes specified.



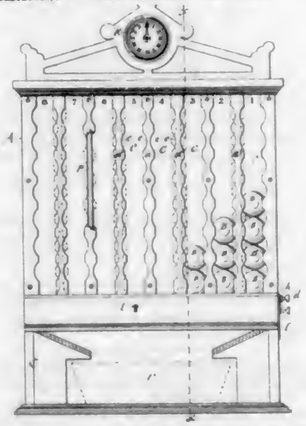
2. The combination, in a valve for water-closet cisterns, of the tube *l*, a ring, of rubber or other elastic material, at the lower end of said tube, the tube *m*, supported by and surrounding the tube *l*, and having an open lower end and closed top, and the slotted tubular guide below the lower end of tube *l*, substantially as and for the purposes set forth.

3. In a water-closet cistern, the valve *k*, open tube *l*, tube *m*, closed at the top, and valve-seat *s*, in combination with the lever *h*, slotted arm *i*, float *f*, and rod *g*, the latter within the slot of the arm *i*, and the valve *p*, operated by said float, substantially as and for the purposes set forth.



292,902. MAP-HOLDER. JOHN W. H. DOUBLER, Rockford, assignor to A. H. Andrews & Co., Chicago, Ill. Filed Apr. 24, 1882. (Model.)

Claim.—1. In a map-holder, a swinging case, B, open on one side only, adapted to receive and hold a series of maps, and supported by hinged bars D, pivoted at one end to the ends of the case a little forward of the center of gravity, substantially as and for the purposes specified.



2. In a map-holder, a case, B, adapted to receive and hold a series of maps, and provided with projecting irons, *d*, in combination with irons C, provided with a slot, *a*, and bars D, pivoted at one end to the irons C and at the other end to the ends of the case B a little forward of the center of gravity, substantially as and for the purposes set forth.

292,902.

292,903. POOL-RACK. PATRICK W. FARLEY and A. LUCAS TROWBRIDGE, Canenovia, N. Y. Filed Oct. 16, 1883. (No model.)

Claim.—1. A pool-rack having the ball-receiving channels arranged vertically therein, and a movable gate at the bottom of said channels, substantially as set forth.

2. A pool-rack having the ball-receiving channels arranged vertically therein, guards on the front of the channels for retaining the balls therein, and a movable gate at the foot of the respective channels, substantially as set forth and shown.

3. A pool-rack having the ball-receiving channels arranged vertically therein, guards on the front of the channels, having excisions for the introduction of the balls, and intervening barriers for retaining the balls, and adapted to be moved longitudinally, and a movable gate at the foot of the respective channels, substantially as described and shown.

4. In combination with the vertical channels, a movable gate at the foot of the channels, and movable guards on the front of said channels, arranged to move automatically with the movement of the gate, substantially as set forth and shown.

5. In combination with the vertical channels, vertical strips projecting at opposite edges of the channels and having excisions to form ports for the introduction of the balls, and a gate arranged at the base

of the channels and adapted to support the balls in the channels below the ports thereof, substantially as specified and shown.

6. In combination with the vertical channels C C, the guard-strips *a*, fixed in position and provided with the excisions *a a*, the strips *a'*, arranged movable longitudinally and provided with corresponding excisions, *a a*, steps *b*, attached to the strips *a'*, and the gate *c*, adapted to encounter said steps, substantially as described and shown, for the purpose set forth.

7. The combination of channels C C, arranged vertically, guard-strips *a*, fixed to one edge of the channels, strips *a'*, arranged movable longitudinally on the other edge of the channels, and a lock for retaining the movable strip in its desired position, substantially as set forth and shown.

8. In combination with the channels C, the movable guard-strips *a'*, steps *b b* on said strips, the gate *c*, adapted to engage with said steps, and a lock for confining the strip *a'* in its position, substantially as described and shown.

9. In combination with the channels C C and gate *c*, the movable guard-strip *a'*, provided with the step *b*, adapted to engage with the gate, and the registering apparatus R, actuated by said guard-strip, all constructed and combined to operate substantially as specified and shown.

292,904. IRONING-BOARD. ROBERT W. FERGUSON, Decatur, Ill., assignor to William B. Clark and Frazier W. Nevius, both of same place. Filed Apr. 9, 1883. (No model.)

Claim.—1. The combination, with the body of the board, of the flap hinged thereto, and having a grooved front edge and a pivoted clamp-wire, substantially as described.

2. The combination, with the body of the board, of the flap hinged thereto, and a wire having its ends pivotally connected to the body of the board, said wire forming a clamp for the flap, substantially as described.

3. The combination, with the body of the board, of the flap hinged thereto, and a clamp-wire having its ends driven obliquely into the board, said board being cut away near the ends of said wire, substantially as and for the purposes set forth.

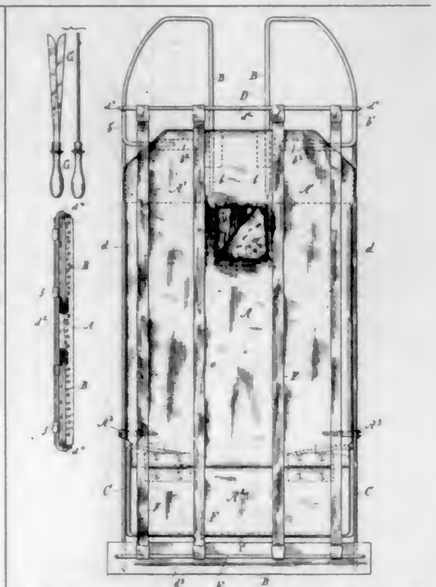
4. The combination, with the board and the eyes or sockets, of the wires B, bent substantially as shown, and having their inner ends embedded in the board and their outer ends upturned and movably held in the eyes, substantially as described.

292,905. PLAITING-MACHINE. ROBERT W. FERGUSON, Decatur, Ill., assignor to William B. Clark and Frazier W. Nevius, both of same place. Filed July 25, 1883. (No model.)

Claim.—1. The combination, with the board, of a frame provided with tapes and adapted to be removably fitted to said board, substantially as described.

2. The combination, with the board having pivot-pins, of the tape-frame having sockets to fit over said pins, substantially as described.

3. The combination, with the board having pivot-pins and having a groove in each of its side edges, of a tape-frame, substantially as described.

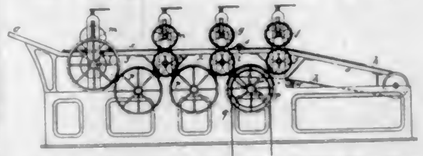


4. The combination, with the board, of the tape-frame having end bars to sustain the tapes, and having side bars adapted to fit over the board and act as springs to tighten the tapes, substantially as described.

5. The combination, with a board having pivot-pins placed centrally of its side edges, and having double grooves in its side edges, of a tape-frame, constructed substantially as described.

6. The combination, with the board having springs B, of the tape-frame bent, as at d^4, to clasp said springs, substantially as described.

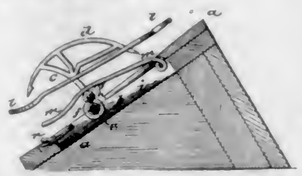
7. The combination, with the board having expanded portions A' with grooved side edges, of the pivoted tape-frame adapted to enter the grooves, substantially as described.



8. The combination, with the side-bars and end bar of the tape-frame, of the strip d^3 and the tapes E, substantially as described.

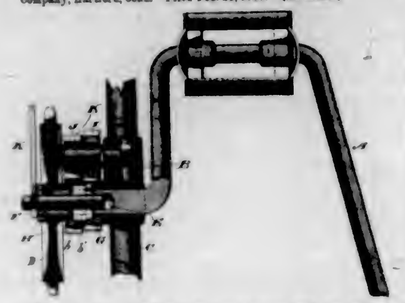
9. The combination, with the board having narrow flap A^3 and clamp-wire C, of the pivoted tape-frame D, adapted to fit over said board and flap, substantially as described.

10. In a plaiting-machine, a plaiting-knife having two blades, the ends of which are cut away in reverse directions, substantially as described.



292,906. CAKE AND CRACKER MACHINE. ISAAC GOODMAN and LOUIS F. WOTTER, New York, N. Y. Filed Nov. 27, 1882. (No model.)

Claim.—1. The combination, in a cracker and cake machine, substantially as hereinbefore set forth, of a pair of kneading-rolls, *l m*, a pair of kneading, drawing, and delivering rolls, *n n*, having greater speed than rolls *l m*, a pair of printing rolls, *g i*, a pair of cutting-rolls, *f j*, having endless cutters, substantially as described, the stationary plates *y z* between the kneading and printing rolls, respectively, the endless carrier *h* between the printing and cutting rolls, and connecting and actuating mechanism, substantially as described.



2. In a cracker-machine, the combination of the printing-rolls *g i*, endless carrier *h*, stripping-rod *s*, the cutting-rolls *f j*, and connecting and operating mechanism, substantially as described.

292,907. GRAIN-BINDER. HENRY GUYER and LUKANUS F. KING, Pole, Ill. Filed Feb. 24, 1883. (No model.)

Claim.—In a grain-binder of the character described, the combination of the binder-arm carrying the friction-rollers with the pivoted compressor-arms *m m*, adapted to operate substantially as and for the purposes specified.

292,908. VELOCIPEDE. CHARLES F. HADLEY, Chicopee, Mass., and ALBERT H. OVERMAN, Hartford, Conn., assignors to the Overman Wheel Company, Hartford, Conn. Filed Feb. 28, 1883. (No model.)

Claim.—1. In a velocipede, the combination, with the pedal-shaft and a chain-wheel loosely secured thereon, having an interiorly-slotted pinion rigidly secured to it, of the independent sliding locking device adapted to engage the slotted pinion, and means for actuating said device, whereby the said chain-wheel is thrown out of and into connection with the shaft.

2. In a velocipede, the combination, with a slotted pedal-shaft and a chain-wheel loosely mounted thereon, of a locking-pin arranged within said shaft, a pinion loosely mounted on said shaft, and gearing interposed between said chain-wheel and the bearing of the shaft, substantially as set forth.

3. In a velocipede, the combination, with the pedal-shaft and a chain-wheel loosely mounted thereon, of the gearing, the locking-pin, and the means for actuating the said pin, whereby the said wheel may be directly connected with said shaft to turn therewith or indirectly connected with the shaft, substantially as set forth.

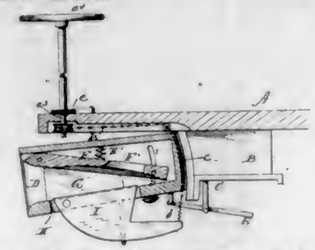
4. The combination, with the pedal-shaft provided with a hollowed or socketed end, a pin resting in said socketed end and provided with a feather, and means for moving the pin longitudinally, of a chain-wheel loosely journaled on the shaft, a pinion rigidly secured to the chain-wheel, a pinion loosely journaled on the shaft, and intermediate gears connecting the wheel on the shaft and the wheel on the chain-wheel.

5. The combination, with the pedal-shaft having a hollowed or socketed end, a feathered pin working in said slot, and a lever for moving the pin, of a chain-wheel loosely secured on the shaft, a slotted pinion rigidly secured to the chain-wheel and surrounding the shaft, a slotted pinion loosely journaled on the shaft, and two gear-wheels rigidly secured together and adapted to mesh, respectively, with the loose pinion on the shaft and the rigid pinion on the chain-wheel, substantially as set forth.

6. The combination, with the shaft A and bearing B, of the chain-wheel D, feathered pin F, and the pinions G I J H, all of the above parts combined and adapted to operate as described.

7. The combination, with the pedal-shaft having holes and the pedals fitted thereon, of collars having corresponding holes and pins or equivalent devices for connecting them with the shaft for securing the pedals, said collars being adapted to be adjusted to compensate for the wear, substantially as set forth.

292,909. CASE FOR PENCILS. JOHN C. HARING, Jersey City, N. J. Filed Dec. 5, 1883. (No model.)



Claim.—1. The combination, with the receiver and a carrier furnished with a pin or lateral projection, of a fixed guide within the receiver and a movable guide between the receiver and carrier, the two said guides having between them a passage for the said pin or projection on the carrier, and a spring and pressure-cap for operating said movable guide for opening and closing said passage, substantially as herein described.

2. The combination, with the receiver and a carrier furnished with a pin or lateral projection, of a fixed guide within the receiver, a movable guide between the receiver and carrier, and a spring and pressure-cap applied to the said movable guide, the said guides comprising straight and inclined portions, and being notched for the passage and stoppage of the said pin or projection, substantially as herein described.

3. The combination of the receiver A, the carrier B, having a projection, *a*, the stationary and movable notched guides E D^2, having a passage, *c c c*, between them for the said projection, the pressure-cap, and the spiral spring, substantially as herein described.

292,910. CAR-COUPLING. JOHN McD. HARPER, Colfax, Wash. Filed Nov. 8, 1883. (No model.)

Claim.—1. In a car-coupling, the combination, with the car or platform having a block secured to its under side, the front end of which is provided with a dovetailed flange, of a draw-head having a corresponding dovetailed groove to receive the dovetailed flange of said block, and a lever pivoted to the under side of the said block, its end being secured to the under side of the draw-head, whereby the said draw-head is rendered vertically adjustable, substantially as set forth.

2. The combination, with the draw-head slotted on its under side, of a coupling-hook pivotally secured in the forward end of said slot, a coiled spring secured to the rear end of said hook, a chain secured to said spring, a pulley journaled to the under side of the car, and a shaft having a drum and hand-wheel and mounted in the forward end of the platform, said chain being secured to said drum and adapted to be wound thereon, substantially as set forth.

3. The combination, with the draw-head having blocks or stripe secured on its inner sides, of a latch pivoted in the forward end of said draw-head and slotted at its rear end, and a coupling-hook pivoted in a slot in the draw-head, substantially as set forth.

4. The combination, with the draw-head having blocks or stripe secured on its sides, of a latch pivoted in the forward end of said draw-head and slotted at its rear end, an angular rod secured to the side of said latch, and extending through an opening in the side of the draw-head, an alarm secured to the under side of the draw-head, and a coupling-latch, substantially as set forth.

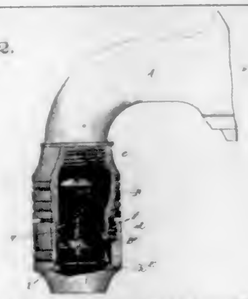
5. The combination, with the draw-head slotted on its under side, of a coupling-latch pivoted in the forward end of said draw-head, and having a spring secured to its rear end, a chain connecting said spring and the shaft *e*, and a U-shaped bracket secured to the under side of the draw-head to limit the downward movement of the coupling-hook, substantially as set forth.

292,911. POSTAL-BAG RACK. CHARLES R. HARRISON, Fond du Lac, Wis. Filed Dec. 5, 1883. (No model.)

Claim.—1. In a postal-bag rack, the combination of a movable section or sections opening either way, with the fixed rack-sections *x x*, substantially as and for the purposes set forth.

2. The combination, in a movable rack-section, of the platform A, casters *a a*, elliptic hinge-eye *d*, pivot *e*, cam *f*, and block *g*, substantially as shown, for the purpose specified.

3. The combination, in a postal-bag rack, of the hook B, having a mortise, *b*, in its shank, and ring, with the pins or pegs C in the rack-rod *y*, substantially as shown, for the purpose specified.

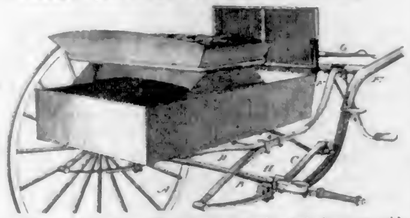


4. The hook B, having in its ring and shank the transverse mortise *b*, substantially as shown, for the purpose specified.

292,912. WATER-FILTER. JOHN E. HEATH, Albany, N. Y., assignor of one-half to Henry L. Smith, same place. Filed Aug. 16, 1883. (No model.)

Claim.—1. In a water-filter, the shell composed of the upper section and lower section, constructed substantially as shown and described, and containing within its uppermost section a vertically-arranged filtering-hood attached to a valve adapted to close and open annular opening *e* between the lower portion of said section and the base of the hood, and containing within its lowermost section the valve which supports the hood, the said valve being centrally perforated, and supported from the lower section by a base, which is perforated in its sides and lower end for communication from both the interior of the hood and upper chamber to the interior of the lower chamber, accordingly as said valve is raised or lowered, for operations as set forth.

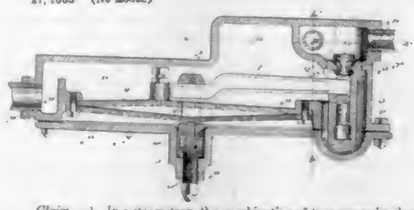
2. In a water-filter, the combination, with hood-stand E, supported in a seat made in lower section, B', provided with a coupling screw-thread, of upper section, B, containing a water-pressure chamber, and



292,912.

having centrally-perforated diaphragm *d* and screw-threaded nib, and inclosing a water-filtering hood attached to the perforated platform of said hood-stand, for operations substantially as set forth.

3. In a water-filter, the combination, with upper section, B, containing a pressure-chamber, and provided with a centrally-perforated diaphragm, *d*, and screw-threaded nib *f*, of the lower section, B', containing a wash-chamber, and having seat *k* and screw-thread *g*, the said sections being unitedly adapted to clamp the perforated stand which supports the filtering-hood and the valve which closes the central perforation in diaphragm *d*, and release said perforated stand and lower the valve carried by the same, for alternately changing the direction of the passage of the water from the pressure-chamber to the wash-chamber, accordingly as the lower section is raised or lowered, substantially as and for the purposes set forth.



292,913. TWO-WHEELED VEHICLE. HENRY H. HEER and JOHN F. SCHONERT, Fayettaville, Ind. Filed Oct. 10, 1883. (No model.)

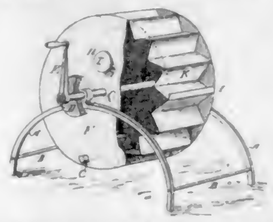
Claim.—1. In a two-wheeled vehicle having its body supported by a set of regular platform-springs, the combination of the jointed connections of springs to cross-bar of shafts, with the journal-connections to the axle, and with the journal-boxes, the upper half of which are constructed with beveled projections, all as described and shown.

2. In a two-wheeled vehicle, the combination of a journaled axle with a journal-box having a flanged projection, substantially as described, and for the purpose specified.

292,914. STEAM-TRAP. JOHN C. HENDRY, Boston, Mass. Filed Aug. 27, 1883. (No model.)

Claim.—1. In a steam-trap, the combination of two expansion-bars with a valve-actuating lever having its fulcrum and one arm connected with the said bars, and the valve connected with the other arm of the said lever, substantially as described.

2. In a steam-trap, the expansion-bars and valve-actuating lever connected therewith, combined with the fulcrum-adjusting device, substantially as and for the purpose described.



3. In a steam-trap, the main chamber or casing provided with inlet and outlet openings, and a partition separating the said openings, having two independent passages, combined with an automatically-operated valve controlling the flow of fluid through one of the said passages, and a hand-operated valve controlling the flow of fluid through the other of the said openings, and affording an independent discharge of the fluid to the outlet of the main casing, substantially as described.

4. In a steam-trap, the main casing provided with inlet and outlet openings, and a partition separating them, combined with the tubular slotted valve-holder provided with an annular groove, and the valve and valve-stem provided with cup-shaped recesses, to operate substantially as described.

5. In a steam-trap, the case provided with inlet and outlet openings, and a valve to control the flow of fluid therethrough, combined with a bent expansion-bar, abutments supporting it at its ends, and the valve-actuating lever having one arm connected with the before-mentioned valve and its other arm connected with and actuated by the lateral movement of the expansion-bar between its ends, substantially as described.

6. In a steam-trap, the main chamber or casing provided with inlet and outlet openings, and a partition separating the said openings, having two independent passages, one above the level of the other, the said casing on the inlet side of the said partition having a depressed portion constituting a sediment-chamber, combined with an automatically-operated valve controlling the flow of fluid through the higher of the said passages, and the hand-operated valve controlling the flow of fluid through the lower of the said passages, whereby the sediment may be blown from the sediment-chamber into the outlet-passage of the main chamber, substantially as described.

292,915. CHURN. ORRIN HENRY, Port Andrew, Wis. Filed July 2, 1883. (No model.)

Claim.—In a churn, the rotating body composed of the disks or ends F, provided with suitable openings at one end, as shown, in combination with the step-like or corrugated periphery K, having the turned-up blades L, to form buckets, whereby water-power may be applied to rotate the same, substantially as herein set forth.

292,916. SUBMARINE BOAT. JESSE JOPLING, near Longwood, Mo.; Monroe Jopling Executor of said Jopling, deceased. Filed June 6, 1883. (No model.)

Claim.—1. In combination with a cylindrical portion of a boat of the form described, and having tapering or conical ends, the straight metallic keel-rail B, bolted externally to said cylindrical portion, having each end tapered, as described, so as to furnish a broad and stable bearing for the boat when resting on the ground, and also a support for lower end of guide-rod D, as set forth.

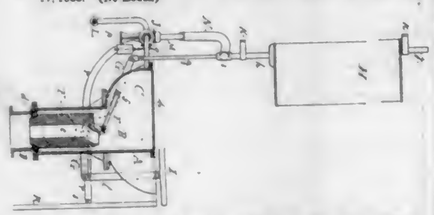
2. In combination with the bottom of a boat, a tube extending through a ball in the bottom of the boat, and having out-and-in movement, said ball being mounted in a ring, so as to have universal movement and permit the ready manipulation of the tool, substantially as described.

3. In combination with a submarine boat, the improved level-indicator, consisting of the bar and semicircle suspended in forked arms, and the pendulum suspended from said bar, substantially as and for the purposes hereinbefore described.

4. In combination with a submarine boat, an air-pump with mouth-piece and tubes to withdraw the air immediately as it is exhaled from the lungs of the crew, and force it through a receptacle of lime-water or similar substance, substantially in the manner stated.

5. In combination with a submarine boat provided with an air-pump, and means, such as described, for purifying air, a face cap or cup to cover the nose, mouth, and chin of a person, said cap or cup divided into two parts by a partition, the part next the face having valves opening inward, and the partition having a valve opening toward the air-pump, as set forth.

6. In combination with a submarine boat, a tube leading to the outside of such boat, connections, substantially as described, for operating the indicator, and a clock-work indicator having hands to indicate in feet the depth of submersion, and a rotating hand to indicate the water-log and running-level of the boat, and the direction and rapidity of vertical motion, substantially as described.



292,917. POCKET-KNIFE. FRIEDRICH WILHELM KALDENBACH, Solingen, Prussia, Germany, assignor to Alexander Coppel, same place. Filed Aug. 6, 1883. (No model.)

Claim.—1. The herein-described pocket-knife, consisting of the sheath or handle A, having a slot, *h*, in its back, the sliding blade B, having a vertical opening and horizontal opening intersecting therewith, the spring *f*, seated in the latter, and the push-pin having the body *a*, neck *b*, head *d*, and bottom projections, *c*, as and for the purpose set forth.

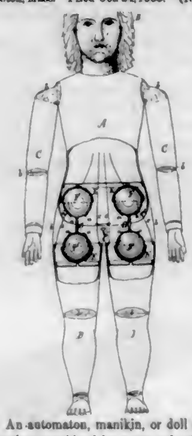
2. The combination of the sheath or handle A, having a slot, *h*, in its back, provided with one or more enlargements, *i*, with the sliding knife-blade B, having a locking-pin consisting of the body *a*, neck *b*, head *d*, and bottom lugs, *c*, and the spring *f*, bearing upon said pin, as and for the purpose set forth.

292,918. WATER-CLOSET. JOHN KELLY, Chicago, Ill. Filed Mar. 17, 1883. (No model.)

Claim.—1. In a water-closet, a vertically-movable service-tank arranged to operate the soil-valve by its differential gravity, in combination with said soil-valve and connections thereto, substantially as set forth.

2. In a water-closet, the vertically-movable service-tank automatically filled and emptied through a valve controlled by the seat, and operating the soil-valve by its differential gravity, in combination with said valves and connections thereto, substantially in the manner set forth.

3. In a water-closet, the combination of the vertically-movable service-tank H, the water-supply valve, and a flexible pipe by means of which the tank and valve are made to communicate, and the soil-valve, all connected together, in a manner substantially as described, so as to open such valve by the overbalance of water in the tank, as set forth.



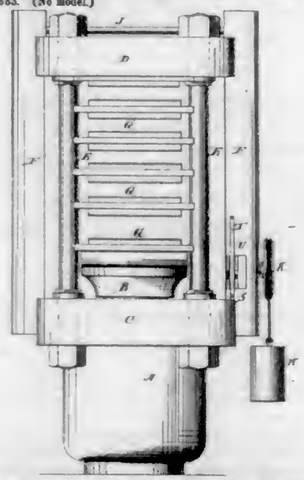
4. In a water-closet, the soil-valve plunger E, arranged within a cylinder, B, that is hermetically closed on top, in combination with said cylinder B, an arm F, shaft *f*, stuffing-box *c*, and operating-lever G, all substantially as set forth.

5. In a water-closet, the lever G and arm F, both secured upon a rocker-shaft, *f*, the tank H, supported on lever G, and the soil-valve plunger E, coupled to arm F, and arranged so that such empty tank H is lifted by the greater gravity of the plunger, but when filled such tank will overbalance and lift the plunger, all constructed and combined substantially as set forth.

6. In a water-closet, the combination of the cylinder B, provided with the transverse shaft *f*, with the plunger E, arm F, connected to plunger and pivoted on shaft *f*, lever G, tank H, supported thereby, and swinging seat I, said lever being provided with standard *l*, which is in contact with the swinging seat I, substantially as set forth.

7. In a water-closet, the stop-cock J, as described, communicating with the vertically-moving service-tank H through flexible pipe N, and with bowl A through pipe M, in combination with said parts and with the beam *o*, weight *p*, arm *r*, shaft *s*, standard *u*, and seat I, all constructed and arranged to operate as herein set forth.

292,919. MANIKIN, AUTOMATON, OR JOINTED DOLL. CARL AXEL KIELGREN, Boston, Mass. Filed Oct. 24, 1883. (No model.)



Claim.—1. An automaton, manikin, or doll having any two of its parts jointed together, combined by means of a duplex ball-joint, substantially, and arranged with them, as described.

2. The described duplex ball-joint, essentially as set forth, consisting of the two balls, their connecting-shank, and the two cups, arranged with the balls and having prongs to lap on them, as explained.

3. The combination, in a manikin or doll, of two members or parts thereof connected by a duplex ball-joint, as set forth, with a cloth or flexile covering extended from one to the other of such members or parts, and inclosing the space between them, and with one or more flexile wires projecting from the edge of one of such members or parts through a guide or guides in the other and arranged with the said covering, substantially as set forth.

292,920. PRESS. CORNELIUS KEPPLER, Chicago, Ill., assignor to himself and the North Western Fertilizing Company, same place. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination of the casings or hollow columns F F', having the movable slides within them, with the base and cap plates C D of a press, substantially as and for the purpose described.

2. The combination of two or more slides, P, with the casings F F' and plates G, substantially as described.

3. The combination of the sprocket-wheels N, mounted upon suitable shafts, with the chains O, movable heads or blocks *m*, having pins *n*, and the slides P, having inclined grooves *o*, substantially as set forth.

4. The combination of the shaft K, the gear-wheels L M, shaft I, sprocket-wheels N, and shafts J and I', substantially as specified.

5. The combination of the ratchet-wheel *a* with the broken-gear wheel *c*, spring-dog *h*, segment-lever T S, and a spring or weight, substantially as described.

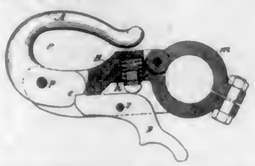
6. The combination of the segment-lever T S, the broken-gear wheel *c*, ratchet-wheel *a*, dog *h*, and wheels L M for rotating the shaft I, substantially as set forth.

7. The combination of the ratchet-wheel *a* with the pawl or dog *b*, sliding bar R, having the notch *i* with the latch *j*, and lever or projection *l*, substantially as specified.

8. The combination and arrangement of the shaft K and spring or weight with the segment and lever T S, broken gear *c*, ratchet-wheel *a*, pawls *h b*, gear-wheels L M, shaft I, sprocket-wheels N, chains O, shafts J I', movable heads or blocks *m*, having pins *n*, and slides *p*, having cams or inclines *o*, all constructed and operating substantially as and for the purposes described.

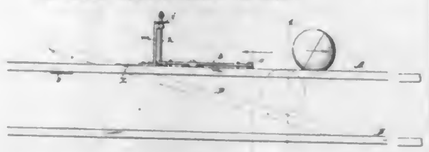
9. The slide P, having the rear support, *q*, incline or cam groove *o*, and projections *p*, substantially as specified.

292,921. COTTON-LAP. RICHD. KITSON, Lowell, Mass., assignor to the Kitson Machine Company, same place. Filed May 2, 1882. (No model.)



Brief.—A lap of substantially equal thickness and straight edge throughout.

Claim.—1. A cotton-lap in proper form to feed to a carding-machine, having a substantially straight edge and equal thickness in all its parts, substantially as described.

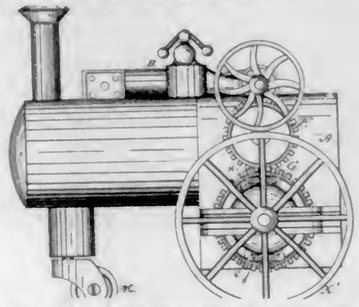


2. A cotton-lap of substantially equal thickness in all its parts, having a straight edge formed upon it without cutting any of its fibers, substantially as described

292,922. TRACE-HOOK. OTTO LAMPE, Hamburg, Germany. Filed Nov. 10, 1883. (No model.)

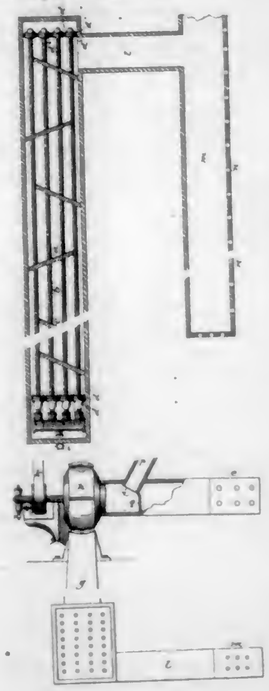
Claim.—The combination of the body or stock B, provided with a recess in its under side, the nose or beak A, pivoted in the body or stock, and provided at its rear end with the notch *a*, the double-armed catch-lever D, arranged longitudinally of the body or stock, pivoted in the recess in the under side thereof, and at its forward end engaging with the notch *a*, and the spring *h*, arranged between the under side of the body or stock and the upper side of said lever, all substantially as herein described.

292,923. STORE-SERVICE APPARATUS. WILLIAM S. LAMSON, Lowell, Mass. Filed Dec. 10, 1883. (No model.)



Claim.—1. In a cash-service apparatus having graduated carriers, the combination of a main track, branch track extending to stations of the store, switch devices for locking the same in one position, and appliances arranged to be moved by the carriers to be switched and to thereby cause the switch to assume a position to direct the carriers onto the other track, substantially as set forth.

2. The combination of the main track, side track, switch pivoted that it may be brought to coincide with either track, lock, and appliances whereby to unlock and change the position of the switch by the action of some of the carriers, while others are permitted to pass onward upon the main line.

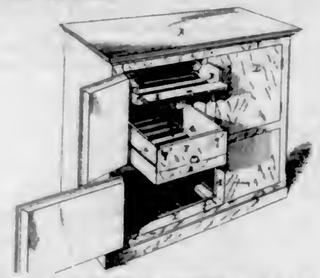


3. The combination, with the track of a store-service apparatus, of a pivoted switch-section, and locking device constructed to be operated by the momentum of special carriers to unlock said section and permit the same to move under the weight of the carrier, substantially as specified.

292,924. TRACTION-ENGINE. CHARLES J. LEACH and ALLEN OLDS, Hartford, Mich. Filed Apr. 17, 1883. (No model.)

Claim.—The road-engine herein described, consisting of the boiler A, having the bearing-plates A' A^2, and the sleeve L, passing through the boiler and engaging the bearing A^2, and provided with the rigid gear-wheel I and drive-wheel L', the axle K, journaled in the sleeve and bearing A', and having the rigid gear-wheel J and drive-wheel K', the gear-wheel G, provided with pinions H H, mounted loosely on the axle between wheels I J, and the nut *x* on the end of the axle, to secure the mechanism together, as shown and described.

292,925. REFRIGERATING-MACHINE. CHARLES B. LEE, Galveston, Tex. Filed Oct. 22, 1883. (No model.)

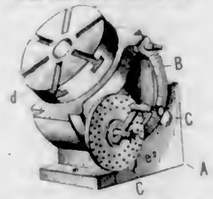


Claim.—1. A refrigerating-box having a detachable top and hinged sides, a series of pipes for containing the refrigerant, arranged within said box, and a series of partitions extending alternately from opposite sides nearly across the box, for causing the air to be cooled to make a long circuit in passing through the box, substantially as and for the purposes described.

2. A refrigerator-box having a series of refrigerant-pipes extending longitudinally through it, each pipe being connected at each end with a connecting-pipe by means of separate flanges, and the end pipes connected by flanges with supply and discharge pipes, whereby any one or more of the pipes may be taken out or replaced without interfering with the operation of the machine, substantially as and for the purposes described.

3. In combination with a refrigerator, a perforated cold-air-distributing box in the lower part of the room, a perforated air-box in the upper part of the room, and suction-fan for withdrawing the warm air from the room and forcing it through the refrigerator and the cold-air box and out into the room, substantially as and for the purposes described.

4. The suction-fan having a valve, and arranged in connection with a fresh-air pipe, and a pipe leading from the upper part of the room, in combination with a refrigerator and an air-distributing box, whereby the air may be drawn from the outside or from the room at will, substantially as and for the purposes described.



292,926. REFRIGERATOR. JOEL LINSLEY, Burlington, Vt. Filed Dec. 6, 1883. (No model.)

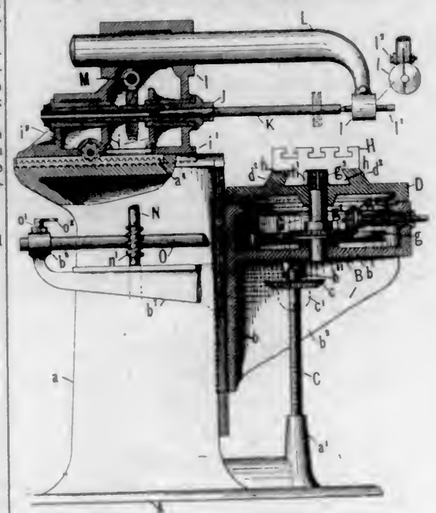
Claim.—1. In a refrigerator, the combination of a sliding provision-section with suitable spring-stops to limit its outward movement, a wide bottom bar to close the opening between its interior and the provision-room when the section is drawn out as far as the stop will permit, and suitable elastic packing to prevent the escape of air around it, substantially as described.

2. A sliding provision-section in a refrigerator, in combination with suitable flush-rollers, *f*, on which it rests, a hinged end, F, in front controlled by suitable fastenings, *g*, suitable spring-stops, G, to prevent its being entirely drawn out, a rear bottom bar, H, of sufficient width, and suitable elastic packing, I, substantially as specified, and for the purpose described.

292,927. INDEX-HEAD FOR MILLING-MACHINES. CHARLES E. LEPE, Syracuse, N. Y. Filed June 8, 1883. (No model.)

Claim.—1. The combination of a head, substantially as described, capable of movement in the arc of a circle, and carrying the spindle of a work-holding table, with worm-gear mechanism, substantially as described, for revolving the table, and mechanism, substantially as described, for moving the worm in and out of gear.

2. In combination with base-piece A, the gear-wheel d^3, the worm-shaft E, the bushing *e'*, for adjusting the worm-shaft relatively to the gear-wheel d^3, and the set-screw H, for securing the shaft when adjusted, as described.



3. In combination with the base-piece A, the worm-shaft E, the cylindrical plug F, having the nut *f*, and the set-screw G, as described.

4. The base A, having the projections *a a*, in combination with the head B, having the recesses *b b*, and the securing-screw C, as described.

5. The machine described, consisting of the base-piece A, the swing-ing head B, with screws C C, for clamping the head to the base, the spindle D, with face-plate *d* and gear-wheel d^3, and the worm-shaft E, eccentric-bushing *e'*, with set-screw H, as set forth.

6. The combination of the following elements: the concave base-piece A, adapted to rest upon the bed of the machine, the convex head B, adapted to move in the arc of a circle upon the base-piece, and the spindle D and face *d*, adapted to revolve in the head B, as described.

292,928. UNIVERSAL MILLING-MACHINE. CHARLES E. LEPE, Syracuse, N. Y. Filed June 15, 1883. (No model.)

Claim.—1. In combination with the fixed box b' b^{rs} of the vertically-moving bracket, the cap D, adapted to revolve upon the box, and an expansible ring, substantially as described, adapted to clamp the cap to the box.

2. In combination with the fixed box and moving cap, the expanding ring E, adjusting-screw F, and nuts f f^2, adapted to clamp the cap to the box, as described.

3. In combination with the clutch-shaft Q, having the worm *q'*, and mechanism, substantially as described, for moving the shaft out of gear, the wheel *g*, vertical shaft G, pinion g^3, rack-bar *h'*, and the table H, as described.

4. In combination with the rack-bar *h'* of the work-table H, the shaft G, having the wheels *g*, *g'*, and g^3, as and for the purpose described.

5. In combination with the wheel *g* and shaft Q, with clutch *q* and worm *q'*, the movable journal-box, as and for the purpose described.

6. In combination with the shaft Q, with clutch *q* and worm *q'*, the movable journal-box q^2, and the actuating-spring q^3, the shaft, by the action of the spring, being moved upon the clutch-point as a pivot, as described.

7. In combination with the shaft Q, the movable journal-box q^2, the actuating-spring q^3, the lever q^6, and stud q^7, as and for the purpose set forth.

8. In combination with the horizontally-moving head I, the independently-adjustable arm L, as and for the purpose described.

9. The head I, having the chambers for oil, as described.

10. In combination with the vertical shaft N, having the worm *n'*, and mechanism, substantially as described, for actuating the same, the horizontal shaft O, having the wheel o^3, and the connecting-box P, for uniting the two together.

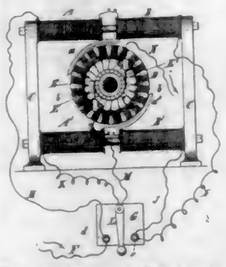
11. In combination with the horizontal clutch-shaft O, having the clutch mechanism *o* *o'* o^2 o^3 o^4 o^5 o^6, and receiving movement from a vertical shaft, the horizontal clutch-shaft Q, having the worm *q'*, as described.

12. In combination with a horizontal moving head and a vertically-moving bracket, a vertical shaft capable of lateral movement, a horizontal shaft capable of vertical movement, and a connection-box with contained gearing for uniting the shafts together, substantially as described.

13. In combination with the horizontal shaft O, capable of a longitudinal movement, and having the groove o^8, the vertical shaft *o'*, with handle o^9 and pin o^8, as described.

14. In combination with the mechanism, substantially as described, upon the main driving-shaft, for communicating movement, the vertical shaft N, the horizontal shaft O, and connection-box containing connect

ing-gearing, the shaft N being capable of lateral movement relatively to shaft O, and the shaft O being capable of vertical movement relatively to the shaft N, as described.



15. In a machine of the class described, a supporting-column provided with suitable sliding ways, combined with a vertically-adjustable knee or slide for holding work, a horizontally-adjustable head supporting the cutter-spindle, driving mechanism, substantially as described, and an automatically-adjustable connection, as described.

292,929. NECKTIE-FASTENER. JULIUS LOCHMAN, New York, N. Y. Filed Dec. 12, 1883. (No model.)

Claim.—The wedge-shaped fastening C, closed at its upper end and sides and provided with the button-slot D, as described, on its face, the lower end of the fastening being open, and said fastening being applied to the shield of a neck tie or scarf by lips cut thereon and penetrating the shield, substantially as set forth.

292,930. ELECTRIC MOTOR. ADOLPH E. G. LUBKE, New York, N. Y., assignor of one-half to Otto Heikel, Jersey City, N. J. Filed July 31, 1882. (No model.)

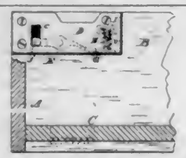
Claim.—1. The method herein specified of varying the speed of magnetic motors, in which the magnet-coils and armature-helices are connected in series by short-circuiting portions of the field-helices, to lessen the resistance and increase the speed of the armature, and lessen the power and the reverse, substantially as set forth.

2. In a magnetic motor, four helices wound, substantially as specified, to produce central N and S poles, and pole-pieces connected to the cores, in combination with the revolving armature and the switches, substantially as specified, for cutting out or short-circuiting the whole or portions of the field-helices, for the purposes set forth.

3. The combination, with the revolving armature and field-magnets, of the pole-pieces *a a'* at opposite sides of the armature, attached at one end to the field-magnet cores, and curved, and the outer ends nearest to the armature, substantially as specified.

4. In an electric motor, the combination of the field electro-magnets A A', the wires F H I, the contact-piece *c*, the switch-lever L, the wire M, armature D, commutator and brushes E E' E², and the wire N, substantially as specified.

5. In an electric motor, the combination of the field electro-magnets A A', the wire F, and contact-piece *d*, the wires H and I, the contact-piece *c*, the wires J K M, the switch-lever L, the armature D, the commutator and brushes E E' E², and the wire N, substantially as specified.



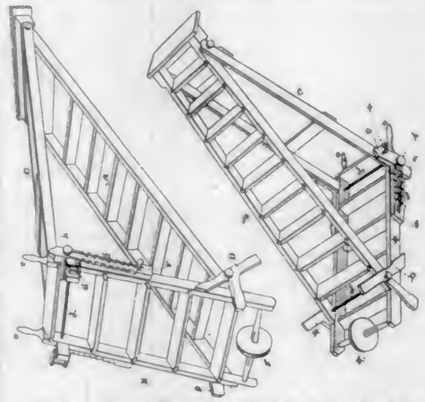
6. In an electric motor, the combination, with field electro-magnets, of the wires Q Q' and switches whereby their adjacent ends may be united, substantially as specified.

7. In an electric motor, the combination, with field electro-magnets, of the wires O O' P P' and switches whereby the same may be connected, substantially as specified.

8. The combination, in an electric motor, of a circular revolving armature, a surrounding frame, and the pole-pieces *a a'*, that are magnetized by induction, and which act with the pole-pieces of the armature, substantially as described.

292,931. END-GATE FOR WAGONS. JOHAN D. MACK, Salem, assignor of one-half to George H. Redway, Albany, N. Y. Filed Aug. 30 1883. (No model.)

Claim.—1. A fastener adapted to be secured to an end-gate of a wagon, consisting of a plate, D, having a slot or opening, *c*, for the passage of the catch-lip on the side of the wagon, and having pivoted thereto a vibratory or rocking lever, E, the end *f* adapted to enter a gate or channel in the catch-lip, and the opposite end, G, extended laterally to receive pressure from the fingers of the operator, substantially as hereinbefore set forth.



2. The plate D, provided with the pivoted lever E, formed as described, and having the slot or opening *c*, with the raised projection *d*, whereby the upward movement of the end *f* of the lever is limited, substantially as and for the purpose set forth.

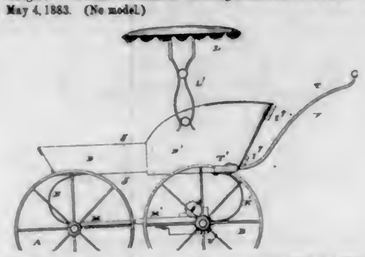
3. In combination with the plate D and lever E, constructed and arranged as described, the box or keeper I, seat *o*, and spring H, whereby the lever is positively operated, substantially as hereinbefore set forth.

4. In combination with the end-gate of a wagon provided with the plates D and latch-levers E, as described, the catch-lips F, secured to the sides of the wagon, and formed with beveled sides and securing-channel, substantially as and for the purposes set forth.

292,932. ADJUSTABLE STEP-LADDER. EDWIN MARKWICK, Pinckney, Cal. Filed Oct. 30, 1883. (No model.)

Brief.—Consists of a two-part ladder hinged together and mounted upon a single wheel, and having a common back leg-brace connected with slotted extension-legs having ratchet-faces which are engaged by pawls.

Claim.—1. In an adjustable step-ladder, the ladder A and the hinged leg-braces C, forming two sides of a triangle, in combination with a ladder, B, hinged to the ladder A, and adapted to be secured to leg-braces C by means of the leg F and pins H, to form the third side of the triangle, substantially as herein described.



2. In an adjustable step-ladder, the ladder A and hinged leg-braces C, forming two sides of a triangle, in combination with the ladder B, hinged to the ladder A, and adapted to be secured to the leg-braces C by means of the leg F and pins H, to form the third side of the triangle, and a single-wheeled truck, upon which said ladder B is mounted, whereby the device may be transported and reversed to throw either ladder in position, substantially as herein described.

3. In an adjustable step-ladder, the longer ladder, A, and hinged leg-braces C, forming two sides of a triangle, in combination with the shorter ladder, B, hinged to the longer ladder, and adapted to be secured to the leg-braces to form the third side of triangle, the single wheel E on its forward end, the leg-frames D on its sides, and the handles *e* at its rear, substantially as herein described.

4. In an adjustable step-ladder, the ladder A, leg-braces C, and a base connecting the two to form a triangle, as shown, in combination with the independent sliding and swinging ratcheted extension-legs F on the base, and the pawls I, engaging therewith, substantially as herein described.

5. In an adjustable step-ladder, the ladders A B and leg-braces C, forming a triangle, as shown, in combination with the slotted extension-legs F, having ratchet-faces *f*, and cross-heads G, the pins H, the studs k, and the swinging ball-pawls I, all arranged and operating substantially as herein described.

292,933. CHILD'S CARRIAGE. THOMAS MCKNIGHT, Denver, Colo., assignor of one-half to James A. McGonigle, Leavenworth, Kans. Filed May 4, 1883. (No model.)

Claim.—1. A longitudinally and transversely divided child's carriage, hinged to fold together sidewise, the forward part telescoping into the rear part, as set forth.

2. In a child's carriage, the combination of the top, body, handle, and axles, all divided longitudinally and hinged together, as shown, the body, reach, and side bars all divided transversely, and the forward parts telescoping into the rear parts, as shown, and means for drawing the parts together simultaneously, as set forth.

3. A longitudinally and transversely divided child's carriage, the rear part of the body folding outward, the front part of the body folding inward, the top folding upward, the handle folding downward, the bottom of the rear part of the body folding upward, the axles folding rearwardly, and the front portions of the body, reach, and side bars telescoping into their rear portions, as set forth.

4. In a child's carriage, the body divided transversely and longitudinally, the divided ends being hinged together and to the sides, and the front part telescoping with the rear part, as set forth.

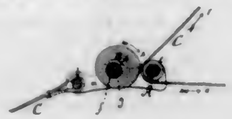
5. In a child's carriage, the body longitudinally and transversely divided, the transversely-divided parts sliding one in the other, and the bottom of the rear part being hinged to the sides of the body, and the bottom of the front part removable, as set forth.

6. A child's carriage having a folding top secured to its supporting-braces by spring-catches, substantially as and for the purpose set forth.

7. A child's carriage having its reach made in two parts, one of which is adapted to telescope the other, in combination with sectional axles, as and for the purpose set forth.

8. A child's carriage having is reach made in two parts, the front part adapted to telescope the other, which has a pivoted bottom with which the front part comes in contact and moves it back, substantially as and for the purpose set forth, in combination with the sectional axles, as described.

9. A child's carriage having its reach made in two parts, one secured to the front and the other to the rear axle, the former adapted to telescope the latter, and the latter having a hinged bottom adapted to have end movement, and to be moved endwise by the forward part of the reach, for the purpose set forth, in combination with the sectional axles, the rear axle having a pin adapted to come in contact with and raise the rear end of the pivoted bottom of the rear part of the reach, substantially as shown and described, for the purpose mentioned.

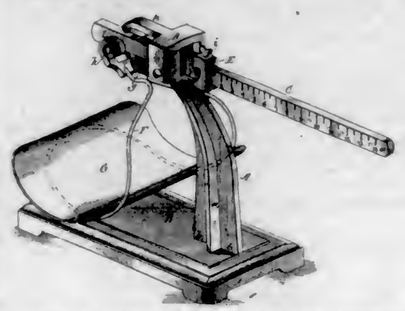


10. A child's carriage having a two-part reach, one of which is adapted to telescope the other, in combination with the spring secured to one part and adapted to engage in a hole in the other part to hold the two parts in their shipping position, substantially as set forth.

11. In a child's carriage, the combination of a sectional reach and sectional side bars, and the side bars having racks secured thereto, which are engaged by gearing connecting them with the rear wheels of the carriage, for the purpose set forth.

12. In a child's carriage, the combination of sectional reach and sectional side bars, the side bars having flexible racks secured thereto, which are engaged by gearing connecting them with the rear wheels of the carriage, for the purpose set forth.

13. In a child's carriage, the combination, with the sectional side bars and reach, and racks secured to the side bars, of the gearing engaging with the racks, and adapted to be held in or out of engagement with the rear wheels of the carriage by suitable pivoted dogs, substantially as and for the purpose set forth.



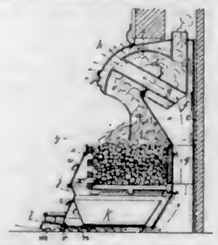
292,934. STRAP-CLAMP. EDMUND R. MENZEL, Jersey City, N. J. Filed May 10, 1883. (No model.)

Claim.—1. In a clamp having eccentrically-journaled roller B, the combination thereof with the spring *g* and with the rod *e*, substantially as specified.

2. The combination of the frame A, having rods *b d* and cheeks *a a*, with the eccentrically-journaled roller B and strap C, substantially as herein shown and described.

292,935. BALANCE. FREDRICK MEYER, Jr., Newark, N. J. Filed Dec. 13, 1883. (No model.)

Claim.—1. A suitable base provided with a slot, in combination with a column or standard, constructed substantially as described, and keyed to said base, a balance-beam provided with knife-edge projections having their bearing in said column or standard, and similar projections, forming a bearing for a pendulum cradle or pan, and a removable cap for the column or standard, having an extension forming a stop for the beam, as and for the purpose specified.

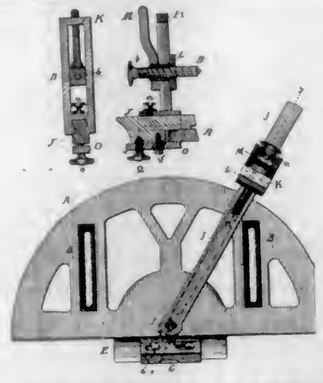


2. A pendulum cradle or pan formed, preferably, from a single piece, and provided with hooks, also preferably formed in one piece, in combination with a scale-beam having knife-edge projections forming bearings for the hooks of the cradle or pan, and similar projections at its center of gravity, a curved right-angularly-webbed column or standard keyed to the base, and provided with beam-bearings and stop at its upper end, and a cap removably secured to said column or standard, and having an extension forming an over-stop for said beam, substantially as shown, and for the purpose described.

292,936. FRUIT-PICKER. FRANK A. MOORE, Louisville, Ky. Filed Oct. 15, 1883. (No model.)

Claim.—In a fruit-picker, a bifurcated shank, one of the arms thereof being a spring-bar and the other curved, as described, in combination with two hoops, one being rigidly secured to each of said arms, a blade secured to one of said hoops, and a cord secured to one hoop, and passing through both hoops and over the curved shank, substantially as and for the purpose specified.

292,937. OPEN-FIRE STOVE AND HEATER. ALONZO R. MORGAN, New York, N. Y. Filed Dec. 5, 1882. (No model.)

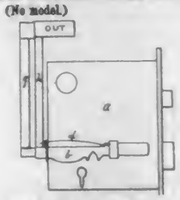


Claim.—1. In an open-fire stove having a distinctive reverberatory or expansion chamber, *d*, communicating with the top of the fire-box by the throat *e*, and having a downward extension from said throat, in which the products of combustion are received and materially retarded and ex-

panded before escaping into the chimney, the said expanding chamber having a tube or tubes arranged for conducting the air from the lower back part to the upper front part, in combination with an air-jacket surrounding the fire-box and expansion-chamber, and having a perforated jacket, through the openings of which the air is directly discharged from said tube or tubes, substantially as described.

2. In an open-fire stove or furnace, a removable guard-plate, *i*, for closing the lower portion of the front opening and supporting the blower for the upper portion of said front opening, the said guard-plate resting directly on the base-plate *n* of the stove, said plate having a groove in its upper surface for lodgment of said guard-plate therein, to securely maintain it in its proper relations with the fire-box front, substantially as described.

3. In an open-front stove or furnace having the guard-plate *i* resting on the low-down base-plate *n*, and having the air-passages *m* to the heating-jacket arranged in the front plate at the sides of the front opening, the said guard-plate *i*, for closing the lower part of the open front, having the outwardly-projecting top flange, *j*, to catch the droppings from the fire when the blower is removed, said outwardly-projecting top flange being extended upward and along the sides of the front opening to the front plate, said front plate having the said passages *m* below said projecting flange *j*, substantially as described.

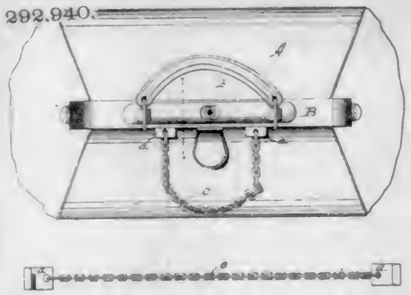


292,938. TOOL-HOLDER. ERASTUS D. MOSS, Defiance, Ohio. Filed Aug. 8, 1883. (Model.)

Claim.—1. In combination with the table A, the adjustable radial arm J, post K, and center D, adjustable on said post, substantially as and for the purposes set forth.

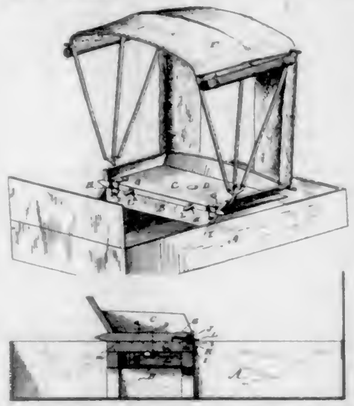
2. In combination with the table A, the radial arm J, slotted post K, center D, adjustable vertically on said post, and rest H, when constructed, arranged, and operating substantially in the manner and for the purposes specified.

292,939. INDICATING-LOCK. EUGENE C. NICHOLS, Bangor, Me. Filed July 10, 1883. (No model.)



Claim.—1. A door-lock the bolt of which is provided with an arm or standard carrying an indicator-plate, in combination with a door provided with an opening which coincides with said plate when the bolt is in its locking position.

2. A door-lock having two locking-bolts, adapted to be operated from opposite sides of the door, each of said bolts being provided with an arm or standard carrying an indicator-plate, said plates arranged in the same line, in combination with a door having an opening which coincides with said plates, whereby either of said plates may be exposed according as the door is locked from the inside or the outside.

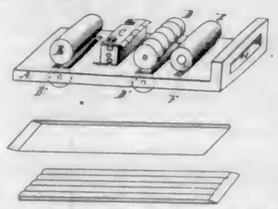


292,940. SAFETY ATTACHMENT FOR TRAVELING-BAGS. FRED. A. NICKERSON, Springfield, Mass., assignor of two-thirds to Charles M. Shedd and Henry A. Chapin, both of same place. Filed Mar. 10, 1883. (No model.)

292,940.

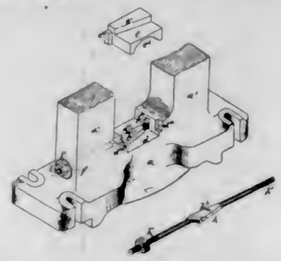
Claim.—As a new article of manufacture, a device for securing traveling-bags, consisting of a chain, *c*, having at each end a hook adapted to embrace one of the jaws of a traveling-bag, and to be secured between them when the jaws are locked, substantially as described.

292,941. BUGGY-TOP. DUDLEY NUNNELLEY, Keene, Ky. Filed Nov. 10, 1883. (No model.)



Claim.—1. In a vehicle, the seat-supporting frame, in combination with the seat pivoted thereon, and spring-plates secured to the seat and engaging with the upper face of the said frame, so as to automatically hold the said seat at any portion of its revolution, as set forth.

2. In a vehicle, the seat-supporting frame, in combination with the seat pivoted thereon and carrying a top, a link connected to the seat at each end, and hooking over projections or studs secured to the front face of the seat-supporting frame, as and for the purpose set forth.

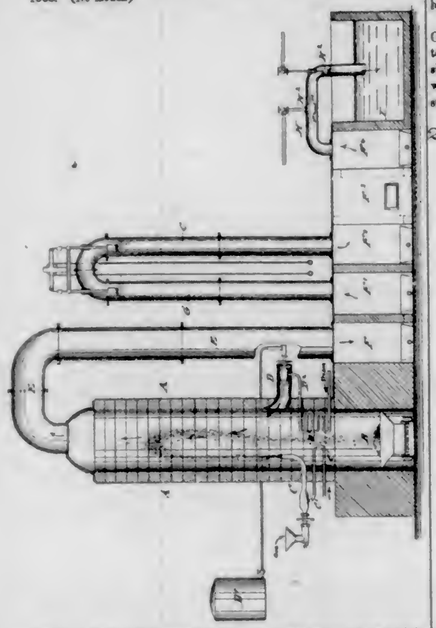


3. In a vehicle, the seat-supporting frame, in combination with the seat pivoted thereon and carrying a top, and plates provided with pointed projections, and adapted by spring-pressure to engage with the upper face of the seat-supporting frame, as and for the purpose set forth.

292,942. BASKET-SPLINT MACHINE. SAMUEL OAKMAN, Melrose, Mass. Filed Nov. 19, 1883. (No model.)

Claim.—In a machine for making wicker-work splints, the combination of the feed-rolls B B', the cutter-head C, whereby the riven wood is formed into a sheet, flat on one side and cut nearly through by corrugations on the other side, with the corrugated feed-roll D, smooth-roll D', pressure-roll E, and series of knives F, all arranged to operate substantially as described, and for the purpose set forth.

292,943. ROLLING-MILL. DAVID B. OLIVER, Allegheny, Pa. Filed Sept. 3, 1883. (No model.)



Claim.—1. The combination, in a rolling-mill, of a roll and its bearings with an adjustable wedge placed horizontally back of the bearing at right angles to the axis of the roll, to take up the wear of the bearings and prevent end motion of the rolls, substantially as and for the purposes described.

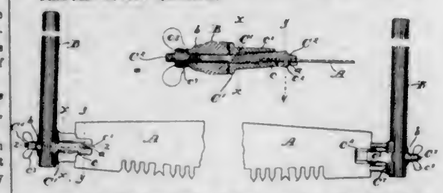
2. The combination, in a rolling-mill, of a roll having adjustable bearings provided with inclined end surfaces, in combination with adjusting-wedges arranged back of the bearings and at right angles to the axis of the rolls, to operate in conjunction with the inclined end surfaces of the bearings, substantially as and for the purposes described.

3. The combination, in a rolling-mill, of the roll and its bearing *a* with the seat *d*, lateral wedge A, arranged back of the bearing, stems A', and standards *a'*, substantially as and for the purposes described.

4. The combination, in a rolling-mill, of a roll and its bearing with an adjusting-wedge arranged back of the bearing, and a bearing-seat having a shoulder or vertical side for supporting the wedge, substantially as and for the purposes described.

292,944. DESULPHURIZING-FURNACE. HENRY E. PARSON and GEORGE V. NORTHEY, New York, N. Y., assignors, by mesne assignments, to Thomas J. Powers, Trustee. Filed Mar. 19, 1882. Renewed July 12, 1883. (No model.)

Claim.—The combination, in a desulphurizing-furnace, of an upright shaft, an ore-injector near the bottom of the shaft, consisting of an ore-pipe provided with an upwardly-directed nozzle, and an air-blast pipe connected with said ore-pipe, a hydrocarbon-injector having an upwardly-directed discharge opposite the ore-injector, a receptacle at the bottom of the shaft for the coarse ores, a series of settling-chambers for the finer ores, a pipe connecting the top of the shaft with said settling-chambers, and an exhausting device, substantially as described.

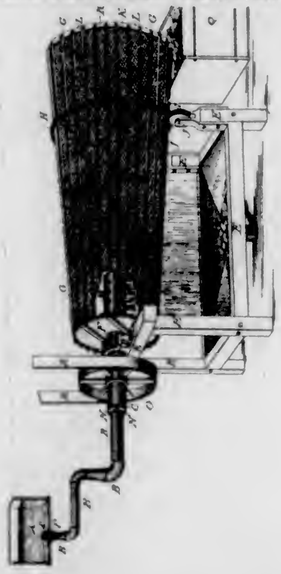


292,945. VEHICLE-SEAT. ALBERT M. PLIMPTON, Horsellsville, N. Y. Filed Dec. 8, 1883. (No model.)

Claim.—1. The combination of the bottom-board A, beveled as desired, the back-board B and end-boards C, miter-jointed to each other, the dowel-pins *b*, projecting at right angles to said joint, and the corner-irons D, having the flanges *d* embedded in the upper edges of said back and end boards, substantially as shown and described.

2. The combination of the back-board B and an end-board, C, with a corner-iron, D, having downwardly extending and diagonally-disposed flanges *d*, substantially as shown and described.

292,946. SAW-HANDLE. ROBERT E. POINDEXTER, Indianapolis, Ind. Filed June 29, 1883. (No model.)

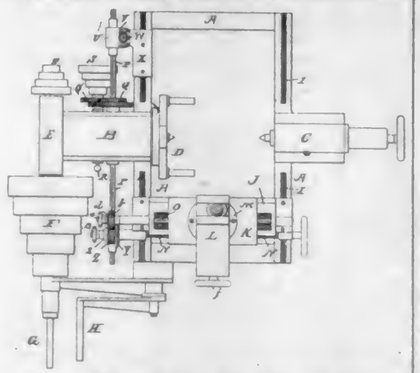


Claim.—1. The combination, with the saw A and handle B, of the fastening composed of the combined hook and wedge bolt C^2 and the device C', which, together with said bolt, is adapted to clamp and hold the saw-blade, substantially as set forth.

2. The combination of the saw A, handle B, device C', and hook-bolt C^2, provided with thumb-nut c^2, substantially as set forth.

3. The combination, with the saw A and handle B, of the device C', having portion *c* extending out on one side of the saw, and bifurcated to pass the projection c^3 and the portion *c'* extending out on the other side of the saw, to form a bearing for the wedge-bolt, and the combined wedge and hook-bolt C^2, having projection c^3 and thumb-nut c^2, substantially as shown and specified.

292,947. PAPER-PULP-SAVING MACHINE. JAMES T. PORTER and HORATIO A. PORTER, Holyoke, Mass. Filed Oct. 27, 1883. (No model.)



Claim.—1. The combination, with the revolving screen or save-all and the stuff-box, of a pipe projecting above the bottom of the said box, and connecting the same with the save-all, and a perforated screen, into which said pipe discharges, and which is connected with the head of the said revolving screen or save-all, so as to rotate therewith, substantially as set forth.

2. The combination, with the frame E and the rotary screen or save-all, of the encircling band H and one or more grooved pulleys, I, supported by said frame, and adapted to receive said band, substantially as set forth.

3. The combination, with the rotary screen or save-all, of the hollow shaft C, connected with the head thereof, the pipe B, entering said shaft, and the securing-nut N, substantially as set forth.

4. The combination, with the stuff-box A, of the pipe B, projecting above the bottom of the said box, and the check-nuts P P, for adjustably securing said pipe in place, substantially as described.

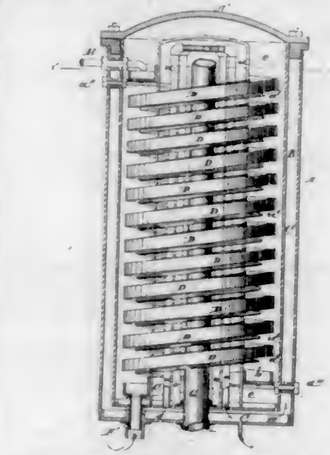
292,948. PULLEY-LATHE. GEO. T. REISS, Hamilton, Ohio, assignor to the Niles Tool Works, same place. Filed May 29, 1883. (No model.)

Claim.—1. The combination, in a pulley-lathe having its main driving-shaft arranged at right angles to its spindle, of a pair of shifting-rails provided with longitudinally-arranged feed-screws, a splined feed-shaft arranged parallel to the main driving-shaft, mechanism for transmitting motion from the main driving to the splined feed shaft, and suitable gearing adapted to transmit motion from the splined feed-shaft to said feed-screws, substantially as and for the purpose set forth.

2. The combination, in a pulley-lathe having its main driving-shaft arranged at right angles to its spindle, and a pair of shifting-rails provided with feed-screws, of the splined shaft P, provided with gearing suited to transmit motion to the said feed-screws, the gears Q on the splined shaft, the clutch-gears Q', the clutch-mover R, and the belt-cones S and T, substantially as and for the purpose set forth.

3. The combination, in a pulley-lathe, of a pair of shifting-rails provided with longitudinally-arranged feed-screws, bevel-gears loose on said screws, friction-clamps for said bevel-gears, a splined feed-shaft arranged at right angles to the rails, and mechanism for transmitting motion from said splined shaft to said bevel-gears, substantially as and for the purpose set forth.

4. The combination, in a pulley-lathe having a pair of shifting-rails and a splined feed-shaft, of feed-screws on the rails, a bevel-gear on each of the said feed-screws, a bevel-pinion for each of said bevel-gears, mechism for transmitting motion from said splined shaft to the bevel-pinions, and a bracket fitted to support each pinion and to shift along the splined shaft as the rails are shifted, substantially as and for the purpose set forth.



5. The combination, in a pulley-lathe having shifting-rails with feed-screws driven through bevel-gearing by a splined shaft arranged at right angles to the rails, of the extension W of the shaft carrying the bevel-pinion V, and the rail provided with the bearing-hole *r* for said extension, substantially as and for the purpose set forth.

6. The combination, in a pulley-lathe having shifting-rails with feed-screws driven through the medium of gearing by a splined feed-shaft arranged at right angles to the rails, of the bracket U, fitted to slide on the splined shaft and provided with flange X, adapted to be clamped between rail and the frame of the lathe, substantially as and for the purpose as set forth.

7. The rail-screw N, bevel-gear Y, friction-clamp *a*, and thrust-collar *p* within the friction-clamp, combined substantially as specified.

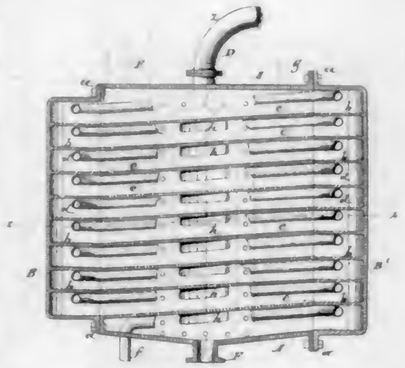
8. The rail-screw and rail-rod, the intermeshing gears thereon, the friction-clamps thereon, and the hand-nuts to the friction-clamps arranged with the rim of one nut located in the neck of the other nut, combined substantially as specified.

292,949. APPARATUS FOR CONDENSING OR DRYING LIQUIDS. NATHANIEL B. RICE, Chicago, Ill., assignor to Christian Wahl, same place. Filed July 26, 1883. (No model.)

Claim.—1. In a liquid condensing or drying apparatus, the removable continuously-descending channel D, substantially as and for the purpose specified.

2. The combination of the removable channel D with the steam-pipes *a*, substantially as described.

3. The combination of the removable channel D with the casing A B, cover A', and steam-pipes *a*, constructed and operating substantially as described.



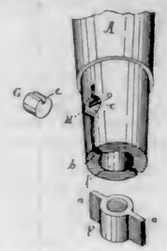
4. The combination of the exhaust-pipe G with the steam-pipes *a*, casings A B, and the removable channel D, substantially as specified.

5. The combination of the removable channel D and the removable coil *a'* with the outer case, A B, substantially as described.

6. The combination of the removable channel and pipe D *a'* with the outer case and the vertical pipes *a*, substantially as specified.

292,950. APPARATUS FOR CONDENSING OR DRYING LIQUIDS. NATHANIEL B. RICE, Chicago, Ill., assignor to Christian Wahl, same place. Filed July 26, 1883. (No model.)

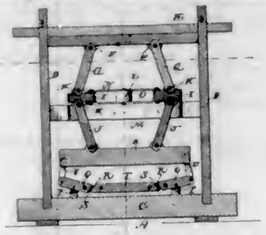
Brief.—Improvement on Letters Patent No. 250,694, dated December 13, 1881.



Claim.—1. The casing A B B', in combination with the channel-bottoms *b c* and the division-plate G, whereby the continuous channel is brought into a compact space and the channel is formed without risers or flanges attached to the channel-bottoms, substantially as specified.

2. In an evaporating apparatus, the steam-pipes *d e*, located beneath the bottom of a channel and out of contact with the contents of the channel beneath, whereby the channels and contents are heated without the contact of the steam pipes or passages with the liquid, substantially as described.

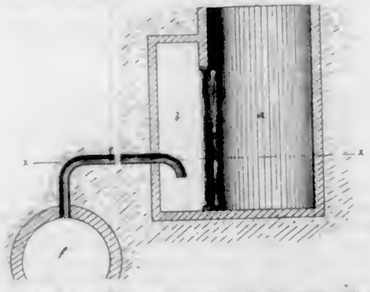
3. The combination of the vertical passage C with the casing A, having the side openings, A, and the exhaust-passage D, substantially as specified.



4. The central section, A, having the steam-pipes attached to it, in combination with the removable end sections, whereby the device may be opened without detaching the pipes, substantially as described.

292,951. SAW-HANDLE. CHRISTOPHER RICHARDSON, Newark, N. J. Filed Nov. 24, 1883. (No model.)

Claim.—The combination, with the handle A, having the hole I and radial slots *b*, of the nut F, constructed with wings *a*, and the stops inserted in the handle beneath the wings to retain them in place, substantially as set forth.

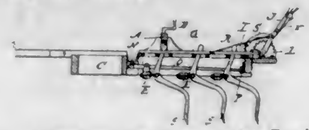


292,952. BALING-PRESS. GEORGE W. ROBBERTS, Elmo, Tex., assignor of two-thirds to John E. Polk and Henry K. Hart, both of same place. Filed Apr. 4, 1883. Renewed Jan. 9, 1884. (No model.)

Claim.—1. In a baling-press, the combination of the sill having uprights or fulcrums, levers mounted upon the latter, a follow-block connected to the inner ends of said levers by loose joints, a vertically-sliding follower, rods connecting the outer ends of said follower with the outer ends of the levers, and mechanism for operating the follower, substantially as described.

2. In a baling-press, the combination of the follower moving vertically above the sill, levers pivoted to uprights or fulcrums upon the sill, and having inner beveled ends, a follow-block loosely jointed between the inner ends of said levers, and having beveled ends registering with the beveled ends of the levers, whereby close joints are formed, rods connecting the outer ends of the levers with the follower, and suitable operating mechanism, substantially as described.

292,953. CESSPOOL-WELL. WILLIAM ROWBOTTOM and JOHN M. ROWBOTTOM, Allegheny, Pa. Filed June 22, 1883. (No model.)



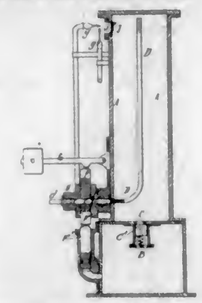
Claim.—The combination of the well *a* with the auxiliary chamber *b*, grating *d*, discharge-pipe *e*, and sewer *f*, substantially as and for the purposes described.

292,954. KEY-TAG. JOHN C. RUSSELL, Boston, Mass., assignor to Tobias New, New York, N. Y. Filed July 13, 1882. (No model.)

Claim.—As a new article of manufacture, a key-tag bearing an imprint of a central point of delivery, a statement of a reward to be paid, and a serial number indicating ownership, substantially as set forth.

292,955. WHEEL-HARROW. ANDREW SCHAFFER, Detroit, Mich. Filed Aug. 1, 1883. (No model.)

Claim.—1. The frame C, having transverse bars E, and the teeth F, pivoted to such bars E, and having their upper ends projecting between the bars of the sliding frame G, the spring locking device M N, the said sliding frame G, and means, substantially as described, for manipulating all the teeth simultaneously, and for locking the frame G in its rearward position with the teeth in operation, as set forth.

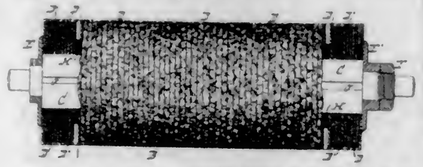


2. In combination with the frame C, harrow-teeth F, and sliding frame G, constructed substantially as described, the locking device M N, adapted to be elevated and depressed simultaneously with the movements of the sliding frame by means of the levers O and P and connections with the lever operating the sliding frame, substantially as specified.

3. In combination with the frame C, teeth F, frame G, rod I, lever J, and quadrant L, the levers O P, link R, arm S, and springs N, substantially as described.

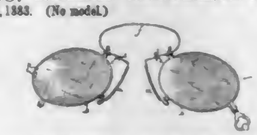
292,956. COMPOUND FOR PRESERVING THE SOLES OF BOOTS AND SHOES. MAX SCHÜTZ, Fort Lee, N. J. Filed Aug. 21, 1883. (No specimens.)

Claim.—A compound for preserving the soles of boots and shoes, which consists of twenty-five parts of shellac and twenty-five parts of alcohol, mixed with fifty parts of boiled linseed-oil.



292,957. APPARATUS FOR PRODUCING COMPRESSED AIR. JAKOB SCHWEIKER, Soleure, Switzerland. Filed Mar. 5, 1883. (No model.) Patented in France Jan. 12, 1883, No. 153,068.

Claim.—1. In an apparatus for compressing aeriform fluids, the combination of the explosion-chamber, provided with a valved aperture to admit air at its upper part, the gas-supply pipe, arranged as shown, and the valve aperture opening into the reservoir for the compressed fluids, the said reservoir provided with the piston F', the valve F, the weighted lever G, the valve E, the jet *g*, and means, substantially as described, for actuating the valve E and for causing the flame *g* to enter the explosion-chamber and ignite the gases therein, all arranged to operate substantially as set forth.



2. The combination, in an apparatus for compressing aeriform fluids, of the upright explosion-chamber A, provided with a valved aperture, I, at its upper part, for the admission of air, and a valved aperture, C, at its lower part, for the passage of the compressed fluids to the reservoir B, the gas-supply pipe D, with its upper end perforated and arranged in the upper part of the explosion-chamber A, the reservoir B, the jet *g*, and means, substantially as described, for regulating the influx of gas and air to the explosion-chamber, whereby the explosion in the upper part of chamber A effects the compression of the fluids in the lower part of said chamber without the intermediation of the piston, substantially as set forth.

292,958. ROLLER FOR IRONING-MACHINES. HAMILTON E. SMITH, New York, N. Y. Filed Feb. 17, 1883. (No model.)

Claim.—The combination, substantially as herein set forth, of the axial shaft, the two alternating series of fibrous disks on the shaft having different diameters, and the larger disks having the edges napped or carded, and the end heads of the shaft.

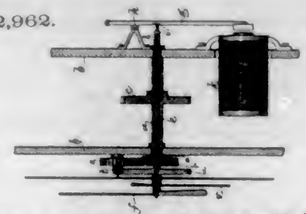
292,959. EYEGLASSES. JOHN S. SPENCER, New York, N. Y. Filed May 16, 1883. (No model.)

Claim.—The nose-pieces A, having their lower parts bowed and secured in place, and their upper parts bent toward the glasses and to form the shoulders, said bent part and shoulder being of equal width and strength throughout, in combination with the bridge-piece, the ends of which are of equal proportions, and have applied thereon the sockets *d*, in which the unreduced upper ends of the nose-pieces are retained and have free play, substantially as set forth.

292,960. BUTTON-FASTENER. EDWARD D. STEELE, Waterbury, Conn. Filed Dec. 13, 1883. (No model.)

Claim.—As an improved article of manufacture, the herein-described button-fastener, consisting of the plate or table *a*, having two or more sharp prongs, *b*, and a curved neck or loop, *d*, provided with a half-circular head, *c*, having recesses *f*, substantially as and for the purpose specified.

292,961. BICYCLE. HIRAM STRAIT, Troy, N. Y. Filed Oct. 26, 1883. (No model.)



Claim.—1. In a bicycle, the fork prolonged or extended below the axle, the lower end of the extension of the fork being extended upward, so as to connect with the axle, as and for the purpose set forth.

2. In a bicycle, the fork prolonged or extended below the axle, and upwardly-extending arms connecting with the lower end of the fork, as set forth.

3. In a bicycle, the fork prolonged or extended below the axle, and upwardly-extending arms connecting with the lower end of the fork, the axle passing through openings or slots formed in the arms and the fork, as set forth.

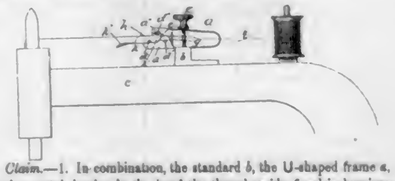
4. In a bicycle, the fork prolonged or extended below the axle, upwardly-extending arms connecting with the axle, and a link, chain, or equivalent device connecting the arms to the fork, as set forth.

292,962. DEVICE FOR SYNCHRONIZING CLOCKS. CHARLES N. TALBOT, Flushing, N. Y. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination, with the clock and its hands, of a frictional connection between the minute-hand arbor and the clock-work, and an electro-magnet to liberate the frictional connection and allow the hand to assume its true position by gravity, substantially as set forth.

2. The combination, in a clock, of an arbor, a minute-hand upon the same, a frictional connection between the arbor and the clock-work, and an electro-magnet, and armature-lever to give end motion to the arbor and liberate the frictional connection, substantially as set forth.

292,963. FINGER-RING. OTTO THIE, Union, N. J. Filed Nov. 19, 1883. (No model.)



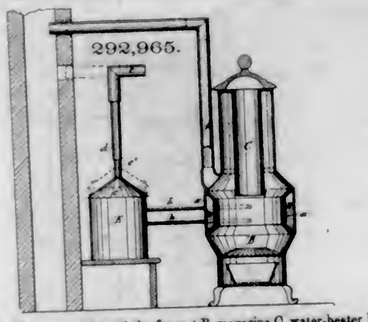
Claim.—1. As a new article of manufacture, the ring A, having cavity *a*, adapted to receive perfume, and the cover *b*, and means for permitting the diffusion of said perfume from out of said cavity, substantially as specified.

2. The combination of ring A, having cavity *a*, with cover *b*, perforated at *d*, substantially as specified.

3. The combination of ring A, having cavity *a*, with cover *b*, perforated at *d* and carrying stone *c*, substantially as specified.

292,964. TENSION DEVICE FOR SEWING-MACHINES. JOHN THOMSON, Hartford, Conn. Filed Nov. 1, 1883. (No model.)

Claim.—1. In combination, the standard *b*, the U-shaped frame *a*, of spring metal, having in the bend the thread-guide *f* and in bearings between its free ends the rolls *d d' d''*, the tension-adjusting screw *e*, and the thread-guides *g* and *h*, located on opposite sides of the tension-rolls, all substantially as described.

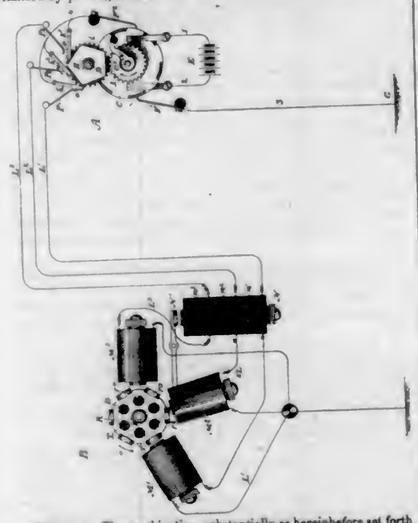


2. In a tension device, the combination of the U-shaped spring-frame *a*, bearing between its free ends the tension-rolls *d d' d''* and in its bend the thread-guide *f*, with the lever *k*, having its fulcrum on the trunnions of one of the rolls and an arm bearing against the trunnions of the opposite roll, whereby the upper and lower rolls may be held out of contact, and the adjusting-screw *e*, all substantially as described.

3. In combination, the bent spring-frame *a*, with the thread-guide *f* in the bend, the tension-rolls *d d' d''*, supported in bearings on the free ends of the frame, the adjusting-screw *e*, the thread-guide *g*, secured back of the rolls, and the lever *k*, bearing the thread-guide *h* in front of the rolls, all substantially as described.

4. In combination with the spring-compressed tension-rolls *d d' d''*, arranged as shown, the lever *k*, having its fulcrum on the extended shaft of one of the nests of rolls, and an arm bearing against the shaft of the opposite roll, whereby the upper and lower rolls may be held out of contact, all substantially as described.

292,965. APPARATUS FOR HEATING AND MOISTENING TOBACCO-HOUSES. MICHAEL TOBIN, Baldwinsville, N. Y. Filed Mar. 31, 1883. (No model.)



Claim.—1. In a tobacco-assorting room, the combination of a stove or furnace, a water-heater connected therewith, a tank communicating with the water-heater by water-pipe and steam-pipe, and a steam-distributing pipe extended from the tank and having its discharge end adapted to be turned to throw the steam either into or out of the sampling-room, substantially as described and shown.

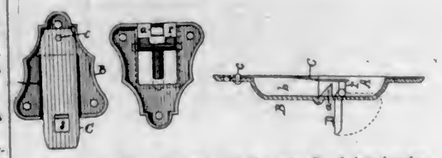
2. The combination of the fire-pot B, magazine C, water-heater D, steam-receiver E, removable cover *c*, steam-duct *d*, provided with the telescopic joint *d'*, and having its discharge end adapted to be turned into or out of the assorting-room, substantially as described and shown, for the purpose set forth.

292,966. PRINTING-TELEGRAPH. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 30, 1883. (No model.)

Brief.—Static discharge neutralized by making the successive currents to each motor-magnet of opposite polarity. Printing-magnet N vitalized by prolonged current.

Claim.—1. The combination, substantially as hereinbefore set forth, of a battery, a motor-armature, a series of electro-magnets for actuating said armature, a series of electric conductors respectively including the coils of said electro-magnets, and means, substantially such as described, for transmitting electric currents from said battery upon each of the conductors in succession, and for reversing the polarity of each succeeding current thus transmitted.

2. The combination, substantially as hereinbefore set forth, of a battery, a series of electro-magnets, a series of electric conductors in which the coils of said electro-magnets are respectively included, and means, substantially such as described, for transmitting electric impulses from said battery upon each of the said conductors in succession, and for causing the impulses transmitted upon each conductor to be of the opposite polarity or direction from that of the preceding impulse transmitted upon the same conductor.

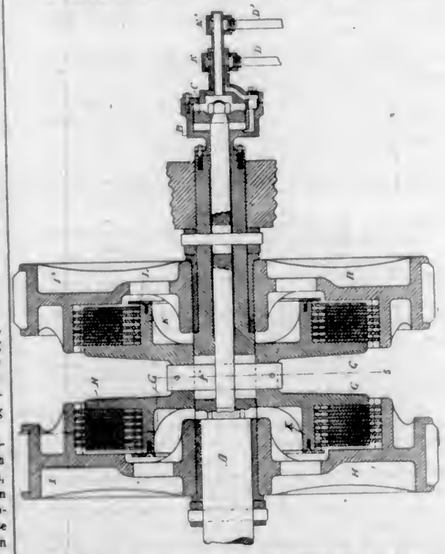


3. The combination, substantially as hereinbefore set forth, of a battery, a series of line-conductors, means for transmitting electric impulses of alternate positive and negative polarity upon said conductors in recurring succession, an electro-magnet constructed with a series of independent coils, which coils are respectively included in the circuits of said line-conductors, and an armature applied to said electro-magnet, and responding only to a prolonged impulse transmitted through one or more of said coils.

4. The combination, substantially as hereinbefore set forth, of a battery, a pole-changing device, a series of electric conductors, a series of circuit-closers respectively applied thereto, and means, substantially such as described, operated by the movement of said pole-changing device to actuate one of said circuit-closing devices at each reversal of said battery through the action of said pole-changing device.

5. The combination, substantially as hereinbefore set forth, of a revolving pole-changer, a revolving polygonal cam mechanically connected therewith, a series of contact-springs, and a series of contact-arms successively caused to impinge each against one of said contact-springs by the action of said cam.

6. The combination, substantially as hereinbefore set forth, of a revolving pole-changer, a polygonal cam, three contact-arms respectively impinging upon the peripheries of said cam, and three contact-springs, against which said contact-arms are successively caused to impinge by the action of said cam.



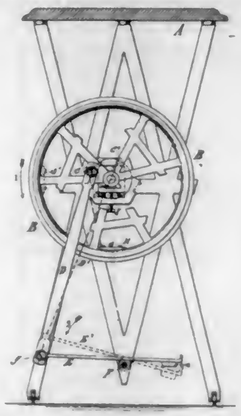
292,967. TRUNK-CATCH. JAMES WATLAND, Newark, N. J. Filed June 21, 1883. (No model.)

Claim.—1. The combination, with the casing B and slotted spring-tongue C, of the casing A, formed with hook *a*, slot *t*, and sockets *n n*, and provided with the lever D, having pivots *d* and bit or bits *r*, the lever being constructed to detach the spring from the book when elevated, and being held in its elevated position by the pressure of the spring only until the tongue C is withdrawn, substantially as herein shown and described.

2. The construction for the bearings of the lever D in the casing A, consisting in the combination, with the sockets *n n*, of the malleable lugs *s*, cast at one side of the socket and bent over the same to inclose the pivots of the lever, as herein shown and described.

292,968. REVERSING MECHANISM FOR ROLLING-MILLS. THOS. A. WESTON, Stamford, Conn., assignor to the Yale & Towne Manufacturing Company, same place. Filed Nov. 24, 1883. (No model.)

Claim.—1. In combination with the rolls, clutch-shaft A, and loose reversing clutch-wheels I of a rolling-mill, two Weston friction-disk clutches, pressure-plates, piston-rod, and operating fluid-pressure cylinder, substantially as and for the purpose described.



2. The combination, with shaft A, of a clutch-wheel, I, a Weston friction-disk clutch, and a single pressure-plate, G, piston rod and cylinder for operating the same, substantially as described.

3. The combination of a clutch-wheel, I, a Weston friction-disk

clutch, and a pressure-plate, G, provided with nub K and guard-ring L, substantially as described.

4. The combination of a clutch-wheel, I, a Weston friction-disk clutch provided with notches or cut-away portions N and O, for the circulation of air and water, substantially as described.

292,969. DEVICE FOR POISING TREADLE-AND-CRANK MOVEMENTS. JAMES H. WHITNEY, Brooklyn, N. Y. Filed July 6, 1883. (No model.)

Claim.—1. The mode herein shown and described of balancing the crank-motion for sewing-machines, which consists in equipoising the weights acting on opposite sides of the treadle-fulcrum by weighting the forward end of the treadle, and then applying to the fly-wheel a preponderating weight, G, for the purpose set forth.

2. In a crank-movement for sewing-machines, a treadle, E, provided beneath its forward end with a weight, *e*, in combination with the pitman D and with a fly-wheel, B, having a counter-weight, G, substantially as and for the purpose set forth.

3. The combination of the treadle E, provided at its forward end with a weight, *e*, the pitman D, and the fly-wheel B, having a counter-weight, G, said weight being adjustable in position.

4. In combination with the fly-wheel of a sewing-machine, the weight G, provided with slots *g*, and the screws H, passing through the said slots into the rim of said wheel, for securing and adjusting the position of the said weight, for the purpose set forth.

5. In combination with the frame A of a sewing-machine stand, and with the fly-wheel bearing *a*, having elastic support *i*, an adjustable stop, I, limiting the downward movement of the said bearing.

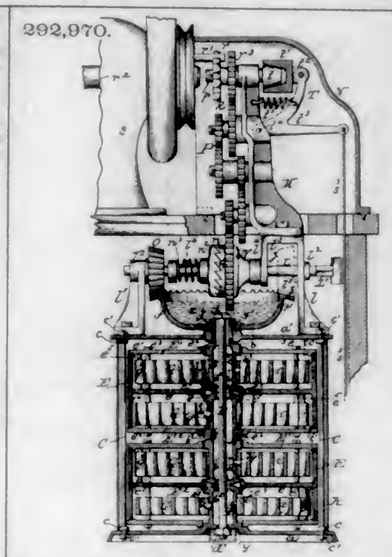
292,970. SPRING-MOTOR. HENRY B. WHITTAKER and GEORGE F. GODLEY, Philadelphia, Pa. Filed Nov. 28, 1883. (No model.)

Claim.—1. A spring-motor having an attachment, substantially as shown and described, for connecting it to the operating-shaft of the driven machine, as set forth.

2. The combination, with an operating-shaft of a driven machine, of a spring-motor and interposed detachable connecting mechanism, substantially as shown and described.

3. The combination, with a driven shaft having an end eccentric pin or stud, of a spring-motor shaft carrying a star or recessed wheel for engagement with said pin, substantially as shown and described.

4. A spring-motor provided with a detachable eccentric device for engagement with the operating or other shaft of the driven machine, substantially as shown and described.



5. A spring-motor shaft, *p*, provided with a brake composed of a cone and correspondingly-recessed bearing-block and mechanism for controlling its action, substantially as shown and described.

6. In a spring-motor, the shaft *p*, having a brake composed of a cone and a block fitting thereon, and secured to a pivoted lever having mechanism which acts to normally engage the parts of the brake, substantially as shown and described.

7. A spring-motor brake, T, composed of a friction-wheel, *t*, recessed block t', lever t^2, spring t^3, and a treadle mechanism for controlling the action of the brake, substantially as shown and described.

8. A spring-motor having a brake attachment with operating-lever, and a treadle mechanism composed of a pivoted foot-piece, *s*, and bar s', having adjusting apertures or points of connection s^2, as and for the purpose set forth.

292,970.

9. In combination with a spring-motor having bracket attachment M, the removable casing V, substantially as shown and described.

10. In a spring-motor, the end or last shaft, *p*, carrying a brake attachment and an engaging device for the driven shaft of the device to be operated by the motor, substantially as shown and described.

11. A spring-motor having a shaft, *p*, with end brake, T, and recessed or star wheel R, substantially as shown and described.

12. A spring-motor having a driving-shaft, L, arranged to serve as a winding-shaft, substantially as shown and described.

13. In a spring-motor, the shaft L, carrying loose wheel N, clutch *n*, pinion *o*, and having a winding end, L', substantially as shown and described.

14. A spring-motor shaft, L, arranged substantially as shown and described, and provided with a transferable pinion, O, whereby said shaft may be rotated in reverse directions, and the motor adapted for right-and-left operating or driven machines, substantially as shown and described.

15. In combination with a spring-motor, the shaft L, supported in standards *l l'*, the latter having a seat, l^3, of a bracket, M, carrying multiplying-wheels, a brake attachment, and connecting devices, substantially as shown and described.

16. In a spring-motor, the standard *l*, having seat l^3, lug l^4, and space l^5, substantially as shown, and for the purpose set forth.

17. In a spring-motor, the combination of a shaft or arbor having projecting studs, a cage having rods or posts, and springs having in one end a recess or depression terminating in an opening, and the other end being bent or made hook shape, whereby the springs may be loosely secured to the arbor and cage, substantially as shown and described.

18. A spring-motor composed of a sectional arbor, revolving cages, and interposed springs, each of which has its ends connected to its respective arbor-section and cage on opposite sides of the same, substantially as shown and described.

19. A spring for motors, having an opening in one end and an opposite bent or hooked end, substantially as and for the purpose set forth.

20. A spring for motors, having a depression terminating in an opening at one end and an opposite hooked or bent end, substantially as shown and described.

21. The spring G, having hooked end g^2 and depression *g*, with opening g', as shown and described.

22. A spring-motor having a hollow sectional mandrel with a central stationary supporting-rod, substantially as shown and described.

23. In a spring-motor, an arbor composed of tubular sections having rounded ends, as and for the purpose set forth.

24. A spring-motor having an arbor composed of tubular sections having rounded ends, and a central supporting-rod, substantially as shown and described.

25. In a spring-motor, the arbor B, having shoulder *b*, and the arbors B' B^2, having bearings b^2 b^3 for cages E E, substantially as shown and described.

26. In a spring-motor, a spring-shaft composed of a series of hollow arbors having collars b' b^1 and bearings b^4, substantially as shown and described.

27. In a spring-motor, the hollow sections B, B', and B^2, having oil cups or spaces at their junctions and a surrounding bearing for cages E, substantially as shown and described.

28. In a spring-motor, the hollow sectional mandrel B', having inner flanged ends with central opening or play space, b^7, and exterior bearing-collars, b^2, b^4, and b^5, with shoulder b^4, substantially as shown and described.

29. In a spring-motor, a hollow sectional arbor, a central support therefor, and means for lubricating the bearings of the arbors or sections and the cages, substantially as shown and described.

30. In a spring-motor, the sectional shaft A, carrying a lubricant-reservoir, and means for conveying the lubricant to the inside of shaft A, substantially as shown and described.

31. The combination of spring-shaft A, carrying wheel F, and lubricant *x*, the loose supporting-rod D, and retaining-nut d'', substantially as shown and described.

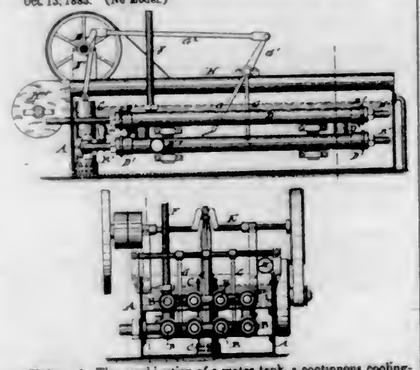
32. The cage E, having removable top and bottom plates or arms and screw-connections therefor, substantially as shown and described.

33. The cage E, having removable top and bottom plates, and central plate, *e*, having oppositely-located spring-connections e^2, substantially as set forth.

34. In a spring-motor, the mode of inserting the springs in the barrels or cages and securing the ends of the springs to the cages and arbors, which consists in first coiling or winding the spring, then temporarily locking it in its wound or nearly wound-up condition, then inserting it in the cage, then securing its ends to the arbor and cage, and then releasing or unlocking the spring, as set forth.

35. A spring-motor provided with springs of varying capacity, substantially as shown and described.

36. A spring-motor having sectional spring-shaft made cam or eccentric shape in cross-section, as and for the purpose set forth.



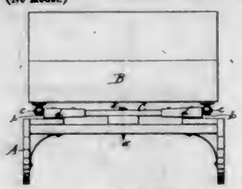
37. A flexible case or covering, K, for spring-motors, having interlocking or hooked ends *k k'*, substantially as shown and described.

38. In a spring-motor, the combination of a hollow shaft or arbor, a barrel, and an intervening spring or springs having detachable end connection with said shaft and barrel, substantially as shown and described.

39. A spring-motor having a sectional spring-shaft carrying springs of different capacity, and cages for the springs, substantially as shown and described.

40. In a spring-motor, the combination of a sectional shaft, revolving cages, springs connected to said shaft and cages, a driving and winding shaft, and a train of multiplying-wheels terminating in a shaft carrying a brake and an engaging attachment, as set forth.

292,971. BEER-COOLER. VALENTIN WILHELMI, Paterson, N. J. Filed Oct. 13, 1883. (No model.)

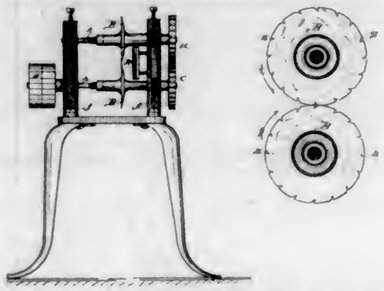


Claim.—1. The combination of a water-tank, a continuous cooling-pipe, a circulating-pump located in the tank and connected to one end of said cooling-pipe, exterior inclosing-pipes submerged in the water-tank, and supply and discharge pipes to conduct the fermented liquor to and from the exterior pipes, substantially as set forth.

2. The combination of a water-tank, cooling-pipes connected by semicircular end sections, a circulating-pump connected to said cooling-pipes, exterior pipes inclosing the cooling-pipes, and an oscillating agitator, substantially as specified.

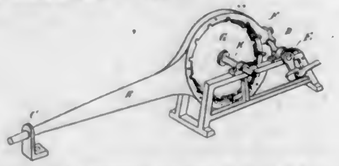
3. The combination of a water-tank, cooling-pipes connected by semicircular end pipes, a circulating-pump connected to said cooling-pipes, exterior pipes inclosing the cooling-pipes, a perforated air-distributing pipe extending along the side wall of the tank, and an air-forcing apparatus connected to said air-pipe, substantially as set forth.

292,972. SLEIGH. WILLIAM H. WIDNEY, Meridian, N. Y. Filed Nov. 19, 1883. (No model.)



Claim.—1. In a sleigh, the body connected with the bolster by an oscillatory bearing, substantially as set forth.

2. In a sleigh, the combination of the bolster mounted on the bob, and provided with trunnions on its ends and supports secured to the body, and provided with bearings for the trunnions of the bolster, substantially as shown and set forth.

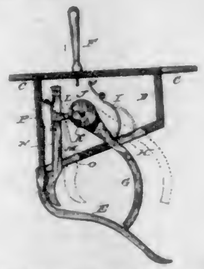


3. In a sleigh, the combination, with the bolster mounted on the bob, of a shoe or sleeve attached to the ends of the bolster, and provided with trunnions standing parallel with the bolster, and brackets secured to the body, and provided with bearings for the aforesaid trunnions, substantially as described and shown.

292,973. HOOP-POLE-SPLITTING MACHINE. JOB WINTERBOTHAM, Joliet, Ill. Filed Nov. 15, 1883. (No model.)

Claim.—In the hoop cutting and splitting machine described, the rotary knives B B, arranged to stand, as shown, with their cutting-peripheries nearly or quite in contact with each other, and having their cutting-peripheries provided with a series of notches, S, forming teeth or hooks set far enough apart to leave cutting-edges between them, and adapted to feed or propel the hoop-pole through between said rotary knives by means of said teeth or hooks, as and for the purpose set forth.

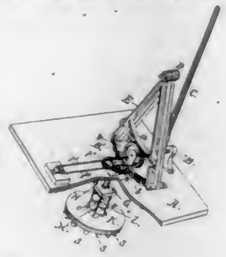
292,974. MECHANICAL MOVEMENT. GEORGE YEOMANS, Wayne, Mich. Filed Nov. 3, 1883. (No model.)



Claim.—1. In a mechanical movement, the shaft H, having secured thereto the gear-wheel G, in combination with an internally-geared ring, A, surrounding the same and supported on and deriving its motion from the rotation of a crank-shaft, D E, passing through the outer circumference of said ring A, whereby a continuous rotary motion is imparted to said shaft H, substantially as described.

2. In a mechanical movement, the shaft H and wheel G, in combination with an internally-geared ring, A, surrounding the same and supported by and deriving its motion from the crank-shafts D E D E, passing through the outer circumference of said ring A, as and for the purpose set forth.

3. In a mechanical movement, a gear-wheel eccentrically journaled within an internal gear which is actuated by a circular motion similar to the strap of an eccentric, and produces thereby a continuous rotary motion of the inclosed gear-wheel, the external gear being inclosed oil-tight upon its sides, whereby a casing is formed which serves to protect the gearing, and forms an oil-cup for lubricating the same, substantially as described.



292,975. MAIL-BAG CATCHER. WILLIAM ANGLE, Welsh Run, Pa. Filed Nov. 26, 1883. (No model.)

Claim.—1. A mail-bag catcher consisting of a catcher-arm, a curved clasping-arm having means for forcing it rearward, clasping the bag from the front, and a trigger at the inner corner of the catcher-arm, releasing the curved clasping-arm when struck, as and for the purpose shown and set forth.

2. The combination of a casing having trunnions at its inner corners and an inwardly-projecting arm upon its inner side, an outwardly and forwardly projecting catcher-arm attached to the outer rear corner of the casing, a rearwardly-curved clasping-arm pivoted at its inner end inside the casing, projecting through its outer side, and forming a disk upon its inner end, having a notch, a spring bearing against the back of the clasping-arm and forcing it rearward, a trigger projecting with its outer end through the outer side of the casing in the fork formed by the catcher-arm and the casing, and having a lug engaging the notch in the disk upon the end of the clasping-arm, and a spring forcing the trigger forward, all constructed to operate as and for the purpose shown and set forth.

292,976. MECHANICAL MOVEMENT. CHARLES A. BENTLEY, New York, N. Y. Filed July 30, 1883. (No model.)

Claim.—1. The combination, with a reciprocally-rotating gear-wheel upon the end of a rock-shaft, a swinging double segmental gear engaging the same and actuating a gear-wheel upon the end of a tubular shaft at right angles to the rock-shaft, a disk or plate connected to said tubular shaft to partake of its movement, but left free to vibrate longitudinally thereon, and a longitudinally-reciprocating rod attached to said disk to rotate with it, and extending thence loosely through the tubular shaft, of double rods P P, or their equivalent, as described, hinged at one end to vibrate to and from the end of the tubular shaft, and whose free ends, loosely jointed to the upper end of its longitudinally-reciprocating rod to lift the same without interfering with its rotation, are extended to engage the web of the gear-wheel upon the rock-shaft, so as to be lifted by its reciprocating movement, substantially in the manner and for the purpose herein set forth.

2. The combination, with the rock-shaft B and its gear-wheel B', the double segment-gear E, actuated thereby, the stationary frame D, supporting it, and the hinged rods P, whose free ends engage said wheel B and are lifted thereby, of the stops R R, adapted to engage the frame and to limit the movements of the wheel, segment-gear, and rock-shaft, and protect the rods P against undue strain, substantially in the manner herein set forth.

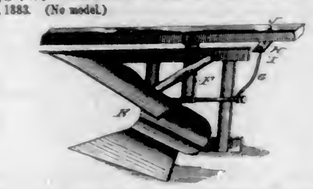
292,977. WHIP-SOCKET. FREDERICK A. BRADLEY, New Haven, Conn. Filed Nov. 26, 1883. (No model.)

Claim.—The combination of the socket A, the metal base B, constructed to receive the lower end of the socket, and the bolt C through the bottom of the socket and base, whereby the base and socket are secured together, substantially as and for the purpose described.

292,978. SHAFT-COUPLING. JOHN BRAUN, Philadelphia, Pa. Filed May 15, 1882. (No model.)

Claim.—1. A coupling having an internal clamp and a screw fitted thereto, and an exterior shell formed with an opening, whereby said screw is accessible and movable from the outside of the shell, substantially as and for the purpose set forth.

2. In a coupling, an internal clamp having a differential screw and nuts, in combination with an exterior shell, which, connected with said clamp, is formed of one piece of metal, substantially as and for the purpose set forth.



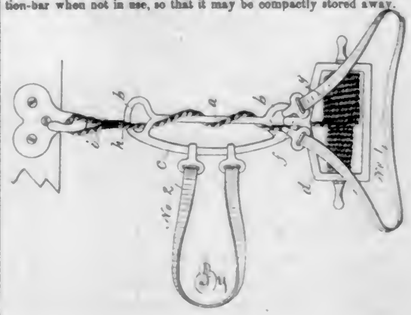
3. In a coupling, an internal clamp having a differential screw and nuts, and exterior shell formed at its ends with heads, which are connected with said clamp, substantially as described.

4. In a coupling, an internal clamp having studs J, in combination with the exterior body or shell, having openings a, which receive said studs, substantially as and for the purpose set forth.

5. A clamp having legs F', in combination with the heads of the exterior body or shell, having openings L coincident with the space between said legs, substantially as and for the purpose set forth.

6. In a coupling, a hollow body or shell, in combination with a clamp having means for attaching it with the heads of said body, one or both of said heads being removably connected with said body, substantially as and for the purpose set forth.

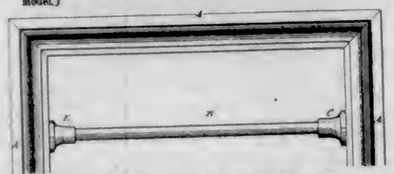
292,979. CULTIVATOR. DOMINICUS BELZ, Geneseo, Ill. Filed Nov. 23, 1883. (No model.)



Claim.—In a reversible plow, the combination of the forward standard or hanger, F, pivoted at its upper end to turn on the under side of the plow-beam, the rearmost standard or hanger, G, having a laterally-projecting flat perforated bar upon its upper end, and the plow-beam having means for engaging the perforations in the flat laterally-projecting bar, whereby the point of the plow may be adjusted to or from land, as and for the purpose shown and set forth.

292,980. SOAP. CHARLES F. BROADBENT, Baltimore, Md. Filed Dec. 11, 1883. (No specimens.)

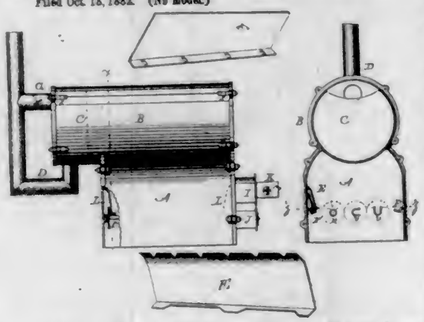
Claim.—An improved soap, which consists of ordinary soap, water, hyposulphite of soda, borax, and spirits of ammonia, all combined substantially as specified.



292,981. FIRE-ESCAPE. THOMAS BROOKS, Des Moines, Iowa. Filed Nov. 3, 1883. (No model.)

Brief.—A reel-frame for the lowering-rope is hooked to the friction-bar when not in use, so that it may be compactly stored away.

Claim.—The improved fire-escape consisting of the sliding frame a b c, the spool-frame d f, carrying a spool, a rope, and two belts, substantially as shown and described, to operate in the manner set forth.

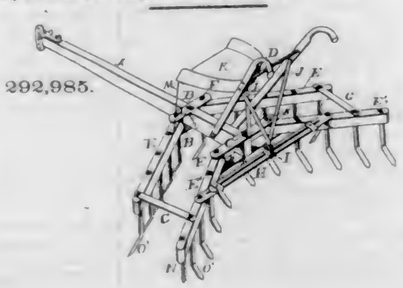


292,982. SUPPORTING-ROD FOR WINDOW AND DOOR CURTAINS. JOHN A. BROWNE, Philadelphia, Pa. Filed Dec. 5, 1883. (No model.)

Claim.—1. A supporting-rod for window and door curtains, constructed substantially as herein shown and described, and consisting of the rod B, the socket C, the socket-nut E, and the screw-plug F, as set forth.

2. In a supporting-rod for window and door curtains, the combination, with the casing A, of the rod B, the socket and screw C D, and the socket-nut E, screw-plug F, and screw G, substantially as herein shown and described, whereby the said rod can be readily connected with and disconnected from the said casing, as set forth.

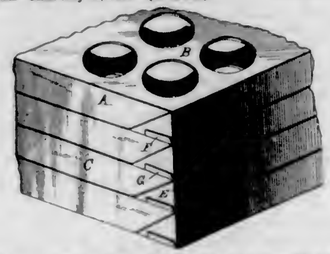
292,983. FIRE-POT AND LINING. STEPHEN T. BEYCK, Dayton, Ohio. Filed Oct. 18, 1882. (No model.)



Claim.—In the fire-pot of a furnace, an intermediate plate, F, with flange at bottom having numerous orifices, and which supports the fire-plate E, which is notched at its top to admit of the circulation of air between said plates, these in combination with the end plates of said fire-pot, and arranged with reference to the side walls of same, substantially as and for the purpose set forth.

292,984. GAS-PURIFIER SCREEN OR GRID. JOHN CABOT, Lawrence, Mass. Filed Nov. 9, 1883. (No model.)

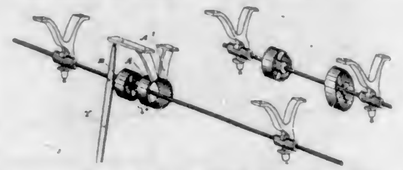
Claim.—As an improved manufacture, the gas-purifier screen or grid constructed with each of its wooden bars A having linear or very narrow bearings, substantially as described, in each of its supporting-holes of its holders B, without contact between such bearings with the boundary of the hole, all being substantially as set forth.



292,985.

292,985. HARROW. EDWIN V. CALDWELL, Harpersville, Ala. Filed May 5, 1883. (No model.)

Claim.—The combination of the draft-beam A, having at the rear end the two sets of transverse arms B B, with the removable tooth-beams E E', hinged to said arms, provided with teeth on the front beams forwardly inclined, and the teeth on the rear beams rearwardly inclined, and with the adjusting-rod H and clamp I, substantially as herein set forth.

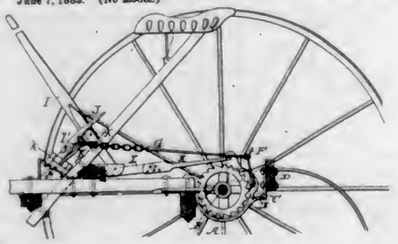


292,986. EGG-CARRIER. GENRY A. CHAPMAN, Strawberry Point, Iowa. Filed July 14, 1883. (No model.)

Claim.—1. The combination, in a tray for egg-carriers, of the top plate having downwardly-bent flanges, the ends of which flanges are soldered one over the other, and having perforations for the reception of the eggs, with the triangular flanged re-enforcing corner pieces soldered upon the edges of the flanges at the corners of the tray, as and for the purpose shown and set forth.

2. A tray for egg-carriers, consisting of a top plate having perforations for the reception of the eggs, and downwardly-bent flanges cut off at the ends, as described, to form overlapping ends, soldered together, and triangular plates having bent flanges upon their catheti, and soldered by these flanges upon the outside of the edges of the flanges upon the top plate at the corners, as and for the purpose shown and set forth.

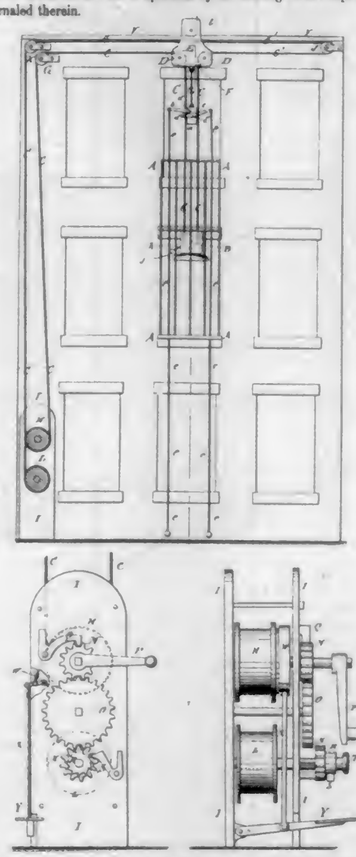
292,987. SELF-SHIPPING BELT-PULLEY. HENRY PITHIE CHRISTIE, San Francisco, Cal. Filed Nov. 27, 1883. (No model.)



Claim.—1. A self-shipping belt-pulley consisting of the pulley part B, fixed to, but capable of longitudinal movement upon, its driving-shaft, a stationary belt receiving and holding part A independent of the driving shaft and pulley, but capable of entering or telescoping within the pulley-rim from one side thereof, and a means for shifting the pulley, substantially as hereinbefore described.

2. The combination together of the fixed belt-holding surface, composed of the tapering rim A and the laterally-movable pulley B, with beveled edge, and of suitable diameter internally to slip over and telescope with the fixed rim, substantially as hereinbefore described.

3. The combination, with the fixed rim A, tapered externally, of the movable pulley B, having its rim tapered internally, and with sufficient clearance inside to allow the two parts to telescope, substantially as hereinbefore described.

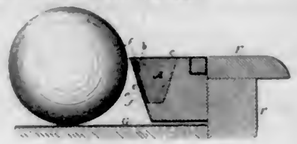


292,988. HORSE HAY-RAKE. JAMES M. CLARK, Greeley, Colo. Filed June 7, 1883. (No model.)

Claim.—The combination, with the lever I and chain or rod G, connected to a forward-moving pawl, of the spring-catch J and bell-crank lever or treadle K, connected to the catch and to the chain or rod G, and adapted to move in an oblique plane, substantially as shown and described, and for the purpose set forth.

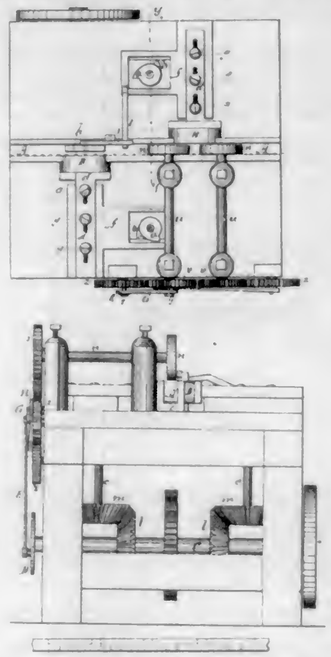
292,989. FIRE-ESCAPE. ROBERT P. CLARK, Philadelphia, Pa. Filed Apr. 16, 1883. (No model.)

Brief.—The ropes which move the cage both laterally and vertically are wound upon and operated by drums geared together. The gear-wheel of the lower drum is connected to its journal-shaft by tongue and groove, and has a ratchet and pawl to hold it from rotating when disconnected from the other gear-wheels. The drums are connected to move the cage vertically and disconnected to move the cage horizontally. A friction-clamp is suspended from the traveler over the cab, and an alarm on the cab is operated by the turning of the rope-pulley journaled therein.



Claim.—1. In a fire-escape, the combination, with the cage A, of the ropes C C', the carriage E, the drums H L, the gear-wheels M N O, the ratchet-wheel and pawl R S, and the crank P, substantially as herein shown and described, whereby the said cage can be moved laterally and vertically, as set forth.

2. In a fire-escape, the combination, with the carriage E and the cage-operating rope C, of the suspended support *a*, the levers *b c*, and the cords *e*, said levers having rollers *d* arranged on opposite sides of one of the cords *e*, substantially as herein shown and described, whereby the descent of the cage can be stopped, as set forth.



3. In a fire-escape, the combination, with the cage A and the operating-rope pulley B, of the pins *f*, the spring-held hammer-lever *h*, the two-armed trip-block *g*, pivoted to the latter and adapted to engage the aforesaid pins, and the gong *k*, substantially as herein shown and described, whereby the movement of the cage will sound an alarm, as set forth.

292,990. BILLIARD-TABLE CUSHION. HUGH W. COLLENDER, New York, N. Y. Filed Jan. 2, 1884. (No model.)

Claim.—A cushion-strip composed of a soft-rubber body provided with a face-hardening strip or strips of hard-rubber compound, and provided with means for holding down (against any upwardly-stretching tendency) such strip or strips, all substantially in the manner set forth.

292,991. MACHINE FOR CUTTING HEADS OF BOXES. MORTON E. CONVERSE, Winchendon, Mass. Filed Mar. 23, 1883. (No model.)

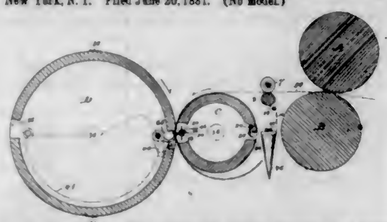
Claim.—1. The method of forming and cutting out box-heads and other articles in wood, which consists in passing strips of wood, previously made of proper width and thickness, equal to double the thickness of the heads or articles to be formed, or thereabout, between two cutting-dies, thereby cutting forms on both sides thereof, and then cutting the strips in two edgewise to sever the articles from the strip, substantially as and for the purpose herein specified.

2. In a machine for forming and cutting out box-heads and other articles in wood, the combination of a feed-trough, A, holding the strips of wood and reciprocating cutting-dies B B, having their movements at right angles to the trough and through the sides thereof, substantially as and for the purpose herein specified.

3. The combination of the two cams *a b*, placed one above the other on the same shaft *c*, the cam-yoke *f*, having cam-spaces for the reception of the respective cams, one above the other, and the die-stock *d*, secured adjustably to the cam-yoke, substantially as and for the purpose herein specified.

4. The combination of a cutting-die, B, cam *i*, secured to the cam-yoke *f*, or equivalent projection on the cam-stock *d*, and pressure-lever *j*, pivoted on one side of the feed-trough or way A, substantially as and for the purpose herein specified.

5. The combination of the intermittently-reciprocating dies B B, intermittently-turning feed disks or rollers *n n o o*, driving-shaft C, adapted to operate both the dies and the rollers, intermediate mechanism, as described, between the driving-shaft and dies, crank-disk D, connecting-rod E, pawl-arm G, and ratchet-wheel H, operating the gear-wheels for turning the said feed disks or rollers, whereby the intermittent movement of the dies alternate with the intermittent movements of the feed disks or rollers, substantially as herein specified.

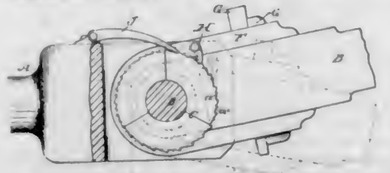


292,992. ALARM-SIGNAL FOR HOT JOURNALS. OLIVER H. P. CORNELIUS and GEORGE H. TURNER, Turner, Oreg. Filed July 6, 1883. (No model.)

Claim.—1. The combination of the adjusting-block *m* and wire *n* with a thermometer, and with the wires of an electric battery arranged for closing the circuit by the effect of increased temperature on the thermometer, substantially as described.

2. The combination, with the bulb *d*, provided with the tube *b*, having the enlargement *b'*, of the block *m*, provided with the wire *n* and spring *o*, and arranged in the enlargement of the tube, substantially as herein shown and described.

292,993. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to R. Hoe & Co., New York, N. Y. Filed June 20, 1881. (No model.)



Claim.—1. A cylinder or revolving carrier provided with means for gathering or collecting sheets, and with pins for securing a proper register of the sheets, substantially as described.

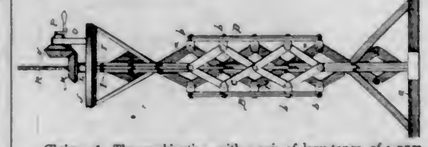
2. The combination, with a rotating carrier provided with nipping-jaws, of a carrier provided with means for gathering or collecting sheets, and with a folding-blade co-operating with said jaws, all substantially as described.

3. The combination, with the pins 25, their shaft, and connecting-rod 28, of a rotating cam, as 34, to cause said pins to recede within the cylinder C, substantially as described.

4. The combination, with a revolving carrier, a shaft supported thereby and carrying a multiplicity of folding-blades and a corresponding number of lever-arms, and with a companion carrier provided with nipping-jaws co-operating with said folding-blades, of means for bringing one of said blades into position to coact with said jaws at each revolution of the folding-blade carrier, all substantially as described.

292,994. PITMAN-BOX. FENNER DARLING, Franklin, Mass. Filed Sept. 14, 1883. (No model.)

Claim.—1. In a pitman-box, the sleeve C, adapted to be placed upon the wrist-pin, and adapted to have imparted to it an intermittent rotary motion, substantially as and for the purposes set forth.



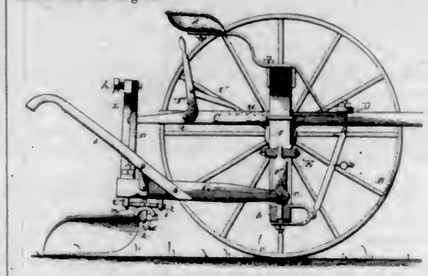
2. In a pitman box, the rotary sleeve C, formed with the ratchet a^2, in combination with the stop-pawl J, and pawl H, pivoted to pitman B, substantially as and for the purposes set forth.

3. The pitman-box herein shown and described, consisting of the rotary sleeve C and outer box, E, placed around said sleeve, substantially as and for the purposes described.

4. The sleeve C, formed with the oil-groove *b* and oil-holes *c*, in combination with the box E and strap F, having oil-holes *e f*, respectively, substantially as and for the purposes set forth.

5. The sleeve C, placed upon the wrist-pin D and formed with the ratchet a^2, in combination with the box E, strap F, and pawls H J, arranged to operate substantially in the manner and for the purposes set forth.

292,995. ELEVATOR. RILEY L. DAVIS, Mooresville, N. C. Filed Nov. 20, 1883. (No model.)



Claim.—1. The combination, with a pair of lazy-tongs, of a number of additional pairs of lazy-tongs having their knees connected in a flexible manner to the knees of the former, or to the knees of the former and to each other, substantially as shown and described.

2. The combination, with a pair of lazy-tongs, of four additional pairs of lazy-tongs arranged in the form of a quadrilateral prism around the former, and having their pivotal points connected in a flexible manner to the pivotal points of the former and to each other, and the two series of continuous toggle-braces connected to the longitudinally-central pivots of the main or central and two of the side lazy-tongs, substantially as shown and described.

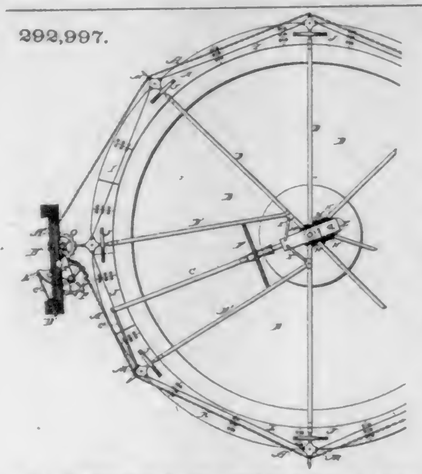
3. The combination, with the series of flexibly-connected lazy-tongs, of a platform supported on top of the central pair of lazy-tongs, and having slotted pendant-guides, a cross-rod connecting opposite joints of the said central pair and adapted to slide in said slotted guides, a screw-rod connected to said cross-rod and extending up through the platform, a nut screwing on said screw-rod and supported by the platform, and means for rotating the nut, substantially as shown and described.

292,996. CULTIVATOR. JOSEPH DIVORA, Peru, Ill. Filed July 28, 1883. (No model.)

Brief.—The clod-crushers or other implements have a rocking connection with the drag-bar.

Claim.—1. The combination, with the arched axle and braces connecting the sides of the end arches of the axle, of standards swiveled to the braces and axle, drag-bars pivotally secured to the standards, and clod-crushers or other suitable implements secured to the drag-bars in such a manner whereby they are allowed to tilt or change their relative positions to the drag-bar, substantially as set forth.

2. The combination, with an arched axle and wheels mounted thereon, of braces connecting the sides of the end arches of the axle, standards connecting the braces and axle, drag-bars secured to the standards, and a sectional adjustable yoke connecting the rear ends of the latter, substantially as described.



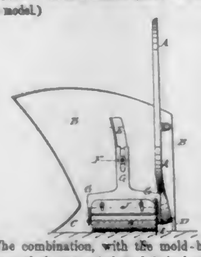
3. The combination, with an arched axle and wheels mounted thereon, of braces connecting the sides of the end arches of the axle, standards connecting the braces and axle, drag-bars, a yoke, a bell-crank, and a dog adapted to raise and sustain in place the drag-bars, substantially as described.

292,997. CLAY-TEMPERING MACHINE. JOHN F. DORNFELD, Watertown, Wis. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination, in a clay-tempering machine, of a central revolving support, a series of radial sweeps, an endless sprocket-chain, an axle-shaft provided with a clay-tempering wheel, and a sprocket-wheel adapted to communicate motion to said chain, said radial sweeps being provided at their diverging ends with brackets for the reception of said chain, whereby said chain is supported and carried with the sweeps as it communicates motion to them all, substantially as and for the purpose specified

2. In a clay-tempering machine, the combination of the central support, R, platform E, series of radial arms D and D', brace-rods I, rollers P, endless chain A, circular track K, and sprocket-wheel O, said wheels P being adapted to roll upon the circular track K and support the outer ends of the sweeps, as set forth.

292,997.



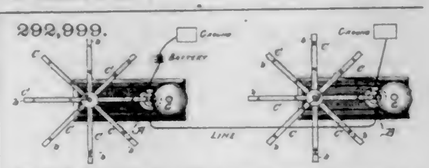
3. The combination, in a clay-tempering machine, of the central platform, E, block G, secured in said platform by horizontal bolt H, radial sweeps D, attached to said platform, sweeps D' D', attached at their inner ends to the next succeeding sweeps, D, axle-shaft C, clay-tempering wheel F, and rod or chain S, said rod S and block G being adapted to communicate a circular motion to said axle-shaft and wheel around the pit, while it permits them to rise and fall, conforming to the height of the clay in the pit, substantially as set forth.

4. In a clay-tempering machine, the combination, with the diverging ends of a series of sweeps centrally supported upon a revolving platform, of the brackets M, axles P, supporting-wheels J, brace-rods I, and sprocket-chain A, said sprocket-chain being adapted to be operated by a sprocket-wheel around which it passes, and from which it communicates motion to said radial sweeps, said brackets being adapted to support and carry said sprocket-chain, while said brace-rods co-operate to strengthen and sustain said sweeps and communicate motion simultaneously to all, substantially as set forth.

5. The combination, with the endless sprocket-chain A, of the sprocket-wheel O, bracket T, tightening-wheel P, cord or chain C', and sheave D', said cord being provided with a weight adapted to retain said tightening-wheel P in contact with said sprocket-chain, as and for the purpose specified.

6. In a clay-tempering machine, the circular track K, having an arc of its circle next opposite the sprocket drive-wheel depressed or curved downwardly, in combination with the diverging ends of the radial sweeps and their supporting-wheels, said depression being adapted to permit the outward ends of said sweeps with their supporting-wheels to successively drop below said sprocket drive-wheel as they pass it, substantially as and for the purpose specified.

292,998. PLOW. JOHN T. ELLYSON, Pleasant Plain, Iowa. Filed Dec. 6, 1883. (No model.)

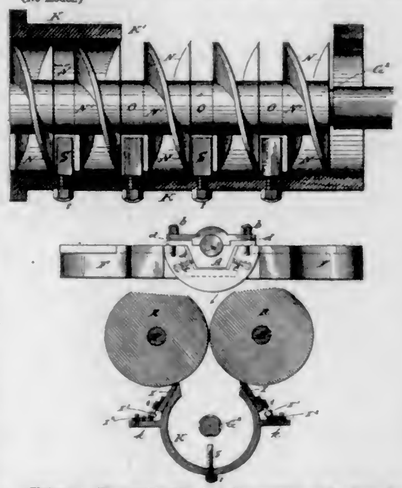


Claim.—The combination, with the mold-board B, having the flanged bar E secured thereto, of slotted forked plate G, carrying the roller, disk, and scraper at its forked end, and a bolt on the flanged bar E, for adjustably securing the slotted upper end of the plate G, substantially as set forth.

292,999. SIGNALING APPARATUS FOR TELEPHONIC AND TELEGRAPHIC CIRCUITS. LORENZO S. FAIRBANKS, Boston, Mass. Filed June 4, 1883. (No model.)

Claim.—1. In an electric signaling-circuit, and at each station in

292,999.



said circuit, the combination, with an electro-magnet, of a series of vibrating armatures having different rates of vibration, each of which armatures is adapted to be brought or moved to and over said magnet, for the purpose specified.

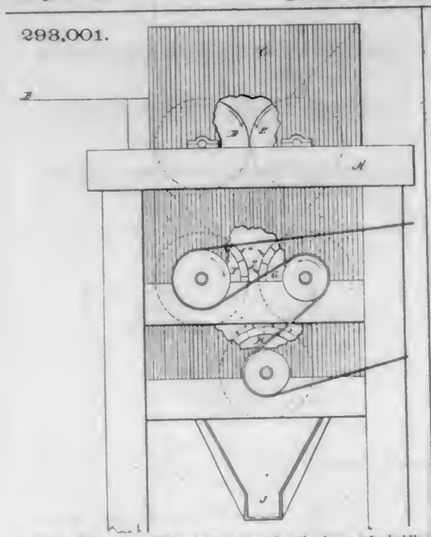
2. In an electric signaling-circuit, and at each station in said circuit, the combination, with an electro-magnet, of a series of vibrating armatures and an alarm-bell, said armatures having different rates of vibration, and each adapted to be brought or moved to and over said magnet, for the purpose specified.

3. In an electric signaling-circuit, and at each station in said circuit, the combination, with an electro-magnet, of a series of vibrating armatures having different rates of vibration, and adapted to be severally rotated about a center, for the purpose specified.

4. In an electric signaling-circuit, and at each station in said circuit, the combination, with an electro-magnet, of a series of vibrating armatures and an alarm-bell, said armatures having different rates of vibration, and adapted to be severally rotated about a center, for the purpose specified.

293,000. COMBINED CLAY-CRUSHER AND TILE-MACHINE. JOHN D. FATE and EGBERT M. FREESE, Plymouth, Ohio. Filed Nov. 12, 1883. (No model.)

Claim.—1. The combination, in a tile-machine, of the frame having the fixed shaft-bearing A' and a recess, *a*, near the feed-chamber, the adjustable box A, having slots c in its wings or extensions and inclined sides, bolts *b*, sliding in said slots, set-screws *e*, bearing with their ends against the inclined sides of box A, and the feeder-shaft G' G², as and for the purpose shown and set forth.

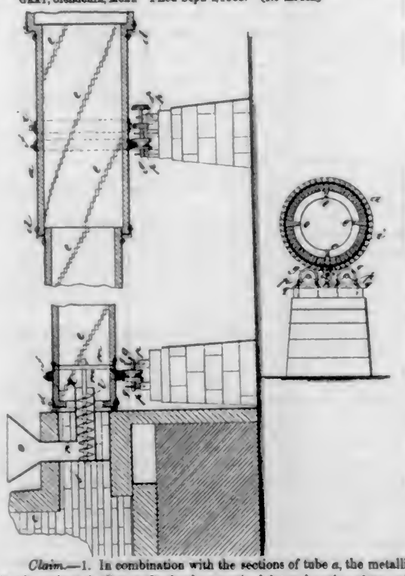


2. The combination of the feed-chamber having a longitudinal opening at its upper side and laterally-projecting extensions *k*, the crusher-rollers, the beveled blocks I' upon the extensions, the scrapers having female-threaded perforated lugs *i*, and the set-screws I', as and for the purpose shown and set forth.

3. In a tile-machine having a cylindrical feed-chamber, the combination of a revolving shaft, collars secured upon the shaft and provided each with two spiral flanges having a twist of one-half revolution in opposite directions, and having the ends cut off perpendicular to the shaft, spacing-collars inserted between the flanged collars, and knives or studs inserted in the bottom of the feed-chamber and projecting up in and nearly filling the spaces between the perpendicular ends of the flanges, as and for the purpose shown and set forth.

293,001. CLAY-PULVERIZER. LORENZO D. FERGUSON, Nashville, TENN. Filed Nov. 16, 1883. (No model.)

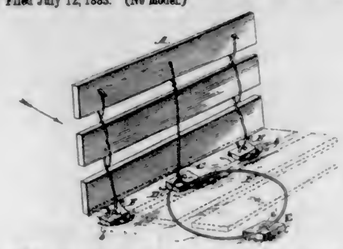
Claim.—1. The combination, with a pair of rollers and means for



293,001.

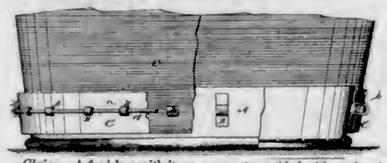
revolving the same at different rates of speed, and a hopper for holding clay on said rollers, of a pair of toothed drums beneath said rollers, and means for rotating said drums at different rates of speed, as described, for the purpose set forth.

2. The combination of a hopper for receiving clay, a pair of rollers therein and means for revolving the same at different rates of speed, a pair of toothed drums beneath said rollers and means for revolving said drums at different rates of speed, and a third drum beneath the space between the first-named drums, and means for rotating the latter drum, all substantially as shown and described, for the purpose specified.



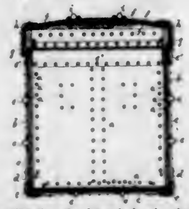
293,002. ROASTING-FURNACE. NEWMAN A. FOSS and JOHN M. GRAY, Clendenin, Mont. Filed Sept. 4, 1883. (No model.)

Claim.—1. In combination with the sections of tube *a*, the metallic bands or rings *d*, offset to fit closely over the joint or junction of two adjacent sections, as shown and described.



2. The combination, with tube *a*, lined on the inside with refractory material, of spiral ribs formed of brick laid to make a succession of steps, as and for the purpose specified.

293,003. FLOOD-FENCE. ELISABETH S. GARRETT, Downeyville, Ind. Filed July 12, 1883. (No model.)



Claim.—In a flood-gate of the described construction, the combination of the hinged panel A, anchors B B and D, spring C, bent to form the loop F, and anchor E, having staple *e'*, for holding the loop F in position, constructed and arranged to operate substantially in the manner and for the purpose shown and described.

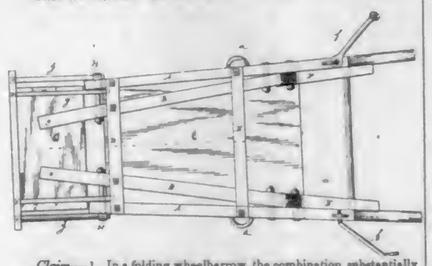
293,004. FEED-BAG. JAMES W. GIDNEY, New York, N. Y. Filed Nov. 17, 1883. (No model.)

Claim.—A feed-bag with its canvas part provided with perforations, as described, in combination with a metal bottom, A, with eyes B fixed to it, a perforated strip, *c*, and a binding-wire, *d*, as and for the purpose described.

293,005. TRUNK. HENRY E. GILSON, Somerville, MASS. Filed Oct. 18, 1883. (No model.)

Claim.—The within-described trunk, having its top and body composed of several veneers of wood, with the grain of one veneer crossing the grain of the other, and a sheet of suitable textile or fibrous material interposed between the veneers and glued thereto, substantially as described.

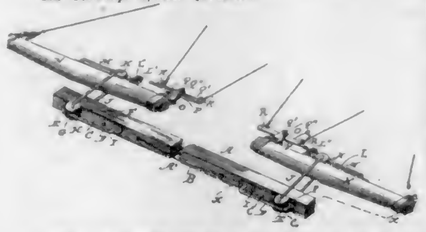
293,006. IRON WHEEL. LEVI H. GOODWIN, Cincinnati, Ohio. Filed Sept. 22, 1883. (No model.)



Claim.—1. In an iron wheel, the combination of the mortised tire, the spokes tenoned at their outer ends and provided at their inner ends with notches forming outwardly-inclined shoulders, the disk A, notched radially from its periphery to receive the inner notched ends of the spokes, side clamping-plates having annular flanges to bear against the inclined shoulders of the spokes, and means for drawing said disks together to force the spokes outward against the tire, substantially as specified.

2. The combination, substantially as specified, of the central notched disk, A, the spokes B having notched edges at their inner ends, which ends fit into the notches in disk A, with the plates C, having annular flanges *c* to bear against the inclined shoulders formed by the notches in spokes B, and the screw-threaded sleeve D, for drawing the said plates firmly upon the disk A and edges of the spokes.

3. In a wheel of the character described, the combination, substantially as specified, of the plates C, centrally bored and screw-tapped, with the sleeve D, screw-threaded to engage the threads in the parts C, for the purpose of drawing the plates firmly upon the spokes.



293,007. FOLDING WHEELBARROW. LEVI H. GOODWIN, Cincinnati, Ohio, assignor to the Mosler Manufacturing Company, same place. Filed Oct. 16, 1883. (No model.)

Claim.—1. In a folding wheelbarrow, the combination, substantially as specified, of the wheel-bars B, beveled at their forward ends, with the pivoted legs F, having their upper ends beveled, and having offsets, as shown, and the braces *f*, whereby the legs are adapted to fold for shipment, and when set up for use to be firmly braced by the ends of the bars B and swinging braces *f*.

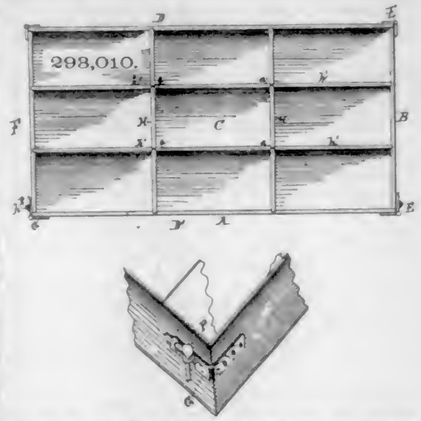
2. In a folding wheelbarrow, the combination, substantially as specified, of the side bars, A, wheel-bars B, with the folding back G, and eye-bolts H, the outer bar, *g*, of said back passing through the eyebolt H, and the bolt passing through bars A, upright *g'*, and bar B, and adapted to turn therein to permit the back to be folded down for shipment or turned up for use.

293,008. DRAFT-EQUALIZER. WILLIAM P. GRAINER, Walcottville, Ind. Filed Sept. 19, 1883. (No model.)

Claim.—1. In a draft-equalizer of substantially the described construction, the combination of the double-tree A, having brace A', chafing-plates C C, provided with apertures I and guide-rods D D, single-trees N N, having chafing-plates L L, provided with apertures I and guide-rods M M, and movable blocks E E and K K, connected together by links J, and having grooves F G, and spring-catches H, adapted to engage with the apertures I of the chafing-plates, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

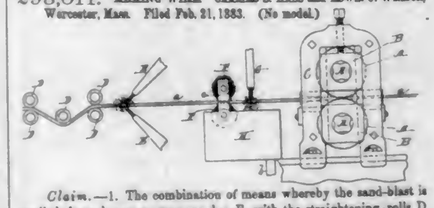
2. In a draft-equalizer of substantially the described construction, the combination of the single-trees N N, provided with the slotted clips O O, secured to the single-trees on their inner ends, with the bars Q Q, adapted to be adjustably secured within the slotted clips O O by means of keys Q'' Q'', and having their inner ends extended to adapt them to enter apertures L' in the upwardly-curved ends of the chafing-plates L L, as and for the purpose shown and set forth.

293,009. FASTENER FOR FENCE WIRES AND BOARDS. CHAS. K. GRIFFITH, Storm Lake, Iowa. Filed Aug. 17, 1883. (No model.)



Claim.—1. The combination of the slotted plate D, and the screw-bolt C with head *c* and bit *d*, for holding the members of the fence at a distance from the posts or trees, substantially as shown and described.

2. The combination, with a wire cable, of the slotted plate D, bent to form tube *a*, and the screw-bolt C, having head *c* and bit or shoulder *d*, for holding the wire at a distance from the post or tree, as described.



293,010. BUILDING-WALL COMPOUND. LEVI HAAS, Chester, Pa. Filed Mar. 2, 1883. (No model.)

Claim.—1. A building material composed of three parts of furnace-slag and one part of mortar made of lime, sand, and water, and combined in suitable proportions with an additional cementing-mortar made of powdered flint, alkaline solution of flint, sand, and clay, substantially as described.

2. The combination of the mold-bottom C, partitions H and A', walls B, D, D', and F, and hinged hasp G, substantially as shown, and for the purpose described.

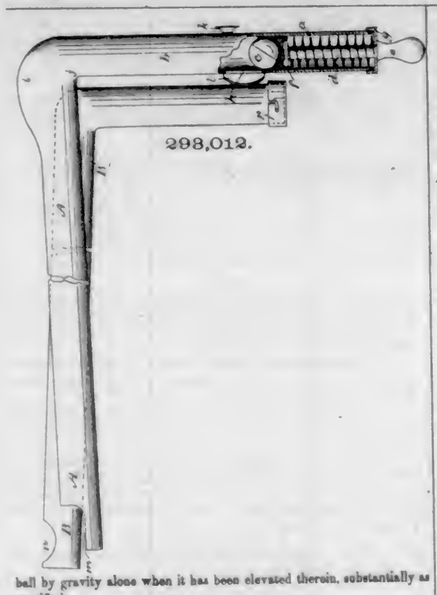
293,011. MAKING WIRE. CHARLES S. HALL and EDWIN J. WATSON, Worcester, Mass. Filed Feb. 21, 1883. (No model.)

Claim.—1. The combination of means whereby the sand-blast is applied through one or more nozzles, E, with the straightening-rolls D and reducing-rolls A, substantially as and for the purpose set forth.

2. The combination of means whereby the sand-blast is applied through one or more nozzles, E, with the straightening-rolls D, substantially as and for the purpose set forth.

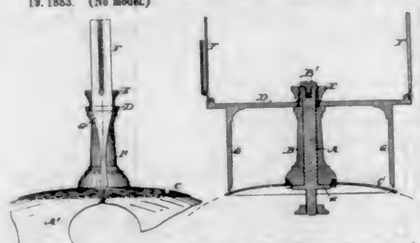
3. The combination of means whereby the sand-blast is applied through one or more nozzles, E, with the reducing-rolls A, substantially as and for the purpose set forth.

293,012. CASH-CONVEYER. OSBORN B. HALL, Malden, Mass. Filed Nov. 30, 1883. (No model.)



Claim.—1. In a cash-conveyer, the combination of an inclined guiding-way terminating in a depending section provided with an opening for the insertion of the cash-ball, a plunger arranged in said depending section, and provided with a head to receive said ball, a spring arranged to be depressed by the drawing down of said plunger, and adapted to elevate the same when released, and to thereby impel the ball into said inclined way, substantially as specified.

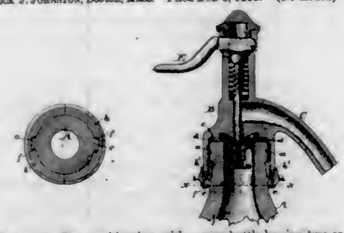
2. In a cash-conveyer, the combination of inclined conduit A, terminating in a depending section, *b*, having an aperture, *k*, for the insertion of the cash-ball, plunger *d*, provided with head *f*, to receive said ball, and also with a handle by which to depress it, and helical spring *a*, arranged to be depressed by the drawing down of said plunger, and when liberated to actuate the same, and thereby impel the ball into the inclined conduit, substantially as specified.



3. In a cash-conveyer embodying the inclined way A, terminating in depending section *b*, provided with devices whereby the cash-ball may be impelled from said depending section into the inclined way, an enlargement, *i*, in the outer angle or line of said way, at the intersection of the inclined and depending sections, whereby an enlarged radius of the curve is obtained, to facilitate the change of direction of the ball, substantially as specified.

4. In a cash-conveyer, the combination, with a tubular conduit for the cash-ball, of a whistle and speaking devices, whereby said tube may be utilized for transmitting oral messages, substantially as specified.

5. In a cash-conveyer, the combination, with suitable devices whereby the cash-ball may be elevated to the requisite height, of a tubular conduit arranged at an inclination to insure the traversing thereof by said ball by gravity alone when it has been elevated therein, substantially as specified.

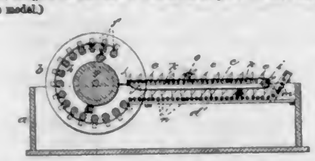


293,013. ALIDADE. JOHN E. HAND, Philadelphia, Pa. Filed Jan. 19, 1883. (No model.)

Claim.—1. A central post, a sleeve fitted thereon, a graduated plate rigidly connected with said sleeve, and a sight-carrying arm fitted on said sleeve, in combination with a screw and nut, said screw being adapted to connect said post and sleeve, and said nut to clamp said sleeve and arm, substantially as and for the purpose set forth.

2. A central post, a sleeve, a graduated plate, a sight-carrying arm, a securing-nut for said post and sleeve, and a clamping-nut for said sleeve and arm, in combination with a binnacle, substantially as and for the purpose set forth.

293,014. SIPHON-BOTTLE. HERMAN L. HANSON, Medford, and FREDERICK J. JOHNSTON, Boston, Mass. Filed Dec. 5, 1883. (No model.)



Claim.—1. The combination, with a glass bottle having two or more rectangular lugs or ears molded upon and projecting from its neck, and provided with an annular flange or collar at its top end, of a threaded metallic coupling-ring made in two parts, and provided with a radial shoulder or shoulders to engage with said lugs or ears, and a head or cap provided with a female thread to engage with the thread on said divided coupling-ring, substantially as and for the purposes described.

2. In a siphon-bottle, the combination of the head B, the coupling-ring *b b*, each half of which is provided with a recess or notch, *f*, and the lugs *e e*, molded upon and projecting from the neck of the bottle A, substantially as and for the purposes described.

3. In a siphon-bottle, a divided coupling-ring provided with a means of securing thereto the metallic head of said bottle, and also provided with an upwardly-extending annular lip adapted to inclose the lower end of said head, substantially as and for the purposes described.

293,015. HAT-SIZING APPARATUS. NATHAN HARPER, Newark, N. J., assignor to Marcus W. Adams, same place. Filed June 29, 1883. (No model.)

Claim.—1. In hat-sizing apparatus, dipping mechanism constructed and adapted to automatically dip or immerse the hat-rolls in the felting-liquid outside of the felting-chamber, substantially as set forth.

2. In a hat-sizing apparatus, dipping mechanism constructed and adapted to automatically dip or immerse the hat-rolls or hat-bodies in the felting-liquid outside of the felting-chamber, and thence convey them toward or into said chamber, substantially as set forth.

3. In a hat-sizing apparatus, dipping mechanism consisting of a traveling belt or apron submerged, or in part submerged, beneath the felting-liquid, and provided with slats, ribs, bosses, or other projections adapted to receive a roll of hats between them, and to automatically dip or immerse said hats in said liquid outside of the felting-chamber, substantially as set forth.

4. In a hat-sizing apparatus, dipping mechanism consisting of a traveling belt or apron submerged, or in part submerged, beneath the felting-liquid, and provided with slats, ribs, bosses, or other projections adapted to receive a roll of hats between them, and to automatically dip or immerse said hats in said liquid outside of the felting-chamber and thence convey them toward or into said chamber, substantially as set forth.

5. In hat-sizing apparatus, a belt or apron adapted to convey the hat-rolls from the folders to the felting-chamber, or to return them from the felting-chamber to the folders, said belt or apron being provided with slats, substantially as and for the purpose set forth.

6. In a hat-sizing apparatus, a feeding belt or apron provided with slats, ribs, bosses, or other projections adapted to receive a roll of hats between them, and convey or impel said hats toward or into the felting-chamber, substantially as set forth.

7. In a hat-sizing apparatus, a feeding belt or apron provided with slats, ribs, bosses, or other projections adapted to receive a roll of hats between them, and to convey said hats from the felting-chamber.

8. In a hat-sizing apparatus, a feeding and a discharging mechanism having but a single carrying belt or apron, said belt or apron being provided with slats, ribs, bosses, or other projections adapted to receive a roll of hats between them, and to convey or impel said hats to and from the felting-chamber, substantially as set forth.

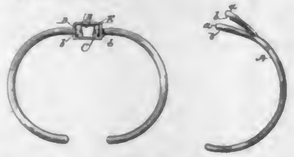
9. In a hat-sizing apparatus, a feeding belt or apron arranged and adapted to convey the hat-rolls from the folders toward or into the felting-chamber, said feeding belt or apron being submerged, or in part submerged, within the felting-liquid to dip or immerse said hats therein while conveying them toward said felting-chamber, substantially as set forth.

10. In a hat-sizing apparatus, the combination of a feeding belt or apron adapted to convey the hat-rolls toward or into the felting-chamber, and a discharging belt or apron adapted to convey said hat-rolls from the felting-chamber, one or both of said aprons being submerged, or in part submerged, within the felting-liquid to dip or immerse said hats therein while conveying them toward said felting-chamber, substantially as set forth.

11. In a hat-sizing mechanism, the combination of a felting-chamber with a feeding apparatus containing a stationary table, platform, or bed adapted to receive the hat-rolls, and along which said rolls are impelled or drawn by a belt or other suitable mechanism toward or into the felting-chamber, substantially as set forth.

12. In a hat-sizing apparatus, a feeding mechanism containing a stationary platform of rollers adapted to receive the hat-rolls, and along which said hat-rolls are drawn or impelled by a belt or other suitable mechanism toward or into the felting-chamber, substantially as set forth.

13. In a hat-sizing apparatus, a feeding and discharging mechanism consisting of a traveling belt or apron provided with slats, ribs, bosses, or other projections adapted to receive a roll between them, and to convey said hats from the felting-chamber, in combination with a stationary



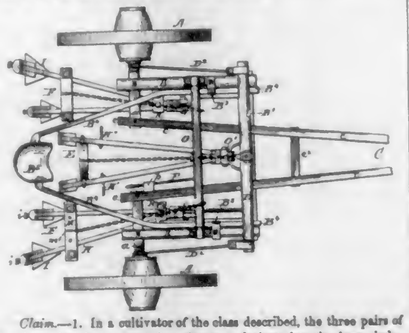
table, platform, or bed, along which said hats may be drawn or impelled by said belt or projections toward or into said chamber.

14. In a hat-sizing apparatus, a feeding and dipping mechanism containing a stationary table, platform, or bed adapted to receive the hat-rolls, and along which said rolls may travel or be impelled or drawn by a belt or other suitable mechanism toward or into the felting-chamber, said table, platform, or bed being submerged, or in part submerged, in the felting-liquid outside of the felting-chamber to dip or immerse said hats in said liquid while being conveyed toward said chamber, substantially as set forth.

15. In a hat-sizing apparatus containing feeding and discharging mechanism, a guide or connecting device provided with a series of rollers and adapted to guide or convey the hat-rolls from one mechanism to the other, substantially as set forth.

16. In a hat-sizing mechanism, the combination of belt *c*, slats or projections *e*, platform *d'*, and tank *a*, substantially as and for the purpose set forth.

293,016. BRACELET. JOHN C. HARRINGTON, Providence, R. I. Filed Nov. 20, 1883. (No model.)



Claim.—1. In a bracelet, the combination of arms A A, provided with the transverse groove *b*, perforated piece C, holding-piece D, and spring B, substantially as described.

2. The improved joint for bracelets, formed by a groove at the inner side of the bracelet-arm, the perforated piece adapted to enter the groove, and the holding-piece, all arranged substantially as described.

293,017. CULTIVATOR. WILLARD M. HARRIS, Wyoming, Del. Filed Nov. 17, 1883. (No model.)

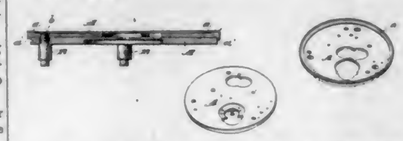
Brief.—A straddle-row cultivator with three independent pairs of shovels, the central pair arranged to be vibrated laterally, and the side pairs to be set and secured at any desired width.

Claim.—1. In a cultivator of the class described, the three pairs of shovels, each pair constructed as shown, and pivoted to the frame independently of the others, substantially as specified.

2. In a cultivator of the class described, the three separate pairs of shovels independently and pivotally connected to the frame, substantially as specified.

3. In a cultivator of the class described, the combination, with the frame, of two independent outside brakes, each carrying a pair of shovels, and a central independent pivotally-connected brake carrying a pair of shovels, substantially as specified.

4. In a cultivator, the combination of a brake comprising two beams and a uniting band or strap, a bracket with a sliding clevis, provided with a link horizontally pivoted thereto and vertically pivoted to said beams, substantially as specified.



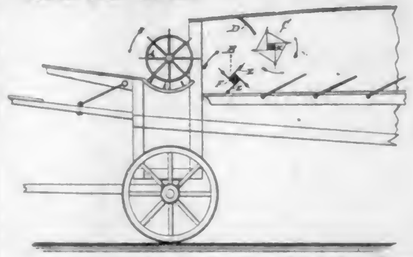
5. The combination of the beams H H, link L, having vertical pivots *k* and horizontal pivots *l*, and the clevis K, substantially as shown and described.

6. The combination of the brakes F F, the central brake, E, links L, clevises K, brackets J, chains N, shaft O, pulley O', and lever P, substantially as shown and described.

7. The combination of the side brakes, F, straps R, links S, and brackets T, substantially as shown and described.

8. The combination of the central pivotally-connected brake, E, provided with stirrups H', with the independent side brakes, F, on each side thereof, provided with the chain N, strap R, and with the link S and means for adjusting the same as to its length, substantially as shown and described.

293,018. WATCH PLATE. GEORGE E. HART, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Nov. 3, 1883. (Model.)



Claim.—1. As an article of manufacture, the watch-plate constructed of two sections separately formed, pierced, and recessed, and then secured together by screw end pillars, substantially as and for the purpose described.

2. A watch-plate composed of two separate full plates superimposed one upon the other, and united together so as to form one plate, substantially as shown and described.

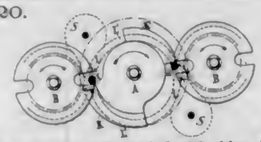
3. A watch-plate composed of two separately-formed full sections, which are united by means of the pillars, substantially as and for the purpose set forth.

4. As an improvement in the setting of jewels, a watch-plate composed of two separately-formed full plates, which are superimposed one upon the other and fastened together, and have their contiguous faces recessed to receive and contain the jewels, substantially as and for the purpose shown and described.

293,019. THRASHING-MACHINE. ANDREW T. HAWLEY, Alton, Ill. Filed Nov. 1, 1883. (No model.)

Claim.—1. A thrashing-machine constructed with a heavy beater adjoining the thrashing-cylinder and revolving in an opposite direction thereto, and a light beater adjoining the heavy beater above and in rear of it, and revolving in an opposite direction thereto, whereby the straw will be received from the cylinder by the heavy beater and thrown upward, and as it falls be subjected to the action of the light beater, substantially as herein shown and described.

2. In a thrashing-machine, the combination, with the thrashing-cylinder A, of the heavy beater B, adjoining the cylinder and revolving in a direction opposite thereto, the light beater C adjoining the heavy beater B above and in rear of it, and revolving in an opposite direction thereto, and of the downwardly-inclined guard or deflector D between the beaters B C, whereby the heavy beater B will receive the straw from the cylinder and throw it upward against the deflector, and as it falls be subjected to the action of the light beater, substantially as herein shown and described.

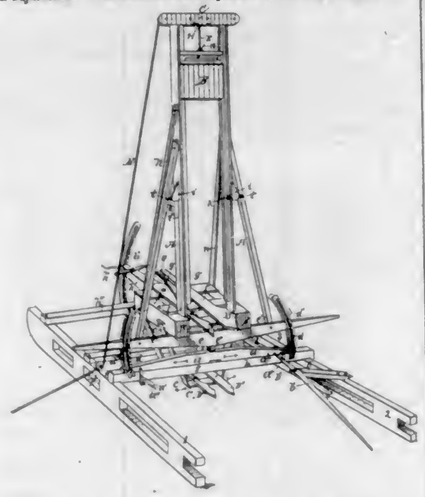


3. In a thrashing-machine, the beater B, consisting of a central shaft, wings covered with sheet-iron, and a casting, G, having spikes H upon the outer edge of each wing, substantially as herein shown and described.

4. In a thrashing-machine, the combination, with the cylinder A, of the beater B, constructed with four wings covered with sheet-iron, and provided on the edge with castings having spikes, and of the beater C, provided with four wings suitably braced, substantially as herein shown and described.

293,020. BRAIDING-MACHINE. WILHELM HEITMANN, ERNST HENKELS, and AUGUST SCHMEDEL, Langerfeld, near Barmen, and MAX FISCHER, Berlin, Prussia, Germany, assignors to Albert Henkels, Langerfeld, near Barmen, Prussia, Germany. Filed Feb. 20, 1882. (No model.) Patented in Germany July 30, 1881, No. 20,712, and Nov. 1, 1881, No. 18,809.

Claim.—1. The combination, with a circular or nearly circular spool-track, L, of the drivers K K', rotating eccentrically to the said track, substantially as and for the purpose described.

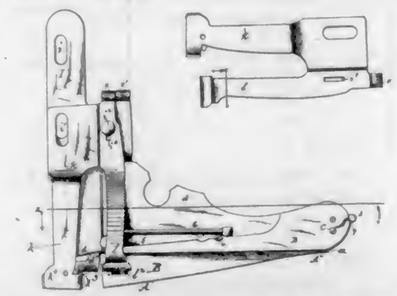


293,020.

2. The combination, with a track, L, of the drivers K K', eccentrics C C', pins E E', and driving-head A, substantially as described.

293,021. POST-DRIVER. EDWIN HIATT, New Castle, Ind. Filed Sept. 28, 1883. (No model.)

Brief.—A post-driver consisting of means for adjusting laterally the base of the machine, and a device for securing or holding the same in adjustment. The hammer-rest is operated by a spring and cord.



Claim.—1. In a post-driver, the sliding bar *a*, adjustably secured to the axle *b* by clamps *a'*, and made to slide sidewise by the lever *b'*, working in holes *a''*, and resting on the arm *b'''*, and pin *b''*, all for the purpose set forth.

2. In a post-driver, the uprights A, having hammer-rests *i*, bearings *k' k''*, rest *k*, spring *i'''*, rod *i''*, and cord *i'*, all for the purpose set forth.

293,022. BINDING ATTACHMENT FOR SEWING-MACHINES. ROBERT HUGHES, New Orleans, La. Filed Apr. 28, 1883. (Model.)

Brief.—An upper and a lower scroll-plate having folded front edges for forming passages for the binding material and goods are secured together at the feeding end, and are adjustably arranged and combined with guides at the other end for properly delivering the material and goods to the stitching mechanism.

Claim.—1. The plate A, adapted to be attached to a sewing-machine, substantially as described, in combination with the plate B, secured at its outer end to plate A, springing its inner end thereon, each plate being folded back nearly upon itself at one edge, each of said folded portions being twisted from a horizontal position at its inner end to a vertical position at its outer end, the original outer edges of the two folded portions being contiguous when folded and twisted as described, forming a passage whose inlet is a vertical plane and whose outlet is two parallel horizontal planes joined at one edge, as and for the purpose specified.

2. The plate B, folded and twisted as described, in combination with the plate A, folded and twisted as described, and having the point *a'* lying across the line of the opening between the adjacent edges of said plates.

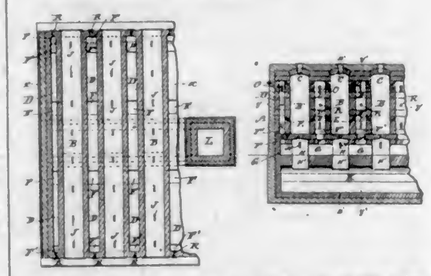
3. The combination, with the plate A, having the notches *p* therein, of the guide *q s*, having an elastic body attached to said plate, adapted to spring into the aforesaid notches, as shown and described.

4. The plate A, having the notches *p* and rib *s'*, in combination with the guide *q*, having the hook *q'*, adapted to hook loosely over the rib *s'*, as shown and described.

5. The plate A, having a hole, *f'*, in it, and the plate B, having the inclined-edged projection *f*, adapted to pass through said hole *f'*, in combination with the slide G, provided with a plate, *f''*, adapted to slide between plate A and projection *f* to raise the plate B, as shown and described.

6. The combination, with the plate A, having two slots in it, of the slide G, having two studs, *g g'*, and the spring k^3, held by said studs, impinging upon one side of plate A to hold slide G in frictional contact with the other side, as described.

7. The folded and twisted plate A, having the extension c^4, in combination with the folded and twisted plate B, having the extension c^5, adjacent to each other, as shown and described.

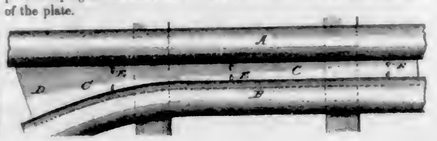


8. The combination, with the guide *l*, having the flexible arm *k*, each provided with guiding-edges in line with the other, of the guide *l'*, having the flexible arm *k'*, each provided with guiding-edges in line with the other, substantially as described.

9. The flexible arm *k*, having the projecting lip k^2, and a hole, k^4, for the machine-needle to enter, and shaped to be secured to a sewing-machine beneath the presser-foot, in combination with means for feeding work thereto, substantially as shown and described.

10. The folded and twisted plate A, having the diagonal serrations *n'* at its delivery end, in combination with the folded and twisted plate B, having similar serrations, *n*, adjacent thereto, as shown and described.

11. The folded and twisted plate A, having the diagonal bar *m'*, secured on its upper face, in combination with the folded and twisted plate B, having the bar *m*, secured on its lower face adjacent to and practically parallel with said bar *m'*, as shown and described.

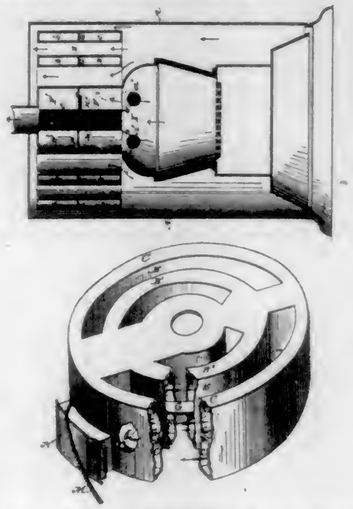


293,023. COKING-FURNACE. ARTHUR RICHARD BALDWIN HILTAWSKI, Zaborze, Upper Silesia, Germany. Filed Nov. 15, 1883. (No model.) Patented in Germany Nov. 24, 1882, No. 21,455.

Claim.—A coking-furnace constructed with a series of coking-chambers, B, gas-chambers D between them, longitudinal channels H below the coking-chambers, transverse channels G, connecting the channels H, and a channel, K, communicating with the channels H by the flues H', and leading to the smoke-stack, and slots J, communicating with the channels H and the coking-chamber B, substantially as herein shown and described, and for the purpose set forth.

293,024. LIFE-PROTECTOR FOR RAILROAD-RAILS. EDWARD J. HOFFMAN, Sioux City, Iowa. Filed May 1, 1883. (No model.)

Brief.—A safety-plate resting upon elastic cushions secured by staples clamping the cushions and riveted with their free ends upon the top of the plate.



293,024.

Claim.—The life-protector for railroad-rails, consisting of the steel plate C D, elastic cushions F F, and staples E, constructed and combined substantially in the manner and for the purpose herein shown and set forth.

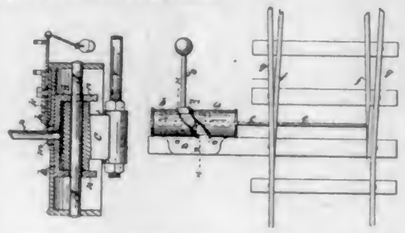
293,025. RADIATOR FOR HOT-AIR FURNACES. CYRUS S. HOOD, Corning, N. Y. Filed Sept. 25, 1883. (No model.)

Claim.—1. The radiator or heater embracing two or more concentric fire-flues divided horizontally, the vertical central chamber, a damper for dividing said chamber, a cross-flue opening into the lower part of said chamber, communicating with the lower concentric fire-flues at the rear side of said heater, a cross-flue opening into the upper exit part of said central chamber, communicating with the upper concentric fire-flues, and open air-spaces between the said concentric fire-flues, substantially as described, for the purpose set forth.

2. A heating-drum or radiator having a central rising chamber, F, two or more concentric flues, each divided into an upper and a lower communicating passage by a horizontal partition, a top exit-chamber, F', and a damper dividing said central rising chamber from the exit-chamber, such division being coincident with the horizontal division of the concentric flues, for the purpose stated.

3. The combination, with a heater composed of concentric fire-flues, intervening open air-spaces, and a vertical central chamber communicating with the combustion-chamber and with the said fire-flues, substantially as described, of a self-closing damper arranged to divide said vertical flue, having an outside bent or curved handle, and the feed-door in the casing of the outer concentric flue, arranged to press against and turn said handle to open the damper in opening said door, substantially as herein set forth.

4. The combination, with the fire-pot and the dome, of a heater composed of concentric fire-flues divided horizontally, and a vertical central chamber divided by a damper, and open air-spaces between the said fire-flues, the pipes or collars *b b*, connecting the inner of said fire-flues with the combustion-chamber, the lower cross-flue connecting the outer of said fire-flues with the lower part of the central chamber and with the combustion-chamber, and the upper cross-flue connecting the said fire-flues with the upper part of said central chamber, substantially as herein set forth.

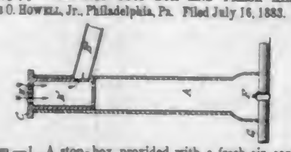


5. The combination, with the rising chamber F, of one or more separate concentric fire-flues divided horizontally into separate lower and upper communicating flues, the lower and upper cross-flues, J J', the central top exit-chamber, F', the damper H, and one or more open concentric air-heating spaces, the said concentric fire-flues opening into the said cross-flues and into the said central rising and exit chambers at points directly over each other, substantially as described.

6. The combination, in a radiator, of the central rising and exit chambers, F F', one or more separate concentric fire-flues divided horizontally, and communicating by openings in said divisions, the cross-flues J J', communicating with said separate concentric flues and the said central chambers, and the open air-heating spaces, with a damper dividing the said central chambers, adapted to be opened by the pressure of the gas in the combustion-chamber, and to close automatically upon the relief of said pressure, substantially as described.

7. An air-heater for stoves and furnaces, having one or more separate concentric fire-flues divided horizontally, a central rising and exit chamber, a damper dividing said central chamber in line horizontally with the fire-flue divisions, and one or more open air-heating spaces between the said fire-flues, the latter receiving the products of combustion through an opening in said central rising chamber beneath its dividing-damper and discharging them through an opening in said central exit-chamber above said damper, both the receiving and discharging openings being on the same side of said central chamber, and communicating with the said fire-flues by openings in their division-plates, substantially as herein set forth.

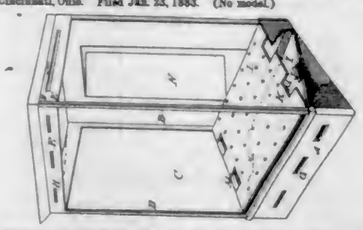
293,026. RAILROAD-SWITCH MOVER. GEORGE W. HORNE, New York, N. Y., assignor of one-fourth to Benjamin A. Dare, same place. Filed Aug. 7, 1883. (No model.)



Brief.—A projection on the traveling nut which holds the moving arm travels in the spiral channel in the stationary case. The traveling nut is secured, either directly or through a movable sleeve interposed, to the switch-bar, which moves therewith

Claim.—1. In a switch-mover with a spiral slot or grooved channel, the rotating and traveling nut or hub *b*, with projecting lug *m* and protruding lugs or ears *n*, embracing the sleeve *c*, and moving the same in either direction, substantially as and for the purpose described.

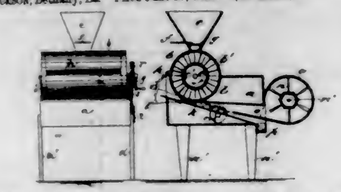
2. In a switch-mover, the case *a*, with spiral guide, nut, or hub *b*, with lugs *m*, protruding ears *n*, the adjustable sleeve *c*, and guide-rod *d*, the whole combined and operated in the manner described, for the purpose specified.



293,027. COMBINED STOP-BOX AND FRESH-AIR CONDUIT. LEWIS C. HOWELL, Jr., Philadelphia, Pa. Filed July 16, 1883. (No model.)

Claim.—1. A stop-box provided with a fresh-air conduit or pipe adapted and arranged to supply air to the main drain of a building, substantially as shown and described.

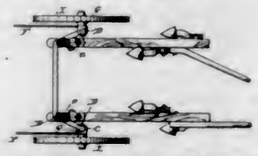
2. In a device of the character herein specified, stop-box A, provided with fresh-air conduit B and a cover, C, perforated at E, substantially as and for the uses and purposes shown and described.



293,028. VENTILATED SHOW-WINDOW. SAMUEL E. HYNDMAN, Cincinnati, Ohio. Filed Jan. 23, 1883. (No model.)

Claim.—1. In show-windows, the lower and upper casings provided with openings G and H, in combination with the inclined plane or floor I, extending nearly to the rear of floor B, with side and front openings, J, and perforated floor K, with openings M, and the incline O at the top, substantially as and for the purpose herein set forth.

2. In a show-window, the upper and lower casings provided with openings G and H, perforated floor K, and the inclined plane I below said floor K, extending nearly to the rear, and having side and front openings, J, substantially as described.

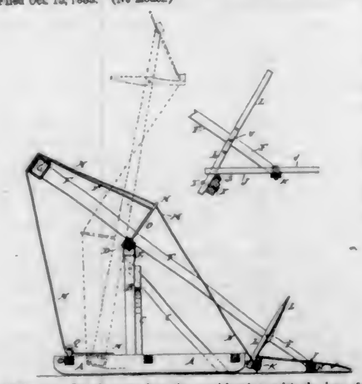


293,029. HULLER, CLEANER, AND SEPARATOR. WM. WORTH JACKSON, Bethany, La. Filed June 16, 1883. (No model.)

Claim.—In a pea or bean huller, the combination of the fan, the inclined sieve, the rotary toothed hulling-cylinder, and the stationary toothed case, the latter provided with an opening near the bottom to intercept the smaller matters and discharge them on the sieve, and an opening at the side for discharging the vines beyond the end of the sieve, substantially as shown and described.

293,030. TONGUELESS WHEEL-CULTIVATOR. THOS. B. JEWETT, Steubenville, Ohio. Filed Oct. 29, 1883. (No model.)

Brief.—Axle-arch turned rearward, and the ends thence upward to receive the plate carrying the wheels and draft-rods. The beam-connection is carried forward to render the machine compact and to prevent it from falling down when the draft is slackened.



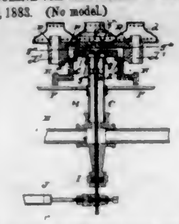
Claim.—1. In a wheel-cultivator, an axle having its ends turned backward at an angle, so as to bring the points of draft to the rear of the front ends of the beams, substantially as shown.

2. In a tongueless wheel-cultivator, the combination of the axle, having its ends turned backward at angle and then upward, with draft-bars carrying the spindles for the wheels, the draft-bars being applied to the vertical portions of the turned-up ends, substantially as described.

3. In a wheel-cultivator, the combination of the axle, having its ends turned backward and then upward, with the wheels applied to the upturned ends, substantially as set forth.

293,031. HAY-STACKER. JAMES HENRY JOHNSON, Greencastle, Mo. Filed Oct. 15, 1883. (No model.)

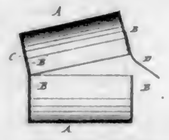
Claim.—1. In a hay-stacker, the combination, with the base-frame A and standards B, of the pivoted handle F, with its axis supported upon the standard, the prongs J and L, loosely connected together, the prongs L having adjusting-apertures, and the hoisting-rope M, substantially as and for the purpose set forth.



2. The combination, with the pivoted handle F of a hay-stacker, of the prongs J and L, the said prongs J and L being loosely connected, and the prongs L being provided with adjusting-apertures, whereby the prongs L may be adjusted relatively to the handle, substantially as shown and described.

3. In a hay-stacker, the combination, with the base-frame A and the standards B, of the fork-handle F, the shaft D, the prongs J L, loosely connected together, the prongs J and the cross-bar H of the handle F, the V-shaped standard O, the brace P, and rope M, substantially as and for the purpose set forth.

4. In a hay-stacker, the combination of the handle F, the end cross-bar, H, provided with staples or eyes I, the head K, and the prongs J L, the prongs J being connected loosely to the head K, and the prongs L being connected to the side bars of the handle F, substantially as and for the purpose set forth.



5. In a hay-stacker, the head K and cross-bar H of the handle F, in combination with the prongs J L, the intermediate or middle ones of the delivery-prongs L being pivoted to the head K, to allow them to be moved wider apart, and the intermediate or middle ones of the receiving-prongs J being disposed sufficently far apart for the passage of the horse, substantially as set forth.

293,032. GASOLINE-VAPOR BURNER. THOMAS JOHNSON, St. Louis, Mo. Filed Aug. 9, 1883. (No model.)

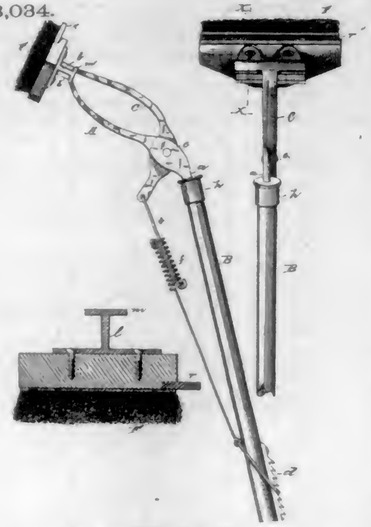
Claim.—In a gasoline-vapor-burner head, the combination of the head-block G, formed with valve-seat *g* at bottom, neck *g'''*, vertical passage *g×*, radial passages *g'*, hollow threaded projections *g''*, forming extensions to the radial passages, the supports D, secured to the projections and having central openings, *d'*, and passages *d'''*, in communication with the radial passages, extensions, and the L-shaped jets E, secured in the passages in the supports, as set forth.

293,033. COIN-HOLDER. CHARLES CARROLL JOHNSTON, Jackson, Miss. Filed Dec. 15, 1883. (Model.)

Claim.—1. A coin-holder made substantially as herein shown and described, and consisting of semi-cylindrical sections held together by a hinge-joint at one end, as set forth.

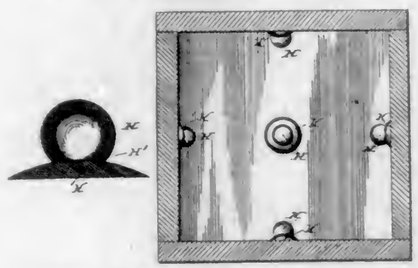
2. In a coin-holder, the combination, with two semi-cylindrical sections, of a flexible strip secured to the adjoining ends of two sections, substantially as herein shown and described.

3. In a coin-holder, the combination, with the two semi-cylindrical sections A, having heads B, of the flexible strip C, secured to two adjoining heads, and of the strip D, secured to one of the opposite heads, substantially as herein shown and described.



293,034. HOUSE-CLEANING IMPLEMENT. LARKIN F. JOHNSTON, Springdale, Ark. Filed Aug. 9, 1883. (No model.)

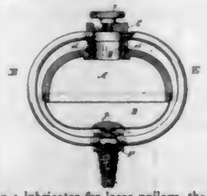
Claim.—1. A pair of tongs arranged obliquely to the handle, and adapted to grasp and retain between them a brush, mop, or other article for cleaning purposes, one of said tongs being connected to the handle, and the other being movable and pivoted to the fixed tong, and a spring-connection secured to the end of said pivoted tong, and adapted to engage a ratchet on the handle, substantially as and for the purpose set forth.



2. The improved brush and mop holder, consisting of the arms A C, pivoted to each other, and provided with jaws, as shown, one of the arms being secured to a handle, and the other having a perforated end and a spring connecting means adjustably secured to the handle, the parts being combined and organized substantially as shown, and for the purpose set forth.

3. In a house-cleaning implement, a brush having a longitudinal flanged rib on its rear side, and a rubber, *r*, at or near its edge, substantially as set forth.

293,034.



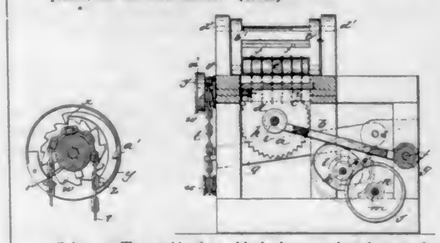
293,035. BUTTER-PACKAGE. DANIEL S. JOHNS, Kortright, N. Y. Filed Dec. 10, 1883. (No model.)

Claim.—1. A transportation-case for butter-jars or similar articles, consisting of a casing, C, having elastic cushions which consist of base-pieces K and hollow rubber balls or spheres H, cut away or recessed upon one of their sides, and secured upon the base-pieces K, as and for the purpose shown and set forth.

2. A transportation-package consisting of a casing, C, having elastic cushions consisting of hollow rubber balls or spheres H, secured upon suitable base-pieces, K, upon its sides and bottom, and a glass jar, A, constructed as described.

293,036. LOOSE-PULLEY LUBRICATOR. LOUIS E. KANE, Cincinnati, Ohio, assignor of one-half to George J. Murray, same place. Filed Aug. 6, 1883. (No model.)

Claim.—1. In a lubricator for loose pulleys, the combination, substantially as specified, of the stem F and a reservoir having its discharge-orifice inverted with relation to the stem, with suitable means, such as shown, to connect the discharge-orifice with said stem.



2. In a loose-pulley lubricator, the combination of the stem F, tubes E, and cap C, with the inverted reservoir A B D, substantially as specified.

3. An oil-reservoir for loose-pulley lubricators, consisting, substantially as before set forth, of a rigid part, A, at one end, and terminating at its other end in a tubular neck, B, and a flexible part, D, the open end of which is secured to the open end of the rigid part A, to form a single vessel.

4. The combination, substantially as specified, of the stem F, cap C, and tubes E, with the rigid part A, neck B, the flexible part D, and weight *g*.

5 The combination, substantially as specified, of stem F, the curved tubes E, and cap C, with a reservoir suspended from said cap, between the tubes, said reservoir having a weighted flexible part, D.

293,037. CIRCULAR SAWING MACHINE. GEORGE J. KAUFT, Emporium, Pa. Filed Dec. 14, 1883. (Model.)

Claim.—1. The combination, with the lever *q*, pivoted at *s* to the frame, and connected at its free end to the chain *t*, which passes under an idler below the lever, and over a chain-pulley on the shaft of the feed-roller *d* above the lever *q*, of the cam *p*, mounted on shaft *k*, for operating lever *q* and devices connected therewith, substantially as described.

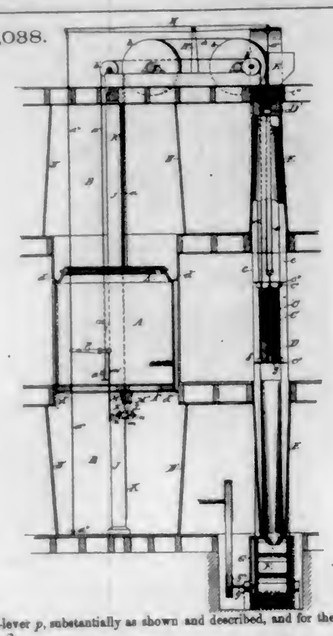
2. The combination of the feed-roller *d*, on the shaft of which is mounted loosely a chain-pulley, *v*, having secured thereto a ratchet-disk, *w*, and also a disk rigidly secured to said shaft *d*, and carrying a spring-pawl, with the chain *t*, idler *u*, and pivoted cam-operated lever *q* below the table, substantially as set forth.

3. The combination of the shaft *k*, provided with the cams *l p*, the former for operating the swinging saw-frame and the latter for operating the pivoted lever *q*, connected with the chain *t*, passing under idler *u* and over loose chain-pulley *v*, on the shaft of the feed-roller *d*, with the fixed disk on said shaft carrying the fixed ratchet *w* and its spring-pawl, and suitable gearing for operating the shaft *k* and the saw, substantially as set forth.

4. The combination of the shaft *k*, carrying the cams *l p*, mounted, respectively, below the swinging saw-frame and pivoted lever *q*, and said shaft *k*, also provided with cog-wheel *o*, with the shaft *m*, provided with pinion *n*, gearing with wheel *o*, and with a driving-pulley for operating said shaft *m*, and the pulleys *g h* on the saw-frame shaft and saw-arbor, respectively, by belts passing over the same, substantially as set forth.

293,038. ELEVATOR. AUGUST KIRCHHEFER, Milwaukee, Wis. Filed Nov. 6, 1883. (No model.)

Claim.—1. In an elevator, a counterbalancing-bucket, C, adapted to rise and fall in vertical ways, properly connected to the car or platform, and adapted to raise or lower the same respectively as the proper weight is emptied in said bucket from a valve-controlled hopper in the top of the building or emptied from said bucket through a valve in its bottom, as set forth.



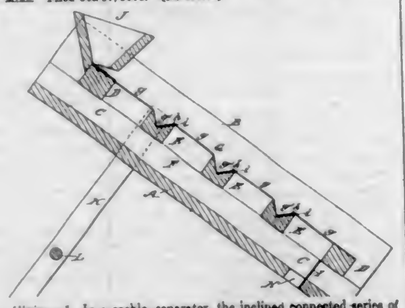
2. In an elevator, a well-room having the sides of its top story inclined inward toward the ceiling, wherein a sufficient volume of air may be compressed by means of elastic strips fitted on the corresponding sides of the car-top to gradually arrest the sudden rise of the car, due to a breakage of some part of the hoisting mechanism or to some other accident, in combination with the similarly-inclined sides of the well-room basement and the elastic strips fitted on the sides of the car-bottom, as set forth.

3. In an elevator, the counterbalancing-bucket C, having notched bearings *c'* in its top and bottom, and the automatic valve D, in combination with the bucket-belt elevator F, having the boot G and the valve-controlled hopper E', substantially as shown and described, and for the purpose set forth.

4. In an elevator, the bucket C, filled with shot C', in combination with the wire cables *a*, the sheaves *b b*, and the car A, substantially as shown and described, and for the purpose set forth.

5. In an elevator, the clutch-brake L, consisting of right-and-left-threaded crank-shaft *m* of articulated levers N, having threaded sleeves *n n*, slotted fulcrum *o*, and clutching-arms *n' n'*, both supported by bracket-hanger M', and fulcrum-hinging bolt P on cross-bar M, in combination with flat iron bar K of post J, connecting rod or link *m'*, and

293,038.



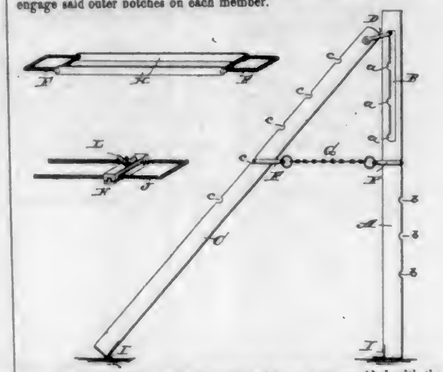
hand-lever *p*, substantially as shown and described, and for the purpose set forth.

6. In an elevator, the inclined sides B' of the well-room top story and the elastic strips *d'* along the sides of car-top A', in combination with the inclined sides B' of the well-room basement story, and the elastic strips *d'* along the sides of the car-bottom A^3, substantially as shown and described, and for the purpose set forth.

7. In an elevator, the inclined sides B' of the well-room top story, and the elastic strips *d'* on sides of car-top A', in combination with the wires *a*, sheaves *b b*, the funnel-shaped pipes E, fitted in the basement story on the path of counterbalancing-bucket C, having elastic strips *c'* around its bottom, substantially as shown and described, and for the purpose set forth.

8. In an elevator, the funnel-shaped pipe E, fitted in the top story on the path of the counterbalancing-bucket C, having the elastic strip *c'* around its top, in combination with the inclined sides B' of well-room basement, and the elastic strips *d'* on the sides of the car-bottom, substantially as shown and described, and for the purpose set forth.

293,039. COCKLE-SEPARATOR. JAMES MADISON KING, Rochester, Minn. Filed Oct. 17, 1883. (No model.)



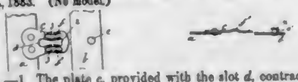
Claim.—1. In a cockle-separator, the inclined connected series of screens *g*, having the detents *g'*, in combination with the series of transversely-arranged V-shaped-guttered bars E, within which the said detents are located, substantially as and for the purpose set forth.

2. In a cockle-separator, the inclined series of screens *g*, provided with detents *g'*, having the imperforate smooth-faced plates A, secured to the lower or forward sides of the detents, in combination with the series of transversely-arranged V-shaped-guttered bars E, substantially as and for the purpose set forth.

3. The cockle-separator herein shown and described, comprising a suitable inclined bottom and side boards and the cross-bars D D and guttered cross-bars E E, and the screen G, held in the gutters of the cross-bars E and provided with the plates A, substantially as and for the purposes set forth.

293,040. SCAFFOLDING-BRACKET. MARK N. ENIGHT, Skowhegan, Me. Filed Apr. 23, 1883. (No model.)

Brief.—An upright piece of timber provided with a longitudinal slot, and in one edge with a series of notches, and below said slot, in its outer edge, with a series of notches, the other piece also notched in its outer edge and provided with a pivoted U-shaped link which passes through the slot and engages the notches, also links united by bars which engage said outer notches on each member.

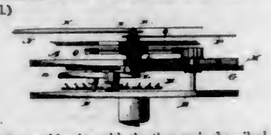


Claim.—1. The combination, with the piece A, provided with the notches *a b*, of the piece C, provided with notches *c*, and of the U-shaped link D, pivoted to the upper end of the piece C, substantially as herein shown and described, and for the purposes set forth.

2. The combination, with the piece A, provided with the slot B and with the notches *a b*, of the piece C, provided with notches *c*, and of the link D, pivoted to the upper end of the piece C and passed through the slot B, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the notched pieces A C, adjustably hinged together, of a brace having links or loops engaging the notches of the said pieces, substantially as herein shown and described.

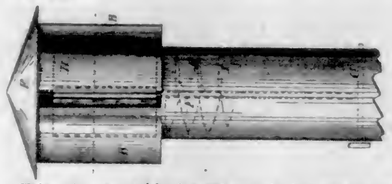
4. The combination, with the piece A, provided with the notches *b*, and the piece C, provided with the notches *c*, of the link D, the links F, and the bars H, uniting them, substantially as herein shown and described, and for the purpose set forth.



293,041. FASTENING FOR WEARING-APPAREL. PERLEY LAFLIN, Warren, assignor to Theodore C. Bates, North Brookfield, Mass. Filed Apr. 14, 1883. (No model.)

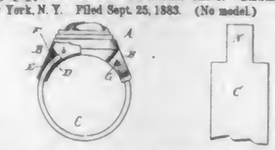
Claim.—1. The plate *c*, provided with the slot *d*, contracted near the middle of its length, and wholly surrounded by the metal of the plate, and having the spring-arms *f f'* and cut-away portions 3 3 between said arms and the edges of the plate, substantially as shown and described. and the single plate *c*, having the slot *d*, contracted between its ends, and wholly surrounded by and contained within the metal of the plate,

2. A fastening device for wearing-apparel, comprising a headed stud and provided between its ends with a stop bent or struck up from the body of the plate, to arrest the accidental escape of the headed stod from the said slot, for the purposes set forth.



293,042. WATCH. CLAUDIUS D. LEGER, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Sept. 12, 1883. (No model.)

Claim.—In combination with the time-train described, the arbor I, journaled within the hollow arbor H, provided with the pinion *i*, and carrying the seconds-hand K, and the wheel M, secured to and rotated



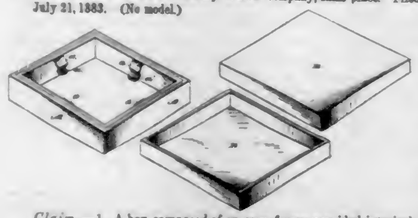
by the arbor of the second wheel G, and meshing with said pinion, substantially as and for the purpose specified.

293,043. DRAFT-REGULATOR FOR PIPES, FLUES, AND VENTILATORS. LEWIS YOUNG LENHART, Red Wing, Minn. Filed Dec. 24, 1881. (No model.)

Claim.—As a new article of manufacture, the draft-regulator consisting of a pipe, A, the tangential wings B, formed by cutting the end of said pipe vertically and horizontally, the cone-cap E, secured directly to the top edges of said wings, the central rotary shaft, F, the flat radial blades H, arranged on this shaft in the plane of the openings between the wings B, the spiral vane I, and the cross-step G, all constructed and adapted to operate as shown and described.

293,044. ADJUSTABLE FINGER-RING. BENJAMIN LEWKOWITZ, New York, N. Y. Filed Sept. 25, 1883. (No model.)

Claim.—1. In a finger-ring, the combination, with a frame having inclined pockets projecting from the sides, of a removable shank having its ends passed into the pockets, and of a screw passed through the edge of each pocket and adapted to bind on the edge of the shank, substantially as herein shown and described.



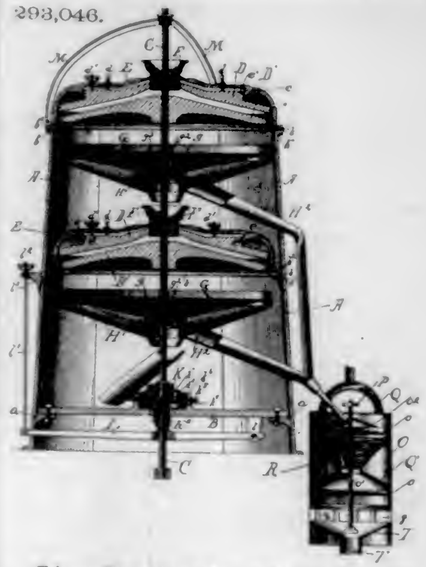
2. In a finger-ring, the combination, with a frame, A, having inclined pockets B on the sides, of the shank C, having recesses or notches a in the edges at the ends, and of the screw G, passed through an edge of each pocket, substantially as herein shown and described.

3. In a finger-ring, the combination, with the frame A, having inclined pockets B on the sides, of the plates D, each having groove E and cross-piece F, and of the screws G, adapted to pass through the edges of the plates D, and to bind on the edges of the shank, substantially as herein shown and described.

293,045. MIXED PAINT. HOWARD LITTLE, Deckertown, N. J. Filed Aug. 18, 1883. (No specimens.)

Claim.—The improved paint herein described, consisting of the ingredients named in the proportions stated, to wit: to five gallons of coal-tar thinned by a light oil four quarts of finely-sifted wood-ashes, the ingredients being thoroughly incorporated with each other, and adapted for use substantially as specified.

293,046. WATCH-MOVEMENT BOX. EDWARD A. LOCKE, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed July 21, 1883. (No model.)



Claim.—1. A box composed of an open frame provided interiorly with spring-clasps for engagement with either or both plates of a watch-movement, substantially as and for the purpose specified.

2. An open frame provided interiorly with spring-clasps, for engagement with the plate or plates of a watch-movement, in combination with covers which are adapted to be passed over and to inclose the sides of said frame, substantially as and for the purpose shown.

293,047. MILLING APPARATUS. FRANK M. MACKEY, La Porte, Ind., assignor to himself, and Edward Morf and Gustav B. Morf, both of Chicago, Ill. Filed Apr. 9, 1883. (No model.)

293,046.

Claim.—1. The combination, with a series of lower revolving conical disks or reducers provided with smooth-surfaced spiral dress and secured to a vertical shaft, of a series of upper stationary opposing conical disks or reducers having a smooth-surfaced radial dress, and a series of dished sieves having a circular vibrating motion, substantially as specified.

2. The combination of chamber or frame A, bridge-tree B, shaft C, lower revolving conical reducers, D', secured thereto, and provided with smooth-surfaced spiral dress, stationary upper opposing conical reducers, D, provided with smooth-surfaced radial dress, hoppers F, copings E, dished screens G, and eccentrics g^3, for giving to said screens a circular vibrating motion, substantially as specified.

3. The combination, with the bridge-tree B, of the shaft C, collar K, secured to said shaft, and provided with flange k', and sleeve k^4, provided with an annular groove or recess, k^2, in its upper end, to receive the downwardly-projecting flange k' of the collar K, and thus form also an oil-receptacle, substantially as specified.

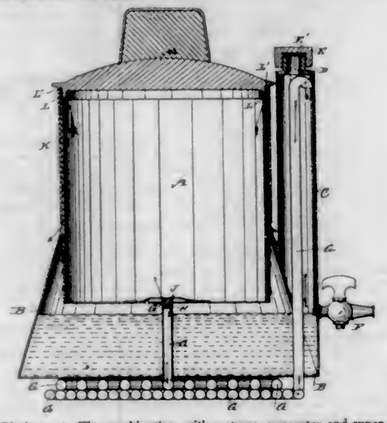
4. The combination of sieve G, spring H, secured to said sieve and to the stationary frame, and a shaft and eccentric for communicating to the sieve a circular vibratory motion, substantially as specified.

5. The combination of under revolving conical reducer, D', stationary opposing conical reducer D, coping E, set-screws d and hand-screws d', hopper F, provided with screw-threads, whereby it is secured to reducer D, and chamber A, substantially as specified.

6. The combination, with the chamber A, provided with interior flanges, b', of ring b, provided with projection b^2 on its upper surface, coping E, provided with grooved foot secured to said ring, upper stationary adjustable conical reducer, D, hopper F, secured to said reducer, and under revolving conical reducer, D', and shaft C, to which said reducer D' is secured, substantially as specified.

7. The combination of chamber A, coping E, secured to said chamber, upper stationary adjustable conical reducer, D, supported from said coping, and provided with smooth-surfaced radial dress, shaft C, and revolving conical reducer D', secured to said shaft, and provided with smooth spiral dress extending from center to periphery, substantially as specified.

8. The combination of chamber A, coping E, upper stationary conical reducer, D, supported from said coping, shaft C, under revolving conical reducer, D', secured to said shaft, cam-sleeve g^3, secured to said shaft, and circularly-vibratory sieve G, supported and operated by eccentric on shaft C, substantially as specified.



9. The combination of dished sieve G, provided with open collar g, shaft C, provided with cam-sleeve g^3, by which said sieve is supported and operated, spring H, and dished bottom H', provided with discharge-spout, substantially as specified.

10. The combination of chamber A, bridge-tree B, shaft C, collar K, rigidly secured to said shaft, and provided with flange or shoulder k', sleeve k^3, loosely mounted on said shaft, and provided with grooves k^2, adapted to receive shoulder k^3 and leave an oil-receptacle, adjusting-ring k^4, brackets k^5, and adjusting-screws k^6, substantially as specified.

11. The combination, with the shaft C, of the cam-sleeve g^3, secured to said shaft, and provided with a horizontally-projecting flange or shoulder, of the dished sieve G, and collar g, rigidly secured to the sieve, and provided with an interior shoulder or flange fitting over the flange on the cam-sleeve g^3, whereby the sieve is supported and operated by the cam-sleeve, substantially as specified.

12. The combination, with the shaft C, of the cam-sleeve g^3, secured to said shaft, and provided with a horizontal projecting flange or shoulder, of the dished sieve G, collar g, rigidly secured to the sieve, and provided with an interior shoulder or flange fitting over the flange on the cam-sleeve g^3, and dished bottom H', provided with discharge-spout H^3, secured to the frame of the sieve, so as to vibrate therewith, substantially as specified.

293,048. STEAM-COOKER. HUDSON MAXIM, Pittsfield, Mass. Filed June 21, 1883. (No model.)

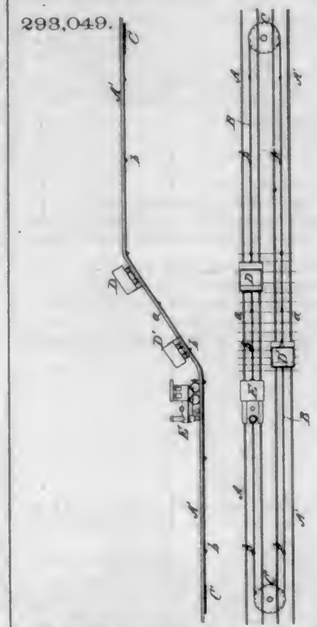
Claim.—1. The combination, with a steam-generator and superposed cooking-vessel, of a pipe having a valved end in the bottom of the cooking-vessel, and an open end in the steam-space of the generator, carried down from the steam-space through the bottom, bent alternately in opposite directions under said bottom, and passing through the generator into the cooking-vessel, as shown and described.

2. In a steam-cooker, the combination, with the vessel A, of the steam-generating vessel B below it, the tube C, extending upward from the vessel B, and the pipe G, extending from the top of the tube C to the bottom of the vessel B, under which it is coiled or passed alternately in opposite directions, and is then passed through the bottom of the vessel B to the bottom of the vessel A, substantially as herein shown and described.

3. In a steam-cooker, the combination, with the vessel A, of the steam-generating vessel B, the tube C, extending upward from the bottom of the same, the pipe G, extending from the top of the tube C to and under the bottom of the vessel B, and up to the bottom of the vessel A, and the valve H in the end of the pipe G, substantially as herein shown and described.

4. In a steam-cooker, the combination, with the vessel A, of the vessel B, the tube C, the pipe G, the valve H, and the cross-strips J on the upper surface of the bottom of the vessel A, substantially as herein shown and described.

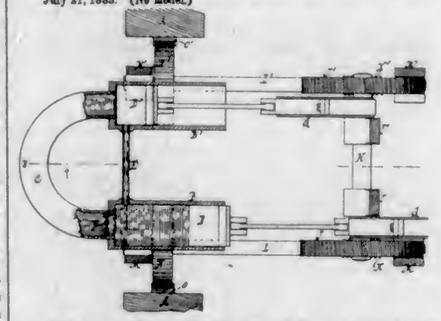
5. In a steam-cooker, the combination, with the vessels A and B, of the cover K, provided with a groove, L, and a packing-strip, L', and of the weight M in the top of the cover, substantially as herein shown and described.



293,049. METHOD OF OPERATING TRAINS ON CABLE RAILROADS. PAUL H. MATOR, Oswego, N. Y. Filed Sept. 15, 1883. (No model.)

Brief.—Trains on endless-cable railways which have inclines are operated through a locomotive attached to one or both trains.

Claim.—1. The method of operating trains on inclines of double-track cable railroads, in which, through the intervention of the cable, arranged to pass down the one track and up the other, the gravity of a descending train on the one track is used to haul up an ascending train on the adjacent track, the same consisting in connecting with the one train a locomotive-engine for controlling the movements of the cable and its attached trains traveling in opposite directions, substantially as specified.



2. In the operation of trains on inclines of double-track cable railroads, in which, through the intervention of the cable, arranged to connect trains moving on both tracks in reverse directions, the gravity of the descending train is used to haul up the ascending train, the method

293,049.

of controlling the movement of the cable and its attached reversely-traveling trains, which consists in connecting a locomotive-engine with each of said trains, substantially as described.

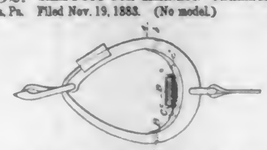
293,050. ELEVATOR. THOMAS MCADOO, New York, N. Y. Filed July 21, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, with an elevator-car, of two cylinders fastened to the car, the pipe C, and the tube E, connecting said cylinders, the check-valve in the pipe C, the pistons moving in the two cylinders, and suitable mechanism for imparting to the pistons a reciprocating motion in opposite directions.

2. The combination, substantially as hereinbefore described, with an elevator-car, of two cylinders fastened to the bottom of the car, the pipe C, and tube E, connecting said cylinders, the check-valve in the pipe C, the pistons moving in the two cylinders, the toothed racks secured to the posts A A', the cog-wheels N N', shafts L L', worms K K', worm-wheels J J', shaft H, and suitable means for transmitting motion from the shaft H to the pistons D D'.

293,051. DEVICE FOR LOCKING WHEELS. WM. L. MCDOUGALL, New York, N. Y. Filed June 30, 1883. (No model.)

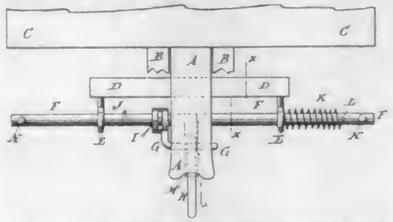
Claim.—1. A device for coupling the wheels of a vehicle, consisting of a coupling-rod provided at its extremities with yokes having pivoted spring locking-keepers, substantially as and for the purposes specified.



298,051.

2. A device for coupling the wheels of vehicles, consisting of an extensible sectional coupling-rod provided at its extremities with yokes having pivoted spring locking-keepers, substantially as and for the purposes specified.

3. The combination, with a wheel-coupling rod provided at its extremities with felly-yokes, of protective sleeves arranged on the arms and keeper of the yoke, substantially as and for the purposes specified.



298,052. SHAFT-TUG FOR HARNESS. PATRICK MCFADDEN, Philadelphia, Pa. Filed Nov. 19, 1883. (No model.)

Claim.—1. In combination with recessed or slotted stirrup B, the plate C, having lugs c c and slots c', and the roller D, journaled in said lugs, substantially as described.

2. The combination, with tug A, of slotted or recessed stirrup B, secured inside said tug by rivets b, and slotted plate C, having lugs c c, supporting an anti-friction roller, D, substantially as shown and described.

298,053. CAR-COUPLING. FRANK L. MCQUISTON, Greencastle, Iowa. Filed May 4, 1883. (No model.)

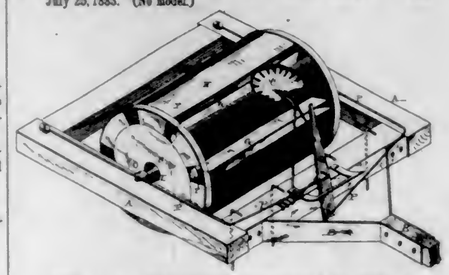
Claim.—1. A car-coupling constructed substantially as herein shown and described, and consisting of the draw-head A, the cross-bar D, having bearings E, the rod F, having stop-pins I J L, the spring K, the elbow M, and the bent coupling-pin G, as set forth.

2. In a car-coupling, the combination, with the draw-head A, of the sliding rod F, having stop-pins I J L, the spring K, the elbow M, and the bent coupling-pin G, substantially as herein shown and described, whereby the cars can be coupled by operating the said rod, as set forth.

3. In a car-coupling, the combination, with the draw-head A, having a recess in its lower side, and the sliding rod F, carrying the bent coupling-pin G, of the elbow M, substantially as herein shown and described, whereby the link can be guided into the draw-head of an adjacent car, as set forth.

4. In a car-coupling, the combination, with the slide-rod F, having pin I, and the coupling-pin G, having slotted sleeve, of the link-lifter M, whereby the link may be lifted without moving the pin, as described.

298,054. ALBUM. STEPHEN MEEKS, Brooklyn, N. Y. Filed July 26, 1883. (No model.)

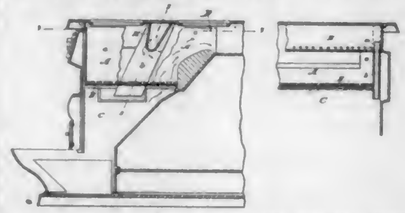


Claim.—1. An album the leaves of which are each composed of two sheets of paper having openings, the edges of which openings are embossed and thereby raised to create a pocket for receiving the picture, substantially as described.

2. An album the leaves of which are composed of the two sheets of paper having openings provided with embossed edges, in combination with the folded strip united to the inner edges of the sheets, and the filling-piece arranged in such strip, as shown and described, for the purpose set forth.

3. An album the leaves of which are composed of the two sheets of paper having openings provided with embossed edges, in combination with the filling-piece arranged between the sheets at the base of the embossed edges, substantially as and for the purpose described.

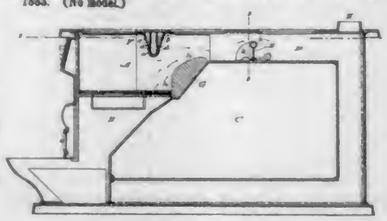
298,055. STALK-CHOPPER. WM. H. MERCER, Mercer, S. C. Filed July 25, 1883. (No model.)



Claim.—1. In a stalk-cutter, the combination of the slotted outer cylinder, H, having the openings I through its ends, and which is made to roll along upon the ground independently of the shaft which passes through it, the cylinder F, provided with cutters and secured rigidly to the shaft E, the single shaft E, which passes through both of the cylinders H F, and the frame A, the shaft being smaller than the openings I, so as not to control the movement of the cylinder H, substantially as shown.

2. In a stalk-cutter, the combination of the frame, a shaft journaled therein, the cylinder provided with cutters and secured rigidly to the shaft, the slotted inclosing-cylinder provided with openings through its ends larger than the shaft, the sliding plugs placed on the ends of the shaft, and rods connected to the plugs for forcing them into the openings in the end of the cylinder, substantially as described.

3. The combination of the frame, the shaft, the cylinder provided with knives, the outer slotted inclosing-cylinder, the plugs for connecting this cylinder to the shaft, the rods connected to the shaft, and the operating-lever, the parts being combined and arranged to operate substantially as set forth.

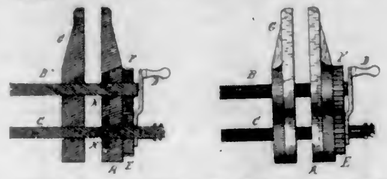


298,056. COOKING OR HEATING STOVE. JOHN A. MILLER, Newark, N. J. Filed Apr. 20, 1883. (No model.)

Claim.—1. In a stove wherein a hollow perforated pendent partition is employed to partially divide the furnace or fire-pot into two chambers, the combination, with this partition, of a flue arranged to connect the hollow of this partition with the ash-pit of the stove, substantially as set forth, and for the purposes specified.

2. The combination, with the hollow perforated pendent partition E, arranged to partially divide the fire-pot into two chambers, of the flue or flues b, arranged at the side of the stove and to extend down into the ash-pit C, whereby air from the ash-pit is supplied to said partition by the natural draft of the stove, as set forth.

298,057. STOVE. JOHN A. MILLER, Newark, N. J. Filed Apr. 20, 1883. (No model.)

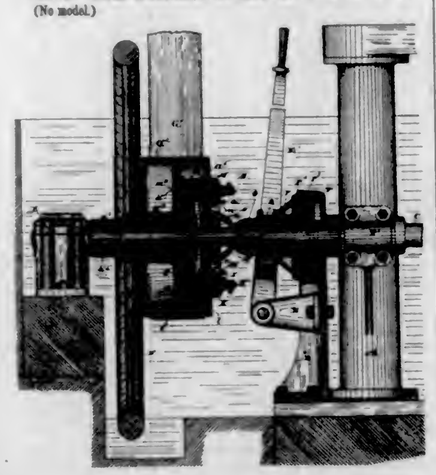


Claim.—1. The pendent partition F of a stove, arranged to divide the fire-box into two chambers, and provided with a longitudinal chamber with a perforated bottom, and passages arranged parallel to said chamber within said partition F, adapted to receive air at the side or sides of the stove, the said parallel passages having communication with the said chamber at its end or ends, whereby a zigzag passage is formed in said partition F, within which the incoming air is heated before it reaches the combustion point in the stove, substantially as set forth.

2. The pendent partition F of a stove, arranged to divide the fire-box into two chambers, and provided with a central chamber with a perforated bottom, and passages *b* and *c*, adapted to receive air from opposite sides of the stove, the said passages having communication with the central chamber at the ends of the partition opposite to the points where the air enters, substantially as set forth.

3. The combination, with the stove walls or sides provided with apertures *j*, of the damper H, provided with a perforated pipe, *i*, arranged to register with said apertures when the damper stands erect, and means, substantially as described, for closing said apertures when the damper is lowered, as set forth.

298,058. SCREW-CLAMP. FRANK A. MOORE, Louisville, Ky., assignor of one-half to Eugene L. Elrod, same place. Filed Oct. 15, 1883. (No model.)



Claim.—1. The combination, with the jaws of a clamp and two screws journaled in one jaw and screw-threaded into the other jaw, of a crank mounted on one screw to revolve it, and gear-wheels mounted on both screws to communicate rotary motion from one screw to the other, substantially as and for the purpose specified.

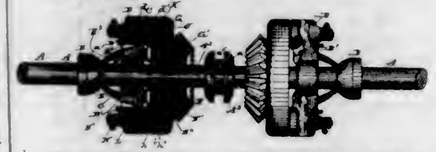
2. The combination, with the two jaws of a screw-clamp, having two screws journaled in one jaw and screw-threaded in the other, of toothed wheels mounted on said screws, means, substantially as described, for disengaging one of said toothed wheels from the other, and a crank, mounted substantially as described, whereby the two screws may be simultaneously rotated, or one may be rotated independently of the other.

3. The clamp-jaw A, the screws B and C, journaled therein, the jaw G upon and engaging the thread of said screws, the shoulder-nuts N, fixed on said screws, the toothed gear-wheels E and F on said screws, and the crank D, mounted on one of said screws, one of said gear-wheels being longitudinally adjustable on its screw, as and for the purpose specified.

298,059. COMBINED BRAKE AND SPEED-REGULATING MECHANISM. THOMAS R. MORGAN, Sr., Alliance, Ohio. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination, with a shaft, driving-pulley, and fly-wheel, of clutch and brake mechanism, constructed and arranged substantially as set forth.

2. The combination, with a shaft and band-pulley, of a friction-clutch, friction-brake, and a hand-lever, the parts being constructed and arranged so that by moving the hand-lever in one direction the clutch will lock the band-pulley to the shaft, and also move the friction-brake disk longitudinally on the shaft and release the brake, while an opposite movement of the hand-lever will release the band-pulley and apply the brake, substantially as set forth.



3. The combination, with a shaft, of a fly-wheel and band-pulley, constructed and arranged to be rotated independently of the shaft, and clutch mechanism for locking the fly-wheel and band-pulley to the shaft and causing them to rotate therewith, substantially as and for the purpose set forth.

4. The combination, with a shaft, a fly-wheel provided with an elongated sleeve, and a band or driving pulley attached to said sleeve, of a clutch secured to said shaft, and devices for locking the band-pulley to said clutch by frictional contact therewith, substantially as and for the purpose set forth.

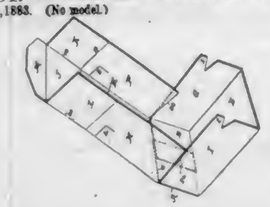
5. The combination, with a band-pulley having frictional surfaces a cast integral therewith, of the cross-bar secured to the shaft, the yielding face-plate, curved levers, conical sliding collar, and frictional wearing blocks or plates, substantially as and for the purpose described.

6. The combination, with the shaft, fly-wheel, band-pulley, and clutch, of the sliding collar provided with wearing-blocks and a stationary friction-surface, constituting a friction-brake for the shaft, substantially as and for the purpose set forth.

298,060. CLUTCH. THOMAS R. MORGAN, Sr., Alliance, Ohio. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination, with two clutches, of a sliding key having conical collars secured to its opposite ends, and a shifting collar and lever for simultaneously locking one clutch and releasing the other, substantially as set forth.

2. The combination, with two clutches having bevel or gear wheels or pinions connected therewith, of a shifting collar or sleeve and a sliding key for simultaneously locking and unlocking said clutches, substantially as and for the purpose set forth.



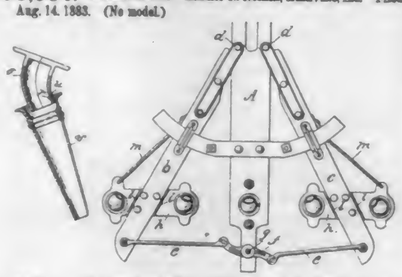
3. The combination, with a pinion, bevel, or gear wheel loosely mounted on a shaft, and a clutch-disk secured thereto, of a cross-bar keyed to the shaft, a face-plate secured in a yielding manner to said cross-bar, and a sliding collar and levers for operating said face-plate, substantially as and for the purpose set forth.

4. The combination, with a bevel-wheel, gear-wheel, or pinion loosely mounted on a shaft and having a clutch-disk secured thereto, the latter being provided with an annular groove, of a cross-bar keyed to said shaft, a face-plate secured to the cross-bar in a yielding manner, and bolts extending through the face-plate and cross-bar, and provided with friction-blocks that engage in the annular groove in the clutch-disk, substantially as and for the purpose set forth.

5. The combination, with the bevel-wheel F, clutch-disk G, provided with the annular groove H, of the cross-bar C, face-plate D, bolts L, levers E, conical blocks B, and the friction-surfaces K N, substantially as and for the purpose set forth.

6. The combination, with the bevel-wheel F, and the clutch-disk secured to the rear side of said wheel, of the clutch mechanism constructed and arranged to be engaged with and disengaged from said disk, and a sliding key passing through the sleeve of the bevel-wheel for operating the clutch, substantially as set forth.

298,061. PAPER BOX. HARVEY S. MUNSON, New Haven, Conn. Filed Oct. 29, 1883. (No model.)

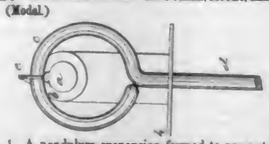


Claim.—1. A blank consisting of the general rectangular form shown, having folding lines 5 6 7 8 9 10 11 12 13 14 15 16 and incisions 21 22 17 18 19 20, whereby the folding parts necessary to constitute a box and cover are provided, and having the incisions forming the tongues 1 2 and pockets 3 4, whereby said parts are locked into hollow or box form, substantially as described.

2. A box formed of a single piece of material cut, scored, and incised to form the bottom A, bottom flaps, B C, front D, back E, sides F G H I, locking-tongues 1 2, and locking-pockets 3 4, said parts being folded, so that the bottom flaps are confined between the bottom A and the lower edges of the sides F H, substantially as described.

3. A box and cover formed of a single piece of material cut, scored, and incised to form the bottom A, bottom flaps, B C, front D, back E, sides F G H I, top J, top closing-flaps, K L, tucking-flap M, locking-tongues 1 2, and locking-pockets 3 4, said parts being folded so that the bottom flaps are confined between the bottom A and lower edges of the sides F H, and the locking tongues and pockets are arranged to confine the free edges of the sides G I, substantially as described.

4. A locking-pocket for the parts of boxes made from paper or similar material, the same being formed by a right-angular incision, whereby the locking-tongue is free to enter, and is nipped securely at one edge, substantially as described.



293,062. GRAIN-DRILL. ALBERT N. NORRIS, Rushville, Ind. Filed Aug. 14, 1883. (No model.)

Claim.—1. In a grain-drill, the combination, substantially as shown and described, of plate *h*, having receiving-cups V V, and secured diagonally across radial wing *b*, and a pair of drill-hoes secured to the under side of said plate.

2. In a grain-drill, the combination of a grain-feed box having a hole in one side and a swinging spout having a flaring mouth provided on one side only with a short inwardly-projecting pin engaging said hole in said feed-box, all substantially as shown and described.

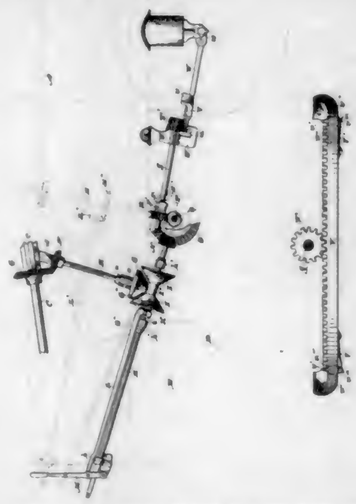
293,063. CLOCK-PENDULUM. LEVI ORSER, Mobile, Ala. Filed Aug. 1, 1883. (Model.)

Claim.—1. A pendulum suspension formed to present two curved lines or surfaces of support or bearing parallel to each other and to the plane in which the pendulum swings, substantially as described.

2. The combination, with the ring or loop *c*, of the pendulum-rod and the supporting-stud *a* and curved bearing *b*, substantially as described, whereby the contact between the loop *c* and the bearing is taken upon two points or surfaces parallel to each other and to the plane of vibration.

3. The combination of the guard *a* with the pendulum-suspension loop *c* and stud *a*, having bearing *b*, substantially as described.

4. In a pendulum-suspension device, the combination of the guard A with the pendulum-rod having a ring mounted between curved supports or bearings, substantially as and for the purpose set forth.



293,064. SHOE. FREDERICK PACKARD Brockton, Mass. Filed Aug. 24, 1883. (No model.)

Claim.—1. A shoe having its leg portion provided on both sides with an elastic gore extending around the rear of such leg portion and projecting above the inelastic heel portion thereof, substantially as and for the purpose set forth.

2. In a shoe, the combination, with the leg portion, of the two elastic side gores, B B, united by an elastic portion, *c*, extending around the rear of such leg portion and projecting above the inelastic heel portion thereof, all constructed and arranged to operate substantially in the manner and for the purpose described.

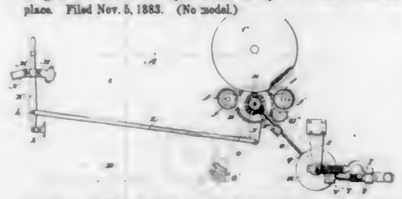
293,065. TRACTION-ENGINE. J. FORMAN PALMER, Auburn, N. Y., assignor to himself, John Seymour, and Sidney W. Palmer, all of same place. Filed Nov. 5, 1883. (No model.)

Claim.—1. In a steering apparatus for traction-engines, the friction-wheel driven by means of suitable connections from the driving mechanism of the engine, and the steering mechanism for turning the front axle to guide the machine, the two friction-wheels connected with the steering mechanism by suitable gearing, and adapted to be brought into frictional contact with opposite sides of the power-driven friction-wheel at will, so that the steering mechanism can be driven in either direction, and means for so bringing either one of the wheels into contact with the power-wheel, as desired, substantially as shown and described.

2. In a steering apparatus for traction-engines, the combination of the friction-wheel driven by suitable connecting-gearing from the driving mechanism of the engine, with the friction-wheels adapted to be brought into contact with either side of said friction-wheel, the shaft upon which they slide, but which turns with them, means for shifting them on the shaft, and mechanism connected with the shaft and actuated by its revolution in one direction or the other, whereby the front axle of the machine is turned to guide the engine, substantially as shown and described.

3. In combination with the friction-wheel driven by suitable gearing from the driving-shaft of the engine, the double friction wheel or spool feathered on a shaft and adapted to be slid thereon, so that it can be brought into contact with one side or the other of the single friction-wheel, and be turned thereby in either direction, and suitable connecting gearing or mechanism between this shaft and the front axle, all so arranged and constructed that by the rotating of the shaft the axle will be caused to swing on its pivot to guide the engine, substantially as shown and described.

4. In combination with the friction-cone driven from the driving-shaft of the engine, the double cone sliding on a shaft and adapted to be brought into contact with either side of the single cone, means for so shifting the double cone within reach of the driver, the bevel-wheel on said shaft meshing with the bevel-gear on a shaft carrying a worm, and the worm-wheel meshing with this worm and fixed on a shaft which bears at its front end a bevel-wheel, which meshes with and actuates a segmental rack attached to the front axle by means of suitable arms, substantially as and for the purpose set forth.



5. The segmental steering-rack connected by suitable arms with the front axle and provided with upturned portions at each end, to act as stops to limit the movement of the rack, and with yielding teeth at each end of the series of rack-teeth, in combination with a pinion for actuating such rack, so as to turn the front axle, substantially as shown and described.

6. In the steering apparatus for a traction-engine, the shaft which carries the rack-actuating pinion, in combination with the worm-wheel loosely mounted on the shaft and driven by suitable mechanism, and a clutch for connecting and disconnecting the worm-wheel and shaft, substantially as shown.

7. In a steering apparatus for traction-engines, the friction-cone driven by gearing connecting it with the driving-shaft of the engine, the shaft at right angles to the shaft of the friction-cone, a double friction cone or spool sliding on this shaft, with one of the cones composing it on each side of the power-driven cone, and means for shifting such double cone back and forth on its shaft, to throw it into contact with either side of the single cone or out of contact with the latter, and suitable connecting mechanism between this shaft and the segmental steering-rack attached to the front axle, all in combination, substantially as and for the purpose set forth.

8. The shaft carrying the sliding double friction cone or spool, which is adapted to be thrown into or out of contact with the power-driven cone, connected by suitable gearing with the pinion meshing with and actuating the segmental steering-rack, and adapted at its rear end to receive a crank, whereby said shaft can be turned by hand to cramp the front axle when the machine is at rest or when it is in motion, but the double friction-cone is shifted out of contact with the power-driven cone, substantially as and for the purpose set forth.

293,066. TRACTION-ENGINE. J. FORMAN PALMER, Auburn, N. Y., assignor to himself, John Seymour, and Sidney W. Palmer, all of same place. Filed Nov. 5, 1883. (No model.)

Claim.—1. In a traction-engine, in combination with the crank-wheel thereof, a rocking yoke carrying friction-wheels adapted to be alternately brought into contact with the crank-wheel and to be rotated thereby, gearing connecting one of these wheels with a shaft, so as to rotate it in one direction, and gearing connecting the other with the shaft, so as to rotate it in the opposite direction, and suitable connecting-gearing between this shaft and the steering mechanism, which swings the front axle on its pivot to guide the machine, substantially as shown and described.

2. In a power steering apparatus for traction-engines, the gear-wheel journaled on a stud near the crank-wheel, the yoke pivoted on the stud and rocking thereon, the friction-wheels carried on the arms of the yoke and adapted to be brought alternately into contact with the edge of the crank-wheel as the yoke is rocked on its pivot, the toothed wheel attached to and revolving with one of the friction-wheels, meshing directly with the gear-wheel on the yoke-stud, the toothed wheel attached to and revolving with the other friction-wheel, and also connected with the large gear-wheel on the yoke-stud by an intermediate pinion, and suitable actuating-gearing connecting this wheel with the front axle-shifting device, all substantially as and for the purpose set forth.

3. In combination with the crank-wheel, the friction-wheels mounted on arms of a rocking yoke, and adapted to be alternately brought into contact with the crank-wheel by movement of the yoke, the pinions attached to and revolving with the friction-wheels, the large gear-wheel meshing directly with one of these pinions, and connected with the other by an intermediate pinion, the bevel-gear wheel revolving with the large gear-wheel and meshing with the bevel-pinion on a shaft which, on the other end, carries a second bevel-pinion meshing with the bevel-wheel on the screw-shaft for shifting the segmental rack for swinging the front axle on its pivot, substantially as and for the purpose described.

4. The combination of the pivoted rocking yoke carrying the friction-wheels, and means within the reach of the driver or engineer for rocking said yoke on its pivot to bring the one or the other of the friction-wheels into contact with the crank-wheel, substantially as and for the purpose set forth.

5. In combination with the rocking yoke carrying the friction-wheels, and provided with a downwardly-extending arm, the link pivotally connected to said arm and to a lever in reach of the engineer or driver, and springs for normally holding the lever in such position that the yoke will be so held on its pivot that the friction-wheels will be at rest and out of contact with the crank-wheel, substantially as shown and described.

6. In a steering apparatus for traction-engines, the rack-actuating worm-sleeve turning with but capable of longitudinal movement on its shaft, the collars on said shaft, and the rubber buffers between these collars and the ends of the worm-sleeve, to act as yielding stops to limit its movement, substantially as shown and described.

7. The guiding segmental rack sliding and supported in a suitable box attached to supports from the boiler or engine frame, in combination with the rigid sleeves attached underneath the front and rear ends of the rack-web, and the axle-guiding fork hinged at its front end to the axle, and at its rear end provided with arms projecting to the front and rear and playing longitudinally in the sleeves on the rack-web, substantially as and for the purpose set forth.

293,067. TRACTION-ENGINE. J. FORMAN PALMER, Auburn, N. Y., assignor to himself, John Seymour, and Sidney W. Palmer, all of same place. Filed Nov. 5, 1883. (No model.)

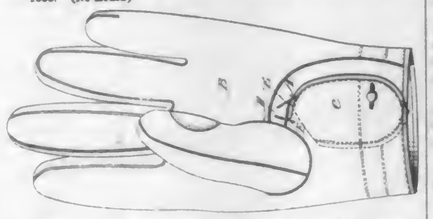
Claim.—1. In combination with the double coned pulley driven by power from the engine, gearing for shifting the front axle to guide the machine, and connecting mechanism between the pulley and such gearing, whereby the speed at which and the direction in which the axle-shifting gearing will be driven from the pulley can be changed at will, substantially as shown and described.

2. In combination with the shaft L, journaled in fixed bearings, and adapted through suitable gearing to cause the front axle of the machine to be shifted as the shaft is revolved, the connecting-gearing between such shaft and the main driving-shaft of the engine, whereby the shaft L can be caused to revolve by power from the engine, and means for throwing such connecting-gearing out of action, for reversing its action upon the shaft, and for changing the speed of such action, substantially as shown and described.

3. In combination with the shaft L, adapted through connecting-gearing to cause by its revolution the front axle of the machine to swing on its pivot to guide the machine, the double friction cone or pulley D, driven by power from the engine, the journal-box M, pivoted and rocking on the shaft, the gear-wheel fast on the shaft, the short shaft journaled in the box parallel to shaft L, the pinion on the short shaft gearing with the wheel on the other shaft, the friction-cone on the end of the short shaft and situated between the two cones of the double friction-cone, and means for rocking the double journal-box on the long shaft to carry the cone on the short shaft into contact with the face of one or the other of said cones, substantially as and for the purpose set forth.

4. In combination with the shaft L, for shifting the front axle on its pivot through suitable connecting mechanism, the box M, pivoted and rocking on the shaft, the long-toothed pinion fast on said shaft and gearing with the short-toothed wheel on the shaft N', journaled and capable of sliding motion in the box parallel to shaft L, the friction-cone on the end of shaft N', situated between the friction-cones of the double friction pulley or spool D, driven by power from the driving mechanism of the engine, and means for sliding the shaft N' in the bearings and rocking the journal-box on shaft L, substantially as and for the purpose set forth.

5. In combination with the sprocket-pulley on the end of the crank-shaft of the engine, the sprocket-chain, the sprocket-wheel fixed to the double friction cone or spool, the shaft for operating the axle-shifting mechanism, the long pinion on such shaft, the journal-box pivoted on the shaft, the short shaft journaled and sliding in the box, the toothed wheel fixed on this shaft and gearing with the long pinion, the friction-cone on the end of the shaft and situated between the faces of the double cone, and a lever adapted to slide the short shaft in its bearings and to rock the journal-box upon the shaft on which it is pivoted, substantially as and for the purpose described.



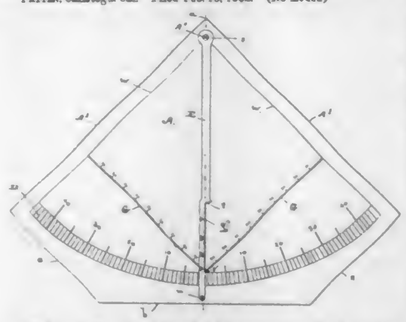
6. In combination with the shaft L, the box M, pivoted and rocking upon it, the shaft N', journaled and sliding in said box, and provided with a fixed gear-wheel in mesh with a long-toothed pinion on shaft L, and the lever S, fulcrumed on a sleeve on shaft L, and pivotally connected with and embracing a sleeve on shaft N', which is prevented from longitudinal motion on said shaft, all substantially as shown and described, so that by the same lever the box can be rocked on shaft L and the shaft N' can be reciprocated in its bearings in the box.

7. In combination with the fork Z, hinged to the front axle, the

transverse screw-shaft V, journaled in supports from the boiler or engine-frame, and adapted to be revolved in either direction by suitable actuating means, the screw sleeve or nut X, traveling on shaft V, and the ring Y, embracing the sleeve and pivoted thereto above and below, as shown, and provided with a fixed sleeve, y', in which is inserted so as to be capable of longitudinal play therein the reduced end of the axle-shifting fork Z, substantially as and for the purpose set forth.

8. In combination with the axle-shifting fork Z, the perforated lugs attached to the bottom of the boiler, and so situated that when the fork is detached from the front axle and swung upward its front ends will come close beside the lugs, and the pivot-bolt x' can be slid through the latter and the ends of the fork, substantially as and for the purpose set forth.

293,068. GLOVE. S. OSCAR PARKER, Littleton, N. H. Filed Jan. 31, 1883. (No model.)



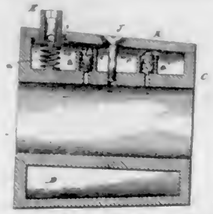
Claim.—1. The combination, with a glove having flap C integral with its body, of a button-piece, A, attached to one edge of the slit and projecting under the flap, substantially as herein shown and described.

2. The combination, with a glove having a flap integral with its body, of the button-piece A, secured to one edge of the slit, and provided with the tongue D, substantially as herein shown and described.

3. A glove having its thumb-piece H made separate and extending to the lower part of the glove, and covered by the wristband G, substantially as herein shown and described, whereby the glove is strengthened and risk of tearing off the thumb avoided in pulling on the glove, as set forth.

4. The combination, with a glove having the button-piece A, provided with the tongues D, of the staples E, substantially as herein shown and described.

293,069. HYPOTENUSE CALCULATOR AND INDICATOR. DANIEL PATTEN, Calistoga, Cal. Filed Feb. 18, 1882. (No model.)



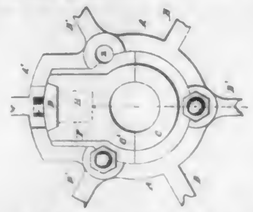
Claim.—1. The herein-described instrument, consisting of the plate A, with the edges b c c, and scales D and G G, and swinging pendulum E, substantially as set forth.

2. In an instrument of the kind described, the combination, with the swinging pendulum E, having the scale, of the graduated lines or scales G G upon a plate or surface over which the pendulum is adapted to swing, said lines forming the adjacent sides of a square having the pivot of the pendulum situated at the opposite angle, substantially as described, to operate as set forth.

3. The hypotenuse-indicator consisting of the plate or surface A, with its scales D, and having the angular sides or faces c c b, the swinging pendulum E, having the scale d, and the scales or graduated lines G G, substantially as described, to operate as set forth.

293,070. LUBRICATING DEVICE FOR WHEELS. GEO. PEACOCK, Selma, Ala. Filed Dec. 14, 1883. (No model.)

Claim.—1. The box C of a hub, cast with an annular oil-reservoir within it, the said reservoir being provided with cups having ducts at

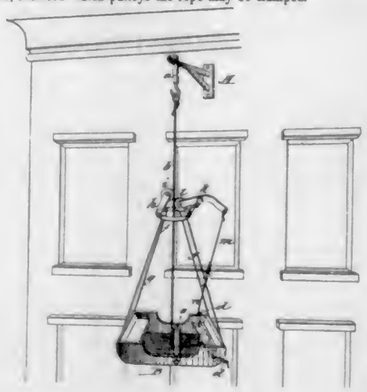


their bottoms, through which the oil is conveyed to the axle, in combination with the removable top, the whole arranged substantially as and for the purposes specified.

2. The combination, with the hub having an annular reservoir, D, of the hollow barrel E, provided with a flange, F, a spline, H, and an orifice, L, above the flange, and at its bottom with a stem, G, setting in the upper end of a spiral spring, a, substantially as and for the purposes specified.

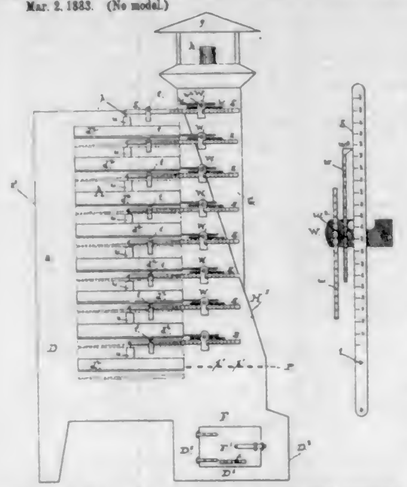
3. In combination with the oil-reservoir in the box, a hollow barrel, E, having a spline, H, a feeding-orifice, L, and a packed valve, F, the barrel being actuated longitudinally and outward by means of a suitable spring, substantially as described.

293,071. HUB FOR CAR-WHEELS. GEO. PEACOCK, Selma, Ala. Filed Dec. 14, 1883. (No model.)



Claim.—1. A skeleton hub cast with tapering external surface and of uniform thickness, and with an enlargement and bolt-openings, in combination with a box constructed in two parts, one having an enlargement adapted to fit in the enlargement in the hub and containing an oil-reservoir communicating with the interior by means of suitable ducts, the parts being provided with bolt-openings corresponding to those of the hub, the whole being secured together by means of bolts, substantially as specified.

2. The combination, with the skeleton hub, of the box constructed in two parts and provided with interlocking lugs and recesses, the hub and box being provided with bolt-holes for the reception of bolts for securing the parts together, substantially as specified.



293,072. FIRE-ESCAPE. THOMAS BROWER PEACOCK, Topeka, Kans. Filed Apr. 7, 1883. (No model.)

Brief.—Upon the ring from which the cage is suspended is arranged a brake consisting of a fixed pulley and a pulley on the end of a pivoted lever, between which pulleys the rope may be clamped.

Claim.—In fire-escapes, the combination of ring f, pulley i, lever k, and pulley l, combined with the car and suspension-rope, substantially as shown and described.

293,073. FRUIT-DRIER. TRUMAN J. PEARCE, Oakland, Cal. Filed Mar. 2, 1883. (No model.)

Claim.—1. In a drying apparatus of the character described, a closed compartment having communication through valve-controlled apertures with flues, passages, or other conductors that supply air to and carry it off from said compartments, and a suspended scale or weighing platform within the compartment, to support the matter to be treated, and which is provided with a device to indicate the weight of the supported matter, and a connection with or to the valves of the air-aperture by means of mechanism that causes the said valves to be operated by the movement of the platform.

2. The combination, with a drying-compartment through which air from the heater or hot-air generator is caused to circulate, of a supporting-platform suspended or balanced from a scale-beam, to hold the matter to be dried, a set of valves to control air inlets and outlets to and from the compartment, and mechanism connecting said valves and suspended platform, whereby the reduction of the matter by the drying process to a certain standard or degree of dryness will cause the platform to rise and close the valves.

3. The combination, with a drying-compartment, B, &c., inlet and exhaust flues, passages, or conductors E D, &c., of valves governing the apertures leading into said flues, a suspended scale-platform placed in said compartment, to receive and support the matter to be dried, but having its weighing-beam and balance located outside of the compartment, and mechanism connecting the said valves and platform to cause the upward movement of the platform to operate the valves.

4. The combination, with a drying-compartment having inlet and outlet apertures communicating with air flues, passages, or conductors through apertures controlled by valves m n, of the tray receiving and supporting platform T, suspended and balanced from a scale-beam, S, by a system of levers, as described, and the pivoted valve-actuating levers Z' Z^2 Z^3, and posts or rods Z Z on the platform.

5. The combination of a closed compartment, B, supply and exhaust flues, passages, or conductors, inlets and outlets controlled by valves m n, and situated one above and the other beneath the supporting-platform, and a balanced tray-supporting platform, T, connected with a weighing-beam, by which the weight of the contents of the tray can be determined, and mechanism connected with and operated by the upward movement of the platform, to act upon and close the valves.

6. The combination, with a case or chamber having separate drying-compartments, of the air flues, passages, or conductors D D' D^2, leading from near the top on one side down the side and under the drying-compartments and the fire, the furnace or heater-chamber K, and the hot-air-distributing chamber H, having independent flues or conductors—one for each compartment—said flues leading from above the furnace and entering the drying-compartments on the side opposite to the air-passage, substantially as described.

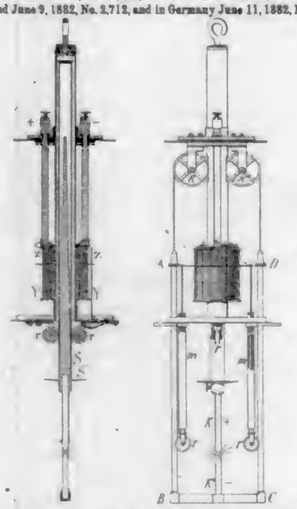
7. The heater having a closed fuel-supporting plate and an air-flue delivering over it, the corrugated top formed into deep pockets j, and the top plate or roof, P, lying just above the corrugated plate, and provided with openings registering with the flues in the chamber H, as set forth.

293,074. REFRIGERATING DISH-COVER. ALFRED C. PRIOR, Baltimore, Md. Filed Nov. 15, 1883. (No model.)

Claim.—1. In combination with the cover of a dish, an ice-receptacle provided with a suitable cover, and connected to the dish-cover within the same and above the contents of the dish, substantially as described.

2. The combination, with the butter-dish and its cover, of an ice-receptacle within the cover, and an air-space between the ice-receptacle and cover.

3. The combination, with a butter-dish, of the flanged intermediate cover, C, having the ice-chamber E connected therewith, and the whole connected to the butter-dish cover, substantially as described.

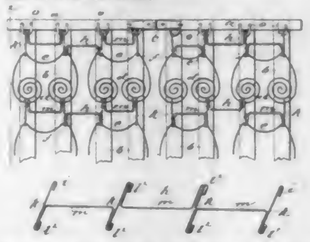


4. The combination, with the intermediate cover, C, having the ice-receptacle and the catches, of the main cover B, substantially as described.

293,075. COTTON-MARKING BRUSH. GUS. PFEIFER, Galveston, Tex. Filed July 11, 1883. (No model.)

Claim.—As a new article of manufacture, the cotton-marking brush embodying the combination of the handle A, formed with the single slot, diagonally-trimmed bristles, with clamping-ferrule, and the wrapping in the exterior formed grooves, substantially as described.

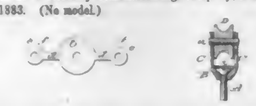
293,076. ELECTRIC LAMP. LUDWIG PIETTE and FRANZ KRIZIK, Pilsen, Austria-Hungary. Filed July 1, 1882. (No model.) Patented in Belgium June 6, 1882, No. 58,118; in France June 7, 1882, No. 149,436; in England June 9, 1882, No. 2,712, and in Germany June 11, 1882, No. 21,372.



Claim.—1. In an electric-arc lamp, the combination, with the sliding solenoid-core S, of the solenoid-coils Y Z, wound one around the other,

the convolutions in each coil gradually increasing toward one end, substantially as described.

2. In an electric-arc lamp, the combination, with the solenoid-core S, of the coils Y and Z, wound one around the other, and tapered or graduated in opposite directions, as shown and described.

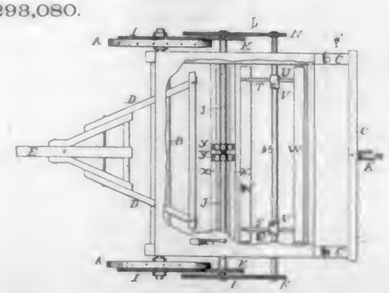


293,077. SPRING BED-BOTTOM. BUTLER R. PLATT, Plainwell, Mich. Filed June 16, 1883. (No model.)

Claim.—1. As a new article of manufacture, the wire coupling for coiled springs of bed-bottoms, the same consisting of a series of cross-heads, *k*, each having a hook at both ends, and the straight stems *m*, which are arranged at right angles to said cross-heads and connect them, as and shown described.

2. The combination of the coupling, consisting of cross-heads *k*, having terminal hooks *i i²*, &c., and connecting stems *m*, with the pairs of springs having connecting cross-bar *s* and notches or outward bends *f*, all as shown and described, for the purpose specified.

293,078. SCREW PULLEY. CHARLES F. POPE, Waterbury, Conn., assignor to the Waterbury Manufacturing Company, same place. Filed Nov. 26, 1883. (No model.)

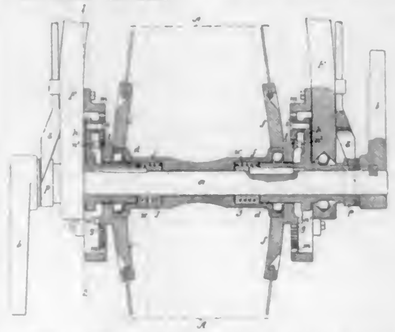


Claim.—The herein-described screw-pulley, consisting of the base B and arms C C, struck from sheet metal, the headed screw-shank A introduced through the base between the arms and secured therein, with the pulley arranged upon a pivot between the arms, substantially as described.

293,079. SCREW HOOK OR RING. CHARLES F. POPE, Waterbury, Conn., assignor to the Waterbury Manufacturing Company, same place. Filed Nov. 26, 1883. (No model.)

Claim.—As an article of manufacture, the herein-described screw hook or ring, consisting of the headed screw-shank A, having the collar B secured to its body below the head, the cap-shaped base D, struck from sheet metal, with a central opening, *d*, therein, the ring or hook struck from sheet metal, and constructed with a radially-projecting shank, *a*, having a tenon, *b*, upon its end corresponding to the central opening in the base, the hook and base secured together by said tenon, the screw and collar introduced into the open end of the base to bring the screw-head to a bearing against the said tenon, and the flange or edge of the base closed down upon the collar on the screw, substantially as described.

293,080.

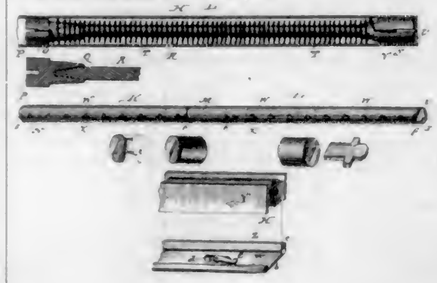


293,080. SOIL-PULVERIZER. JOHN DAXY RANKIN and WILLIAM CURTIS KNOX, Groesbeck, Tex. Filed July 30, 1883. (No model.)

Claim.—1. In soil-pulverizers, the combination of rotating blades on a shaft adjustable forward and backward, the driving-wheel shaft B, the intermediate operating mechanism, and the two transverse shafts J J, substantially as described.

2. The combination of the driving-wheels, the multiplying gear-wheels, the two shafts J J, blades W, shaft M, adjustable forward and backward by means of a lever, S, frame C, having recesses for journal-boxes P, the lugs Q on the latter, and the connecting-rod R, all constructed and adapted to operate substantially as described.

293,081. BICYCLE. WILLIAM RENNYSON, Norristown, Pa. Filed Nov. 12, 1883. (No model.)



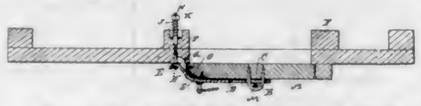
Claim.—1. The combination of the driving-shaft *a* of a bicycle or tricycle, the driving-wheel A, free to turn thereon, and having a spur-wheel, *g*, the fixed annular rack *m*, and an arm, *h*, turning with the shaft *a* and carrying a pinion, *i*, which gears into said spur-wheel and rack, as set forth.

2. The combination of the rear wheel, B, frame D, and steering-yoke F of a bicycle with the crank-shaft *a*, the driving-wheel A, free to turn thereon, and having a spur-wheel, *g*, the annular rack *m*, secured to the yoke F, and an arm, *h*, turning with the shaft *a* and carrying a pinion, *i*, gearing into said spur-wheel and rack, as set forth.

3. The combination of the driving-shaft *a* of a bicycle or tricycle, the wheel A, free to turn thereon, and having a spur-wheel, *g*, the fixed annular rack *m*, a sleeve, *d*, adjustable laterally on the shaft *a*, and having an arm, *h*, with pinion *i*, which, as the sleeve is moved laterally, engages with or is disengaged from the spur-wheel and rack, and means, substantially as described, whereby the wheel is locked to the sleeve as the pinion is thrown out of gear, as set forth.

293,082. WINDOW-SCREEN. GEO. L. REYNOLDS, Orange Valley, N.J. Filed Nov. 12, 1883. (No model.)

Brief.—A screen or curtain roller consisting of two sleeves of sheet metal united by a round stick inserted into their ends and having a series of perforations, having tongues projecting from one edge of said perforations to hold the screen ends. A short spindle, having a socket in one end to receive the reduced end of a longer spindle and a transverse slot in its other end, is secured in the tubular roller. The long spindle has a cap having a transverse slot fitted over its end and two inwardly-projecting lugs projecting into the transverse slot of the spindle. A flat lug secured to the frame projects into the slot in the cap. The screen-bar consists of two strips of metal united at their inner edges by being doubled back together, their outer edges bent upward, and the outer edge of the lower strip doubled downward again.

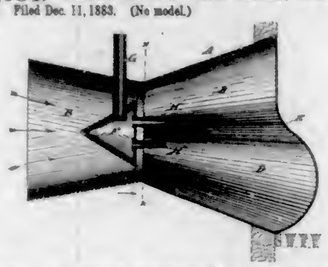


Claim.—1. A roller for screens or curtains, consisting of one or more sheet-metal sleeves having a series of slots or perforations having tongues projecting from one edge of the said slots or perforations and pointing in one direction across the roller, as and for the purpose shown and set forth.

2. The combination of a tubular roller, a short spindle secured inside the tubular roller and forming a socket at one end and having a transverse slot in the other end, a long spindle turning with its reduced end in the socket of the short spindle, and having a transverse slot in its other end, a spiral spring wound around the spindles and having its ends inserted into the transverse slots, a cap or socket having a transverse slot in its head fitting over the end of the long spindle, and having two inwardly-projecting lugs projecting into the transverse slot of the spindle, and a flat lug secured to the window-frame and projecting into the slot in the cap, as and for the purpose shown and set forth.

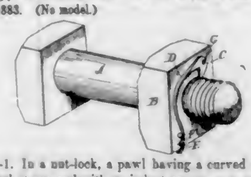
3. The bar at the lower edge of a screen, consisting of two flat strips of metal united at their inner edges by being doubled back together, having their outer edges bent upward, and having the outer edge of the lower strip doubled downward again, in combination with the lower edge of a screen or curtain inserted between the outer edges of the strips and doubled under the outer doubled edge of the lower strip, as and for the purpose shown and set forth.

293,083. CAR-DOOR FASTENING. JACOB RHULE, Pittsburg, Pa., assignor to himself and Onslow K. Gardner, same place. Filed Oct. 12, 1883. (Model.)



Claim.—1. In a car-door lock, the combination, with the hasp D, having a hook end, of the staple B on the door A, and the adjustable eyebolt H, held in the door-frame, substantially as herein shown and described.

2. In a car-door lock, the combination, with the hasp D, having a hook end, of the staple B on the car-door, and of the eyebolt H, provided with a spring, J, for drawing the eyebolt inward, substantially as herein shown and described.

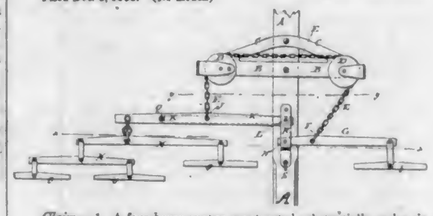


3. In a lock for sliding car-doors, the hasp D, having a hook end, in combination with the spring-eyebolt H on the car-door frame, provided with the collar and nut whereby the tension of spring J may be regulated, and the staple B, substantially as set forth.

293,084. FURNACE-BLOWER. PHILIP RICHARDS, Wilkes-Barré, Pa. Filed Dec. 11, 1883. (No model.)

Claim.—The improved furnace-blower or blast apparatus herein shown and described, consisting of the cones A and B, partitions C, whereby the chambers or compartments D are formed, and conical steam-chest F, provided with the steam-pipe G and nozzles H, projecting with their upper ends into the compartments D, substantially as and for the purpose set forth.

293,085. NUT-LOCK. EDWARD H. RINGER, Bradenville, Pa. Filed July 18, 1883. (No model.)

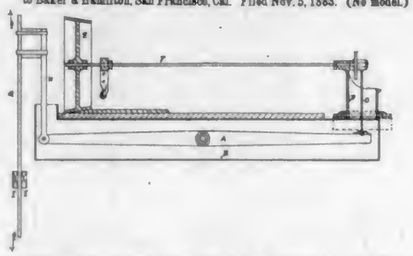


Claim.—1. In a nut-lock, a pawl having a curved flexible arm or spring provided at one end with an indent or recess, as and for the purpose herein set forth.

2. In a nut-lock, a pawl having a curved flexible arm or spring provided at one end with an indent or recess, in combination with a nut, as and for the purpose herein set forth.

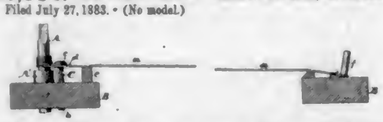
3. In a nut-lock, a nut having on the face thereof a stud, and a pawl having a curved flexible arm or spring provided at one end with an indent to engage with the stud, in combination with the bolt, as and for the purpose herein set forth.

293,086. DRAFT-EQUALIZER. DAVID PITCH ROBBINS, Berlin, Minn. Filed Dec. 5, 1883. (No model.)



Claim.—1. A four-horse evener constructed substantially as herein shown and described, and consisting of the cross-bar B, having grooved pulleys D, the chain E, passing around the said pulleys, and the levers G K, connected with the ends of the said chain, and provided the one with a whiffletree and the other with a three-horse evener, as set forth.

2. The combination, with the tongue A, the whiffletree I, and the three-horse evener M N O, of the cross-bar B, the pulleys D, the chain E, and the levers G K, substantially as herein shown and described, whereby the draft will be equally divided, as set forth.



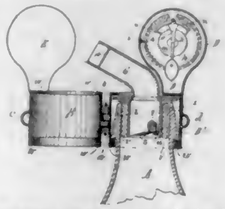
3. In a four-horse evener, the combination, with the tongue A and the lever K, of the brace P, substantially as herein shown and described, whereby the said lever is strengthened against the weight of the three-horse evener connected with its outer end, as set forth.

293,087. HORSE-POWER. ALEXANDER ROBINSON, Benicia, assignor to Baker & Hamilton, San Francisco, Cal. Filed Nov. 5, 1883. (No model.)

Claim.—A horse-power having the box B, and beam A, and pitman H, substantially as and for the purpose described.

293,088. STRINGING PIANOS. CHARLES E. ROGERS, Boston, Mass. Filed July 27, 1883. (No model.)

Claim.—1. The combination, in a piano or other musical instrument, of a tuning-pin, a friction-block arranged to bear against the periphery of said tuning-pin and be prevented from revolving therewith, and a spring attached to both tuning-pin and friction-block, substantially as and for the purposes described.



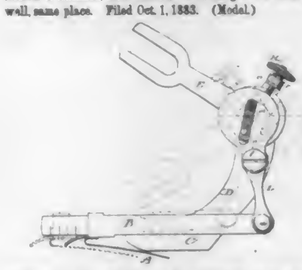
2. In a stringing device for pianos and similar instruments, the combination of the pin A, string *a*, having loop *d*, sheave *c*, block C, and means for preventing the block C from revolving with the pin A, substantially as and for the purposes described.

3. In a stringing device for pianos and similar musical instruments, the combination of a tuning-pin, A, string *a*, having loop *d*, block C, shank *b*, pulley *c*, wrest-plank B, and hitch-pin *f*, all arranged and adapted to operate substantially as and for the purposes described.

293,089. BOTTLE-REGISTER. EBENEZER H. ROGERS, Jr., New York, N.Y. Filed Dec. 27, 1883. (No model.)

Claim.—1. The combination of a bottle, a hinged frame shaped to

293,089.



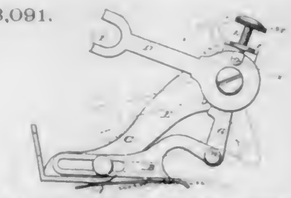
clasp the neck of the bottle, a registering and indicating device mounted upon the hinged frame, suitable mechanism for operating the same, and a device for locking the entire apparatus upon the bottle-neck, all substantially as and for the purposes as herein shown and set forth.

2. The combination, in a registering and indicating apparatus arranged for attachment to a bottle-shaped vessel, of a hinged frame shaped to be clasped and locked upon the neck and mouth of the vessel, a registering and indicating dial, with mechanism for operating the same, and a spout having an automatic valve for opening and closing the same, all arranged, applied, and operating substantially as and for the purposes as herein shown and set forth.

3. The combination of the chambered case D, the cover E, the swinging frames B and B', locking device *c d*, registering and indicating dial A, pendulum *o*, escapement-wheel *m*, and escapement *n*, all arranged, applied, and operating substantially as and for the purposes as herein shown and set forth.

4. The combination of the vessel A, the swinging clasping-frames B B', the chambered case D, provided with registering mechanism, locking device *c d*, pouring-spout G, having automatic valve *z*, and filter 10, all arranged, applied, and operating substantially as and for the purposes as herein shown and set forth.

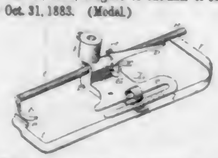
293,090. RUFFLING ATTACHMENT FOR SEWING-MACHINES. JOSEPH S. SACKETT, New Haven, Conn., assignor of one-half to Jane Halliwell, same place. Filed Oct. 1, 1883. (Model.)



Claim.—1. The combination of a crimping-blade arranged to receive reciprocating movement, a vibrating lever constructed for connection with the needle-arm, a slide, G, arranged in guides in the head of the lever at substantially right angles to the central line of the lever carrying a stud, *s*, and made adjustable with relation to the center of vibration of the lever, substantially as described, and the lever L, one arm in substantial connection with the crimping-blade, the other arm constructed with a diagonal slot, P, within which the said stud works, substantially as described.

2. The combination of the crimping-blade A, a slide carrying said blade, the lever E, constructed for engagement with the needle-bar, and with guides *n n* at right angles to the central line of the lever, the slide G, arranged between said guides, carrying the stud *s* and constructed with the screw *o*, the nut H, arranged in the head of the lever for rotation, but without longitudinal movement, and through which said screw *o* passes, and the lever L, hung upon a pivot between the pivot of said lever E and the slide, one arm connected to the slide, the other arm constructed with a diagonal slot, P, within which the stud *s* works, substantially as described.

293,091. RUFFLING ATTACHMENT FOR SEWING-MACHINES. JOSEPH S. SACKETT, New Haven, Conn., assignor of one-half to Jane Halliwell, same place. Filed Oct. 15, 1883. (Model.)

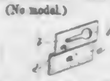


Claim.—1. The combination of a crimping-blade arranged to receive reciprocating movement, a vibrating lever, D, constructed for connection with the needle-arm, a lever, G, one end hung upon the same pivot, *m*, as the vibrating lever D, the other end substantially in connection with the crimping-blade, and a slide, H, arranged in guides in the head of the said lever D, and in a plane at right angles to the pivot on which the two levers turn, said slide made radially adjustable in the head of

the vibrating lever D, and constructed with legs *s t*, extending downward each side the pivot and so as to bear upon opposite sides of the lever G, the said lever G constructed with inclined surfaces, upon which the legs *s t* will respectively bear, and substantially as and for the purpose described.

2. The combination of the crimping-blade A, a slide carrying said blade, the lever D, hung upon a pivot, *m*, and constructed for engagement with the needle-bar, the lever G, one end hung upon said pivot *m*, the other in connection with the slide which carries the crimping-blade, the slide H, arranged in guides in the head of the lever D, and in a plane at right angles to the pivot *m*, said slide constructed with legs *s t*, extending, respectively, downward on opposite sides of the lever G, the said lever G constructed with inclined surfaces, upon which the said legs *s t* will bear, an adjusting-screw L, in connection with the head of the lever D, and the slide H, whereby said slide may be adjusted radially, substantially as described.

293,092. TUCK-MARKER FOR SEWING-MACHINES. JOSEPH S. SACKETT, New Haven, Conn., assignor of one-half to Jane Halliwell, same place. Filed Oct. 31, 1883. (Model.)

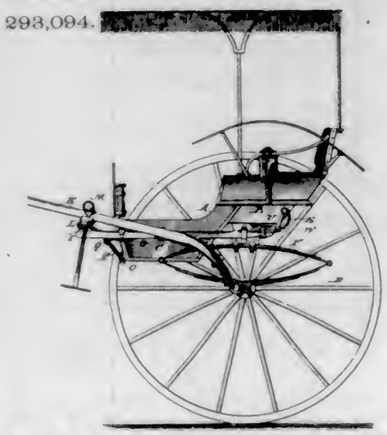


Claim.—1. The combination of the presser-foot, the bar C, arranged to slide through the body of the foot at right angles to the line of stitches to be made, the lever D in connection with said bar, and whereby the rocking or oscillatory movement is imparted to the said bar, the arm I, hung to one end of said bar, and extending across to the opposite end, and at that opposite end constructed with a rib, *a*, and the eccentric finger *b*, fixed to the bar over said rib, and whereby any oscillation of the bar to which the finger *b* is attached produces a rubbing movement of said finger upon the rib below, substantially as described.

2. The combination of the bar C, arranged to slide through the presser-foot at right angles to the line of stitches, the lever D on said bar, and arranged to impart a rocking movement thereto, the arm I, hung to one end of said bar, and extending to the opposite end, that opposite end provided with a rib, *a*, the finger *b* on the end of the bar corresponding to said rib, and the presser-foot provided with an extension constructed with a slot, *e*, parallel to said bar C, and with a guide, *f*, arranged therein, substantially as and for the purpose described.

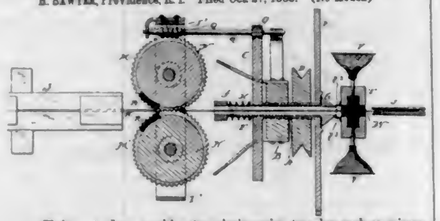
3. In a tuck-marker, the combination of the marking mechanism, a guide arranged to move in a slot at right angles to the line of stitches, and attached to or made a part of a horseshoe-shaped spring, L, its two ends extending through said slot, and the guide attached to one of said ends, whereby said guide may be adjusted and held at any point within said slot, substantially as described.

293,093. SCARF-RETAINER. JOHN SANDILANDS, San Francisco, Cal. Filed Aug. 3, 1883. (No model.)



Claim.—The herein-described fastening device for attachment to neck-wear, consisting of the plate *a*, provided with the button-hole slot *b b'*, and an offset portion, *a'*, for attachment to the scarf, as set forth.

293,094. TWO-WHEELED VEHICLE. ADELBERT FOSS SARGENT and RALPH DORAN FARRELL, Geneseo, Ill. Filed Oct. 16, 1883. (No model.)



Claim.—The combination of an axle, elliptic springs clipped to the axle, shafts clipped to the axle and having the usual cross-bar, side bars hinged at their forward ends to the cross-bars and secured near their rear ends to the springs, upwardly-curved irons secured to the rear ends of the side bars and forming transverse eyes at their ends, a body having transverse bearings at its front and rear ends, and rods rocking in said bearings and having their ends bent upward, forming cranks rock-

293,094.

ing with their ends in the eyes of the upwardly-curved irons and in bearings near the forward ends of the side bars, as and for the purpose shown and set forth.

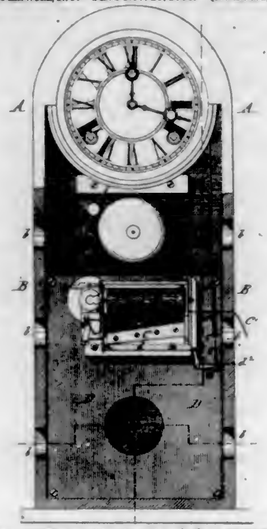
293,095. MACHINE FOR COLORING COVERED WIRE. WILLIAM H. SAWYER, Providence, R. I. Filed Oct. 27, 1883. (No model.)

Claim.—1. In a machine for coloring wire, two dye-pads or wipers arranged to clasp a wire between them, in combination with mechanism for rotating such pads or wipers about the wire, and means for separating said pads and bringing them together intermittently and feeding the wire longitudinally between the pads while they are separated, substantially as described.

2. The combination, with the rotary disk mounted on a hollow shaft and carrying the blocks provided with dye-pads, as described, of means for feeding a wire through the said hollow shaft and between the pads intermittently, and means for rotating the disk and intermittently separating and bringing together the pad-blocks and pads, so that the pads will clasp the wire, substantially as described.

3. The combination, with the disk E, open at its center and mounted upon a hollow shaft, and carrying the pad-blocks provided with dye-pads and pressed together automatically, as described, of the hollow rod arranged through said shaft and provided with a conical head between the pad-blocks and disk, suitable means for feeding a wire through said hollow rod and its head to and between the dye-pads intermittently, and means for operating said rod intermittently to cause its conical head to enter between projecting portions of the pad-blocks and separate said blocks and pads while the wire is being fed, substantially as described.

4. The combination, with the rotary disk E, open at the center and mounted on a hollow shaft, of the blocks T T, provided with pads and pivoted upon said disk, as described, of the sheaves N N', arranged to feed a wire forward intermittently, means for imparting rotary motion from the hollow shaft of the disk to said sheaves, the hollow rod F, extending through the hollow shaft of the disk and provided with a conical head having an opening at its center, the segmental plate K, projecting from said hollow rod, the pin P, projecting from one of the sheaves and arranged to strike and traverse said segmental plate, and means for pressing the rod F toward the sheaves with a yielding force, substantially as described.



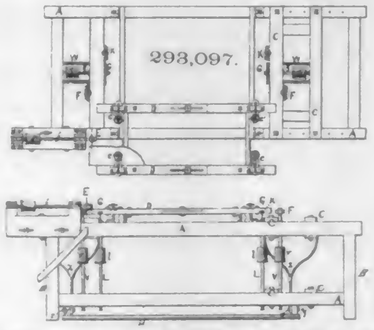
5. The combination, with the disk E, open at the center and mounted upon a hollow shaft, of the blocks T T, provided with dye-pads and connected to said disk, as described, being provided with the projecting plates t^2 t^2, of the hollow rod F, arranged through the hollow shaft of the disk and provided with a conical head in front of the disk, the sheaves N and N', provided with elastic lugs, and the pin P, projecting from one of said sheaves, the segmental plate K, projecting from the hollow rod F, the spring for forcing said rod toward the sheaves, and means for communicating motion to the hollow shaft of the disk and from said shaft to the sheaves, substantially as described.

6. The combination, with the color-applying and wire-feeding devices, as described, of the guide-wheel arranged to receive the colored wire, and constructed of absorbent material, substantially as and for the purpose set forth.

7. The combination, with the pad-blocks and dye-pads mounted thereon, of the cams connected with the blocks and arranged to supply a liquid dye or coloring-liquid to the pads, respectively, substantially as described.

8. The combination, with two absorbent pads suitably supported and facing each other, of means for feeding a wire intermittently between said pads, and for alternately pressing the pads toward each other and separating them, substantially as and for the purpose set forth.

293,096. MUSIC-BOX ATTACHMENT FOR CLOCKS. JACOB SCHMID, New Brunswick, N. J. Filed Nov. 28, 1883. (No model.)



Claim.—1. The combination of a clock-movement having a trip-arm on the pawl of the striking mechanism, a trip mechanism on the arbor of the hour-hand, a trip-hammer that is raised by the same and dropped after the full hour is struck, a music-box arranged below the clock-movement, and an intermediate mechanism that extends from a point in the path of the hammer to the locking device of the music-box, so that whenever the clock has struck the full hour the locking device is released and the music-box set in motion, substantially as set forth.

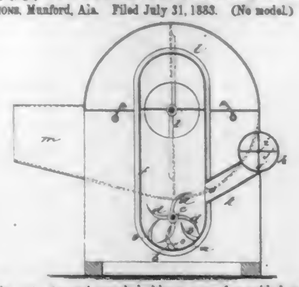
2. The combination, with a clock-case having screened side openings, of a music-box placed on a sounding-board attached to the case, means connecting the starting device of the music-box with the clock-movement, a trip-hammer pivoted to the rear frame of the movement, a trip device on the arbor of the hour-hand, and a trip-arm of the pawl of the striking mechanism, whereby the music-box is started after each full hour has struck, substantially as specified.

3. The combination of a music-box provided with a locking-pawl and a spring-actuated guard-plate sidewise of the disk of the cylinder-barrel, an intermediate mechanism connecting the pawl with the clock-movement, a trip-hammer pivoted to the frame of the clock-movement and adapted to actuate the intermediate mechanism, a trip mechanism secured to the arbor of the hour-hand and adapted to engage the hammer-rod, and the trip-arm on the pawl of the striking mechanism, that releases the trip mechanism of the arbor from the hammer-rod as soon as a full hour has struck, substantially as set forth.

4. The combination of a music-box, A, having a locking-pawl, *a*, and a spring-acted guard-plate, a^2, sidewise of the disk A' of the cylinder-barrel, a connecting-rod, *d*, bell-crank *d'*, a vertically-guided and spring-cushioned trip-rod, *e*, a trip-hammer, E, pivoted to the frame of the clock-movement and having a fork, f^3, a disk, E^2, on the arbor of the hour-hand, said disk having a spring-acted trip, *f*, and pin *f''*, and a trip-arm, *g*, on the pawl of the striking mechanism of the clock, substantially as described.

293,097. DOVETAILING-MACHINE. JOHN SCHMIDT, Burlington, Iowa. Filed Sept. 28, 1883. (No model.)

Claim.—1. In a machine for trimming and dovetailing, the combination of the horizontally-moving carriage on which the stuff is placed with the cutting devices G and G, and means for lowering and raising the same, consisting of the boxes W W, the forked arms *x x*, operated by levers *y y*, and treadle H, substantially as set forth.



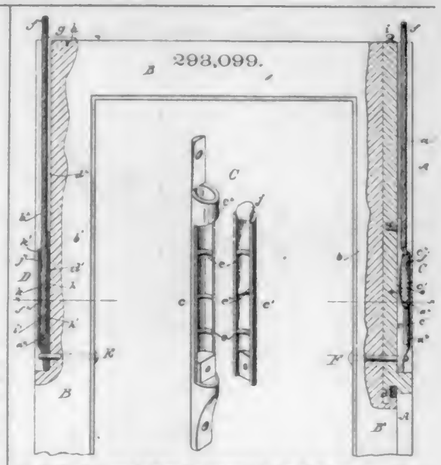
2. In combination with the horizontally-moving carriage D and the vertically-movable cutting devices G G, operated by spindles *g g*, the circular trimming-saw E, secured upon and rotated by spindle *f*, all as set forth.

3. In a machine as described, the vertically-movable cutting devices G G, operated by spindles *g g*, combined with the horizontally-moving frame D, carrying the stuff, the trimming-saw E, and the bits F F, secured to and operated by the shafts V, substantially as set forth.

4. In a machine as described, the horizontally-moving frame D, carrying the stuff to be cut and trimmed, the vertically-movable cutting devices G G, for operating on each end or side of the stuff, and moved by spindles *g g*, and the spurs K K, fastened to and revolved by the vertical spindles L L, substantially as set forth.

5. In a machine for trimming and dovetailing, the combination of the frame D, horizontally moving over frame A and carrying the stuff to be cut, with the circular trimming-saw E, the bits F F, for making one score, the vertically-movable cutters G G, and the spurs K K, for following up the work of said cutters the entire length of the cut, substantially as described.

293,098. PEA-THRASHER AND COTTON-OPENER. CALVIN HENRY SIMMONS, Mumford, Ala. Filed July 31, 1883. (No model.)

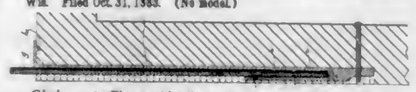


Claim.—1. An end-rounded oblong case, *f*, provided with perforations and curved teeth *b* on the bottom, and an opening, *o*, at one end, near the bottom, in combination with reversely-curved teeth *d*, arranged on a rotary shaft, to intermesh with teeth *b*, and a suction-fan communicating with said case near the top of the latter, as described.

2. The combination, with a bottom-perforated oblong case, *f*, of the connected preparatory beater *h i j*, the bottom beaters, *b d*, and a suction-fan connecting with the upper part of the case, whereby the fan will feed the material from the preparatory to the main beater, and then remove the lighter particles, as described.

293,099. WINDOW-SASH. WILLIAM A. SINSEL, Waukesha, Wis. Filed July 17, 1883. (No model.)

Brief.—Employs cord-fasteners made in two parts, one part having a penetrating-spur, a lip to fit beneath an embracing portion of the main part, and a screw to secure it thereto. The main part of one fastener is extended to the top of the sash. The other fastener is secured to a removable sash-section, such section on the one side and the cord-fastener on the other being detachably secured by pins.

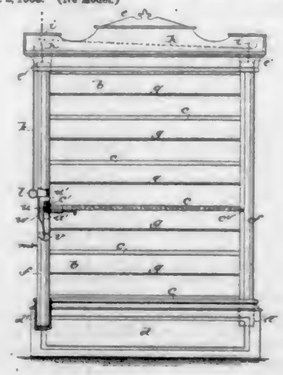


Claim.—1. The removable section A of the window-sash B, provided with the rope-fastener C, substantially as and for the purposes set forth.

2. The sash B, having removable section A, with rope-fastener C attached, in combination with the removable rope-fastener D, substantially as and for the purposes set forth.

3. The removable section A, provided with rope-fastener C, and held in place by the removable pin F, substantially as described.

293,100. SASH-CORD FASTENER. WILLIAM A. SINSEL, Waukesha, Wis. Filed Oct. 31, 1883. (No model.)



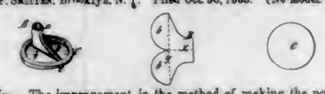
Claim.—1. The combination, with a sash-cord fastener having a hole through its lower end edgewise with the sash, and an upward-projecting shank with an angular end, provided with a fixed spur, of a pin adapted to enter the aforesaid hole from the inner edge of the sash, substantially as shown and described.

2. A trough-shaped body-piece having a bridge arching over it, forming a complete cylinder, in combination with an arched cap having a lip shaped to fit beneath said bridge, and a screw for holding said cap to said body, whereby the body and cap, joined, form a cylinder, as described.

3. A trough-shaped body-piece having a bridge arching over it near one end, and a ledge rising above the sides of said trough near the other end, in combination with a trough-shaped cap having a lip at one end to fit under said bridge, and a ledge near the other end, the sides of the trough rising above said ledge, and a screw adapted to enter holes in said body and cap at said ledges, as shown and described.

293,101. BOOK-CASE. WILLIAM A. SMITH, Wilmington, Del. Filed Aug. 2, 1883. (No model.)

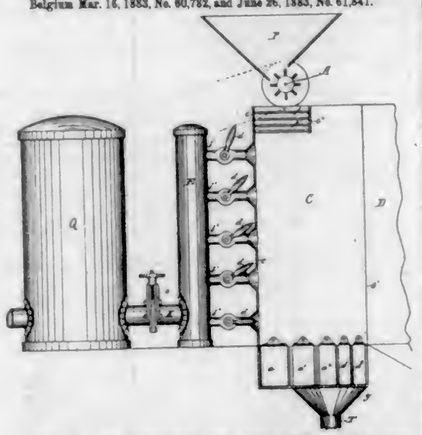
Claim.—1. The combination, with a book-case having shelves *c*, of the vertically-movable frame B, provided with horizontal cross-bars *g*, as and for the purposes specified.



2. The combination, with the book-case A and the movable frame B, formed of vertical and horizontal bars *f g*, of the adjusting cords and pulleys *h i k*, substantially as shown and described.

3. The combination, with the book-case A and the movable locking-frame B, of the slotted plates *o*, fixed to the case, and the headed pins *r*, fixed to the vertical bars *f* of the movable frame, substantially as shown and described.

4. The combination, with the book-case A and the movable locking-frame B, carrying the pins *c'*, of the spring latch-bar *u a'*, substantially as shown and described.

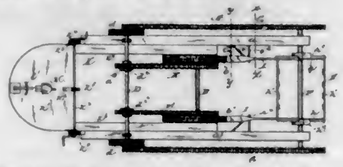


5. The combination, with the book-case A, of a movable locking-frame, B, consisting of vertical and horizontal bars *f g*, re-enforced at the back by the metal plates *n*, substantially as shown and described.

293,102. MANUFACTURE OF BUTTONS AND STUDS. THOMAS W. F. SMITTEN, Brooklyn, N. Y. Filed Oct. 30, 1883. (No model.)

Claim.—The improvement in the method of making the post of a button or stud and a shoe eccentric thereto, which consists in first producing a blank having the post portion B and the shoe portions *b b*, in then bending the shoe portions *b b* into a position at right angles to the post portion B, and in subsequently folding the post portion B lengthwise to form a post of double thickness, and to bring the portions *b b* into proximity, so that they will form, in effect, a single plate, as and for the purpose described.

293,103. PNEUMATIC COAL-CLEANER. AMOUR SOTTIAUX, Strepy-Bracquegnies, Belgium. Filed Oct. 6, 1883. (No model.) Patented in Belgium Mar. 16, 1883, No. 60,782, and June 26, 1883, No. 61,841.



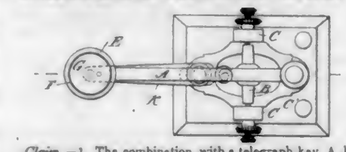
Claim.—1. The combination, with a case having a series of receptacles across its bottom, an open side, and means for introducing material at its upper part, of an air-conducting pipe and means for connecting it with the said case, substantially as described, whereby air may be admitted into the case at a varying pressure increasing from the top downward, as and for the purpose specified.

2. The combination, with a case having a series of receptacles across its bottom, an open side, and means for introducing material at its upper part, of a layere consisting of an air-distributing column provided with a series of nozzles placed one above another and connecting said column with said case, and a valve in each nozzle, substantially as described.

3. The combination of the case C, having the open side *c'*, the compartments or apertures *a a' a² a³ a⁴*, the air-distribution column E, having the nozzles *b'*, provided with graduating-cocks *d*, the bars *f*, arranged in alternating series, the distributing-cylinder A, and the hopper B, substantially as shown and described.

293,104. SPADING-MACHINE. DAVID F. SPANGLER, Santa Ana, Cal. Filed Sept. 30, 1882. (No model.)

Brief.—The power—a horse-power in this instance—is mounted upon the main frame, its front elevation being adjusted by crank and pinion. When spading, the gear-wheels, connected to the shaft of the bearing-wheels, run loosely on their shaft. Thus the power is transmitted wholly to the spading-shaft. The spader-frame twice in each revolution strikes a pallet or pawl engaging teeth upon the bearing-wheels, which drives them forward one notch, the pallet being retracted by a spring. A spring bears against an arm upon the spade-shaft to insure the right presentation to the ground of the pivoted spades.

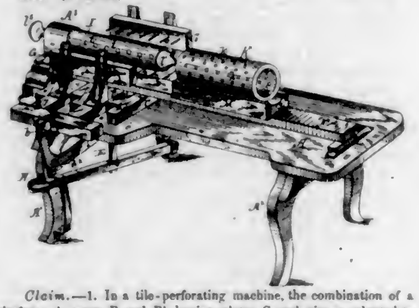


Claim.—1. The spading-frame H, composed of the shaft F, the bearing-block h^3, secured on the shaft F, the side bars, A A, the spade-carrying rods *h'*, journaled in the ends of bars A, and the arms A^2, extended at right angles from the ends of rods *h'*, and having one end arranged to bear on the block h^3, the said frame being suitably journaled and adapted to be revolved, as set forth.

2. In a spading-machine, the combination, substantially as hereinbefore set forth, of the wheels *b b'*, the pallets I I, and spading-frame H, arranged and operating substantially as described, and means for revolving the frame H, as specified.

3. In a spading-machine, the combination of the wheels *b b'*, the revolving spading-frame H, the pallets I I, pivoted on a swinging support, means for revolving frame H, and springs *c'*, connecting the pallets at a point in advance of their pivots with the framing, substantially as set forth.

4. In a spading-machine, the combination, substantially as set forth, of the frame A, having axle B and driving-wheels *b b'*, the spading-frame journaled in the rear end of the frame A, the operating mechanism mounted on said frames, suitable belts and pulleys gearing the operating mechanism with the drive-wheels and with the revolving spading-frame, and the pallets I I, all arranged and operating as and for the purposes specified.



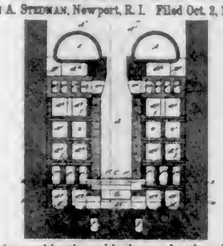
293,105. CIRCUIT-CLOSER FOR TELEGRAPH-KEYS. SAMUEL J. SPURGEON, Houstonia, Mo. Filed Oct. 31, 1883. (No model.)

Claim.—1. The combination, with a telegraph-key, A, having a recess in its button E, of the circuit-closing spring or lever K, the button G, held loosely in the recess of the button E, the stem H, having a slot, H', and the pin J', substantially as herein shown and described.

2. The combination, with a telegraph-key, of the circuit-closing spring or lever K, having a slotted end, the pin M, passing through the slotted end of the lever K, the insulating-sleeve O, the screw N, the button G, held loosely in the button E, and the stem H on the button G, substantially as herein shown and described.

293,106. DRAIN-TILE PERFORATING MACHINE AND PERFORATED DRAIN-TILE. HIRAM P. STAFFORD, Decatur, Ill. Filed July 11, 1883. (No model.)

Claim.—1. In a tile-perforating machine, the combination of a platform, A, ways B and B', having plates G and pins *g*, adapted to move toward each other, and perforated tile I between said pins, substantially as and for the purpose described.



2. The combination of platform A, ways B and B′, and plates G, provided with pins *g*, with bell-cranks D, treadle H, and connecting-rod E, substantially as and for the purpose set forth.

3. The combination of a platform, A, ways B and B′, plates G, and pins *g* with bell-cranks, a treadle, connecting-rod, and spring, substantially as and for the purpose described.

4. In a tile-perforating machine, the combination of laterally-movable plates G, carrying pins *g*, with tube I, having perforations *i* in the sides thereof, and tube-cleaner L, having a conical point, *l*′, at one end, a handle at the other, and a series of parallel wires between them, substantially as and for the purpose described.

5. As a new article of manufacture, a cylindrical tile of uniform diameter from one end to the other, and provided with fine perforations upon the whole periphery thereof, substantially as and for the purpose described.

293,107. GAS-RETORT FURNACE. IRA N. STANLEY, Brooklyn, N. Y., and WILLIAM A. STEDMAN, Newport, R. I. Filed Oct. 2, 1883. (No model.)

Claim.—1. In combination with the combustion-chamber and ash-pit, substantially as described, the series of hot-gas flues d^2 d^2, &c., leading to the chimney and embracing the cross-flue d^3, connecting the flues d^1 and d^3, as shown, the air-flues d' d', &c., alternating with the hot-gas flues and connecting with the upper part of the combustion-chamber *d* and the air-flues f' f' f', &c., alternating with the hot-gas flues and connecting with the ash-pit, as and for the purposes set forth.

2. The open or uncovered water-pan G, exposed directly to the radiant heat from the fire above, and arranged to present its contents directly to currents of previously-heated air flowing to the grate, in combination with the two flues d^3 and independent connections therefrom conducting separate streams of hot products of combustions in opposite directions under the pan, as herein specified.

3. In a gas-furnace, substantially as described, the combination of the water-pipe H and controlling means H′, and the water-pan G, with the flues d^1 d^3 and their connections d^3 with each other, as and for the purposes set forth.

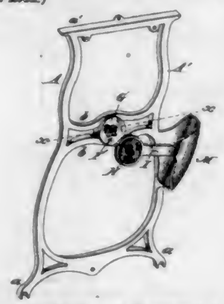
4. In combination with the furnace, the hot-air flues d^2 d^3, &c., and the series of air-flues e' e^3, &c., arranged as described, the flues d^1 and d^3, connected by the flues d^3, the air-flues f' f' f', &c., having the vertical flues f' f^3, as set forth.

5. The series of chambered tiles B′, arranged with their apertures connecting to form air-flues, in combination with the hot flues d^2 d^3, and with the flues e' e^3, bringing partially-heated air, and arranged to discharge the air intensely heated into the furnace, substantially as herein specified.

6. The metallic joint-plates I, in combination with suitable tiles, arranged to break joints with the tiles and to aid in preventing any flow of air through the joints, substantially as herein specified.

7. In a gas apparatus, the flues d^2 d^3, &c., for conducting hot gaseous products of combustion, flues e' e^3, &c., for conducting fresh air near the former, so as to be heated thereby, water-pan G, with provisions for heating it to generate steam, and a fire-grate, C, supporting the fuel for combustion, arranged substantially as shown, whereby previously-heated air from the flues e', &c., mingles with the steam and the mixture is drawn directly through the grate, all substantially as herein specified.

293,108. ATTACHMENT FOR BRIDLES. JOSEPHUS J. SUTPHEN, Washington, D. C. Filed June 21, 1883. (No model.)



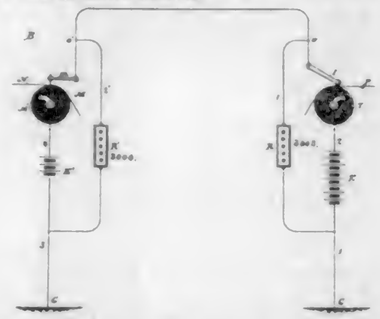
Claim.—1. In a bridle, a nose-strap having an elastic section which is connected to a bit-ring and a supplemental ring, said elastic strap adapted to be passed over the upper jaw of the animal, in combination with reins which are connected to said rings, whereby a primary pull upon the reins comes upon the nose and a secondary pull upon the bit, as and for the purposes set forth.

2. In a bridle, a nose-strap having an elastic section inclosed in a sheath, which is connected to a bit-ring and a supplemental ring, in combination with the reins, whereby a primary pull upon the reins comes upon the nose-band and a secondary pull upon the bit, as and for the purpose set forth.

3. The combination of the nose-strap inclosed in a sheath, rings B B′, straps *b* and *c*, in combination with the reins, as and for the purpose set forth.

293,109. SEWING-MACHINE FRAME. SAMUEL C. TATUM, Jr., Cincinnati, Ohio, assignor to S. C. TATUM & Co., same place. Filed Nov. 24, 1883. (No model.)

Claim.—1. In combination with the centers F H and driving-wheel B, the boss G, having the concentric opening, serrated boss E, and stop-pin *h*, substantially as herein set forth.



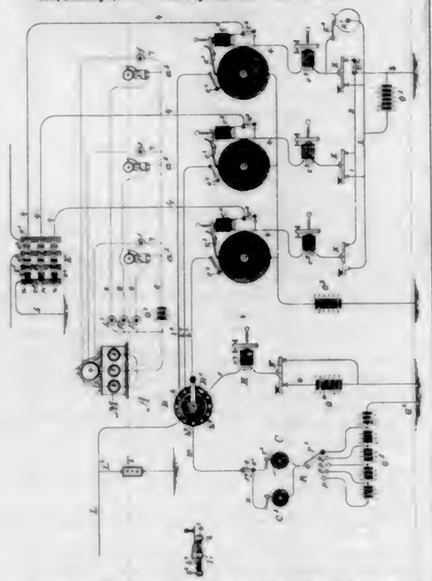
2. In combination with the frame A A′, the boss G, adjustable center F, adapted to receive the stop E, and pin *h*, substantially as herein set forth.

3. In combination with the driving-wheel B, crank K, and wrist-pin L, the serrated boss E, forming a center for a journal-support and secured to the arms of the driving-wheel, substantially as herein set forth.

4. A lock or stop motion for a sewing-machine, composed, essentially, of the serrated boss E, secured to the driving-wheel, and the hub G, secured to the frame, provided with an eccentric central opening adapted to receive the boss E, and pin *h*, substantially as herein set forth.

5. The shield M, cast integral with the post A′ of the frame, and with the arm I, which serves as a journal-support, substantially as shown and described.

293,110. AUTOMATIC TELEGRAPH. THEODORE F. TAYLOR, Chicago, Ill. Filed Apr. 14, 1883. (No model.)



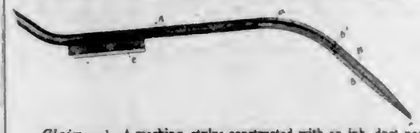
Claim.—1. The combination, substantially as hereinbefore set forth, of a telegraphic main line, a main battery, means for transmitting electric impulses from said battery upon said main line, a telegraphic receiving-instrument, an opposing battery having less electro-motive force than said main battery, through which the impulses transmitted from said main battery to the receiving-instrument are caused to pass, and two branch conductors, each containing an artificial resistance, permanently completing the circuit of the opposing battery through the line and receiving-instrument.

2. The combination, substantially as hereinbefore set forth, of a main circuit, in which is placed a main battery, a transmitting-instrument, an opposing battery of less electro-motive force than the main battery, and a receiving-instrument, two branch or shunt conductors permanently united with the main circuit, one of which spans the transmitting-instrument and main battery and the other the receiving-instrument and opposing battery.

3. The combination, substantially as hereinbefore set forth, of a main circuit, in which is placed a main battery, a transmitting-instrument, an opposing battery of less electro-motive force than the main battery, and a receiving-instrument, two branch or shunt conductors permanently united with the main circuit, one of which spans the transmitting-instrument and main battery and the other the receiving-instrument and opposing battery, and an artificial resistance placed in each of said branch or shunt circuits.

4. The combination, substantially as hereinbefore set forth, of a main line, a main battery, means for transmitting electric impulses therefrom upon said main line, a chemical receiving-instrument, an auxiliary battery of reverse polarity placed in the line adjacent to the said receiving-instrument, a branch or shunt conductor permanently completing the circuit of said opposing battery through said receiving-instrument, and an artificial resistance included in said conductor.

293,111. AUTOMATIC-TELEGRAPH SYSTEM. THEODORE F. TAYLOR, Brooklyn, N. Y. Filed Sept. 18, 1883. (No model.)



Claim.—1. The combination of a telegraphic main line, two or more independent automatic transmitting devices, means for preparing said devices with matter for automatic transmission, and means, substantially such as described, for connecting each of said devices with said main line in its proper succession.

2. The combination, with a telegraphic main line, of a terminal station provided with a central managing desk and two or more subsidiary desks, each being equipped with an automatic transmitting device, means for preparing said devices with matter for automatic transmission, electric signaling apparatus for transmitting signals to and from the central desk, and means for connecting any one of said transmitting devices with said main line.

3. The combination of a main line, two or more independent automatic transmitting-instruments, a switch for placing any one of said transmitting-instruments in connection with said main line at pleasure, a battery, and a series of two or more branch conductors leading therefrom, for preparing the messages to be transmitted from said automatic transmitting-instruments, a series of subsidiary main lines, and a switch by means of which any one of said branch conductors may be connected with any one of said subsidiary lines.

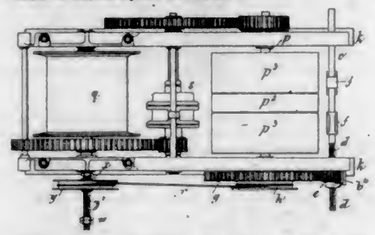
4. The combination of two or more automatic transmitting-cylinders, a transmitting-stylus applied to each of said cylinders, a main battery, a main line, means, substantially such as described, for charging each of said cylinders with matter for automatic transmission, a switch for placing any one of said stylusses in connection with said main line, an annunciator located near said switch, and means, substantially such as described, whereby the respective drops and said annunciator may be actuated from a point near said cylinders.

293,112. MARKING-STYLUS FOR AUTOMATIC TELEGRAPHS. THEODORE F. TAYLOR, Brooklyn, N. Y. Filed Sept. 18, 1883. (No model.)

Claim.—1. A marking-stylus constructed with an ink-duct narrowed or constricted near its lower extremity, and widened into a flattened opening at the nib, substantially as described.

2. A marking-stylus consisting of two sections, the main section and the nib-piece, the latter being constructed with an aperature narrower through a portion of its lenth than that formed in the main section, and widening at the nib into a flattened opening, substantially as described.

3. A stylus constructed with an ink-duct narrowed through a portion of its length, said stylus terminating in a flattened nib-piece having a slit or cut formed across its face.



4. The combination, substantially as hereinbefore set forth, of the main section A, and the nib-piece B, having the narrow aperture *b* and slit *d*.

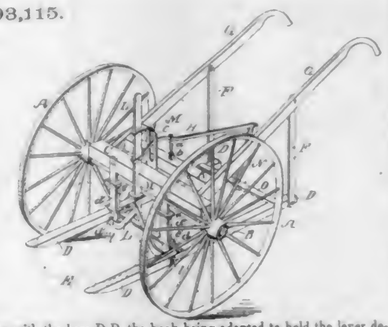
293,118. NUT-LOCK. GEORGE WILLIAM TEGG, Peoria, Ill. Filed Oct. 11, 1883. (No model.)

Claim.—The bolt B, having groove D longitudinally therein through its threads, in combination with a nut, N, thereon, and the spring-metal key C, notched to correspond with said threads, and having its outer end bent away from its containing-groove D, substantially as and for the purpose specified.

293,114. MACHINE FOR LIFTING OR HOISTING. THOS. THOMAS, Cardiff, County of Glamorgan, England. Filed Nov. 30, 1883. (No model.) Patented in England Apr. 28, 1883, No. 2,162.

Claim.—1. The combination of the pulley-shaft, the brackets adjustable in the slotted seats, the belt-shifting bar having its bearings in the said brackets, and the belt-forks connected to the shifting-bar, substantially as and for the purpose set forth.

2. The combination of the screw-threaded shifting-bar, a supporting-bracket therefor, the pinion working on the threaded portion of the shifting-bar and inclosed in the supporting-bracket, the pulley-shaft, and the loose pinion and sheave connected with the pulley-shaft, substantially as and for the purpose set forth.



3. The combination of the drum-shaft having a portion thereof screw-threaded, the sheave traveling on the threaded portion thereof, the screw-nut and collar on opposite sides of the said sheave, the pulley-shaft with the sheave and pinion thereon, means for connecting the two sheaves, the screw-threaded belt-shifting bar and the belt-forks connected thereto, and the pinion working on the threaded portion of the shifting-bar and meshing with the pinion on the pulley-shaft, substantially as and for the purpose set forth.

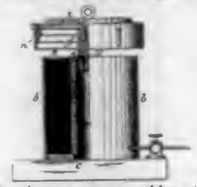
4. The combination of the drum-shaft having a portion thereof screw-threaded, the sheave traveling on the threaded portion thereof, and the screw-nut and collar on opposite sides of the said sheave, substantially as and for the purpose set forth.

293,115. HIVE-CART. CHARLES R. THOMPSON, Fort Omaha, Nebr. Filed June 25, 1883. (Model.)

Claim.—1. In a hive-cart, the lever H, having hook N, in combi-

293,115.

nation with the bars D D, the hook being adapted to hold the lever depressed and the forward ends of the bars elevated, substantially as described.



2. The hive-cart herein shown and described, consisting of the wheels A A, axle B, and handles G G, in combination with bars D D, lever H, T-iron L, and hook N, the bars D D being pivoted in hangers F F, and the hook being adapted to catch under cross-piece O, substantially as and for the purposes set forth.

3. In a hive-cart, the lever H, fulcrumed by means of the link *a* upon the cross-piece K, substantially as shown and described.

4. The combination, with lever H and T-iron L, of the guide-plate M, arranged substantially as and for the purposes set forth.

5. The T-iron L, provided with the irons *d d*, in combination with the irons *d' d'*, attached to the axle or cross-bar C and yoked together, substantially as and for the purposes set forth.

293,116. ELECTRO-MAGNET AND ARMATURE. ILLICS AUGUSTUS TIDDES and STANLEY CHARLES CUTHBERT CURRIE, London, England. Filed Dec. 7, 1883. (No model.) Patented in England Aug. 4, 1882, No. 3,712.

Claim.—1. An electro-magnet comprising a tubular core of magnetic material constituting one of the poles, a cylindrical shell of similar material constituting the other pole, a plate of magnetic material connecting the pole-pieces, and an insulating conducting-helix surrounding the central core, in combination with an armature consisting of a disk having a central projection adapted to slide within the tubular core, substantially as described.

2. The combination, with an electro-magnet having a tubular core, a surrounding helix, and an inclosing-shell of magnetic material, and a connecting-yoke, of an armature consisting of a disk provided at its center with a projection adapted to enter the tubular core, and at its edge a depending flange adapted to slip over the edge of the outer shell, substantially as described.

3. In an electro-magnet, the combination of a central core, a surrounding helix, and an inclosing-shell of magnetic material, with an armature consisting of a disk provided with a depending flange, substantially as described.

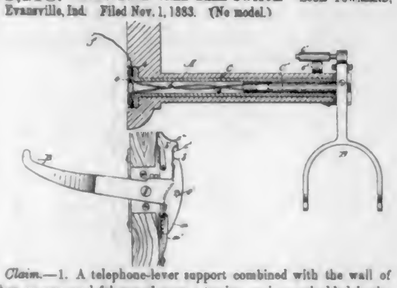
4. The combination, with an electro-magnet, of an armature having an adjustable depending flange.

293,117. MANUFACTURE AND PROPORTIONING OF WEIGHTS AND MEASURES. CHARLES A. L. TOTTEN, United States Army. Filed Apr. 30, 1883. (No specimens.)

Claim.—1. Weights, for use upon scales, balances, &c., based upon the aliquot subdivision of a cubic inch of 5.7 density material, at mean temperature and pressure, into 1,536 grains and 2,000 ultimates, as and for the purposes specified.

2. Weights for similar use based upon suitable multiples of my standard density—to wit, 5.7 specific gravity—as and for the purposes specified.

3. Weights, for similar use, made of an iron or other substance whose density shall be 7.125 water, at mean temperature and pressure, or suitable multiples thereof, as and for the purposes specified.



4. Measures of capacity, liquid and dry, based upon the fact that the standard ounce or unit of capacity-measure shall have the same volume or occupy the same space (to wit, 1.78125 cubic inch) as is occupied by a unit-ounce weight, expressed in pure water under standard circumstances, as above described.

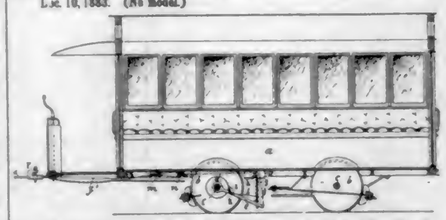
5. The combined system of weights and capacity-measures, unified as above by my formulæ and moduli, and with or without reference to any particular standard temperature and pressure, as and for the purposes specified.

6. Cubes (standard, unit, &c.) of material 5.7 times the density of water, at mean or standard circumstances, marked, stamped, or otherwise designated to show their value in aliquot parts, and their several relations to the foregoing system, as and for the purposes specified.

7. Cubes and other geometrical solids suitable for reference, and of specific materials, metals, alloys, &c., duly stamped, engraved, or otherwise marked, so as to show their relations to the foregoing rectified system of measures, for use as standards of reference, &c., as and for the purposes specified.

293,118. TELEPHONE-CALL-BELL SWITCH. LOUIS TOWNSEND, Evansville, Ind. Filed Nov. 1, 1883. (No model.)

Claim.—1. A telephone-lever support combined with the wall of the box or case, and fulcrumed upon a torsion-spring embedded in the wall of the box, as and for the purpose described.



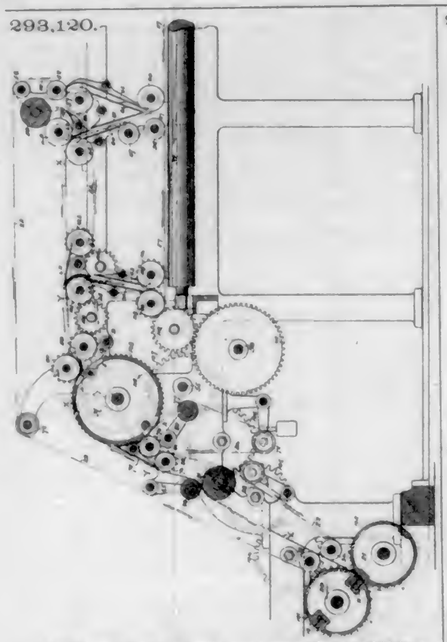
2. The combination, with the telephone-lever support, of the tube C, the shorter inner tube, C', and the torsion-spring connecting the two, the said lever-support being fastened to one tube and the outer tube being fastened to the case, as described.

3. The combination of the tube C, having flange *c*, the shorter inner tube, C', projecting beyond C, the torsion-wires *d d*, connected at one end to one of these tubes and at the other end to the other of said tubes, and the telephone-lever support rigidly fixed to tube C', as and for the purpose described.

4. A switch or contact-spring consisting of three spring-tongues, 1 2 3, the two side tongues of which project at right angles to the middle one, and upon the same side thereof, as described.

5. The combination of tube C, tube C', with slotted end, the torsion-springs *d*, and the adjustable telephone-lever, substantially as described.

293,119. CAR-STARTER. WILBURT C. TRUSSELL, Boston, Mass. Filed Dec. 10, 1883. (No model.)



Claim.—In a car-starter, the combination of the sliding draw-head *r* on the clevis *s*, the rope *f'*, pulley-blocks *m n*, rope *f*, pulley A, and sliding frame *o*, lever *e* and yoke *t*, pawl *i*, and ratchet-wheel *d*, secured to the axle *c*, all operating conjointly, substantially as and for the purpose specified.

293,120. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed Aug. 30, 1881. (No model.)

Claim.—1. The combination, with a primary sheet-manipulating apparatus, consisting of a carrier, as A, which is provided with means by which it is capacitated to guide or fold the sheets, of a secondary sheet-manipulating apparatus, to which the sheets are delivered from the carrier A and folded, of interchangeable gearing, whereby said secondary apparatus is driven at the same or a lesser speed than the primary apparatus, all substantially as described.

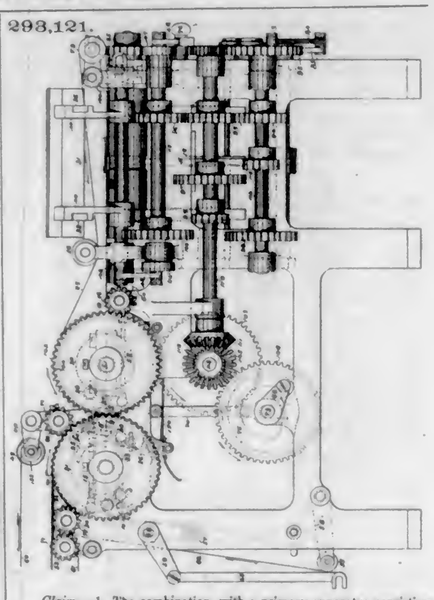
293,120.

2. The combination, with a primary apparatus adapted to fold sheets, of a secondary apparatus adapted to fold the sheets delivered from the primary apparatus, means for rendering the folding mechanism of the primary apparatus inoperative, means for guiding the sheets therefrom, and means for varying the speed of the secondary apparatus, all substantially as described.

3. The combination, with a primary apparatus adapted to fold and associate and fold sheets, of a secondary apparatus adapted to fold the sheets delivered from the primary apparatus, means for rendering the associating and the associating and folding mechanisms of the primary apparatus inoperative, means for guiding the sheets therefrom, and means for varying the speed of the secondary apparatus, all substantially as described.

4. The combination, with a primary apparatus adapted to associate sheets, of secondary apparatus adapted to fold the sheets delivered from the primary apparatus, means for rendering the associating mechanism inoperative, and means for varying the speed of the secondary apparatus, all substantially as described.

5. The combination, with a pair of folding-rollers and a carrier provided with a folding-blade coacting therewith, of a switch or guide, as 13, and means for adjusting the same so that it may be arranged to guide the sheets off from the carrier and permit their being folded, or be removed to admit the operation of the folding-blade, which latter is provided with means for rendering it inoperative, all substantially as described.



6. The combination, with the primary sheet-manipulating apparatus, consisting of the cylinder or carrier A and its appurtenances, and the secondary sheet-manipulating apparatus, of the main sheet channel or pathway and two auxiliary sheet channels or pathways leading at different points therefrom to the said secondary manipulating apparatus, all substantially as described.

7. The combination, with the primary sheet-manipulating apparatus, consisting of the cylinder or carrier A and its appurtenances, and the secondary sheet-manipulating apparatus, of the main sheet channel or pathway and three auxiliary sheet channels or pathways leading therefrom to said secondary sheet-manipulating apparatus, all substantially as described.

8. The combination, with the primary sheet-manipulating apparatus, consisting of the cylinder or carrier A and its appurtenances, and the secondary sheet-manipulating apparatus, of the main and auxiliary sheet-conducting pathways and switches governing the passage of sheets from said main pathway to the auxiliary pathways, all substantially as described.

293,121. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed Sept. 14, 1881. (No model.)

293,121.

Claim.—1. The combination, with a primary apparatus consisting of a rotating folding and gathering apparatus, of a secondary apparatus consisting of a pair of rollers, as 65 66, and the interchangeable vibrating folding-blade, and two vibrating sheet-forwarding devices, with change-gearing whereby said secondary apparatus is driven at an equal, a lesser, and a more rapid speed than the primary apparatus, all substantially as described.

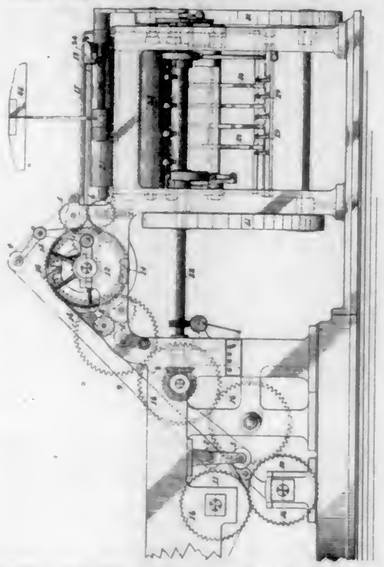
2. In a sheet-delivery apparatus, the combination, with a primary sheet-manipulating mechanism and means for rotating the same, of a secondary sheet-manipulating apparatus, to which the sheets are delivered from said primary apparatus, and change-gearing connecting the primary and secondary apparatus, whereby the latter is run at a lesser and greater speed than the primary apparatus, while the normal speed of the latter is maintained, all substantially as described.

3. In a sheet-delivery apparatus, the combination, with a primary sheet-manipulating mechanism and means for rotating the same, of a secondary sheet-manipulating apparatus, to which the sheets are delivered from said primary apparatus, and change-gearing connecting the primary and secondary apparatus, whereby the latter is run with the same at a lesser and a greater speed than the primary apparatus, while the normal speed of the latter is maintained, all substantially as described.

4. The combination, with a pair of folding-rollers, of means for feeding two sheets over the same so that one edge of each sheet shall overlie said rollers, and means for directing said sheets in succession between said rollers, all substantially as described.

5. The combination, with a pair of folding-rollers, of a slitter for dividing a sheet into two half-sheets, means for feeding said half-sheets so that one edge of each shall overlie said rollers, and means for directing said half-sheets in succession between said rollers, all substantially as described.

6. The combination, with a pair of folding-rollers, of a slitter for dividing a sheet into two half-sheets, means for feeding said half-sheets so that one edge of each shall overlie said rollers, means for directing said half-sheets in succession between said rollers, and means for subsequently folding said sheets, all substantially as described.



7. The combination, with two carriers, as A B, provided with means for associating sheets and for folding sheets, devices for rendering the gathering means inoperative, and devices for causing the folding means to be inoperative during certain revolutions of its carrier, of a subsequent folding mechanism and means for delivering the sheets thereto, and means for varying the speed of the subsequent folding mechanism, all substantially as described.

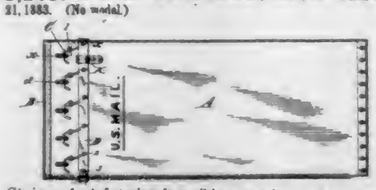
8. The combination, with a rotating carrier provided with means for gathering sheets thereon, and with a folding-blade capacitated to move beyond and within the periphery of the carrier, of a cam for thus moving said blade, means for vibrating the cam into and out of operative relation with said folding-blade, and a companion revolving carrier provided with nipping-jaws, all substantially as described.

9. The combination, with the rotating primary sheet-manipulating

mechanism, operating to gather or fold, or both, and the secondary sheet-manipulating mechanism, of a shaft, 110, transmitting the motion of the former to the latter, and the wheels 97 and 116, for varying the speed of the latter to double that of the former, while that of the former remains unchanged, all substantially as described.

293,122. SHEET FOLDING AND DELIVERY APPARATUS. STEPHEN D. TUCKER, New York, N. Y. Filed Apr. 12, 1883. (No model.) Patented in England July 26, 1876, No. 3,019.

Claim.—1. A folding mechanism consisting of the combination, with a pair of tapering folding-rolls, of a means for entering sheets between them, substantially as described.



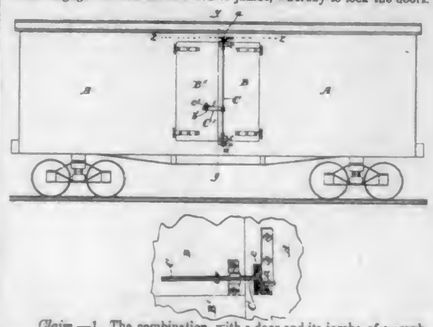
2. The combination, with a folding mechanism consisting of a pair of rolls and means for entering sheets between them, of a second folding mechanism adapted to receive and fold the sheets as they are delivered from the first, the rolls of said first mechanism being made tapering, so as to present the sheets in proper position to said second mechanism, all substantially as described.

3. The combination, with a mechanism for imparting one fold to a sheet, of a mechanism for imparting another fold at right angles to the first, a pair of tapering rolls, as 21 22, arranged to act upon the sheet after receiving the first of said folds to present it in proper position to receive the second of said folds, and means for directing the sheet between said tapering rolls, all substantially as described.

4. The combination, with a primary folding mechanism, as 14 5 6, of a pair of tapering rolls, 21 22, means for directing the sheet between said rolls, and a final-folding mechanism, as 25 26 27, arranged to receive the sheet from said tapering rolls, all substantially as described.

5. The combination, with the rolls 25 26 and blade 27, of the tapering rolls 21 22 and blade 23, arranged parallel thereto, substantially as described.

293,123. MAIL-BAG. WILL A. VAN CAMP, Milton, Ind. Filed Nov. 21, 1883. (No model.)

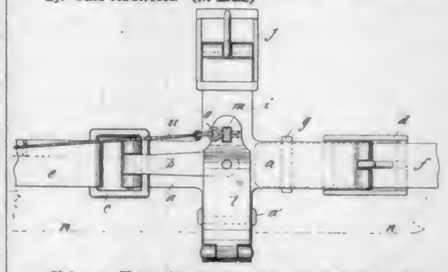


Claim.—1. A fastening for mail-bags, consisting of the strap D, having one end permanently secured to the bag, and the other end provided with means for detachably connecting it to the bag, the catches C C, each having one end riveted to the strap D, and pivoted at about their middle portions to the bag, and the staples *a a*, all constructed and arranged substantially as described.

2. A fastening for mail-bags, consisting of the strap D, having one end riveted to the bag and the other end provided with means for locking it to the bag, said strap having at or near one end the loop E, the loops K, the catches C C, each having one end riveted to the strap D, and pivoted at or about their middle portions to the bag, and the staples *a a*, all constructed and combined substantially as described.

293,124. CAR-DOOR FASTENER. JOHN L. WAGNER, Terre Haute, Ind., assignor of two-thirds to Thompkins A. Lewis, Indianapolis, Ind., and Henry R. Duvall, New York, N. Y. Filed July 12, 1883. (No model.)

Brief.—A crank-rod mounted on a hinged car-door, the cranks of which engage with catches secured to jambs, whereby to lock the doors.



Claim.—1. The combination, with a door and its jambs, of a crank-rod mounted on said door, and catches secured to said jambs, with which the cranks of said rod are adapted to engage, substantially as described, and for the purposes specified.

2. The combination of the car A, having catches *a a*, the hinged door B, and the rod C, having cranks *c c*, substantially as set forth.

3. The combination of the car, catches thereon, the doors mounted on hinges, the crank-rod, the cranks thereon, and the handle therefor, substantially as shown and specified.

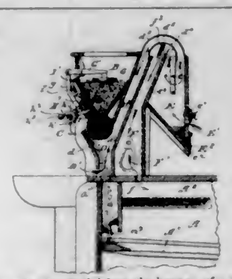
293,125. HORSE-DETACHER. WILLIAM MADISON WALKER, Fulton, Ky. Filed Oct. 29, 1883. (No model.)

Claim.—1. The combination of trace-latch *b*, shaft-latch *l*, fastening-stud *m*, and spring-key *o*, with the plate *a*, having trace-buckle *d* and back-strap buckle *j*, substantially as described.

2. The combination of trace-latch *b*, shaft-latch *l*, fastening-stud *m*, spring *p*, and spring-key *o*, with the plate *a*, having trace-buckle *d* and back-strap buckle *j*, substantially as described.

3. The trace-latch *b*, having stud *t*, in combination with plate *a*, having shaft-latch *l*, said trace-latch *b* being arranged to close behind latch *l*, and be confined by the shaft *s* when it is confined by the latch *l*, substantially as described.

4. The plate *a*, having trace-latch *b*, shaft-latch *l*, trace-buckle *d*, trace-loop *g*, back-band buckle *j*, belly-band loop *d'*, and the latch-stud *m*, combined and arranged substantially as described.



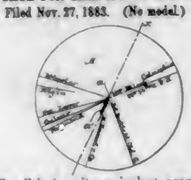
5. The combination of the foot-lever *x*, in the body of the carriage, with the spring-keys *o* and fastening-studs *m* of a horse-detaching apparatus, for releasing the same, substantially as described.

6. In a horse-detaching apparatus, the spring-keys *o*, for releasing the retaining-latches *b l*, having attached cords *n*, extended through the eye *v* of the dash-board, and connected with the foot-lever *x*, pivoted to the floor of the carriage-body at *y*, and supported on the spring *z*, substantially as described

293,126. FEED-HOPPER. JOHN T. WALTER, Easton, Pa. Filed May 10, 1883. (No model.)

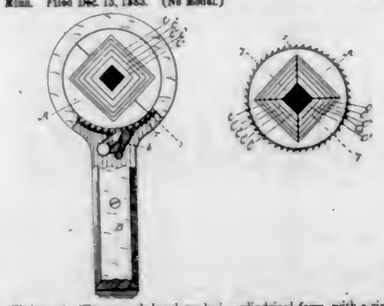
Claim.—1. In a feeding-hopper, the combination, with a valve, I, for regulating the exit of material from the hopper, of a plate, G, located within the hopper, a pivoted lever, G', connected with the plate, and a rock-shaft, H, provided with arms A and A', connected, respectively, with said lever and valve, substantially as described.

293,126.



2. In a feeding-hopper, the combination, with a valve, I, for regulating the exit of material from the hopper, of a plate, G, located within the hopper, a pivoted lever, G', connected with the said plate, a rock-shaft, H, and arms A and A', adjustably secured to said shaft and connected, respectively, with said lever and valve, substantially as described.

3. The combination, with a feed-hopper, B, of a sliding valve, I, a plate, G, located in the hopper, connections joining the plate G and the valve, a spring, *i*, constructed to engage the said valve at its ends, a plate, I', adjustably secured to the hopper and connected with the said spring at the central portion of the latter, and an adjustable stop, I², for limiting the upward movement of the valve, substantially as described.

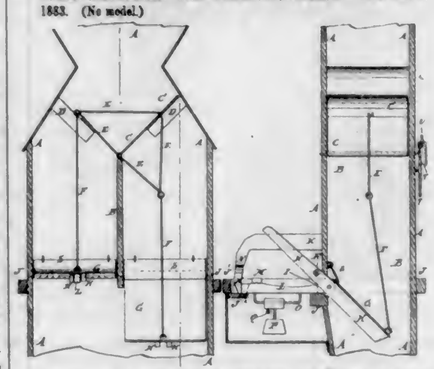


4. The combination, with an exhaust-fan, of a hopper, B, provided with a passage, D, a settling-chamber, E, located in the same casing as the said hopper and adjacent thereto, a screen, *e*, located in the upper portion of said chamber, and a partition, *d'*, located between the adjacent walls of the hopper and chamber, and joined at its ends to the side walls of the casing, and constructed to form with said walls of the hopper and chamber passages D² and F, connecting the top of the chamber at opposite sides of the screen *e* with the passage D and with the said exhaust-fan, substantially as described.

293,127. GAGE FOR HAIR-SPRING STUDS. JOSEPH P. WATHEN, Chicago, Ill. Filed Nov. 27, 1883. (No model.)

Claim.—The disk A or its equivalent, provided with apertures *a* and *a'*, or other means of locating the staff and ruby-pin, and an index for showing the proper position of the stud *b*, substantially as and for the purpose described.

293,128. RATCHET-WRENCH. CHARLES WICKSLER, Minneapolis, Minn. Filed Dec. 13, 1883. (No model.)

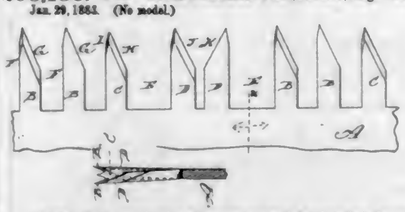


Claim.—1. The wrench-head made in cylindrical form, with a ring of ratchet-teeth around it, and an angular hole through it, with guide-pins projecting inwardly, in combination with a series of slotted angular bushings arranged concentrically in said hole or opening, and extending the full length of the head, and a handle swiveled about the middle of the wrench-head, and provided with a pawl to engage the ratchet-teeth, substantially as and for the purpose described.

2. The wrench-head made in cylindrical form, with a ring of ratchet-teeth around it, and an angular hole through it, with guide-pins projecting inwardly, in combination with a series of flat plates with beveled edges arranged concentrically about the central opening, and of the same length as the head, and slotted longitudinally, to move freely in the head on the pins, a handle swiveled about the middle of the wrench-head, and a pawl contained in the latter, and adapted to engage the ratchet-teeth, substantially as and for the purpose described.

3. A wrench-head having a series of telescoping or sliding angular bushings, of increased thickness toward the center of the head, as and for the purpose described.

293,129. AUTOMATIC REGISTER FOR GRAINS, SEEDS, AND OTHER SUBSTANCES. JOHN WHERRY, Jr., Putnam, Ill. Filed Nov. 3, 1883. (No model.)



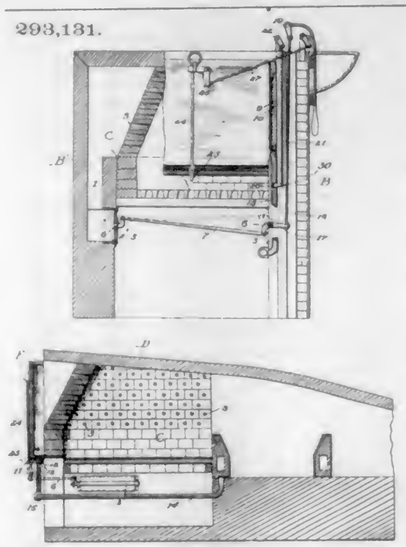
Claim.—1. A grain-register constructed substantially as herein shown and described, and consisting of a two-compartment case provided with an adjustable guide-plate, and hinged bottoms having elastic bars engaging with scale-beams, as set forth.

2. In automatic grain-registers, the combination, with the flanges D D, arranged on the inner and opposite sides of the case A directly under its throat, of the vertical partition B, swinging plate C, pivoted to the upper end of said partition, rods E F, and pivoted platforms G, substantially as shown and described.

3. In a grain-register, the combination, with the case A and the hinged bottom G, of the pairs of elastic bars H, the weighted scale-beams L, having catches M, and the spreaders N, substantially as herein shown and described, whereby the said hinged bottoms will be released when a given weight of the substance has been received upon them, as set forth.

4. In a grain-register, the combination, with the scale-beams L and the elastic bars H, of the catches M and the spreaders N, substantially as herein shown and described, whereby the said elastic bars are made to engage with and release the scale-beams automatically, as set forth.

293,130. SAW. GEORGE WASHINGTON WILLS, Portland, Oreg. Filed Jan. 29, 1883. (No model.)

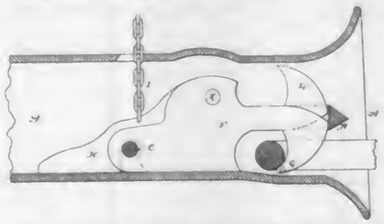


Claim.—The combination of two cutter-teeth having their forward edges straight and their rear edges cut off inclined at their upper portions, and having the edges beveled and sharpened at opposite sides of the two teeth, a clearer-tooth having a straight forward edge and inclined rear edge, and having its edges beveled to both sides, and two drag-teeth having their facing edges cut off inclined and their outer edges straight, and having their edges beveled and sharpened upon opposite sides, said teeth being arranged in alternating groups, the two cutter-teeth in front of the clearer-tooth forming one group, and the drag-teeth forming another group, each group having an intermediate space, as and for the purpose shown and set forth.

293,131. METALLURGICAL FURNACE. JACOB ABTMEYER, Benwood, W. Va. Filed Mar. 21, 1883. (No model.)

Claim.—1. In a furnace, an air-chamber on each side of the com-

293,131.

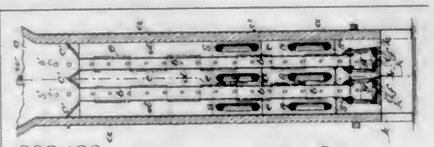


bustion-chamber having openings into said combustion-chamber above the fuel, air-passages leading from said air-chambers to the ash-pit, and valves at each opening in the ash-pit, connected to each other and to suitable operating mechanism, whereby air may be supplied to the two air-chambers, and thence to the combustion-chamber in regulated quantities, substantially as described.

2. The furnace having side chambers separated from the combustion-chamber by inclined perforated walls with valve-passages leading to the ash-pit, and an air-chamber composed of an iron box having flanges bolted to end plates on the end side walls and communicating to the fire-chamber through the perforated wall, air-pipes connecting said box with the heating-passage in the fire-bridge wall, and valves for regulating the supply of air through said pipes, the parts being constructed and arranged substantially as described.

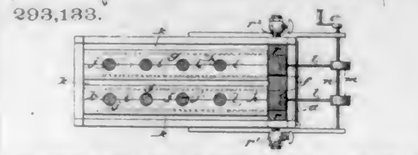
3. The side walls of the furnace having perforations leading into the combustion-chamber, air-passages leading into the ash-pit, and a perforated end wall covered by a separate iron box having flanges, and bolted to the said wall, and suitable valves arranged and adapted to be operated substantially as described.

293,132. CAR-COUPLING. JOHN E. ANGER and DAVID PORTER, Schenectady, N. Y. Filed Aug. 20, 1883. (No model.)



Claim.—1. In a car-coupling, the combination of two hooks which move in opposite directions, and which are pivoted together in such a manner that the raising of the rear end of one hook will move the front ends of the hooks in opposite directions, substantially as shown.

2. In a car-coupling, the combination of the draw-head, the link-guide, and the two coupling-hooks, which are pivoted together and connected to the link-guide in the manner and for the purpose set forth.

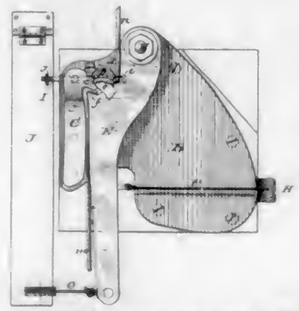


293,133. GRAIN-DRIER. WILLIAM HENRY APPLEGATE, Atlantic, Iowa. Filed June 14, 1883. (No model.)

Claim.—1. The combination, with the grain-passages *b*, having sides *d* of intermeshing wires, of the continuous interlacing wires *e*, forming cross-bars and surface-stays to the sides *d*, substantially as shown and described.

2. The combination, with the grain-passages *b*, of the two-part

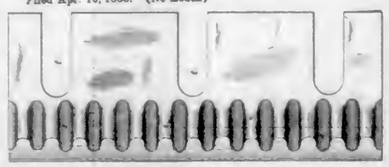
293,133.



valve-casings *g*, flared toward the bottom and centrally divided, and the valves *f*, substantially as shown and described.

3. The combination, with the grain-passages *b* and the flared casings *g*, apertured at *j*, of the valves *f*, apertured at *i*, the rods *l*, eccentrics *m*, and operating-shaft *n*, substantially as shown and described.

4. The combination, with the case *a*, grain-passages *b*, having sides *d* of intermeshing wires, valves *f*, heating-pipes *s*, and passages *k*, of the moisture-outlets *w*, substantially as shown and described.

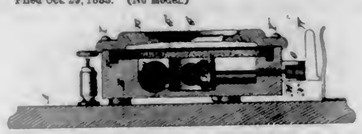


293,134. WIRE CUTTER AND SHAPER. BENJAMIN E. BALL, Denver, Colo. Filed June 13, 1883. (No model.)

Brief.—After completing the coil of one coiled spring, by depressing a treadle severs its rear portion from the main wire and shapes the end of the spring just coiled; also shapes the advanced end of the wire as required to be in the advanced end of the next spring to be coiled. When the treadle rebounds, the finished coiled spring is discharged from the machine.

Claim.—The combination, in a device for cutting and shaping wire, of the bed-plate B, the standard D, and the standard C, having the cutting projection *c* thereon, the lever E, the cutter and shaper *e*, the shaper *f*, and bolt F, all operating as described.

293,135. PLANER-KNIFE. EDWIN BENJAMIN, South Evanston, Ill. Filed Apr. 16, 1883. (No model.)



Claim.—1. A planer-knife adapted to be secured by fastening-bolts at or near its center to a revolving cylinder, said knife having that portion which extends forward from the fastening-bolts to the cutting-edge lightened, substantially as described, whereby the momentum of the forward portion of the knife is reduced.

2. A planer-knife adapted to be secured at or near its center to a revolving cylinder, said knife being provided with a series of transverse flutes extending from near the center of the knife toward the cutting-edge, whereby said knife is lightened, substantially as and for the purpose specified.

3. The combination, in a planer-knife adapted to be bolted to a revolving cylinder, of the slots *i*, through which the fastening-bolts pass, and the transverse flutes extending from near the center of the knife toward the cutting-edge, substantially as described.

293,136. TELEPHONE-CASE. PARK BENJAMIN, New York, N. Y. Filed Oct. 29, 1883. (No model.)

Claim.—1. A telephone-case formed of glass or similar vitreous material, provided with suitable recesses, indentations, or appertures for the reception of the working parts of the instrument, substantially as described.

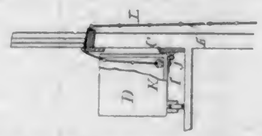
2. A telephone-case formed of glass or similar vitreous material, pressed or molded into substantially a block, which block is provided with suitable recesses, indentations, or apertures for the reception of the working parts of the instruments, substantially as described.

3. A telephone box or case having a detachable cover containing a mouth-piece and mouth-piece orifice, and a receptacle containing suitable recesses, apertures, or indentations for the reception of the working parts of the instrument, and a means of connecting said cover and receptacle, said receptacle and cover being formed of glass or similar vitreous material, substantially as described.

4. In a telephone, the receptacle B, provided with recesses, indentations, or apertures for the reception of the working parts of the instrument, substantially as described, and made of pressed or molded glass or similar vitreous material.

5. In a telephone, the cover E, having a mouth-piece and a mouth-piece opening, substantially as set forth, and made of pressed or molded glass.

6. In a telephone, a glass mouth-piece, substantially as described.



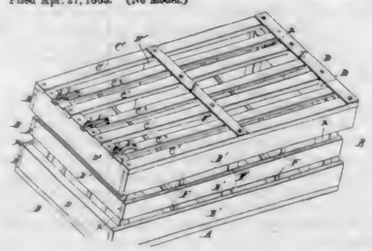
7. A telephone box or case constructed of transparent material, substantially as described.

8. A telephone box or case constructed of transparent non-inflammable material, substantially as described.

9. A telephone box or case constructed of transparent non-inflammable insulating material, substantially as described.

293,137. FIRE-ESCAPE. DANIEL BENNETT, Logan, Ohio, assignor of one-third to Sewell G. Bennett, same place. Filed Apr. 27, 1883. (No model.)

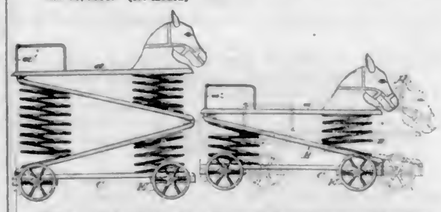
Brief.—The box for storing the ladder is provided on one side with supporting-casters and on the other side with gibs for moving along the horizontal rod.



Claim.—1. The box D, having on one side, beneath the box, the casters or wheels F, resting on the floor to support said box, and the other side of the box provided with gibs I, so that said box may be moved along the wall on the rod H, substantially as herein set forth.

2. The box D, having on one side, beneath the box, the casters or wheels F, resting on the floor to support said box, and the other side of said box provided with the gibs I, in combination with the base-board C, having the brackets G, which carry the horizontal rod H, substantially as herein set forth.

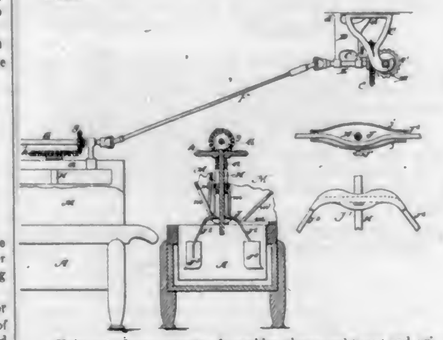
3. In fire-escapes, the combination of the rod H, secured by brackets permanently to the wall, the box D, having rollers F on one side, and on the other side gibs I, to secure said box to the rod H, and with the rope ladder L, secured within the box or to the rod H, substantially as herein set forth.



293,138. POULTRY-COOP. WILLIAM T. BLEKER, Jr., Galveston, Tex. Filed Apr. 27, 1883. (No model.)

Claim.—1. In a poultry-coop, the combination of bottom A, side strips, B', end strips, D', the top end strips having recesses *d*, central vertical partition, F', having recesses *f*, vertical transverse partitions F, and vertical longitudinal partitions G, forming compartments H, between the central partition and the ends of the coop, corner-posts K, and the top strips, C' C², fitting in the recesses, as set forth.

2. In a poultry-coop, the combination of bottom A, side strips, B', end strips, D', the top end strips having recesses *d*, central partition, F', having recesses *f*, corner-posts K, vertical transverse partitions F, and vertical longitudinal partitions G, forming compartments H, the top fixed and removable strips, C' C², having suitable fastenings and fitting in the recesses, and transverse tie-strips E, as set forth.



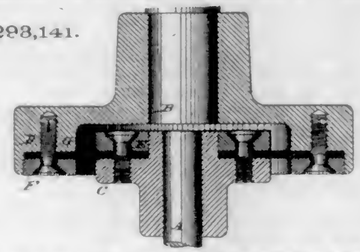
293,139. HOBBY-HORSE. MARTIN BOHLIG, Dubuque, Iowa. Filed Dec. 18, 1883. (No model.)

Claim.—1. In a hobby-horse, a sloping board interposed between the horse and its supporting-base and hinged to both, and springs interposed between the horse and the sloping board, and between the sloping board and the base, substantially as described.

2. A hobby-horse having one or more sloping boards, with hinged connections to the horse and the base, and springs interposed between the boards and the horse, and between the boards and a base supported upon wheels, substantially as described.

293,140. MACHINERY FOR MANUFACTURING CHEESE. ARCHIBALD H. BRIDTNELL, Belleville, Ontario, Canada. Filed Mar. 8, 1883. (No model.)

Claim.—1. In an apparatus for making cheese and to cut and agitate the curd within the vat, the combination of the bevel-gears mounted in bearings on the vat, the shaft F, having a universal joint at each end, the swinging bracket D, the movable arm d^2, and the gears *e* and *e'*, substantially as described.



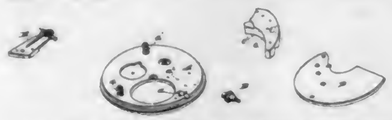
2. In an apparatus for making cheese and for cutting and agitating the curd within the vat, the combination of the gears *h*, mounted on vertical shafts H, the gears *g*, carried by the horizontal shaft G, the shaft F, having a universal joint at each end, the short shaft E, mounted in a swinging bearing, and having a gear adapted to engage a gear upon the main shaft, and means for engaging and disengaging the gears on the short and main shafts, substantially as described.

3. In an apparatus for making cheese, the combination, with the main shaft geared to the vertical shafts in the curd-vat, and provided with a pinion, T, of the vertical shaft S, carrying agitators at its lower end and a gear-wheel, V', at its upper end, a horizontal shaft, U, adapted to slide longitudinally, and provided with a pinion, V, and spur-wheel T', swinging lever W, connected with the horizontal shaft for adjusting the same, and means for holding the lever, substantially as described.

293,141. COUPLING FOR SHAFTING. PETER BROTHERHOOD, Lambeth, County of Surrey, England. Filed Nov. 19, 1883. (No model.) Patented in England Oct. 17, 1883, No. 4,943.

Claim.—A coupling for connecting two lines of shafting, consisting of a diaphragm of flexible material clamped by its periphery to the one

293,141.

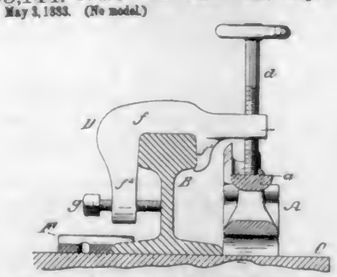


shaft and by its middle to the other shaft, substantially as herein described.

293,142. MAINSPRING-BARREL FOR WATCHES. DANIEL A. A. BUCK, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed July 21, 1883. (Model.)

Claim.—In combination with stem-winding mechanism, a mainspring-barrel made separate from the main wheel, journaled upon the main-wheel arbor, and provided with peripheral teeth, whereby it may be rotated upon and around said arbor to wind the mainspring, substantially as and for the purpose specified.

293,143. WATCH-MOVEMENT. D. AERO A. BUCK, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Sept. 10, 1883. (No model.)

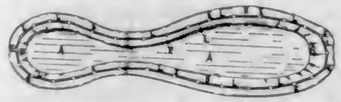


Claim.—1. A winding-bridge which is adapted to confine in place the winding-pinion, to support the balance-bridge, and to act as a pillar between and in connection with the pillar-plate and the top plate, substantially as and for the purpose specified.

2. The combination of the pillar-plate A, provided with the recess *a*, the winding-pinion B, the winding-bridge C, having the recess *c*, and the top plate, D, substantially as and for the purpose shown.

3. In combination with the balance-bridge E, the winding-bridge C, secured upon the pillar-plate A, substantially as and for the purpose set forth.

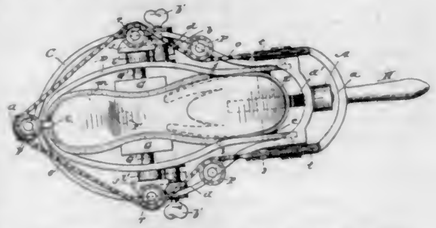
293,144. BORING-GAGE. THOMAS J. BUSH, Lexington, Ky. Filed May 3, 1883. (No model.)



Claim.—1. The boring-gage A, having the seat or similar rest *a*, in combination with means, substantially as described, for locking the gage to and parallel with the rail, as and for the purposes set forth.

2. The locking-device D, having a forked end adapted to bear against the top, against one side, and against the under side of the head or tread of the rail, in combination with the boring-gage A, substantially as and for the purpose set forth.

3. The cramp-iron *f*, carrying screw *d*, and formed with the projection *f'*, adapted to catch against or under the head of the rail B, in combination with the boring-gage A, substantially as and for the purposes set forth.



4. The cramp-iron *f*, formed with the projection *f'* and arm *f''*, and provided with the screws *d g*, in combination with the boring-gage A, substantially as and for the purposes set forth.

293,145. BOOT AND SHOE FASTENING. FRANK CLARK, Boston, Mass. Filed Sept. 17, 1883. (No model.)

Claim.—That improvement in uniting the uppers and soles of boots and shoes consisting in forming holes in the parts to be united, by punching out or removing portions of the same, then passing a cord or thread over such holes, then forcing the removed portions or cores back into the holes, carrying with them the overlaid cord or thread, thus forming a continuous line of fastening, substantially as set forth.

293,146. LASTING-JACK FOR BOOTS AND SHOES. FRANK CLARK, Boston, Mass. Filed Dec. 1, 1883. (No model.)

Claim.—1. The combination, with the last-holding frame proper, of the heel-post, the toe-piece, and the system of gears and connecting-links for causing the same to clamp and hold the last in place in said frame, substantially as and for the purposes hereinbefore set forth.

2. The last-holding frame provided with a heel-stop, in combination with the heel-post, the links connecting said post to the frame, the toe-piece, the pinion to which said toe-piece is pivoted, the sector-gear, and means for locking the links in the position to which they may be brought by the rotation of said sector-gear, the combination being and acting as hereinbefore set forth.

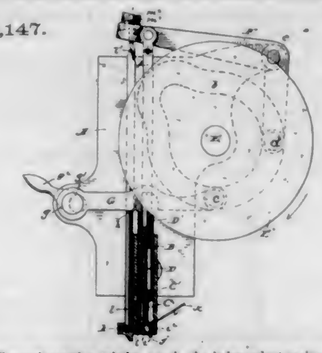
3. The last-holding frame proper, and the heel-post and toe-piece and system of connecting links and gears carried by said frame, in combination with the outer frame, in which said last-holding frame is hung by side trunnions, and the yoke in which said outer frame is hung by end trunnions, substantially as and for the purposes hereinbefore set forth.

4. The combination, with the last-holding frame proper and the pressers movable independently of said frame, of mechanism arranged and operating, substantially as hereinbefore set forth, to act directly and simultaneously upon said pressers, and at the same time to permit differences in the extent of movement of the individual pressers, as and for the purposes described.

5. The combination, with the last-holding frame, the pressers, and the presser-actuating mechanism, of the lining carried by the last-holding frame and interposed between the pressers and the last, substantially as and for the purposes hereinbefore set forth.

6. The combination, with the last-holding frame and its outer supporting-frame, of the pressers, the belt, the system of guide-rollers for the same, and the belt-operating mechanism, under the arrangement and for joint operation substantially as hereinbefore set forth.

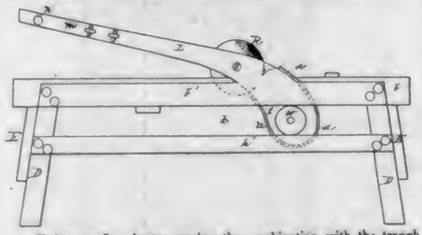
293,147. MACHINE FOR UNITING THE SOLES AND UPPERS OF BOOTS AND SHOES. FRANK CLARK, Boston, Mass. Filed Dec. 1, 1883. (No model.)



Brief.—The machine makes holes in the material by punching out pieces therefrom, lays a thread across the holes thus formed, and afterward drives the punched-out pieces, with the thread, into the holes or apertures.

Claim.—1. The combination, with the punch and the driver, of the cord or thread guide arranged and operating automatically and at the proper times to remove the thread from the path of the punch and to present it to the driver, substantially as and for the purposes hereinbefore set forth.

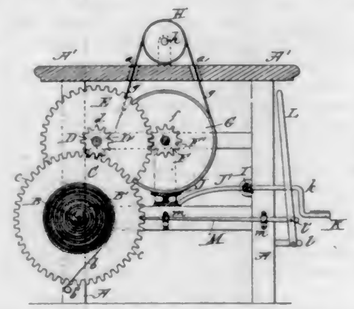
2. The tubular punch, and the driver arranged within the punch, and operating to expel therefrom the core or plug cut out from the work, in combination with the thread-guide and thread-guide-operating mechanism, whereby the said guide is operated alternately to carry the thread out of the path of the descending punch and into the path of the descending driver, substantially as and for the purposes hereinbefore set forth.



3. The combination, with the punch and punch-stock, of the punch-actuating lever supported upon a fulcrum adjustable for the purpose of varying the depth of cut made by the punch, substantially as hereinbefore set forth.

293,147.

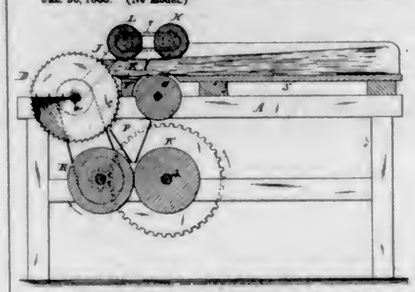
4. The reciprocating tubular punch, the independent reciprocating driver contained in said punch, and the thread-guide, in combination with the head B, swiveled to the frame of the machine, substantially as and for the purposes hereinbefore set forth.



293,148. BUTTER-WORKER. ANSEL C. CLARK, Manchester, Iowa. Filed Aug. 12, 1882. Renewed Apr. 21, 1883. (No model.)

Claim.—1. In a butter-worker, the combination, with the trough A, provided on each side with a double set of parallel guide-bars or track-bars, one set above the other, of the reciprocating roller-frame having extensions of its side bars downward between said guide-bars, and anti-friction wheels, one on each side of each extension between the upper and lower track-bars, substantially as specified.

2. In a butter-worker, the combination, with the trough A and the reciprocating working-roll R, of the handle-frame L, formed with downward extensions V, its side arms provided each with an anti-friction wheel, *w*, and the upper and lower sets of parallel guide-bars, *b b' k k'*, on each side of the trough, engaging the sides of said extensions and the circular edges of said anti-friction wheels, substantially as specified.

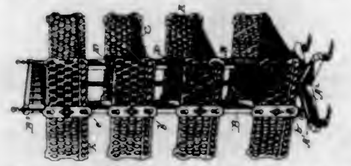


293,149. SEWING-MACHINE MOTOR. JAMES R. CRANDELL, Upper Marlborough, Md., assignor of one-half to James Flint, same place. Filed Dec. 14, 1883. (No model.)

Claim.—1. The foot-treadle K, rod *k*, rock-shaft I, lever J', and brake-shoe J, in combination with the wheel G, substantially as and for the purposes described.

2. The pivoted hand-lever L, reciprocating bar M, and guides *m*, in combination with the tooth-wheel C, as and for the purposes described.

293,150. STRAW-CUTTER. DANIEL M. CUMMINGS, Enfield, N. H. Filed Jan. 30, 1883. (No model.)

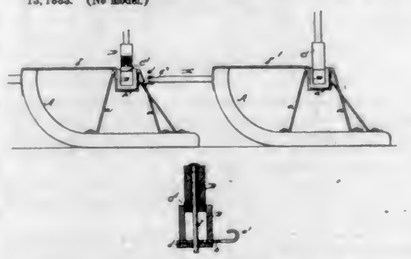


Claim.—1. The combination, in a cutting-machine, of a revolving cutter, D, and stationary blade E, a frame swinging on the cutter-shaft, a feed-roll carried at the outer end of said frame and driven from said shaft, and a pressure-roll carried by said frame at a point above the blade E, all as set forth.

2. The combination of the cutter cylinder and shaft, the frame J, hung to the shaft and carrying the rollers L H, and shaft N, gearing with one of the rollers, and worm-gear for driving the shaft N from the shaft *a*, substantially as set forth.

3. In a straw-cutter, the combination, with the stationary cutter-blade E, of the cutter D, consisting of a shaft having a spiral flat blade mounted thereon with teeth at its edge, the said spiral winding in one direction throughout the cutting extent of the shaft, substantially as set forth.

4. The combination of the cutting-cylinder D, cutter-blade E, rollers H L, supported in frame J, as set forth, and the grinding-rolls R R', geared to rotate at different speeds, substantially as and for the purpose set forth.



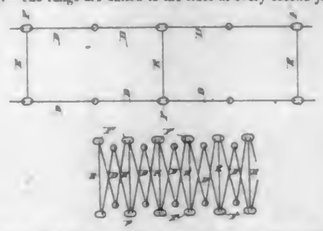
293,151. REVOLVING BOOK CASE AND STAND. JOHN DANNER, Canton, Ohio. Filed Aug. 2, 1883. (No model.)

Claim.—1. The combination of the frame having side pieces, B, with shelf-supports having vertical rows of lugs $e' e^2$, arranged parallel with each other, and horizontal rows of lugs or flanges e^3, substantially as and for the purpose described.

2. The combination of the frame having side pieces, B, with shelf-supports having vertical rows of lugs $e' e^2$, horizontal rows of lugs e^3, removable shelves resting on the latter, and vertical dividing-boards between the rows of lugs e' and e^2, substantially as and for the purpose described.

293,152. BOB-SLEIGH. HENRY DETAMBLE, Aurora, Ill. Filed Dec. 13, 1883. (No model.)

Claim.—1. In a bob-sled, the runners A, continuous braces *a a*, formed with a deep bend, *a'*, and open troughs or boxes B B, in combination with the cross-bars C', springs Q, and rods *c c*, substantially as and for the purpose set forth.

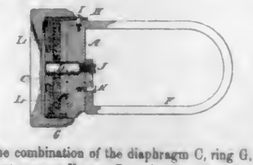


2. In a bob-sled, the combination, with the runners A and the braces

a a, of the troughs or boxes B, adapted to receive the axles of a wagon substantially as and for the purpose set forth.

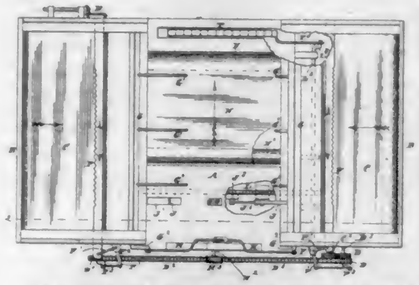
3. In a bob-sled, a reach-coupling consisting of a metal strap or plate passed through the knee of the forward sled and bent or flanged at its forward end, and formed with a hook at its rear end, whereby all strain is removed from the king-bolt, substantially as and for the purpose set forth.

293,153. FIRE-ESCAPE LADDER. ARNOLD M. DOWNING, Oneida, N. Y. Filed Apr. 10, 1883. (No model.)



Brief.—The rungs are united to the sides at every second joint.

Claim.—1. A folding ladder constructed of a series of rods, D, linked to each other, and united at every second joint by a transverse rod or rung, E, substantially as herein shown and described, and for the purpose set forth.



2. A folding ladder constructed of a series of rods, D, linked to each other, and united at every second joint by a transverse rod or rung, E, which is slightly longer than a rod, D, substantially as herein shown and described, and for the purpose set forth.

293,154. TELEPHONE. DANIEL DRAWBAUGH, Eberly's Mill, Pa. Filed Nov. 12, 1883. (No model.)

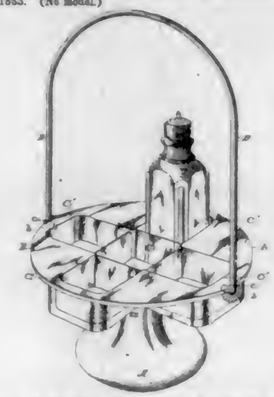
Claim.—The combination of the diaphragm C, ring G, and projection H, permanent magnet F, core D, and surrounding electro-magnet coil and pole-pieces L, substantially as described.

293,155. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. BANNAD DRILLER, St. Charles, Mo. Filed Sept. 22, 1883. (No model.)

Claim.—1. In a band-cutter and feeder, the combination of a cradle, wings secured thereto, an apron and knife in each wing, plates and fingers to receive the straw and deliver it to the floor of the cradle, an apron to catch and deliver the straw from the floor of the cradle, and mechanism to operate the different moving parts.

2. The combination of a cradle, wings, plates, a pair of rock-bars provided with fingers, and suitable means whereby the bars are operated alternately, for the purpose specified.

3. The combination of a cradle, wings thereto, aprons, cutters, and suitable means for operating the aprons and the cutters, for the purpose set forth.



4. The arms and suitable means for operating them, in combination with the cradle, wings, plates, and fingers, for the purpose set forth.

5. The jumper having two arms and a cradle having a floor through which the jumper moves, in combination with suitable means for operating the jumper.

6. The jumper made in two parts, a spring for opening the parts as the jumper is raised, and suitable means for operating the jumper, in combination with a cradle.

7. The combination, with a cradle having a floor formed with a slot transverse thereof, of the hangers transverse of and beneath the floor-slot, the serrated bar to project through the floor-slot, having diagonal slots for the cross-bars of the hangers, and means to reciprocate the bar.

293,156. CASTER. WILLIAM K. ELSON, Martin's Ferry, Ohio. Filed Dec. 1, 1883. (No model.)

Claim.—1. A glass or earthenware caster provided with a detachable bail applied to maintain a vertical rigid position, substantially as set forth.

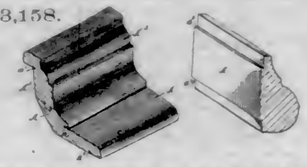
2. A glass or earthenware caster having its cruet support or base pressed complete in one mold, with a central cruet-receptacle and four outer receptacles contiguous thereto, all dependent from the under side of said support or base, substantially as described.

3. A glass or earthenware caster having its cruet support or base pressed complete in one mold, with a central cruet-receptacle and four outer receptacles contiguous thereto, and centrally mounted upon a supporting-foot welded to the support with glass, substantially as described.

4. The combination, in a glass or earthenware caster having a detachable bail, of the cruet support or base centrally mounted upon a supporting-foot, both parts being pressed separately in molds and welded together when hot, the support provided with a central cruet-receptacle, four outer receptacles contiguous thereto, means for receiving the ends of the bail, and means for holding the bail in a vertical rigid position, substantially as described.

293,157. PROCESS OF ROASTING AND AMALGAMATING GOLD AND SILVER ORES. ERNST OTTO FRANCKE, Tupiza, Bolivia, and CARL FRANCKE, Cassel, Germany, assignors of one-third to Charles Adams, Manitou, Colo. Filed June 26, 1883. (No specimens.) Patented in Bolivia Aug. 31, 1880.

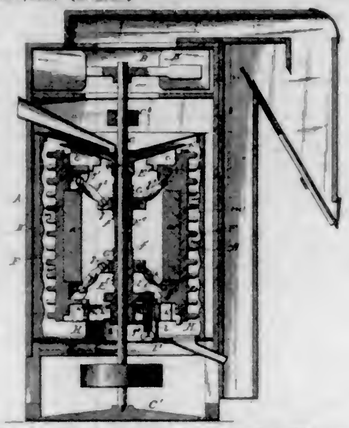
Claim.—1. The process described of extracting precious metals from refractory ores, the same consisting in roasting the ores with salt at such low temperature as will transform the sulphides of iron, copper, &c., into the sulphates and leave the arsenides, antimonides, selenides, and tellurides undisturbed, and subsequently amalgamating said roasted ore, substantially as herein described and set forth.



2. The process herein described of treating refractory ores, consisting in salting and roasting the same at a low temperature for conversion of certain sulphides into sulphates without disturbing other metallic salts, as described, and afterward treating the same in a pulp with common salt and quicksilver, under the influence of heat and in the presence of metallic copper, whereby, through a series of reactions, the silver is reduced to a metallic state and amalgamated, substantially as set forth.

3. The process herein described of treating refractory ores, consisting of the following steps: first roasting the ores at a low temperature, then subjecting them, while in a state of pulp with water, to the action of common salt and quicksilver, under the influence of heat and in the presence of metallic copper, and finally adding quicksilver at successive intervals in small quantities, substantially as and for the purpose set forth.

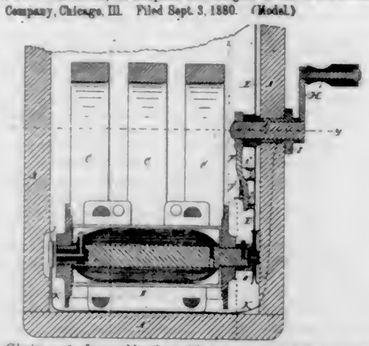
293,158. APPLICATION OF FABRICS TO MOLDINGS AND OTHER ARTICLES. ALFRED FRENCH, Detroit, Mich., assignor to the Detroit Casket Company. Filed Oct. 20, 1883. (No model.)



Brief.—A molding provided with one or more kerfs or grooves, and having the covering fabric pressed into said grooves, so as to conceal its edges.

293,158.

Claim.—A molding covered with fabric, said molding provided with one or more kerfs or grooves and the fabric pressed into said grooves, the construction being such that the edges of the fabric may be suitably concealed in said grooves, substantially as described.



293,159. GRAIN-SCOURER. CHARLES M. GILBERT, Milwaukee, Wis., assignor to the Richmond Manufacturing Company, Lockport, N. Y. Filed Nov. 7, 1883. (No model.)

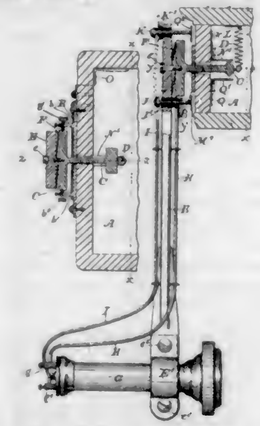
Claim.—1. In a grain-scourer, the combination, with a scouring-case composed of alternating solid corrugated and open-work sections, of a revolving scourer within the scouring-case, having adjustable studded scouring-plates adapted to be moved nearer to or farther from the scouring-case, substantially as specified.

2. In a grain-scourer, the combination, with the scouring-case composed of alternate staves or sections of solid material, having wave-corrugations on their inner faces and perforated sections connecting them, of a revolving scourer provided with scouring-plates having friction-projections, substantially as specified.

293,160. DRIVING-GEAR FOR MAGNETO-ELECTRIC MACHINES. EZRA T. GILLILAND, Indianapolis, Ind., assignor to the Western Electric Company, Chicago, Ill. Filed Sept. 3, 1880. (Model.)

Claim.—1. In combination with a magneto-electric generator, a driving-gear in which the shaft carries both a wheel and an arm, the wheel being loosely mounted on said shaft, and insulated therefrom and from the arm, and the arm being rigidly mounted on the shaft and arranged to pass between two projecting studs or points on said wheel, one of which is insulated from electrical contact with said arm, and the other is not, and which is provided with means for maintaining the contact between the arm and one of said points when the apparatus is at rest, but which shall not operate to prevent a contact from being made between the arm and the other point when the apparatus is put in motion, substantially as set forth.

2. The combination, in a driving-gear for magneto-electric generators, of a wheel insulated from the shaft thereof, an arm on said shaft which is at times insulated by means, substantially as described, from the wheel, and at others not, one of which said conditions shall result from the mechanical act of turning the wheel and the other from allowing it to remain at rest, and means for maintaining the proper contact when the apparatus is at rest, substantially as set forth.



3. The combination, in a driving-gear for magneto-electric generators, of a shaft, a wheel, and an arm, the wheel and arm being mounted on the shaft and so connected, by means substantially as described, that an electrical circuit passing through them shall remain uniformly either open or closed when the apparatus is at rest, but in which the mechanical act of turning the wheel shall operate to automatically change the condition of said electrical circuit, substantially as set forth.

4. The combination, in a driving-gear for magneto-electric generators, of a shaft, G, an arm, F, a spring, F', a wheel, E, having a hub of insulating material, and studs or points on said wheel with which said arm comes in contact, substantially as and for the purposes set forth.

5. The combination, with a main circuit and a magneto-electric machine, of a shunt or short circuit around the machine, and means—consisting of an arm, two points between which it vibrates, one of which is insulated and the other not, and a retractile spring—whereby such short circuit is, immediately upon and continuously during the operation of the machine, broken and kept open, substantially as set forth.

6. The combination, in a driving-gear for magneto-electric generators, of a shaft, a projection thereon, points with which said projection comes in contact, and a spring, said projection forming a part of an electrical circuit when in one position, but, by means of insulating material, being "cut out" when in another position, the mechanical act of turning the gear and the action of the spring being the means of effecting said change of position, substantially as set forth.

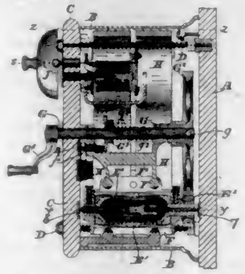
293,161. TELEPHONE APPARATUS. EZRA T. GILLILAND, Indianapolis, Ind., assignor to the Western Electric Company, Chicago, Ill. Filed May 2, 1882. (No model.)

Claim.—1. The telephone apparatus consisting of a telephone, its line, and a vibrating telephone-supporting arm having a portion or projection which is held into contact with a contact-spring forming a portion of said line by a pressure of the ear of the user against the telephone, and out of such contact by a spring which acts reversely to such pressure, substantially as set forth.

2. The combination of the telephone, its arm, the vertical pivots *b' b'*, the device or arm C, a spring for holding the same in position, the contact-springs, and the wires leading therefrom, substantially as set forth.

3. The combination of the telephone, its vertically-movable arm, and the horizontally-movable device C, secured thereto, whereby the telephone can both be accommodated to the height of the user and thrown in and out of circuit, substantially as set forth.

4. The combination, with a telephone-arm, of the bearing-plate B, having arms *b b* and the pivots *b' b'*, whereby said arm is allowed a lateral movement, substantially as described, and for the purposes specified.



5. The combination, with a telephone and its supporting-arm, of connections substantially rigid with said arm, and running back along the same to the rear end thereof, where a connection with the other ap-

paratus is made by means of screws or pins J K and springs M^2 O^2, said pins being adapted to slide on said springs as the arm is raised and lowered, substantially as set forth.

6. The combination of the telephone, the supporting-arm, the device C, and pivots *b' b'* and *c*, substantially as described, and for the purposes set forth.

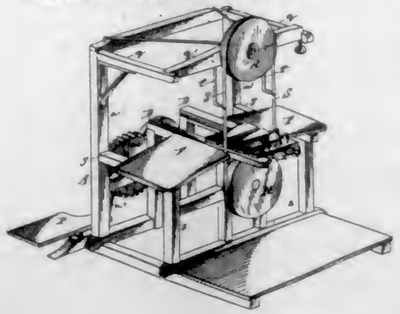
7. The combination of the telephone, the supporting-arm, the connection H, the connection I, the screws or pins J K, the pieces of insulating material J' K', the springs M^2 and O^2, and the wires forming the remainder of the electrical circuit, substantially as set forth.

293,162. TELEPHONE APPARATUS. EZRA T. GILLILAND, Indianapolis, Ind., assignor to the Western Electric Company, Chicago, Ill. Filed Feb. 3, 1883. (No model.)

Claim.—1. The combination, with a call-signal apparatus box and the cover thereto, of screw-rods D, which secure said cover to said box, and also form a part of the electrical connections, substantially as set forth.

2. In a call-signal apparatus for telephonic purposes, in combination with the frame of the magnets which actuate the bell-hammer and the frame on which the armature is mounted, a differential screw passing through both, whereby the relation of one of said frames to the other may be accurately and conveniently adjusted, substantially as set forth.

3. In a call-signal apparatus for telephonic purposes, the combination, with the frame of the magnets I and the frame of the armature thereto, of the screw K, which extends from the front of the box containing the apparatus to said frames, whereby the relation of said frames to each other, and consequently that of the armature to the magnets, can be adjusted from the outside of the box, substantially as set forth.



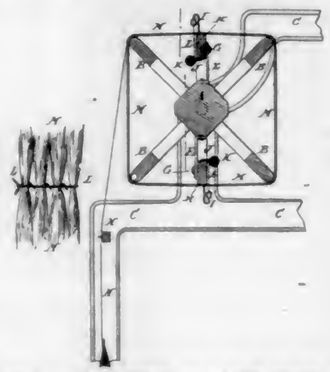
4. The combination, with the frame of the magnets I, provided with dowel-pins *i*, of the pivoted clamps I', whereby said frame is removably secured to the portion of the box on which it is mounted, substantially as set forth.

5. In a call-signal apparatus for telephonic purposes, the combination, with the bells J, of base-plates J', having cam-slots therein, through which the securing-screws pass, and projections *j'*, by which said base-plates may be partly rotated, substantially as described, and for the purpose specified.

6. The combination, with the gravity or movable switch of a telephone call-signal apparatus, of a device for establishing electrical connections, consisting of a combined anvil and spring contact piece, substantially as set forth.

7. The combination of the gravity-switch having pins or projections thereon, and devices with which said gravity-switch comes in contact, said devices being provided with springs with which said pins or projections come in contact, substantially as set forth.

293,163. BAND SAWING MACHINE. ALEXANDER L. GRAY, East Monmouth, Me. Filed Sept. 6, 1883. (No model.)



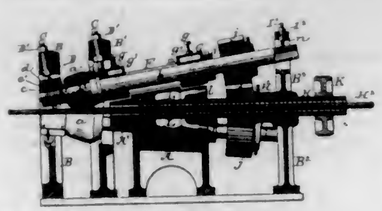
Claim.—1. The combination, in a sawing-machine, of the guide-beams D D, a table supported and sliding thereon, a band-saw, S, suitably supported devices for driving the same, the limbs of said saw being respectively located at each side of the said sliding table, and an inclined table located at the side of each limb, substantially as set forth.

2. The combination, in a sawing-machine, of the guide-beams D D, a table supported and sliding thereon, and provided with devices adapted to engage the beams and secure the table rigidly in position, a band-saw, S, suitably supported devices for driving the same, the limbs of said saw being respectively located at each side of said sliding table, and an inclined table located at the side of each limb, substantially as set forth.

3. In a band sawing machine, the combination, with the shaft I, carrying the saw-driving pulley, of the pinion secured to said shaft, the toothed wheel gearing with said pinion and provided with a wrist-pin and winch, and the intermediately-fulcrumed treadle-platform having one end connected to the wrist-pin by a link, substantially as and for the purpose set forth.

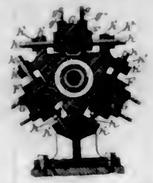
293,164. SKEIN LACING AND TYING ATTACHMENT FOR REELS. GEORGE GRESHAW, Jr., Paterson, N. J. Filed May 18, 1883. (No model.)

Brief.—To one or more sides of the reel-shaft are secured brackets the projecting arms of which are provided with slots. One or more arms having S-shaped hooks arranged in sets upon their outer edges and pivots upon their inner edges are placed parallel with the reel-arms and secured to the projecting arms of the brackets by screws passing through the slots in said arms. On the pivots upon the inner edges of the interposed arms are placed spools upon which are wound the threads for lacing and tying the skein. The thread from a spool is carried up to and laid upon one set of hooks and attached to a hook of the next set, or to a pin. As the thread to form a skein is laid upon the reel in the ordinary manner, it will press the lacing and tying thread down into the spaces between the hooks. When enough thread for a skein has been wound upon the reel, the end of the lacing-thread is passed through the loops formed in said thread, the screws are loosened, the interposed arms pushed inward, withdrawing the hooks from the skein, the lacing-thread is drawn tant, and the skein is ready to be removed from the reel.



Claim.—1. The combination, with a silk-reel provided with a supporting-shaft, of the arm H, provided on its outer edge with a series of hooks, I, and upon its inner edge with supports adapted to carry spools for holding the binding-threads, and the supports E, said hooks being arranged in relation to one another as described, whereby intermediate spaces are formed, in which the skeins are wound, all as set forth.

2. The combination, with the reel-shaft A, of the slotted brackets E, the clamping-screws G, and the arms H, provided at their upper edges with hooks I and at their lower edges with spool-carrying pivots J, substantially as herein shown and described, whereby the lacing and tying will be done automatically while reeling the thread or yarn, as set forth.



293,165. ROLLING-MILL. PHILIP M. HAAS, Youngstown, Ohio, assignor of one-half to Andrews, Bros. & Co., same place. Filed Apr. 14, 1883. (No model.)

Claim.—1. The metal-reducing rolls, arranged in divergent direction, each rounded at their edges and comprehending a beveled collar or shoulder, *a'*, combined with a shaft provided with a screw-thread, *b'*, a screw-sleeve bearing, *c'*, matching the screw *b'*, and a centrally-arranged feeding-tube, H, substantially as described, for the purpose specified.

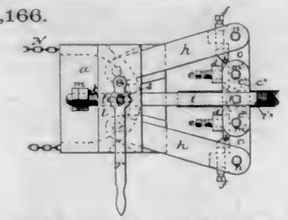
2. The metal-reducing rolls and their shafts, arranged in divergent direction, in combination with the main housing A, a central feeding-tube supported thereby, the separate housings B B' B^2, and means, substantially such as described, arranged within the said housings, whereby said roll-shafts are supported and may be adjusted in the several directions stated at one or at both ends within said housings, substantially as described, for the purpose specified.

293,165.

3. The combination of the rolls arranged in divergent direction, the bed-plates carrying said roll-shafts, provided with cross-slots *f*, the main housing A, and a central feeding-tube, H, with means, substantially such as described, whereby the said bed-plates, with their roll-shafts, are adjusted crosswise to adjust the rolls in relation to each other, for the purpose specified.

4. The combination of the metal-reducing rolls, having their shafts arranged with their axial lines diverging, with the main housing, a centrally-arranged feeding-tube, H, the separate supporting-housings for the roll-shafts, the bed-plates F, provided with the cross-slots *f*, the clamping-screws *f'*, and the screws *g h i*, arranged to act upon the main housing to adjust the bed-plates to set the rolls in relation to each other, substantially as described, for the purpose specified.

5. The metal-reducing rolls, arranged in divergent direction, said rolls having the edges of their ends rounded or beveled, combined with the main housing A, a central feeding-tube, H, the separate housings B B' B^2 for the shaft-bearings, the bed-plates F, and the screws *f' g i*, whereby the roll-carrying bed-plates are adjusted in the direction of the axis of the machine to properly line the rolls transversely, and to adjust said bed-plate radially in relation to said axis to increase and diminish the space between said rolls, substantially as described, for the purpose specified.



6. The combination, with the main housing A and a feeding-tube, H, centrally arranged therein, of the reducing-rolls having their shafts arranged with their axial lines diverging, the bed-plates F, adjustably secured to the main housing, and the separate housings B B' B^2, each provided with adjustable bearings for the roll-shafts, whereby the roll-shafts and their bed-plates are carried and supported out of contact with the said main housing, substantially as described, for the purpose specified.

7. The combination, in a mill for rolling metal articles of cylindrical form, with the reducing-rolls arranged in divergent direction, the main housing A, and a central feeding-tube, H, for the article being reduced, of the chamber L in said housing, through which cold water may be caused to flow over and around that part of said feeding-tube which has its bearing within said housing, substantially as described, for the purpose specified.

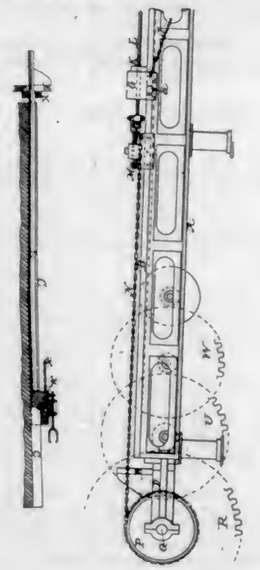
8. In a rolling-mill, the combination, with the main housing A, having the surface projections *h'*, and the central feeding-tube, H, and the rolls, of the bed-plates F for the roll-shafts, having side projections, and the screws *i*, threaded into said housing projections, and adapted to bear upon the bed-plate projections, all constructed and arranged for operation as described.

9. The combination, in a rolling-mill, of the main housing A, having the nose A', the central feeding-tube, H, and the rolls, the bed-plates, within which the roll-shafts are mounted, the several screws for securing and adjusting the bed-plates upon said main housing, and the separate housings B B' B^2, within which the roll-shafts are mounted, each provided with boxes supported upon screws for adjustment in any direction, substantially as described, for the purpose specified.

293,166. METAL-DRAWING DOG. PHILIP M. HAAS, Youngstown, Ohio, assignor of one-half to Andrews, Bros. & Co., same place. Filed Apr 20, 1883. (No model.)

293,166.

Claim.—1. The combination, with a suitable drawing-die, of grasping-dogs, suitable holders therefor, pivoted couplings for the inner ends of said holders, and pivoted operating-connections for their outer ends, connected to the draw-head, whereby the dogs are adapted to operate upon the article being drawn by a compound movement of their biting-points toward each other at right angles to the line of draft, and by a deflection from a right line in their biting action in a direction opposite to that of the draft, substantially as described, for the purpose specified.



2. In a metal-drawing machine, the grasping and drawing device, consisting of the dogs *b b*, their pivoted holders *c c*, their coupling-plates c^2, their coupling-arms *h*, the yoke *i*, provided with the nuts *m*, the draw-head *a*, and the screws *e f*, for adjusting and supporting the dogs, substantially as described.

3. The combination, with a suitable drawing-die, of the dogs *b b*, their holders *c c*, the coupling-plates c^2, to which said holders are pivoted across the line of draft, the pivoted coupling-arms *h h*, the draw-head, and means, substantially such as described, connected with the draw-head and with the coupling-plates, whereby the biting action of the dogs into the article being drawn is automatically limited.

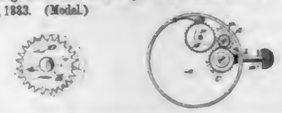
4. The combination, in a metal-drawing machine, a suitable drawing-die, the draw-head *a*, the dogs *b b*, their pivoted holders *d d c c*, the coupling-plates c^2 c^2, the coupling-arms *h h*, the adjustable yoke *i*, and the lever *r*, connected therewith and with the draw-head, substantially as described, for the purpose specified.

5. The dogs *b b*, their holders, and suitable pivoted coupling-connections for their inner ends, in combination with suitable operating-connections pivoted to the outer ends of said dog-holders, and a suitable draw-head, to which said operating-connections are also pivoted, substantially as described, for the purpose specified.

293,167. MACHINE FOR DRAWING METAL BARS. PHILIP M. HAAS, Youngstown, Ohio, assignor of one-half to Andrews, Bros. & Co., same place. Filed Apr. 20, 1883. (No model.)

Claim.—1. The combination, in one machine, of appliances for pushing and for drawing bars or shafts of metal into and through a gaging-die adapted to be shifted in relation to fixed abutments, whereby the said die is placed upon the bar as a preparatory operation of drawing the bar through it, substantially as described, for the purpose specified.

2. In a metal-drawing machine, the combination of a trough-shaped



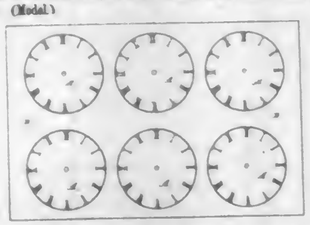
bed or way with a fixed abutment, E, a removable gaging-die, K, a pushing-abutment, M, adapted to slide upon and within said trough, and means, substantially such as described, for drawing said pushing-abutment within said trough against the bar to place the die upon its end, for the purpose specified.

3. The combination, in a metal-drawing machine, of a trough-shaped bed or way, with a fixed abutment, G, a removable gaging-die, K, an abutment, M, adapted to slide upon said trough, a suitable dog or grasping device carried by said sliding abutment, and means, substantially such as described, for operating the drawing device.

4. The combination, with suitable drawing mechanism and a removable gaging-die, of a trough-shaped bed or way, abutments having fixed relation thereto, forming supports for said gaging-die, and an abutment having a nose adapted to slide within said trough to push the bar therefrom into said die, and carrying a suitable dog or grasping device adapted to draw the bar through said die, both the pushing and the drawing operations being in the same direction, substantially as described.

5. In a metal-drawing machine, the combination of a trough-shaped bed or way having a concave line of support for the bar in the line of the drawing action, with the abutment M, having a nose adapted to travel in said trough, an abutment, E, fixed at the end of said trough, a removable gaging-die, and suitable drawing mechanism for said abutment M, substantially as described, for the purpose specified.

293,168. STEM-WINDING WATCH. GEORGE E. HART, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed July 21, 1883. (Model.)

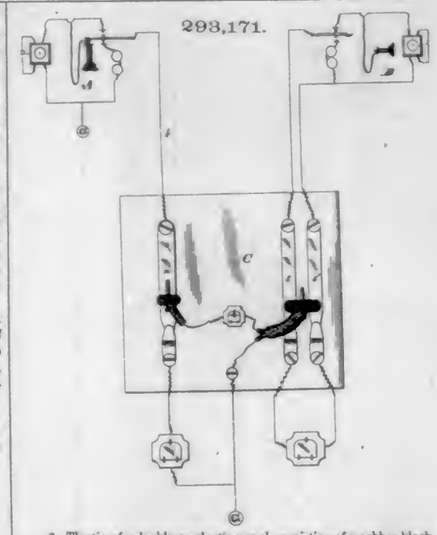


Claim.—A winding mechanism in which are combined the following elements, to wit: a toothed wheel attached to and adapted to rotate a barrel-arbor, a toothed wheel arranged to be rotated by a stem-journaled winding-arbor, and an intermediate wheel which is loosely journaled upon an eccentric or flattened stud, is held in constant engagement with said stem-rotated wheel, and is adapted to automatically engage with said barrel-arbor wheel when rotated in one direction, and to automatically move out of engagement therewith when rotated in an opposite direction, substantially as and for the purpose specified.

293,169. COMPENSATION WATCH-BALANCE. GEORGE E. HART, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Sept. 10, 1883. (No model.)

Claim.—A watch-balance composed of brass, with the inner surface and a portion of the edges of its rim coated with deposited nickel or platinum, substantially as and for the purpose specified.

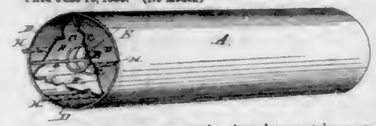
293,170. WATCH-DIAL. GEORGE E. HART, Waterbury, Conn., assignor to the Waterbury Watch Company, same place. Filed Sept. 10, 1883. (Model.)



Claim.—As a new article of manufacture, a watch-dial composed of a metal base or body covered with paper which has printed upon its surface the necessary letters, figures, or characters and time-division marks, and such surface then coated with and protected by means of celluloid, substantially as and for the purpose specified.

293,171. TELEPHONE CIRCUIT-CHANGER. CHARLES D. HASKINS, New York, N. Y., assignor, by mesne assignments, to the Western Electric Company, Chicago, Ill. Filed Feb. 9, 1881. (No model.)

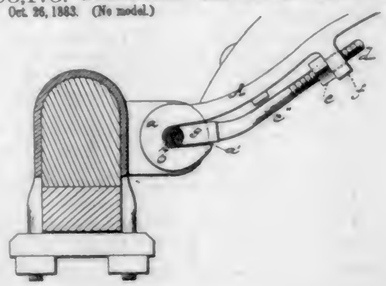
Claim.—1. The combination of spring *n*, stop *o*, and hook *r*, or their equivalents, with a flexible conducting-cord, substantially as and for the purpose specified.



293,171.

2. The tip of a double conducting-cord, consisting of a rubber block provided with eyelet *u* and contact-points *v* and *v'*, each connecting with a strand of the cord, substantially as and for the purpose specified.

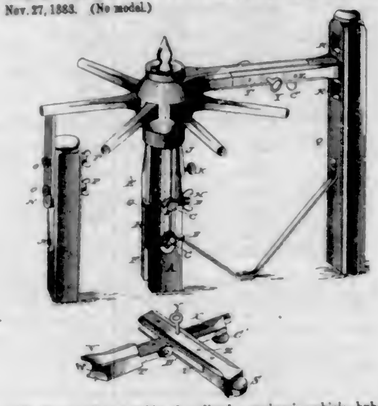
3. The combination, at the central office of a telephone-exchange, of the single switch and the double switch, and means, as described, whereby the single telephone-line of station A and the metallic circuit of station B may be united to form a single ground-circuit, substantially as and for the purpose specified.



293,172. PREVENTING INCRUSTATION IN STEAM-BOILERS. EDWARD J. HOFFMAN, Sioux City, Iowa, assignor of two-thirds to William H. Freed, same place, and William H. Ransom, Missouri Valley, Iowa. Filed June 16, 1883. (No model.)

Claim.—1. A case or receptacle adapted to contain compound or composition for preventing incrustation of steam-boilers, consisting of a closed casing of suitable shape containing one or more inside chambers or compartments adapted to contain the compound, and provided with wires having their ends projecting through apertures in the heads of the casing, and adapted to feed the contents of the same gradually through the apertures, substantially as and for the purpose shown and set forth.

2. The apparatus for preventing incrustation of steam-boilers, consisting of a box or casing, A, of suitable shape, divided longitudinally by diaphragms B into a central compartment, C, and outside compartments, D, and provided with the coiled spring E and twisted wires H, projecting out through apertures in the heads of the casing or receptacle, constructed and combined substantially as and for the purpose herein shown and set forth.

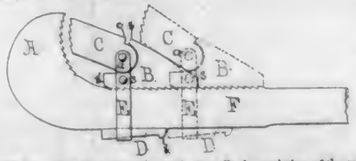


293,173. THILL-COUPLING. ELIAS HOYER, Red Creek, N. Y. Filed Oct. 26, 1883. (No model.)

Claim.—1. In a thill-coupling, the combination, with the coupling-iron A, provided with the hooked end *a*, of the rod *c*, having the flat end *g*, adapted to bear against the coupling-bolt *b*, and forward screw end, *d*, to receive the nut *e*, as shown, described, and for the purpose set forth.

2. In a thill-coupling, the combination, with the axle-clip, the bolt and coupling-iron having hooked end, and provided with the perforated lug rigidly secured thereto, of the rod *c*, having the flat bearing or head *g*, screw-threaded end *d*, and nut *e*, the former adapted to bear against the bolt *b* and the latter against the lug *f*, the whole operating as described, and for the purpose specified.

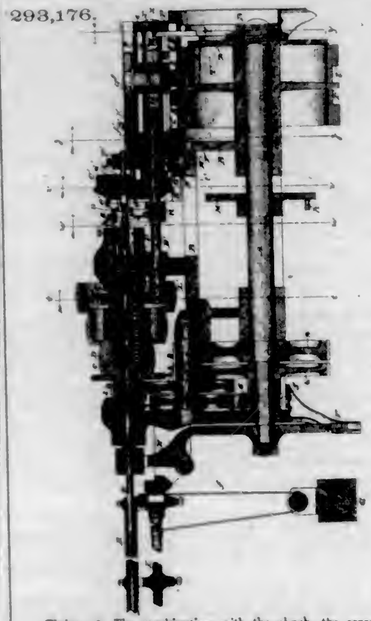
293,174. SPOKE-SETTING MACHINE. JAMES H. HULBURT, Millbrook, Mich., assignor of one-half to George Haggit, same place. Filed Nov. 27, 1883. (No model.)



Claim.—1. In a machine for adjusting spokes in vehicle-hubs, a hub-supporting post having a slotted plate sliding adjustably upon one side, having a bar having its upper end bent sliding in a vertical groove in the other side, having means for clamping it, and provided with two flat bars secured at their upper ends to the upper end of the post, and having means for adjusting their lower ends nearer to and farther from the sides of the same, as and for the purpose shown and set forth.

2. The combination of a hub-supporting post, an upright post having notches in the side facing the hub-supporting post, and a prop consisting of a tenoned portion adapted to engage one of the notches, and having a longitudinal slot, a reduced shouldered portion adapted to bear against the hub and to slide and rock in the slot, a bolt passing through a series of perforations in the sides of the slot and in the reduced end, and a turn-button and a plate attached to the under side of the reduced end, each at one side of the bolt, as and for the purpose shown and set forth.

3. A machine for adjusting spokes in vehicle-hubs, consisting of a hub-supporting post having means for holding the hub and for securing it from rocking, a post having a slotted bar sliding adjustably upon it, adapted to support the outer end of a spoke, a notched bar, and a jointed prop adapted to bear with one end into one of the notches and with the other end against the hub, as and for the purpose shown and set forth.



293,175. PIPE-WRENCH. JAMES JEWELL, Grandville, Mich., assignor of one-half to George Fraser and John J. Fidler, both of same place. Filed Aug. 27, 1883. (No model.)

Claim.—The pipe-wrench herein described, consisting of the toothed jaw A, having the toothed shank F, the toothed block B, pivoted to the pin *a* of the loop E, and having the shoulder *b* and socket, as shown, the jaw C, pivoted to the pin *a* of said loop, and provided with a shoulder, *c*, adapted to abut against the shoulder of the block, whereby strain is relieved on the pin *a*, and the wedge D, for securing the block and shank together, as shown and described.

293,176. METAL-SCREW MACHINE. ALLEN JOHNSTON, Ottumwa, Iowa. Filed July 31, 1883. (No model.)

293,176.

Claim.—1. The combination, with the chuck, the screw-cutting die, and the pointing-tool arranged in line with the axis of the die, of the devices to which said pointing-tool is attached, the said devices being disconnected from the body of said die, so that the pointing-tool constitutes a separate tool, and may by suitable mechanism be made to cut at a different speed from that of the die, substantially as described.

2. The combination, with the chuck, die, and pointing-tool, of the supporting and operating mechanism, substantially as described, whereby the pointing-tool is brought into action while the die is on the screw-stock, and is made to cut the latter at a different speed of rotation from that of the die, as set forth.

3. The hollow screw-cutting die having the cutting-jaws formed in one piece with the body of the die, and provided with an opening in said body of greater diameter than the space between the cutting-edges, in combination with the annular or perforated support for holding the die by the periphery, as explained, so that a pointing-tool can be introduced through said opening into position for acting upon the stock in process of threading, substantially as described.

4. The combination, with the chuck, the die, and the pointing-tool arranged in line with the die, of the mechanism for holding the pointing-tool to its work rigidly and positively instead of by yielding pressure, substantially as described.

5. The combination of the rotary screw-cutting die, the rotating chuck, and the non-rotating pointing-tool, substantially as described.

6. The combination, with the chuck, the turning-down tool, the screw-cutting die, and the pointing-tool, of the automatic mechanism for bringing said tools into action in the order above named and in the manner hereinbefore described.

7. The combination, with the chuck, the chuck-spindle, the cam-shaft, the cam for relieving and restoring the bite of the chuck-jaws, and the mechanism through which the cam controls the said chuck-jaws, of the swinging length-gage mounted upon a stationary part of the machine-frame, and a rotating device—such as an eccentrically-placed pin—carried by a disk on the cam-shaft, and arranged to strike the tail of said length-gage to swing the same across the axis of the chuck, substantially as described.

8. The combination, with the chuck adapted to receive a long rod or screw-stock, and the feed weight and cord, of the slotted tube supported independently of the chuck for upholding the end of the rod or screw-stock outside the chuck-spindle, substantially as described.

9. The turning-down tool movable longitudinally and laterally with respect to the screw-stock, in combination with the mechanism for moving the said tool slightly backward at the end of its cutting action, and then shifting it aside, substantially as described.

10. The combination, with the chuck, the longitudinal slide, the turning-down tool, the screw-cutting die placed immediately behind the turning-down tool, and the cam and connections for operating said slide

to bring said tools into action successively and by the same forward motion, of the separate cam and its connections for moving aside the turning-down tool at the end of its cutting action, substantially as described.

11. The combination, with the rock-shaft supporting the turning-down tool, of the nut or sleeve engaging the said shaft for rocking the same, and imparting thereto a slight end motion in its bearings, substantially as described.

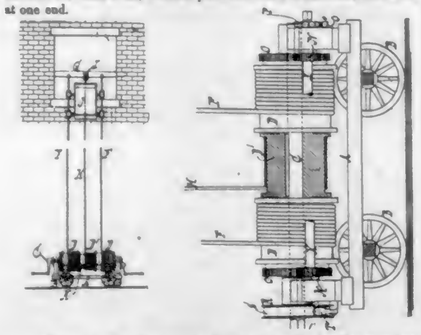
12. The combination, with the main slide, of the screw-cutting die, the auxiliary slide forming a support for said die, and movable in ways of the main slide, and the pointing-tool supported on said main slide, substantially as described.

13. The combination of the rotating sleeve and clutch-piece for revolving the die with the rotating shaft inclosed in said sleeve, the non-rotating clutch-piece surrounding said sleeve, and the clutch-piece revolved by said shaft, substantially as described.

14. The hollow screw-cutting die having cutting-jaws formed integral or in one piece therewith, and provided with an exterior flange at the base for securing it in position in its support, substantially as described.

15. The herein-described automatic screw-machine, comprising the chuck adapted to receive a long rod or screw-stock, the length-gage, the turning-down tool, the screw-cutting die, the pointing-tool, the automatic mechanism for releasing and restoring the bite of the chuck-jaws, the means for advancing the long rod or screw-stock, the automatic mechanism for operating the length-gage, and the automatic mechanism for operating the cutting-off tool, in combination with the longitudinal slide carrying the turning-down tool, the screw-cutting die, and the pointing-tool, the automatic mechanism for reciprocating said slide, the automatic mechanism for revolving and holding stationary the die, and the automatic mechanism for moving aside the turning-down tool and for returning the same, substantially as described.

16. In the screw-cutting die having cutting-jaws formed in one piece with the body of the die and held in by pressure, the compressing means bearing mainly upon the front or cutting side of said jaws, so that the rear or farther part may spring out more or less, and thereby give a slight twist to the jaws, substantially as described.



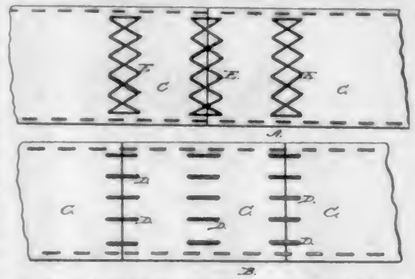
17. The combination, in a screw-cutting die, of the jaws formed all in one piece, with the compressing-ring having bearings upon said jaws mainly over the front or cutting edges instead of over the whole width, substantially as described.

18. In the screw-cutting die, the jaws cut away on the outside so as to leave them thickest at points opposite the front or cutting edges, substantially as and for the purpose described.

19. The screw-cutting die comprising the jaws formed in one piece and screw-threaded on their exterior, and cut away so as to leave threaded bearing-surfaces only opposite the front or cutting edges, in combination with the internally-threaded compressing-ring, substantially as described.

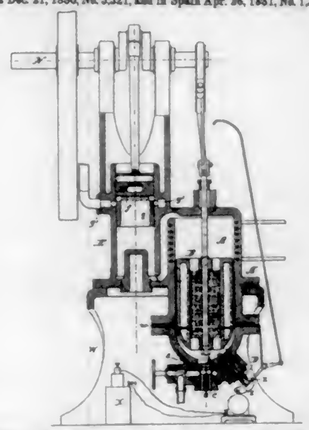
293,177. FIRE-ESCAPE. SAMUEL J. JOYCE, New York, N. Y. Filed Apr. 7, 1883. (No model.)

Brief.—The flexible rails, which form the way for the car, are wound upon the reels, which are loose on the main shaft and move independently therewith by means of a driving-shaft which is geared to them. The other ends of the rails are secured to a cross-bar in the window of the building. The windlass upon which the traction-rope is wound is fixed on the main shaft, which is provided with a brake-wheel and brake at one end.



Claim.—1. The combination of the portable frame, the shaft supported thereby, the two reels and the windlass, all mounted on the one shaft, with the windlass between the two reels and turning with the shaft, and the reels loose thereon, the flexible car-rails arranged on the reels, the traction-rope arranged on the windlass, the car connected with the traction-rope, the brace-bar secured to the car-rails and provided with the guide-pulley, and a driving-shaft for rotating the reels on the shaft of the windlass, substantially as and for the purpose described.

2. The combination, substantially as hereinbefore set forth, of the main shaft, the windlass fixed to said shaft, the reels mounted loosely thereon, the driving-shaft geared with the reels, the ratchet-wheel fixed to the driving-shaft, and the pawl engaging the ratchet-wheel.



3. The combination, substantially as hereinbefore set forth, of the main shaft, the windlass fixed to said shaft, the reels mounted loosely thereon, the driving-shaft geared with the reels, the ratchet-wheel fixed to the driving-shaft, the pawl engaging the ratchet-wheel, the brake-wheel fixed to the main shaft, and the brake-strap acting on the brake-wheel.

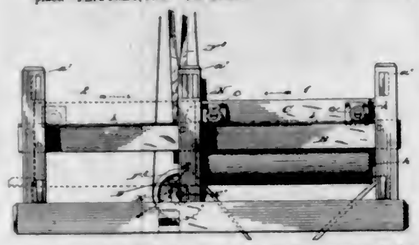
293,178. LEATHER BELTING. HUGH KERR, New York, N. Y., assignor of one-half to Andrew Graf, same place. Filed Nov. 21, 1883. (No model.)

Claim.—The herein-described leather belting, consisting of the sections C, arranged together in layers A B, with the joints of one layer breaking joints with the opposite layer, and the whole being connected together by means of the longitudinal metallic stitching at the edges of the belt and transverse stitches at the adjacent ends of the abutting sections, all substantially as shown, and for the purpose specified.

293,179. GAS-ENGINE. CHARLES WILDEN KING, Manchester, and ALFRED CLIFF, London, assignors to Philip Middleton Justice, Chancery Lane, London, England. Filed Apr. 9, 1883. (No model.) Patented in England Oct. 24, 1879, No. 4,337; in France Apr. 24, 1880, No. 136,313; in Belgium Apr. 27, 1880, No. 51,303; in Germany May 8, 1880, No. 12,183; in Canada Oct. 13, 1880, No. 11,849; in Italy Oct. 16, 1880, No. 40; in Austria Dec. 21, 1880, No. 5,321, and in Spain Apr. 26, 1881, No. 1,366.

Claim.—1. The combination, in a gas-engine, of a cylinder having an exhaust-port communicating freely with the external atmosphere, as described, near its forward end, inlet-port near the rear end, and appliances constructed to open said exhaust for the discharge of spent gases, while the working-piston is at or near the forward position to which it is moved by the explosion of the gases, substantially as set forth.

2. The combination, in a gas-engine, of a cylinder provided with ports near its opposite ends, and means, substantially as described, for supplying an explosive charge at the inner end of the cylinder, and for opening the exhaust as the piston nears its forward position, whereby the incoming fresh charge is made the means of expelling spent gases through the exhaust, substantially as set forth.



3. The combination of the cylinder having its exhaust and inlet

ports at separate points in the cylinder, and a pump and connections whereby the fresh charge is forced in when the exhaust is open, substantially as set forth.

4. The combination of a cylinder having an inlet-port near the rear end, and means for introducing the charge under pressure, and an exhaust-port near the forward end, arranged to be uncovered by the piston as the latter approaches its forward position, and means for then closing the exhaust, so that the further forward movement aids to draw in the new charge, as set forth.

5. The combination of a cylinder having an inlet-port at the rear end, an exhaust which is closed by the piston except when the latter is in a forward position, and means for controlling the ports, substantially as described, whereby each fresh charge is admitted to expel spent gases, is compressed on the inward stroke, and is exploded to impart the outward motion to the piston, substantially as set forth.

293,180. ASPHALT-MIXING MACHINE. WILLIAM H. H. KNIGHT, Washington, D. C., assignor to the Barber Asphalt Paving Company, same place. Filed Jan. 3, 1884. (No model.)

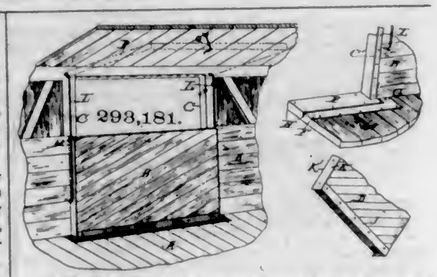
Claim.—1. In a mixing-machine for asphalt, concrete, and other analogous material, the combination of a frame provided with mixing shafts and blades, with a shell or bottom in which the material to be mixed is placed, said shell or bottom having no ends, and means, substantially as described, whereby the shell or case may be moved longitudinally, as and for the purpose set forth.

2. In a mixing-machine for asphalt, concrete, and other analogous material, a frame provided with mixing shafts and blades, in combination with a bottom provided at its bottom and sides with gear rack-bar and rollers, and means for moving said open-ended shell or case in longitudinal direction, substantially as herein set forth and described.

3. In a mixing-machine for asphalt, concrete, and other analogous material, a shell without ends, and provided with gear rack-bar and rollers, in combination with track-timbers secured to the frame, stationary ends, mixing shafts and blades, and means, substantially as described, whereby said shell and mixing-blades are operated, as herein set forth.

4. In a mixing-machine for asphalt, concrete, and other analogous material, the shell C, formed without ends, and provided upon its bottom with a geared rack-bar, D, and upon its sides with rollers *c*, in combination with a gear-pinion, E, mounted upon shaft F, journaled in bearings *d*, said pinion E engaging with the rack-bar D, for the purpose of moving the shell endwise, timbers B, secured to the frame, and provided with tracks *b*, upon which the rollers *c* travel, and mixing shafts and blades, substantially as described.

5. In a mixing-machine for asphalt, concrete, and other analogous material, the ends H H', made separate from the shell C, said ends secured to the frame A, and provided with bearings A', in which are journaled the mixer-shafts I, in combination with said shafts I, and shell C, provided with rack-bar D, rollers *c*, and means, substantially as described, whereby said shell is moved back and forth, as and for the purpose specified.



6. In a mixing-machine for asphalt, concrete, and other analogous material, blades L, the faces at the outer ends of which are at an angle of about forty degrees with the face at a point near the shaft, the face-surface between the points named being somewhat spiral in form, as and for the purpose specified.

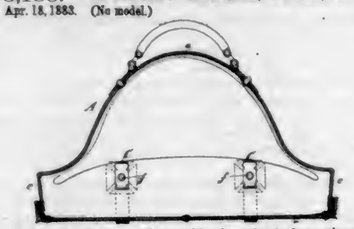
7. In a machine for mixing asphalt, concrete, and material of an analogous nature, the blades L, having faces spiral in form, said blades having a bifurcated end, L', the arms *l* of which embrace the shafts I, and are held in position upon said shafts by tapering pins P, that pass through said arms and shafts, substantially as herein described.

293,181. CAR-DOOR. THOMAS LEE, Cincinnati, Ohio, assignor of one-half to Oliver Kinney, same place. Filed Sept. 12, 1883. (No model.)

Brief.—A flange on the lower edge of the door and flanges at the ends enter an angled groove in the floor. The latter is provided with perforations to permit escape of water.

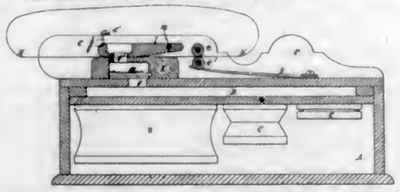
Claim.—1. A plain car-door frame having along the floor an angled groove or recess, H, to receive the flange of the door, said groove having holes I through the floor, substantially as herein set forth.

2. The floor of the car-door opening having the angled groove H, in combination with the door D, having the projecting or flanged ends J K' to enter the grooved floor, substantially as herein set forth.



3. The combination of the car-door opening having the angled groove E in the floor and the vertical bars or rods L on the sides, with the door D, having the staples or eyes M and the flanged lower end, substantially as herein set forth.

293,182. RIPPING ATTACHMENT FOR SCISSORS. FRANCIS S. LOCKERMAN, Manokin, Md. Filed Oct. 31, 1883. (No model.)



Claim.—An improved ripping attachment for ordinary scissors, consisting of a casing secured to the under side of one of the handles, and a ripping-blade pivoted to and adapted to fold within said casing, substantially as set forth.

293,183. CASE FOR HATS. JAMES LUKER, New York, N. Y. Filed Apr. 18, 1883. (No model.)

Claim.—In a hat-case, the combination of a body portion having an upper compartment shaped internally to approximate to the external contour of a hat such as is worn by a Knight Templar, and adapted to contain the hat in an upright position, a handle at the top of the body portion, which will be adjacent to the top of the hat, a strap or straps adapted to extend across the body portion under the hat, so as to support the hat and retain it in its compartment, a lower compartment into which the feather of the hat may extend, and in which other articles may be placed, and a cover applied to the bottom of the body portion, and forming the bottom of said lower compartment, substantially as specified.

293,184. MECHANICAL MUSICAL INSTRUMENT. NEWMAN E. MARSHMAN, New York, N. Y. Filed Nov. 6, 1877.

Claim.—1. In a mechanical musical instrument, the combination of a series of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, and a cap or presser arranged immediately over said rest and holding the music-sheet thereto, substantially as specified.

2. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet travel-

ing over said rest and controlling the operation of said sound-producing devices, and a cap or presser provided with apertures extending between its exterior and the music-sheet, arranged immediately over said rest and holding the music-sheet thereto, substantially as specified.

3. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, and a cap or presser arranged immediately over said rest for holding said music-sheet to the rest, and capable of movement toward and from the rest, substantially as specified.

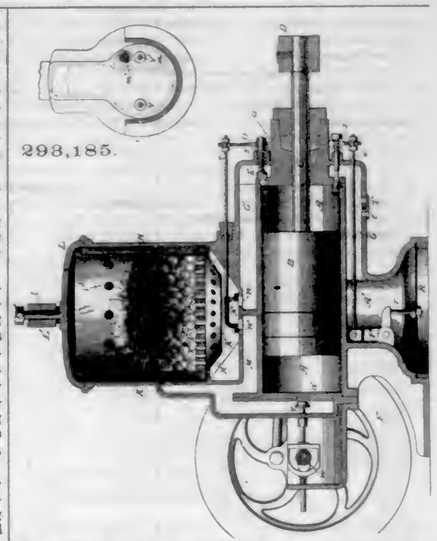
4. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, and a cap or presser arranged immediately over said rest for holding the music-sheet thereto, and pivoted longitudinally, substantially as specified.

5. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, a pivoted cap or presser arranged immediately over said rest for holding the music-sheet thereto, and springs for impelling and holding said cap or presser against the music-sheet, substantially as specified.

6. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, a cap or presser arranged immediately over said rest, and springs for impelling and holding said cap or presser against the music-sheet, substantially as specified.

7. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, and a cap or presser arranged immediately over the rest and bearing upon said music-sheet opposite partitions in the rest between the said openings, whereby said music-sheet is held tightly against said rest, substantially as specified.

8. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, and a cap or presser arranged immediately over the rest and bearing upon the music-sheet opposite a portion of the rest at the front and rear of said openings, whereby said sheet is held tightly against said rest, substantially as specified.



9. In a mechanical musical instrument, the combination of sound-producing devices, a rest provided with openings, a music-sheet traveling over said rest and controlling the operation of said sound-producing devices, a cap or presser arranged immediately over said rest and holding said music-sheet thereto, and guide-rails for the music-sheet, substantially as specified.

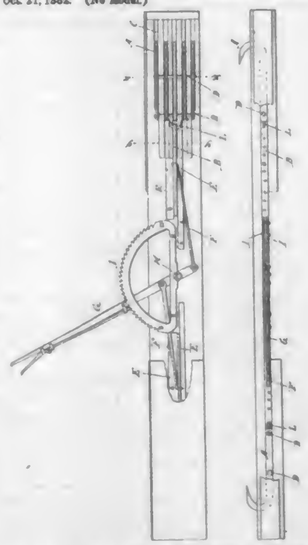
10. In a mechanical musical instrument, the combination of reeds, chambers containing said reeds, air-ducts communicating with said chambers on one side, transverse openings communicating with said chambers at the opposite sides, but out of line with said air-ducts, and a perforated music-sheet acting as a valve, whereby the passage of air through said openings is controlled, the reeds and the music-sheet, as it travels, being approximately parallel, substantially as specified.

11. In a mechanical musical instrument, the combination of a reed, a reed-chamber, an air-duct communicating with one side of said chamber, a transverse opening communicating with the opposite side of said chamber, but out of line with the said air-duct, and a slide-valve for controlling the passage of air through said opening and operating upon said opening in a plane parallel with said reed, substantially as specified.

12. In a mechanical musical instrument, a cap or presser held against a music-sheet in proximity to the reed-ducts by spring-pressure, substantially as specified.

293,185. HOT-AIR OR GAS ENGINE. HIRAM S. MAXIM, Paris, France. Filed Jan. 31, 1883. (No model.)

293,185.



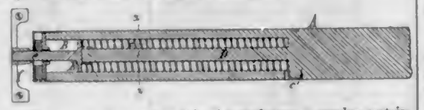
Claim.—1. In an air or gas engine, the combination of a cylinder and piston, a flame or fire chamber, passages or chambers of communication from said flame or fire chamber to opposite ends of the cylinder, valves located at opposite ends of the cylinder, those at one end operating, in conjunction with the piston, as a compressor, and those at the other end for admitting and exhausting air to and from the working end of the cylinder, passages and a valve arranged to connect said passages of communication independently of the fire or flame chamber, and automatic means for operating said valve to shunt all or a portion of the air entirely from said flame or fire chamber in its route from the pumping to the working end of the cylinder, substantially as described.

2. In an air or gas engine having a fire-chamber in communication with the opposite ends of its cylinder by means of suitable passages and valves, and suitable shunt-passages arranged to connect the opposite ends of the cylinder independently of the fire-chamber, a valve arranged to control the flow of air through said shunt-passages, an air space or chamber connected with the pumping end of the cylinder, a flexible diaphragm, forming one of the walls of said space or chamber, and devices connecting said diaphragm with the valve controlling the shunt-passages, and arranged to move said valve in proportion to the pressure on the diaphragm, substantially as and for the purpose set forth.

3. The method herein described of regulating the speed of an air or gas engine, which consists in shunting, through a route distinct from and independent of the fire-chamber, a portion or the whole of the air or gas forced into the engine, as and for the purpose set forth.

4. The method herein described of increasing the efficiency of an air or gas engine, the same consisting in adding a small portion of cool air to the gases issuing from the fire on their way to the cylinder, essentially as set forth.

293,186. SAW-MILL DOG. JOHN J. MCGILLIS, Marinette, Wis. Filed Oct. 21, 1882. (No model.)

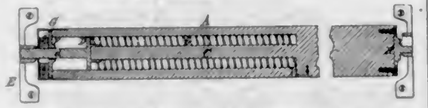


Claim.—1. In a saw-mill, an ordinary reciprocating carriage on which the log rests, in combination with one or more dogs arranged at each end of the carriage, and mounted thereon in a way to permit a reciprocating movement of said dogs on the carriage, a lever on the carriage, and devices for connecting the respective dogs to said lever, whereby the dogs may be operated simultaneously and from one position to dog and undog the logs upon the carriage, substantially as described.

2. In a saw-mill, the log-carriage provided with grooves C at each end, in combination with dogs A, arranged to slide in said grooves at each end of the carriage, the links L, the link-bars B, the connecting-rods F, and the lever G, substantially as and for the purposes set forth.

3. The reciprocating log-carriage, in combination with the sliding dogs A at each end thereof, the lever G on the carriage, the rods F, connecting the dogs at the respective ends of the carriage to the lever on opposite sides of its pivot, the notched segment I, and a pawl on the lever arranged to engage with said segment, substantially as and for the purposes set forth.

293,187. CURTAIN-ROLLER. CHARLES H. MILLER, Buffalo, N. Y., assignor, by direct and mesne assignments, to Edward S. Warren, same place. Filed Mar. 12, 1877. Renewed Mar. 31, 1879.

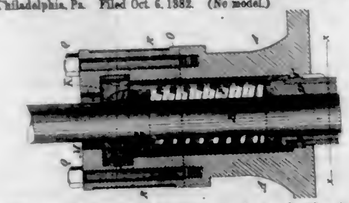


Brief.—The core around which the coiled spring is wound is made integral with the roller inclosing the coiled spring.

Claim.—1. As a new article of manufacture, a wooden curtain-roller provided with the bore B, and having the axial bar D, made in one piece with the roller, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the hollow roller A, of the bar D, formed therewith, so as to rotate with the roller, stationary bearing E *c*, in which the outer end of the bar D rotates, and spiral spring *c*, secured with its ends, respectively, to the roller A and bearing E, substantially as and for the purpose hereinbefore set forth.

293,188. CURTAIN-FIXTURE. CHARLES H. MILLER, Jr., Buffalo, N. Y., assignor to the Buffalo Curtain Fixture Company, same place. Filed Mar. 6, 1877. Renewed Mar. 31, 1879.



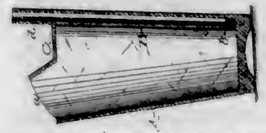
Claim.—1. The combination, with a spring curtain-roller having flattened shank *d*, of one or more sliding catches, *g*, provided on the inner side with a concave portion and projecting lip, as and for the purpose shown and described.

2. The combination, with a spring curtain-roller having a flattened shank, *d*, of the plate F, provided with parallel guide-bars *f f*, and one or more sliding catches, *g*, provided on their inner side with a concave portion and projecting lip, substantially as and for the purpose hereinbefore set forth

---

293,189. METALLIC ROD PACKING. EDWIN PEAR MONROE, New York, N. Y., assignor to the United States Metallic Packing Company, Philadelphia, Pa. Filed Oct. 6, 1882. (No model.)

Claim.—1. The combination of the valve box or chamber A, rod B, support C, and lining D, substantially as described.

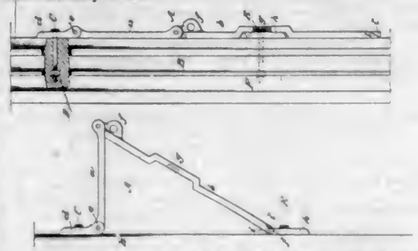


2. The combination, with the packing-receptacle and the stuffing-box cover, having bearing-surfaces arranged in juxtaposition, so as to allow of the sliding of the former upon the latter, of the ring of Babbitt or other anti-frictional metal inserted in the face of the packing-receptacle, so as to move therewith and bear upon the face of the stuffing-box cover, substantially as described.

3. In a metallic packing for valve or other rods, the combination, with the packing-rings, of a tapering coiled metallic spring having at each end two or more of its coils or turns brought in contact, to form abutments or bearings, substantially as described.

4. The combination of the valve box or chamber A, support C, spring F, follower G, packing-rings H I, packing-receptacle J, and covers M O, substantially as described.

5. In a metallic packing for valve or other rods, the combination of the packing-receptacle J and the stuffing-box cover M, provided with the brass lining P, substantially as described.

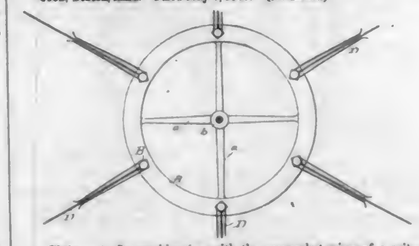


293,190. DRINKING-GLASS. EDWARD L. MOORE, Knoxville, Tenn., assignor to himself and Thomas J. Smith, Chicago, Ill. Filed Jan. 4, 1884. (No model.)

Claim.—As a new article of manufacture, the drinking-vessel having the body A, tube B, projecting mouth-piece *d*, cover C, and opening *a*, substantially as described.

293,191. FIRE-ESCAPE BRACKET. CHARLES MURDOCK, New Rochelle, N. Y. Filed Nov. 6, 1883. (No model.)

Brief.—A folding bracket, the long section of which has a bend in its center for folding over the step when not in use, and the ends of said section and the step so beveled and formed as to prevent all lateral movement when ready for use.

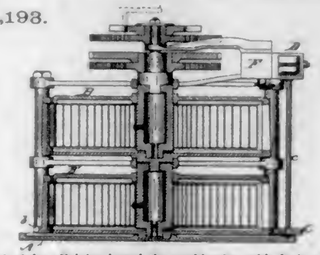


Claim.—1. A fire-escape bracket consisting of the securing-plate *d*, to which is hinged the short section *a*, carrying the section *b*, formed with an eye at its upper end, angular bend or recess near its middle portion, and a projection on its free end for engaging the step *h*, bolted to the window-casing, substantially as set forth.

2. In a folding bracket, the step *h*, beveled at its upper end, and formed with the inwardly-beveled projections *j j*, in combination with the section *b*, formed with the projection *i*, and beveled portions *i*, for engaging the beveled projections *j j*, whereby all lateral movement of the section *b* is prevented, substantially as set forth.

3. In a folding bracket, the section *b*, bent in the center, as at *g*, to fold over the step *h*, substantially as herein shown and described.

293,192. CASH-CAR SYSTEM. BYRON A. OSGOOD and EDWIN P. OSGOOD, Boston, Mass. Filed May 7, 1883. (No model.)



Claim.—1. In combination with the suspended wires of a railway cash system, a supporting bar or ring and pins set therein, and adapted to be connected to the wires and to turn to wind up said wires, said pins having suitable retaining devices, substantially as described.

2. In combination with the wires and supporting bar or ring of a cash-car system, an arresting-stop or a spring-buffer adapted to receive and hold the car.

293,193. SPRING-MOTOR. JOHN R. POWELL, Philadelphia, Pa., assignor to the Powell Motor Company, (Limited,) same place. Filed Oct. 31, 1883. (No model.)

Claim.—1. In a spring-motor comprising two or more barrels, each having its own shaft and spring, the barrel of one shaft being coupled to

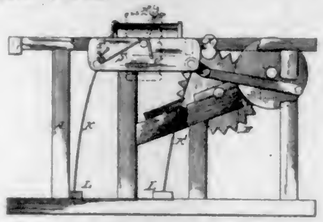
293,193.

the shaft of the adjoining barrel, the combination, with the barrel at that end of the motor opposite to the end where the power of the springs is directly given off, of a winding gear-wheel, substantially as and for the purpose set forth.

2. In a spring-motor comprising two or more barrels, each barrel having its own shaft and spring, and the barrel of one shaft being connected to the shaft of the adjoining barrel, the lower or end barrel formed or provided with gear-teeth, so as to serve as a winding-wheel, substantially as and for the purpose set forth.

3. The combination, with barrel B', formed or provided with gear-teeth, of pinion C on a vertical shaft, *c*, substantially as and for the purpose set forth.

4. In combination with winding-wheel B', the automatic clutch H, comprising a sliding pawl or wedge, *h*, and cam-shield *h'*, substantially as shown and described.

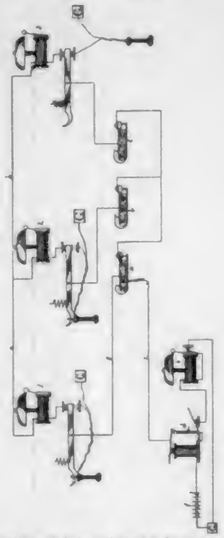


293,194. PREVENTING RAILROAD-TRACKS FROM SPREADING. JOHN REVEN, Lancaster, Pa. Filed May 9, 1883. (No model.)

Brief.—An iron bar with a screw-thread at the end, the other end bent to fit the outside of the rail. On this bar there are three movable slotted flanges with side projections to fit into the sides of the rails, one on the outside and two on the inside of each rail. These flanges are secured against the rails by keys and nuts and washers.

Claim.—The rod passing under the rails with a fixed flange or bent portion at the one end, in combination with the three movable flanges, the keys, and the nut and washer to keep them in position, substantially as and for the purposes as set forth.

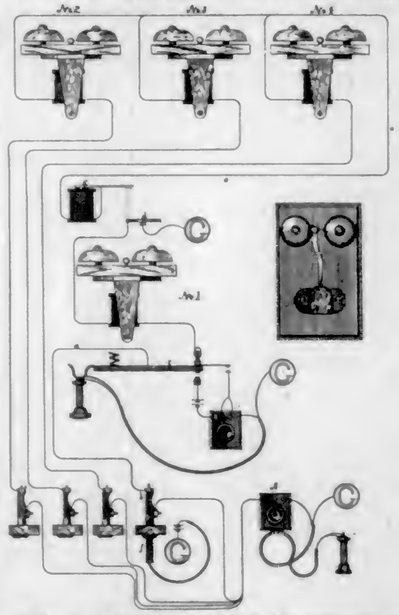
293,195. CHURN. WILLIAM H. ROTHWELL, Midway, Va. Filed Aug. 10, 1883. (No model.)



Claim.—1. The combination of the frame A, drive-wheels B, D, and F, shaft E, pitman H, vibrating frame I J, fixed and supported upon the springs K, and having the boxes M and set-screw R, cylindrical churn-body O, having trunnions N, and spring-catches S, the whole constructed to operate substantially as and for the purpose shown and set forth.

2. In a vibrating-body churn, the combination of the vibrating spring-supported frame I J, having the boxes or bearings M, churn-body O, having trunnions N, set-screw R, and spring-catches S, substantially as and for the purpose shown and set forth.

293,196. NIGHT-SIGNAL CIRCUIT FOR TELEPHONE-EXCHANGES. CHARLES E. SCRIBNER, Chicago, Ill., assignor, by mesne assignments, to the Western Electric Company, same place. Filed June 20, 1881. (No model.)

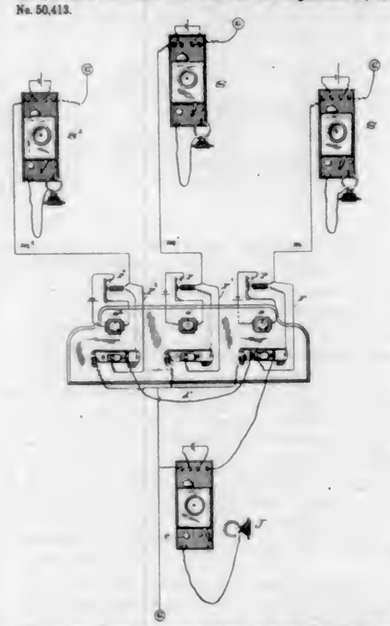


Claim.—The combination, in a telephone-exchange, with several individual telephone-lines connected together by a common outer line, of a branch circuit to ground at the central office containing a battery

293,196.

and annunciator, said branch being adapted to be connected at the central office to any one of the telephone-lines, and switching apparatus at each subscriber's station, whereby the branch containing the battery and annunciator may be closed to ground at any subscriber's station through one or more of the individual lines and the common outer line.

293,197. ANNUNCIATOR-SWITCH AND TELEPHONE-CIRCUIT. CHARLES E. SCRIBNER, Chicago, Ill., assignor, by mesne assignments, to the Western Electric Company, same place. Filed Dec. 12, 1881. (No model.)



Claim.—1. The combination of a group of telephone-lines with any usual central office and subscribers' outfits, with switching devices, one in the circuit of each line between the bell-magnet and common outer line, whereby any line may be separated from the group and connected to ground, as and for the purpose set forth.

2. The combination of the annunciator-shutter with the contact piece or catch and the lever of the automatic switch, whereby the subscriber is compelled to replace the shutter before hanging the telephone on the switch.

3. The combination, with the switch at a subscriber's station, of the shutter of an annunciator, adapted to be operated by current sent from the central office, and means whereby the subscriber must replace said shutter after a call before hanging up the telephone.

293,198. TELEPHONE-SWITCH. CHARLES E. SCRIBNER, Chicago, Ill., assignor, by mesne assignments, to the Western Electric Company, same place. Filed Aug. 23, 1879. Patented in England Nov. 29, 1879, No. 4,903; in France Jan. 15, 1880, No. 134,596, and in Belgium Jan. 28, 1880, No. 50,413.

Claim.—1. In a telephone-exchange, two subscribers' telephone-lines, each line permanently connected with the metallic frame of its switch at the exchange-station, the switch of each line being provided with an insulated ground-contact point, a contact-piece which closes on said contact-point, and a plug-hole in the frame adapted to direct a plug against said contact-piece, in combination with a flexible conducting-cord provided with terminal plugs, whereby the two telephone-lines may be connected together while the contact-pieces are at the same time disconnected from the ground-contact points.

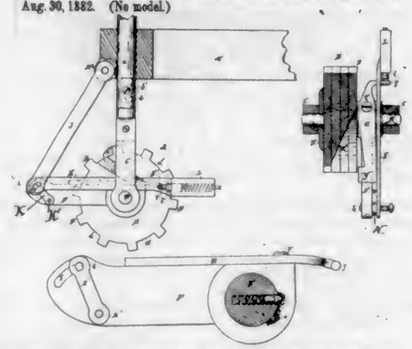
2. The combination, in a telephone-exchange switch, of a metallic frame provided with a plug-hole and insulated ground-contact point, a telephone-line permanently in electrical connection with the movable contact piece or lever of the switch, and a metallic pointed plug adapted to be inserted in said plug-hole, whereby the switch-lever is disconnected from the contact-point and connected to the plug-point, as and for the purpose specified.

3. The switch, in combination with the plug and circuits, whereby the relay is shunted at the same time the ground-wire is taken off.

4. A switch provided with two plug-holes and contact-points C D, in combination with a plug and means whereby the contact of said points is broken when a plug is inserted in either hole, said points closing when said plug is removed—that is, when there is no plug remaining in either hole.

5. A switch consisting of frame E, lever B, and spring I, combined substantially as set forth.

6. A switch consisting of frame E, lever B, spring I, block of hard rubber *b*, and plate *a*, combined substantially as and for the purpose specified.



7. In a telephone-switch, plate *a* and frame E, insulated by a block of insulating material, and combined substantially as shown and set forth.

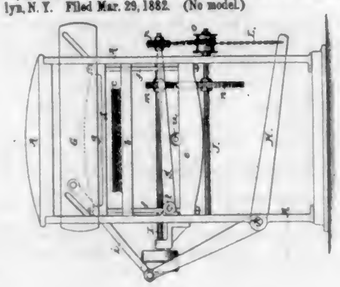
8. In a telephone-switch, the combination of plate *a* and insulated frame E, with lever B, contact-points C D, and a conducting-plug, whereby the circuit is broken at point D, while at the same time the frame E and plate *a* are connected.

9. The combination, with the telephone-lines connected together for conversation, of a branch circuit to ground at the central office, including a telephone and a switch and plug provided with a flexible conducting-cord, as described, whereby said branch circuit may be connected with and disconnected from the circuit of said united telephone-lines.

10. In a spring-jack switch, the combination, with a normally-insulated metallic piece, of a movable contact piece or lever, a contact point, and a connecting-plug adapted to separate the said movable contact piece or lever from said contact-point, and at the same time to form an electric connection between said movable contact piece or lever and said normally-insulated metallic piece.

293,199. PAGING AND NUMBERING MACHINE. CHAS. SEYBOLD, Cincinnati, Ohio, assignor of one-half to Alexander Reid, same place. Filed Aug. 30, 1882. (No model.)

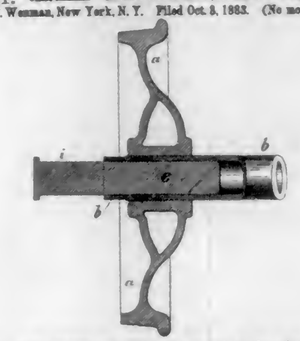
Claim.—1. The combination of the disks B, vibrating lever F, provided with pawl G, and means, substantially as described, for causing said pawl to approach and recede from the disks, and the connecting-rod J, connecting the end of the lever to the neck of the machine, substantially as and for the purposes specified.



2. The combination of the disks B, provided with notches *d* and the inclined notches *d'*, and the vibrating lever F, provided with the pawl G and sliding bar H, and the connecting-rod J, connected at one end to the sliding rod and at the other end to the neck of the machine, substantially as and for the purposes specified.

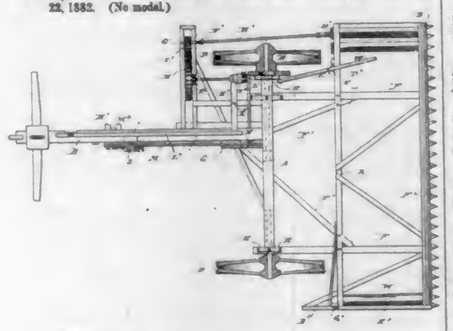
3. The disks B, provided with notches, substantially as described, in combination with the vibrating lever F, pawl G, sliding bar H, and connecting-rod J, the pawl G being pivoted at *g'* to the vibrating lever and one end of said pawl being provided with an arm, *g*, which passes through an opening near one end of the sliding bar, substantially as and for the purposes specified.

4. In combination with the disks B, the pawl G, pivoted at *g'* to the vibrating lever F, and provided with arm *g*, the sliding bar H, provided with slot H', through which the arm *g* passes, and the connecting-rod J, connected at one end to the neck of the machine and at the other end connected to the sliding bar H by the pin A, said pin being capable of moving in the slot *f* in the end of the vibrating lever F, substantially as and for the purposes specified.



5. The combination of the connecting-rod J, sliding bar H, and vibrating lever F, the end of the rod being connected to the end of the sliding bar by a pin, A, said pin being connected to the vibrating lever by a link, K, and located in a slot, *f*, in the end of said lever, substantially as and for the purposes specified.

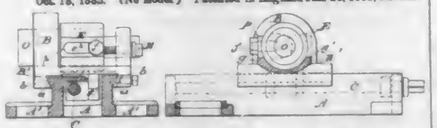
293,200. PAPER-CUTTING MACHINE. EDWIN R. SHERIDAN, Brooklyn, N.Y. Filed Mar. 29, 1882. (No model.)



Claim.—In combination with the usual clamping-frame, knife-bar, and connected main lever for pulling down the latter, an intermediately-arranged auxiliary lever, S, provided with a sheave, *p*, and the usual winch, O, and chain L, the latter arranged in the manner specified, and the whole adapted to operate as and for the purposes hereinbefore explained.

293,201. CAR-AXLE. GEORGE W. STEWART, Atlanta, Ga., assignor to James F. Wenman, New York, N. Y. Filed Oct. 3, 1883. (No model.)

Claim.—The tubular axle and wheel, united by the wheel being driven upon the tubular axle so that the end of said axle passes through the wheel, in combination with a journal having a solid projecting inner end that fits the interior of the tubular axle and is driven tightly into the same, but is removable therefrom, substantially as set forth.

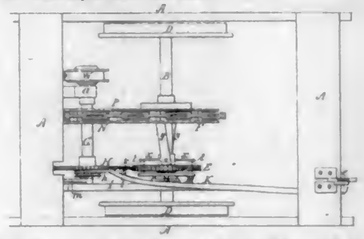


293,202. HARVESTER. CHARLES S. STICKLE, Pekin, Ill. Filed June 22, 1883. (No model.)

Claim.—1. The combination, in a harvester, of the transverse bars F^2 K, the side bars, F, the converging bars F', the upright standards carrying the adjustable bearings, and secured to the bars F, the tongue B, the transverse bar A, the fixed bearing secured thereto, and short independent axles carried in said bearings, substantially as specified.

2. The combination, in a harvester constructed substantially as described, of the transverse bars F^2 K, the converging and rearwardly-extending bars F' F', the curved bar G, the tongue, the tilting lever having a keeper and a spring-catch, and fulcrumed between the standards secured to the tongue, the ratchet attached to the tongue, and the rod connecting the lever with the curved bar, as and for the purpose specified.

293,203. MACHINE FOR TRUING GRINDSTONES. FRANK THIER, Westminster, England, assignor to A. C. Baldwin, Boston, Mass. Filed Oct. 18, 1883. (No model.) Patented in England Jan. 20, 1883, No. 341.



Claim.—1. In a stone working or dressing machine, the cylindrical sleeve adapted to be detachably secured to the cutter-carrying bar, provided with a lug, *p*, and slot e^2, in combination with the trough H' and slide B, whereby the angle of inclination of the cutter can be changed by the partial rotation of the sleeve, as set forth.

2. In a stone-dressing machine, the cutter-carrying slide B, having a trough, H', in which is located a sleeve, E, for holding the cutter-carrier O, said sleeve being provided with a lug or projection, *p*, which is adapted to impinge against the edges of the trough, as and for the purpose set forth.

3. The sleeve E, mounted in the slide B, as described, provided with the slotted projection *p*, in combination with the cutter-carrying bar O and set-screws *f* and H, as set forth.

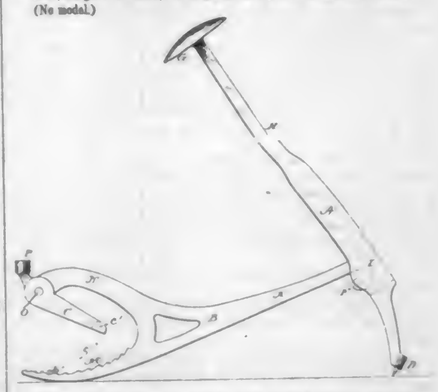
293,204. SPRING CAR-STARTER. WILLIAM A. WARRINER, Franklin, Gloucester County, N. J., assignor, by direct and mesne assignments, of one-half to Olin B. Pendleton, Brooklyn, N. Y., and Jesse Myers, Towanda, Pa. Filed May 24, 1883. (No model.)

Claim.—1. A spring car-starter in which the axle B, having a chain-wheel, F, and pinion E, with pawl-connection, is combined with a spring-shaft, G, having chain-wheel N and spur-wheel H, a belt, P, and means for moving said shaft so as to throw the wheel H into and out of gear with the pinion E, as set forth.

2. The combination of the axle B, the wheel F, the pinion E, and the spring-pawls *y*, carried by the pinion and bearing on the wheel, with the spring-shaft, its wheels H and N, and the belt P, as set forth.

3. The combination of the axle B, the wheel F, the pinion E, the pawls *y*, hung to said pinion and having arms *x*, and the adjustable disk M, having pins *t*, for acting on said arms, as set forth.

4. The combination of the axle B, the wheel F, pinion E, the pawls *y* and their arms *x*, the disk M and its pins *t*, and a cam-plate, *n*, for adjusting said disk, as set forth.



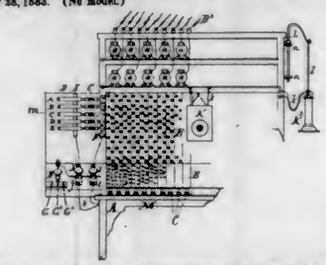
5. The combination of the axle B, its wheel F and pinion E, the spring-shaft G, its wheel N and spur-wheel H, the belt P, the bar I, carrying one end of said shaft G, the spring *f*, and the lever J, for acting on said bar I, as specified.

6. The combination of the spring-shaft G, having a scroll-cam, *k*, and stop-arm *m*, with the arm K under control of said scroll-cam, as set forth.

7. The combination of the spring-shaft G, having a scroll-cam, *k*, and wheel H, with stop-pin *k*, with the arm K, controlled by the cam *k*, and having a stop-lug, *i*, as set forth.

8. The combination of the axle B, the pinion E and its pawls, the disk M, having pins acting on said pawls, the shaft G, having a cam, *k*, and the arm K, controlled by said cam *k*, and having a cam-plate, *n*, for actuating the disk M, as set forth.

293,205. CARPET-STRETCHER. NORMAN WIARD, Washington, D. C., assignor to Henry R. Hughes, same place. Filed Nov. 22, 1883. (No model.)



Claim.—1. A thrust carpet-stretcher provided with a grip attachment, as described.

2. A thrust carpet-stretcher having bar H, provided with points D, head G, and means for attaching a grip mechanism.

3. The part B, provided with clutch M C and hammer-head P.

4. An implement formed of parts A B, arranged for use alternatively together and separately in putting down carpets, substantially as and for the purpose set forth.

293,206. LOOPING-IN MECHANISM AND OPERATOR'S APPARATUS FOR TELEPHONE EXCHANGES. EUGENE M. WILSON, Worcester, Mass., assignor of one-half to Alice P. Carpenter, Foxcroft, Me. Filed July 28, 1883. (No model.)

Claim.—1. The slide-bar C, in combination with its guide C', springs D and F, and contact-bar E, with their respective conductors or wires, D *d e f*, substantially as and for the purpose described.

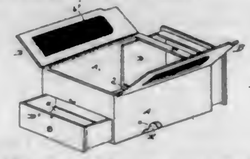
2. In a looping-in device for telephone apparatus, the reciprocative slide-bolt C, mounted in the guiding-case C', fixed upon the table, and provided with the thumb-knob *c*, in combination with contact plates or springs at its front and rear ends, said parts being adapted for making and breaking the circuit through the operator's loop, in the manner set forth.

3. In a system of individual switch-board tables for telephone-exchange, the combination, substantially as described, of the interexchange lines W' W^3, &c., connecting with the indicating-drops on the respective tables, the reciprocating slides C, the springs D, the contact-plates E, and signaling-keys J I, connected with said contact-plates in series *m*.

4. In a system of individual operators' tables for telephone-exchanges, the combination, substantially as hereinbefore described, of the lines D', connecting, through the annunciators or indicating-drops *a* on the tables, the main series M of springs and reciprocative slides, the switch-board B, the contact-bars E and F, the signaling-keys I and J, the operator's loop *k*, an electro-generator, with conducting-wires arranged and organized for operation as set forth.

5. In a system of individual operators' tables for telephone-exchanges, the combination, with the switch-board B, the subscribers' lines D', entering thereon, and the operator's loop *k*, of a main series, M, of looping-in mechanism, constructed as shown and described, for looping in the operators' instruments, and the minor series *m* of looping-in mechanism, with circuit-lines, as W' W^3, &c., connecting with other tables, and the signaling-keys I and J, with their anvils, back contacts, and generator-conductors adapted for signaling in both said main and minor series of mechanism, as set forth.

6. The combination, with a switch-board table and telephone-lines entering thereon, of the series of springs D, connected to said lines, the reciprocating slide-bar C, mounted for action, as described, and connected with the line-bars *b* on the switch, the contact bars or plates E and F at the respective ends of said slides, the signal-keys I and J, connected with said plates and having their back contacts, *i* and *j*, connected with the operator's instrument, and the anvil *k*, connected with an electro-generator or battery, substantially as and for the purpose set forth.



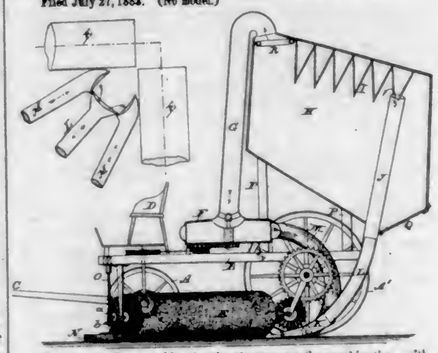
7. The combination, with a switch-board stand for telephone-exchanges, of the swinging crane L and dependent chain *l*, adapted for supporting the operator's receiving-telephone, substantially as shown and described.

293,207. MANUFACTURE OF ARTIFICIAL STONE. RUDOLF C. WITTMANN, New York, assignor to himself and Charles Nelson, East New York, N. Y. Filed July 12, 1883. (No specimens.)

Claim.—1. An artificial stone prepared by mixing together a salt of magnesia—such as carbonate or silicate of magnesia—and a binding material—such as carbonate of lime—then adding to this mixture a sufficient quantity of muriatic acid to moisten the mass, and finally compressing this mass in suitable molds, substantially as described.

2. An artificial stone prepared by mixing together a salt of magnesia—such as carbonate or silicate of magnesia—and a binding material—such ascarbonate of lime—then adding to this mixture a sufficient quantity of muriatic acid to moisten the mass, then introducing into a suitable mold a bottom layer of this moistened mass, an intermediate layer of pasteboard, wood, muslin, or equivalent material, and a top layer of the moistened mass, and finally compressing the whole, substantially as set forth.

293,208. GRASS-COLLECTING ATTACHMENT FOR LAWN-MOWERS. JOHN H. WYNN, Oakland, Cal., assignor of one-half to Maier A. Cahn, same place. Filed Mar. 30, 1883. (No model.)

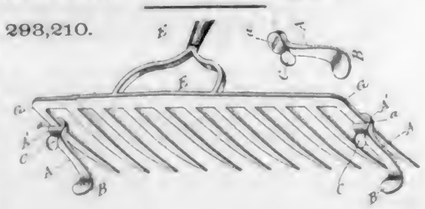


Claim.—1. The herein-described detachable grass-collecting attachment for lawn-mowers, consisting of the frame A, adapted to fit over and inclose the cutting apparatus of the mower, the removable drawers or compartments D D', the lid or cover B, and means for attaching the rear end of the frame to the mower-handle, constructed for application and use substantially as set forth.

2. The combination of the box A, having covered top B, and the space E in the bottom to receive the cutters of a lawn-mower, the front receptacle, D', and the rear receptacle, D, adapted to be withdrawn from the box to discharge its contents and clean out the receptacles, substantially as and for the purpose set forth.

3. A detachable grass-collecting box for lawn-mowers, having the drawers D D' in front and rear of the mower, covered sides, and hinged top, provided with the wire-cloth portions *b'*, substantially as set forth.

293,209. STREET-SWEEPER. JAMES P. HERRON, Washington, D. C. Filed July 27, 1883. (No model.)



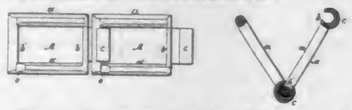
Claim.—1. In a machine for cleaning streets, the combination, with the frame and carrying-wheels, and suitable brooms arranged to sweep the dirt into a ridge or ridges, of a dirt-chest provided with a conduit-tube arranged to travel close to the surface of the street and in a path coincident with the ridge of dirt, and also provided with a suction-pipe having an exhaust-fan, whereby a vacuum is created in the dirt-chest, operating to raise the dirt through the inlet-tube and deposit it in the dirt-chest, substantially as described.

2. In combination with the frame, carrying-wheels, dirt-chest, and exhaust-fan, arranged as described, and the conduit-tube, the blast-tubes M M, arranged each side of the conduit-tube, the blast from which directs and assists the dirt in the movement toward and up the conduit-tube, substantially as and for the purpose set forth.

3. In combination with the revolving brooms E, the end brushes, N, mounted on vertical shafts geared with the shafts of the brooms E, whereby the dirt near the curb is swept into the path of the brooms E, substantially as and for the purposes set forth.

4. The inlet-tube having a flexible section, L, and metallic nozzle K, provided with wheels whereby the said nozzle is kept a uniform distance from the surface of the street, and injury to the nozzle from contact with obstructions avoided, substantially as described.

293,210.



293,210. RAKE SHOE OR RUNNER. CHARLES O. DENNEN, WILLIAM C. GRAY, and HOMER C. NELLIS, Piqua, Ohio. Filed Dec. 17, 1883. (No model.)

Claim.—A detachable and adjustable shoe or guard for rake or harrow teeth, consisting of a shank, A, curved or bent end B, and perforated shoulder *a*, provided with a set-screw or other suitable clamping device, substantially as and for the purposes set forth.

REISSUES.

10,444. DRIVE-CHAIN. WILLIAM DANA EWART, Chicago, Ill., assignor to Ewart Manufacturing Company, same place. Filed Aug. 22, 1883. Original No. 154,594, dated Sept. 1, 1874; Reissue No. 6,337, dated Apr. 20, 1875; Reissue No. 9,256, dated June 15, 1880.

Claim.—1. The combination, in a drive-chain, of the coupling-hooks *c* and side bars sufficiently small close to the end bars to pass through the opening of the hook *c*, as shown and described.

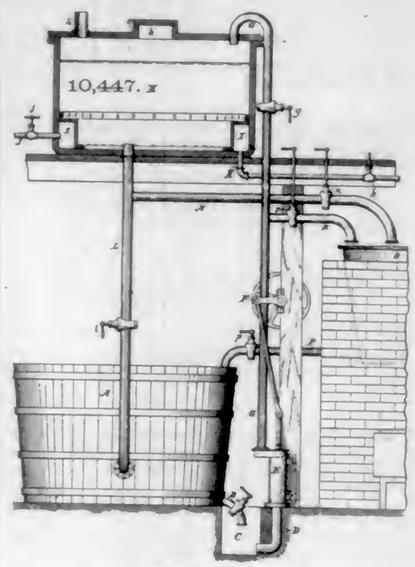
2. The combination, in the open link of a drive-chain, of the end bar *b*, provided with a coupling-hook, and an opposite end of the link adapted to be coupled to the hook of a correspondingly-constructed link, to form a chain, substantially as set forth.

10,445. PANORAMIC SIGN FOR CARS. WILLIAM HALKYARD, Providence, R. I., assignor to Thomas H. Bowles, Fulton County, Ga.; said Bowles assignor of nineteen one-thousandths to said Halkyard. Filed Jan. 8, 1884. Original No. 263,898, dated Sept. 5, 1882.

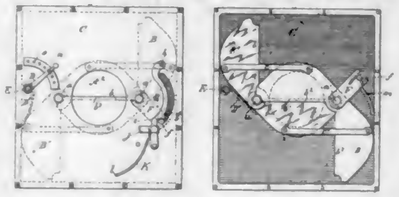
Claim.—1. In a car, an endless apron having advertisements on its surface, arranged longitudinally of the car upon supporting-rollers, in combination with suitable gearing positively connecting one of the rollers to one of the car-axles, whereby a continuous longitudinal movement is imparted to the apron when the car is in motion, substantially as described.

2. In combination, in a car, the endless apron B, the axle C, and means for conveying motion from the axle to the apron, and an automatic reversible clutch constructed to drive the apron in one direction only, as described.

10,446. GLASS GLOBE. JOSEPH LOCKE, Somerville, assignor to William L. Libbey, Newton, (Sarah C. Libbey, Administratrix of said William L. Libbey, deceased,) and Edward D. Libbey, Boston, Mass. Filed Jan. 11 1884. Original No. 238,582, dated Nov. 13, 1883.



Claim.—That improvement in the art or method of producing lamp-globes of two different colors from the same homogeneous stock which consists in forming the globe from amber glass, as described, and cooling and heating the same unequally to develop the darker colors where desired, substantially as described.



10,447. BREWING. MICHAEL MUHLER, Cincinnati, Ohio, assignor, by mesne assignments, of part interest to Leo A. Brigol and Louis Barger, same place. Filed Sept. 17, 1883. Original No. 247,209, dated Sept. 20, 1881.

Claim.—1. The within-described process of brewing, which process consists in steeping the grain in warm water after the wort has been drawn off, then discharging the resultant glattwasser into a suitable receptacle, where it is properly heated, and finally returning this glattwasser or sugar-water to the mash-tub, substantially as herein described, and for the purpose set forth.

2. The improvement in the art of brewing, consisting in applying heat to the glattwasser, and then applying said glattwasser, before it has become cool, to the steeping of subsequent charges of malt.

10,448. PHOTOGRAPHIC CAMERA. GEO. S. NORTH, South Norwalk, Conn. Filed Oct. 30, 1883. Original No. 276,455, dated Apr. 24, 1883.

Claim.—1. The combination, in a photographic camera, of two shutters, pivots on which the shutters swing with a continuous movement in opening and then closing, connecting-bars from one shutter to the other, and a stud by which the simultaneous movements of the shutters are controlled.

2. The combination, in a photographic camera, of two shutters acting in opposite directions, and each having only one continuous movement in opening and closing, a connection from one to the other, a spring to give motion to the shutters, and a latch to hold the shutters open, substantially as set forth.

3. The combination, with a photographic camera, of the plate C, provided with the aperture A^2, the shutters B B', pivoted on said plate at *a a'*, respectively, the connecting-rods *c c'*, and the spring D', as and for the purpose described.

4. The combination, with a photographic camera, of the shutters B B', pivoted on plate C, connecting-rods *c c'*, spring D', arm D, provided with the pin *n*, and series of holes *o*, all as and for the purpose described.

5. The combination, with a photographic camera, of the shutters B B', pivoted on the plate C, which is provided with the curved opening *g*, the rods *c c'*, the arm F, fastened in the shutter B, and provided with the stud *f*, the arm G, provided with the notch *i*, the keeper *j*, and the spring K, all as and for the purpose described.

6. The combination, with a photographic camera, of the shutters B B', pivoted on the plate C, the rods *c c'*, the spring D', the arm F, provided with the stud *f*, and the spring-catch *m*, all as and for the purpose described.

7. The combination, with a photographic camera, of two pivoted shutters, each having two parts or leaves at an angle to each other, and mechanism for swinging the same simultaneously, so that the lens will be uncovered uniformly from the center line outwardly by one leaf of each pair of leaves, and closed from the opposite sides inwardly by the other leaf of the pairs of leaves, the movement being continuous, substantially as specified.

N. PITTS, Photo-Lithographer, Washington, D. C.

REPORT

OF THE

COMMISSIONER OF PATENTS

TO CONGRESS,

FOR THE YEAR ENDING DECEMBER 31, 1883.

Laid before the House of Representatives by the Speaker *pro tempore* January 31, 1884, referred to the Committee on Patents, and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 29, 1884.

To the Senate and House of Representatives of the United States of America in Congress assembled:

In compliance with the requirements of section 494 of the Revised Statutes, I have the honor to submit the following report of the business of this Office for the year ending December 31, 1883.

RECEIPTS.

Detailed statement of all moneys received for patents, for copies of records or drawings, or from any source whatever.

Applications (including caveats, trade-marks, and disclaimers):		
Cash received	$961,785 00	
Cash refunded	2,160 00	
Net cash	959,625 00	
Certificates of deposit	61,040 00	
Total cash and certificates		1,020,665 50
Copies:		
Cash received	79,549 15	
Cash refunded	1,910 75	
Net cash	77,638 40	
Certificates of deposit	923 65	
Total cash and certificates		78,562 05
Recording assignments:		
Cash received	28,405 90	
Cash refunded	1,390 05	
Net cash	27,015 85	
Certificates of deposit	603 50	
Total cash and certificates		27,619 35
Subscription to Official Gazette:		
Cash received	13,134 70	
Cash refunded	55 90	
Net cash	13,078 80	
Certificates of deposit	65 30	
Total cash and certificates		13,144 10
Registration of labels:		
Cash received	5,483 00	
Cash refunded	120 00	
Net cash	5,363 00	
Certificates of deposit	126 00	
Total cash and certificates		5,489 00
Proceeds of sale of rejected models		760 50
Aggregates.		
Cash received	$1,089,118 25	
Cash refunded	5,636 70	
Net cash	1,083,481 55	
Certificates of deposit	62,758 45	
Total cash and certificates		1,146,240 00

EXPENDITURES.

Amount expended under the several appropriations from January 1, 1883, to January 1, 1884.

Salaries	$543,160 15
Contingent expenses (to June 30, 1883)	10,642 99
[By act of Congress, approved March 3, 1883, making appropriations for the legislative, executive, and judicial expenses of the Government for the fiscal year ending June 30, 1884, it was provided that the contingent funds of the various bureaus of the Department of the Interior be consolidated. The contingent expenses herein mentioned therefore only cover a period of six months.]	
Official Gazette	34,220 00
Photolithographing	66,091 49
Copies of drawings	14,990 18
Scientific library	6,130 05
Total	675,234 86

Statement of contingent expenses in detail.

Stationery and books	$267 52
File-holders	60 50
Card-board	257 00
Furniture	453 71
Hardware	175 33
Painting	139 00
Carpets, &c	498 84
Services	1,907 70
Ice	447 47
Engraving and printing	401 47
Desks, cases, and repairing	2,018 55
Tin shelves	14 00
Washing towels, horse livery, paste, lumber, telephone, winding clocks, and sundries	4,001 80
Total	10,642 99

RECEIPTS OVER EXPENDITURES.

Total receipts	$1,146,240 00
Total expenditures	675,234 86
Receipts over expenditures	471,005 14

Statement of balance in the Treasury of the United States on account of the Patent fund.

Amount to the credit of the fund January 1, 1883	$2,205,471 10
Amount of receipts during the year 1883	1,146,240 00
Total	3,351,711 10
Deduct expenditures for year 1883	675,234 86
Balance January 1, 1884	2,676,476 24

SUMMARY OF THE BUSINESS OF THE OFFICE.

Number of applications for patents for inventions	33,073
Number of applications for patents for designs	1,238
Number of applications for reissues of patents	265
Total number of applications relating to patents	34,576
Number of caveats filed	2,741
Number of applications for registration of trade-marks	915
Number of applications for registration of labels	834

Number of disclaimers filed	18
Number of appeals on the merits	640
Total	5,148
Total number of applications requiring investigation and action	39,724
Number of patents issued, including designs	22,216
Number of patents reissued	167
Number of trade-marks registered	902
Number of labels registered	906
Total number of patents granted and certificates issued	24,191
Number of patents expired during the year	8,874
Number of patents withheld for non-payment of final fee	2,366

PATENTS ISSUED.

It will be observed that the business of the Office has greatly increased during the past year, and it is now increasing in a steady ratio. With this increase of business there is, of course, a corresponding increase in the receipts of the Office, the amount paid in during the year ending December 31, 1883, being $1,146,240.00, which is $137,020.55 in excess of the amount received during the year 1882, and $471,005.14 in excess of all expenditures by and for the bureau during the year last past.

AN INCREASE OF FORCE NECESSARY.

I wish, in connection with the above exhibit, to respectfully call the attention of Congress to certain facts, which I trust may have some influence in securing the adoption of such measures as will in the future remove all just cause for the complaints that reach me from all

quarters and sections of the country touching the delay in dispatching the business which comes to this bureau.

I am daily in receipt of communications severely censuring the honorable Secretary and the Commissioner for not employing such additional force as is necessary to bring and keep the work of the bureau up to date. The impression seems to prevail that since the patrons of the Office have provided the funds for the prompt disposition of their business, some blame attaches to the Department or to this Office for not applying the money to the purpose for which it was received. I am daily appealed to by Senators and Members to make applications special, on the ground that if an examination is delayed until the case is reached in its regular order the value of the patent may be in large measure lost to the inventor. Although well disposed to oblige my friends, I cannot, without violating a well-considered rule of the bureau, comply with these requests. I know these delays are not only vexatious, but in some instances very disastrous to the interests involved. There is no valid reason why a single application should remain a week in the Office without being taken up for action, and as little excuse for compelling assignees of interests in patents to wait several months before their deeds can be recorded. Parties entitled to copies of records, which are indispensable as evidence on the trial of pending causes, are compelled to wait several weeks before they can be furnished.

The examining corps is greatly behind with its work simply because it is a physical impossibility with the number employed to keep it up. It has frequently been suggested that the force of the Office does not accomplish as much as ought to be required of it. Since I have taken charge of the Office I have been at pains to ascertain if those employed in the bureau are unfaithful or shirk duty in any wise. I note first that under the rules of the Office shirking is next to impossible, and absence in excess of the thirty days authorized by statute (unless in case of sickness) is not allowed, except in rare instances, and without pay. I am satisfied that no private employer in the country has more faithful and excellent service from his employés than is rendered by those employed in this bureau. There are exceptions, but they are very few, and, I may add, that in such cases what the individuals lack in earnest effort in the discharge of duty here they endeavor to make up by exceptional activity in securing influence and indorsement to induce the Department to retain them in the service and promote them.

It is evident that the Government never intended to make the Patent Office a source of revenue. It was and is desired to make it self-sustaining, and the fees were fixed and are as low as was and is deemed compatible with the possibility of providing ample revenue to secure all necessary facilities of every kind and character for the prompt and thorough dispatch of the business properly coming before it. Not a cent of money expended, directly or indirectly, for the support and maintenance of the Patent Office is raised by taxation. Every dollar is paid by those who have business before the Office—the inventors of the country. It is beyond question that, not only the inventors and those immediately interested in inventions, but the great body of the people as well, are interested in having the business of this bureau done promptly and thoroughly. The inventor does not want a worthless patent, nor are the people willing to pay a royalty when none can be justly claimed, nor do they wish to go into the courts to test the validity of a patent. The inventor not only wants to know whether he is legally entitled to a patent for the subject-matter of his application, but he desires and is entitled to have the question speedily determined.

To provide ample accommodations and a thoroughly-competent corps of examiners, clerks, and needful help, the inventors have paid to the Government a sufficient fund, which is held in trust for that purpose. Under these circumstances I respectfully submit that force enough should be employed to dispatch the business of the bureau thoroughly and without needless delay. The present force is utterly inadequate, nor will the increase suggested by my predecessor be sufficient.

INCREASE IN SALARIES.

I concur in what my predecessor said in his report, dated September 14, 1883, to the honorable the Secretary of the Interior in regard to salaries. The examining corps in this bureau should be composed of men of first-class ability and undoubted integrity. It is of consequence to inventors and to the people at large that patents should not be improvidently issued. The examining corps must, in the main, be relied upon to prevent this. Not one patent in fifty comes under the personal supervision of the Commissioner or his assistant. The examiners determine these important questions in the first instance, and in a great majority of cases *first* and *finally*. The Government, I submit, can afford (especially when inventors provide the funds) to pay as full compensation for first-class ability and strict integrity as a private individual or corporation. The experience of the Office is that it is next to impossible to secure, with the hope of retaining for more than a short period, assistant examiners whose thorough fitness renders them especially valuable to the service. They are constantly leaving to accept more lucrative employment outside. Since every conceivable advantage is on the side of *just*, not to say *liberal*, compensation, I trust it may please Congress to adopt the suggestions of my predecessor and provide the increase of salaries indicated in the estimates submitted, as well as for the increase of the force employed.

ROOM.

I cannot refrain from repeating what Mr. Commissioner Marble said in regard to the rooms occupied by the bureau. They are inadequate. I am compelled to keep valuable documents and records piled on the floor; some are in rooms so damp that the papers are moldy.

Many of the employés occupy small, dark, and damp rooms, and in numerous cases their health has been seriously impaired. Within a few years the entire building now occupied by the Department of the Interior will be required by this Office for the proper accommodation of its force and the safe keeping of its records and files.

Very respectfully, your obedient servant,

BENJ. BUTTERWORTH,

Commissioner.

Statement showing the number of the first patent, design patent, and reissued patent, and the number of the first certificate of registration of a trade-mark and a label issued in each calendar year since July 28, 1836, when the present series of numbers for letters patent commenced, together with the total number of each issued during the year.*

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., February 4, 1884.

SIR: I am directed by the Secretary to inform you that he has ordered that James F. Lingenfelter, of Nowark, Ohio, be not recognized from and after this date as attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,

GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
Washington, February 1, 1884.

SIR: I am directed by the Secretary to inform you that the order of the Department, dated May 24, 1877, disbarring C. P. S. Daniels, of Midway, Alabama, from practice before the Department and its bureaus, has this day been rescinded.

Very respectfully,

GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

Amendment of Rule 26.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, February 4, 1884.

Rule 26 of the Rules of Practice (revised edition November 15, 1883) is hereby amended to read as follows:

26. In case of an assignment of the whole interest in the invention, or of the whole interest in the patent to be granted, the patent will, upon request of the applicant, issue to the assignee; and if the assignee hold an undivided part interest, the patent will, upon like request, issue jointly to the inventor and the assignee; but the assignment in either case must first have been entered of record, and at a day not later than the date of the payment of the final fee; and if it be dated subsequently to the execution of the application, it must give the date of execution of the application, or the date of filing, or the serial number, so that there can be no mistake as to the particular invention intended. The application and oath must be made by the actual inventor, if alive, even if the patent is to issue to an assignee. If the inventor be dead, it may be made by the executor or administrator.

(Signed) BENJ. BUTTERWORTH,
Commissioner.

Approved to take effect February 7, 1884.

(Signed) H. M. TELLER,
Secretary of the Interior.

Amendment of Rule 62.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, January 23, 1884.

Rule 62 of the Rules of Practice (revised November 15, 1883) is hereby amended to read as follows:

62. All cases in the Patent Office are classified and taken up for examination in regular order, those in the same class of invention being examined and disposed of, as far as practicable, in the order in which the respective applications are completed; but applications which have received action by an examiner and have been put into condition for further action on his part shall be entitled to precedence over completed applications in the same class of invention which have received no action. When, however, the invention is deemed of peculiar importance to some branch of the public service, and when for that reason the head of some department of the Government specially requests immediate action, the case will be taken up out of its order. These, with cases remanded by an appellate tribunal for further action, statements of grounds of decisions by primary examiners, provided for in Rules 130 and 140, applications for extensions, for reissue, for letters patent for inventions for which foreign patents have already been obtained, and for designs, have precedence over all others in the order enumerated. Action upon such cases in the order indicated will be promptly made by the examiner in charge, to the exclusion of all other business interfering therewith.

(Signed) BENJ. BUTTERWORTH,
Commissioner.

Approved to take effect February 1, 1884.

(Signed) H. M. TELLER,
Secretary of the Interior.

DESIGNS.

14,640.—VEGETABLE-DISH.—*Henry Alcock*, Cobridge, county of Stafford, England. Application filed December 13, 1883. Term of patent 7 years.

14,641.—COFFIN-PLATE.—*Eli H. Eldridge* and *John H. Eldridge*, Taunton, Mass. Application filed August 10, 1883. Term of patent 7 years.

14,642 to 14,663, inclusive.—CARPET.—*James L. Folsom*, Brooklyn, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed January 9, 1884. Term of patents 3½ years.

14,664.—CARPET.—*Walter J. Gadsby*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed January 7, 1884. Term of patent 3½ years.

14,665 and 14,666.—TRIMMING.—*George F. Ominder*, New York, N. Y. Applications filed December 29, 1883. Term of patents 3½ years.

14,667.—FONT OF PRINTING-TYPE.—*John Graham*, Chicago, Ill., assignor to *Marder, Luse & Co.*, same place. Application filed October 12, 1883. Term of patent 14 years.

14,668 to 14,671, inclusive.—CARPET.—*Arthur L. Halliday*, Yonkers, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Application filed January 4, 1884. Term of patent 3½ years.

14,672.—LADY'S MITT.—*Warren P. Jennings*, Brooklyn, N. Y. Application filed December 19, 1883. Term of patent 7 years.

14,673.—CARPET.—*David G. Melville*, Medford, assignor to *The Roxbury Carpet Company*, Boston, Mass. Application filed January 7, 1884. Term of patent 3½ years.

14,674.—INSULATOR.—*Samuel Oakman*, Melrose, Mass. Application filed November 2, 1883. Term of patent 7 years.

14,675.—COLLAR AND CUFF.—*Frederick Prêbe*, Jersey City, N. J. Application filed December 1, 1883. Term of patent 3½ years.

14,676.—FENDER.—*James H. White*, New York, N. Y., assignor to *The Manhattan Brass Company*, same place. Application filed December 29, 1883. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

10,924.—BITTERS.—*William H. Burt*, New York, N. Y. Application filed January 15, 1884.

"The arbitrarily-selected word-symbol 'SWA-GEH.'"

10,925.—PLUG, TWIST, FINE-CUT, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*William T. Hancock*, Richmond, Va. Application filed January 12, 1884.

"The words 'THE FOUR SEASONS.'"

10,926.—PLUG, TWIST, FINE-CUT, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*William T. Hancock*, Richmond, Va. Application filed January 12, 1884.

"The word 'MARITANA.'"

10,927.—PLUG-TOBACCO.—*Liggett & Myers Tobacco Company*, St. Louis, Mo. Application filed January 8, 1884.

"A star-shaped tag or label having an aperture at its center, and of such material, color, or appearance as to contrast strongly with the surface upon which it is affixed."

10,928.—FERTILIZERS.—*Cord Meyer, Jr.*, Newtown, N. Y. Application filed January 8, 1884.

"The letters or word 'ACME.'"

10,929.—CIGARS.—*Gustave Paulsen*, Chicago, Ill. Application filed December 18, 1883.

"The words 'GARDEN CITY,' and three separate views or pictures, one of the pictures being a view of a frontier scene, consisting of a log hut, some trees, and a camp-fire, around which are a group of four Indians. The second picture shows a burning city on the shores of a lake or sheet of water; and the third picture shows an active city on the shores of a lake or sheet of water, with the sun in the horizon."

10,930.—PILE-OINTMENT.—*Will R. Post*, Catskill, N. Y. Application filed January 2, 1884.

"The word 'GITST.'"

10,931.—BOLTING-CLOTH.—*O. Schindler-Escher*, Zurich, Switzerland. Application filed December 19, 1883.

"A colored line or thread along one selvage of the bolting-cloth."

10,932.—LINIMENT AND INHALENT.—*Shepherd Spencer*, Knoxville, Tenn. Application filed September 17, 1883.

"A picture representing in the foregrounnd a shepherd reclining at the foot of a tree. In his hand he holds his crook, and by his side lies his dog. In front of him his sheep are grazing, and in the backgrounnd rises the spire of a church."

10,933.—CORDIALS AND LIQUORS.—*Luyties Brothers*, New York, N. Y. Application filed January 11, 1884.

"The word 'CALORIC.'"

10,934.—PACKAGE DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.

"The arbitrarily-selected word or term 'HOUSEHOLD.'"

10,935.—PACKAGE DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.

"The arbitrarily-selected words or term 'RICH WOMAN'S.'"

10,936.—PACKAGE DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.

"The arbitrarily-selected word or term 'GEM.'"

10,937.—PACKAGE DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.

"The arbitrarily-selected words or term 'RICH MAN'S.'"

10,938.—PACKAGE DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.

"The arbitrarily-selected words or term 'POOR WOMAN'S.'"

10,939.—PACKAGE DYES.—*Frank A. Ransom*, Dunellen, N. J. Application filed December 27, 1883.

"The arbitrarily-selected word 'COTTAGE.'"

10,940.—CORNMEAL.—*Ira Crandall Woodward* and *Charles H. Crofut*, Cleveland, Ohio. Application filed December 27, 1883.

"The word 'GOLD-DUST.'"

LABELS.

3,883.—Title: "CHEMICAL PARLOR ILLUMINATOR."—*Lyman H. Abrams*, Philadelphia, Pa. Application filed January 21, 1884.

3,884.—Title: "BARNSLEY DUCKS."—*Adolph Bernheimer*, New York, N. Y. Application filed January 21, 1884.

3,885.—Title: "BELFAST FANCY DRILLS."—*Adolph Bernheimer*, New York, N. Y. Application filed January 21, 1884.

3,886.—Title: "BARNSLEY DRILL."—*Adolph Bernheimer*, New York, N. Y. Application filed January 21, 1884.

3,887.—Title: "GREENBACKS THE PEOPLE'S CHOICE." (FOR CIGARS.) *Henry Coan*, St. Louis, Mo. Application filed January 17, 1884.

3,888.—Title: "NEUTRALINE," (FOR A PREPARATION FOR THE FEET.)—*Henry G. Haring*, Philadelphia, Pa. Application filed January 17, 1884.

3,889.—Title: "OLD HICKORY," (FOR BITTERS.)—*Herrmann & Grossman*, New Orleans, La. Application filed January 22, 1884.

3,890.—Title: "CARBONATED LITHIA WATER." (FOR A MEDICINE.) *Christian Lewis Keppler*, New Orleans, La. Application filed January 19, 1884.

3,891.—Title: "ÄECHTER AROMATIQUE FEINSTER MAGEN-LIQUEUR."—*Julius Lappe*, Neudietendorf, Thuringia, Germany. Application filed January 22, 1884.

3,892.—Title: "ÄECHTER AROMATIQUE-FEINSTER MAGEN-LIQUEUR."—*Julius Lappe*, Neudietendorf, Thuringia, Germany. Application filed January 22, 1884.

3,893.—Title: "MADAME C. LEWENBERG'S OPALINE," (FOR THE CURE OF CHAPPED HANDS, &C.)—*Clara Lewenberg*, New York, N. Y. Application filed January 17, 1884.

3,894.—Title: "CENTENNIAL" (FOR PAINTS, LEADS, ZINCS, &C.)—*William E. Lucas*, New York, N. Y. Application filed January 21, 1884.

3,895.—Title: "MILLER'S NECKTIE HOLDER AND FASTENER."—*Henry F. Miller*, New York, N. Y. Application filed January 19, 1884.

3,896.—Title: "NEW PROCESS HOMINY."—*Martin L. Mowrer*, Newark, N. J. Application filed January 12, 1884.

3,897.—Title: "INFALLIBLE CORN CURE. E. M. B. SCOTT, MANUFACTURING CHEMIST, SOLE PROPRIETOR, OTTUMWA, IOWA."—*E. M. B. Scott*, Ottumwa, Iowa. Application filed January 18, 1884.

3,898.—Title: "ARTOPHYLAX" (FOR A PREPARATION FOR THE HAIR.) *Peter Stieb*, New York, N. Y. Application filed January 18, 1884.

DISCLAIMER.

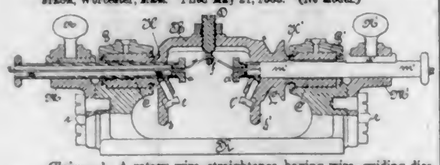
66,499.—*George Johnston* and *Edwin G. Smith*, Auburn, Cal. Patent dated July 9, 1867. IMPROVED AMALGAMATOR AND CONCENTRATOR. Disclaimer filed January 31, 1884, by the present assignee, *The True Vanning Machine Company*, by Sydney D. Miller, president.

Enters its disclaimer "to the words 'or percussive,' as the same occur in the following sentence in the specification, namely: 'A rocking or percussive motion may be employed for the same purpose; but we think a shaking motion preferable.' By this disclaimer it is intended to exclude from the first claim a revolving belt or apron having a percussive motion, and leave said claim to be considered as though it read as follows:

'1. The revolving belt or apron F, with its raised edges O, having a shaking or rocking motion from side to side,' (not a percussive motion,) 'substantially as and for the purpose described.'"

PATENTS

GRANTED FEB. 12, 1884.



293,211. CAR-WHEEL. RICHARD N. ALLEN, Cleveland, Ohio. Filed July 28, 1883. (No model.)

Claim.—1. A car-wheel composed of a hub, a single central plate, and a tire provided with an inwardly-projecting web, in which the tire and the central plate are secured together by two tongue-and-groove locks, one formed upon the web and the outer face of the central plate, and the other upon the central plate and the inner edge of the tire, and by bolts passed through the central plate and the web of the tire.

2. A car-wheel composed of a hub, a single central plate, and a tire provided with an inwardly-projecting web, in which the tire is secured to the central plate by a tongue-and-groove lock formed upon the web of the tire and the outer face of the central plate, and by bolts passed through the central plate and the web of the tire.

293,212. MACHINE FOR STRAIGHTENING WIRE. CARL ANGSTRÖM, Worcester, Mass. Filed May 21, 1883. (No model.)

Claim.—1. A rotary wire-straightener having wire-guiding dies, which are adapted for adjustment toward or from each other in a direction longitudinal with the axis of rotation, for the purpose set forth.

2. In a rotary wire-straightener, the end guides or wire-holders, *a* and *a'*, adjustable toward and from each other, substantially as set forth.

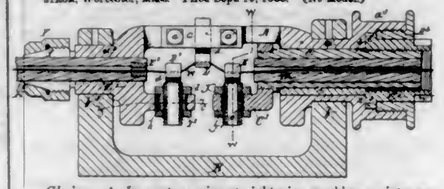
3. In a rotary wire-straightener, the end guides, *a* and *a'*, adapted for adjustment toward and from each other, and means for supporting them in stationary position, in combination with the revolving mandrel, for the purpose set forth.

4. In a rotary wire-straightener, the end guides, *a* and *a'*, adapted for adjustment to and from each other, and in combination therewith, means for supporting said guides in connection with the mandrel for rotative action therewith.

5. In a rotary wire-straightener, the combination, with the revolving mandrel, of adjustable end guides, as *a a'*, adapted for stationary or rotative action at will, substantially as set forth.

6. In a rotary wire-straightener, the combination of longitudinally-adjustable, end dies or wire-guides, *a* and *a'*, and a radially-adjustable wire-guide, *f*, with a revolving mandrel or flier, for the purposes set forth.

7. In a rotary wire-straightener, the revoluble mandrel B, formed open at one side, and provided with counter-weights or projections *d d'*, substantially as and for the purpose set forth.



8. In a revolving wire-straightener, the combination, substantially as described, of a revolving mandrel or flier having hollow journals, the end dies or wire-guides fixed in longitudinally-adjustable guide-supporting tubes extending through the mandrel-journals, the tube-supporting brackets attached to the bed-frame, and means for retaining said tubes and guides at adjusted positions, as set forth.

9. In a rotary wire-straightener, the combination, with the revoluble mandrel B, provided with journals C C', the bearing portion of which is of greater diameter than the neck portions K, of the journal-boxes G G' for the mandrel-journals, provided with inwardly-projecting lips or collars *s* and *s'*, that embrace the journals at the ends of their bearing-surfaces, substantially as and for the purposes set forth.

10. In a rotary wire-straightener, the combination, with the revoluble flier or mandrel, of the screw stud or bar D, provided with a guide hole or loop, *f*, for the purpose set forth.

11. In a rotary wire-straightener, the combination, with the wire tubes *m* and *m'* and bed-plate R, of the tube-supporting bearings M and M', set-screws N and N', and the gib-keys *x x'*, as and for the purpose set forth.

293,213. MACHINE FOR STRAIGHTENING WIRE. CARL ANGSTRÖM, Worcester, Mass. Filed Sept. 19, 1883. (No model.)

Claim.—1. In a rotary wire-straightening machine, an intermediate wire-guide adapted for longitudinal adjustment in relation to the revolving mandrel and end guides, as and for the purpose set forth.

2. In a rotary wire-straightening machine, the combination, with the revoluble mandrel provided with longitudinally-adjustable end guides, of the intermediate wire guide or guides adjustable in longitudinal direction, as set forth.

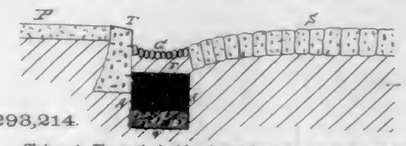
3. In a rotary wire-straightening machine, the combination, with the mandrel, of the intermediate wire-guides adapted for adjustment both radially and in longitudinal direction, substantially as set forth.

4. A guide for rotary wire-straightening machines having its wire-guiding eye formed with an opening or slot, *d*, for admitting the wire into said guide from one side without the necessity of threading its end through the eye, as set forth.

5. The guide D, for rotary wire-straightening machines, formed as a loop or hook of flat metal, with the guiding-eye *d'* and passway *d*, for the introduction of the wire, substantially as set forth.

6. In a rotary wire-straightening machine, the combination, with the revolving mandrel, of a wire-guide having flattened sides, and a clamp device for connecting said guide with the mandrel and retaining it at any desired position of radial and longitudinal adjustment, as set forth.

7. The combination, with the revoluble mandrel A in a wire-straightening machine, of the flat wire-guide D, the clamp-bar G, and set-screws G', for the purposes set forth.



8. In a rotary wire-straightening machine, the combination, with a tubular guide or bushing, as E', of a revoluble mandrel having the divided and tapered end *f*, and the conically-bored chuck-nut F, for compressing said tapered end inward upon said bushing, as and for the purpose set forth.

9. The combination, with the revolving mandrel, of the longitudinally-adjustable tube or guide carrier provided with an arm, C', carrying radially-adjustable wire-guide E, substantially as and for the purpose set forth.

10. The combination, with the revoluble arbor A and longitudinally-adjustable tube carrying the wire guide or guides E, of the flanged sleeve-nut O', fitted with a screw-thread upon said tube, and the collar A^4, fitted with a screw-thread within the mandrel end, as and for the purposes set forth.

11. The combination, with the revoluble mandrel, of the longitudinally-adjustable tube C, carrying a radially-adjustable wire-guide, as E, the radially and longitudinally adjustable intermediate guide, D, and the radially and longitudinally adjustable guide D', as and for the purposes shown and described.

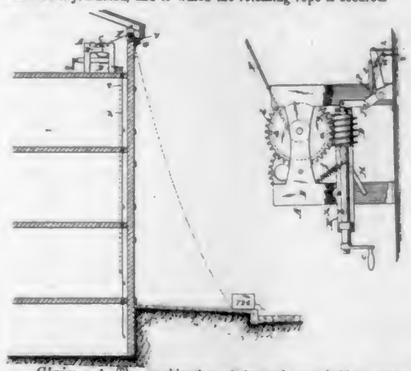
293,214. ASPHALTIC-CONCRETE CONDUIT. WILLIAM W. AVERELL, Bath, N. Y. Filed May 26, 1883. (No model.)

293,214.

Claim.—1. The method of forming an insulating concrete, consisting in first ascertaining the voids or interstices of the silicious materials used, and then adding such a percentage of the binding agent thereto, substantially as set forth.

2. The insulating-concrete hereinbefore described, consisting of silicious matter, asphaltum, and petroleum residuum, combined in the proportions ascertained or determined by the measurement of the interstices or voids, as set forth, and substantially as described.

3. An insulating asphaltic-concrete conduit formed of silicious materials and tempered asphalt, the percentage of the latter being equal to the ascertained voids of the silicious material, and containing wires laid *in situ*, substantially as set forth.



4. An insulating asphaltic-concrete conduit formed of silicious materials and tempered asphalt, the percentage of the latter being equal to the ascertained voids of the silicious material, and containing tubes laid *in situ*, substantially as set forth.

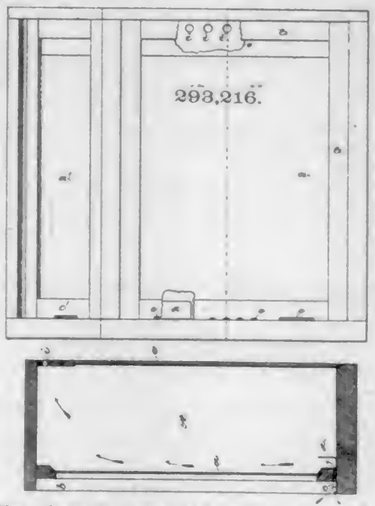
5. An insulating asphaltic-concrete conduit formed of silicious materials and tempered asphalt, combined in the proportions set forth, and having its top finished off to form part of the street or roadway, substantially as set forth.

6. An insulating asphaltic-concrete conduit formed of silicious materials and tempered asphalt, combined in the proportions set forth, and containing pipes or tubes laid and lined with paper *in situ*, substantially as set forth.

293,215. FIRE-ESCAPE. N. ROBERT BAAR, CALVIN J. COE, and IRA R. COE, Lowville, N. Y. Filed May 23, 1883. (No model.)

Brief.—The worm and shaft which winds up the flexible ladder and which holds the reel from turning when the ladder is wound up is journaled in a frame which can be lowered at one end, to permit the ladder to unwind from the reel, by means of toggle-jointed arms, in which that end is journaled, and to which the releasing-rope is secured.

Claim.—1. The combination of the reel, rope ladder, worm D, adapted to a toothed wheel upon the reel-shaft, frame E, carrying the worm, and appliances for adjusting the frame, substantially as specified.

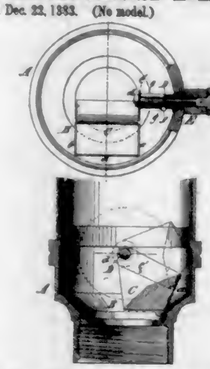


2. The combination of the worm-frame E, appliances for adjusting the same, operating-cords extending therefrom to rooms in the building, and a supplemental operating device extending to a point accessible to the clerk or attendant, substantially as described.

3. The combination of the frame B, reel, pivoted frame E, carrying a worm and shaft, toggle-arms J, and cables A, extending to the different rooms, substantially as specified.

4. The combination, with the series of reeling apparatus A, and appliances for releasing the reel of each apparatus, of a shaft, *p*, with arms bearing upon the releasing appliance of each apparatus, and means for operating the said shaft, substantially as set forth.

293,216. STORE-WINDOW. LYMAN CLAFF BAILEY, Calais, Me. Filed July 10, 1883. (No model.)

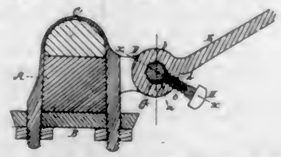


Claim.—A store or show window consisting of the fixed exterior window, *a*, having at its bottom the air-openings *c* and the air-deflecting plate *d*, arranged before said openings, to direct the incoming air upwardly along the interior surface of the pane and the interior window or

293,216.

partition, *e*, having the openings *i* at the top thereof, substantially as shown, and for the purpose described.

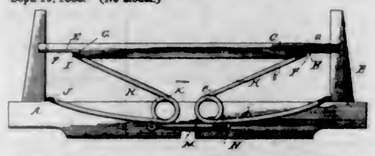
293,217. BINOCULAR MICROSCOPE. EDWARD BAUSCH, Rochester, N. Y. Filed Dec. 22, 1883. (No model.)



Claim.—1. In a binocular microscope, a swinging prism-holder adapted to support the prism within the body of the microscope either in or out of the field of vision, as herein specified.

2. The combination, with the doubly-reflecting prism of a binocular microscope, of a prism-supporting arm and spindle attached thereto, and extending outward through the microscope-body, as described.

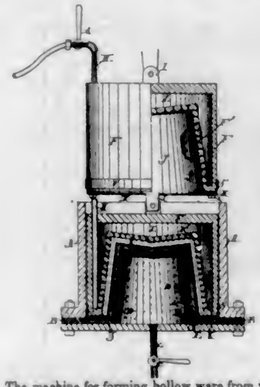
3. The combination, in a binocular microscope, of the prism C, prism-holder B, spindle D, provided with the stop-pin *f*, and the slotted sleeve E, as herein specified.



293,218. ANTI-RATTLER FOR THILL-COUPLINGS. JOB N. BERRY, Boston, Mass. Filed Dec. 17, 1883. (No model.)

Claim.—1. As an improvement in anti-rattlers for thill-couplings, the hollow screw H, having an elastic substance located therein, in combination with the axle-clip C, thill-iron E, and connecting-bolt O, substantially as set forth.

2. In combination with the hollow screw H, the spring *c*, and pressure-block *d*, located therein, for keeping the rear surface of the thill-eye *a* and contiguous surface of the connecting-bolt G in contact, as and for the purpose described.

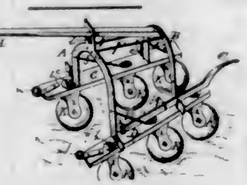


293,219. VEHICLE-SPRING. GEO. E. BLAINE, Ringgold, Ga. Filed Sept. 19, 1883. (No model.)

Claim.—1. The combination, with the bolster A, provided with the standards B and coil-support N, of the sliding bolster C and springs H H, all constructed, arranged, and operating as set forth.

2. The combination of stationary bolster A, having standards B, bolster C, having at each end a recess or notch, D, and a sheathed recess, E, in the under surface, and a notch or shoulder, G, the springs H, each having a short arm, I, adapted to rest and slide within said recess E and support the bolster C, coils K L, and arms J, adapted to rest upon and with the coils embrace the stationary bolster A, and the coil-supports M, attached to said bolster A, all substantially as and for the purpose herein shown and described.

293,220. MACHINE FOR FORMING HOLLOW WARE FROM PAPER-PULP. JOSEPH G. BODGE, Waterville, Me. Filed June 19, 1883. (No model.)

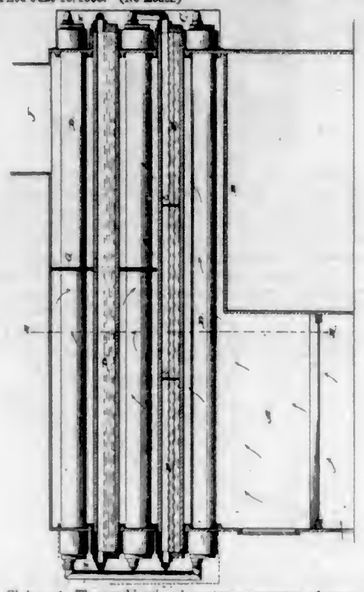


Claim.—1. The machine for forming hollow ware from wood pulp, consisting of the cylinder A, containing the perforated male die or former D, combined with the plunger F, containing female die F', chamber L, rubber bag J, and pipe H, all substantially as described and shown.

2. In a machine for forming hollow ware, the perforated male die B, over which fits the female die F", lined with the rubber bag J, formed smaller than the female die, combined with the chamber L and pipe H, by means of which the bag J may be held away from the forming pail and by a hydraulic pressure afterward applied, substantially as shown and described.

3. The process of forming hollow ware from wood pulp on the outside of a perforated male die, consisting of lowering over the male die a female die lined with a rubber bag, which bag is expanded away from the forming article by suction or otherwise, and after the article is formed allowing the bag to collapse and immediately applying a hydraulic pressure, substantially as described and shown.

4. The process of forming hollow ware on the outside of a male die, consisting of forcing over it a female die of larger diameter lined with a rubber bag, and applying a heavy hydraulic pressure on the outside of said bag as soon as the article is formed, substantially as shown and described.



293,221.

293,221. CULTIVATOR. LOUIS A. BRINGHER, Donaldsonville, La. Filed Oct. 20, 1881. (No model.)

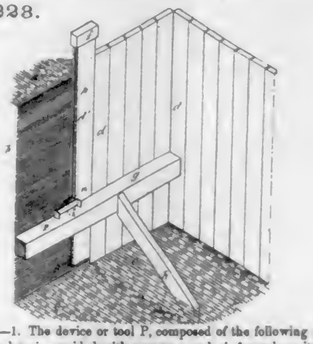
Claim.—A cultivator composed of side pieces, C D, provided with yoke-standards *i* and revolving disks K, the said side pieces adjustably secured by stirrups *e* to the arches A B, as described, and the machine provided with a beam, H, and having strengthening-rods *g g'*, braces *f*, and a guide-handle, O, substantially as and for the purpose specified.

293,222. STEAM-GENERATOR. GEO. F. BROTT, Washington, D. C. Filed June 15, 1883. (No model.)

Claim.—1. The combination, in a steam-generator, of two or more series of steam-generating tubes or flues, each of said tubes or flues being adapted to constantly remain partially filled with water by connecting the exit-tubes near the upper surface thereof and communicating with each other, the ends of said tubes being connected in pairs by double-headers provided with plugs *b b*, substantially as described.

2. The combination, in a steam-generator, of two or more series or sections of tubes arranged above each other, the ends of each pair of tubes united by a cap, which cap is screw-threaded, and has a circulating-tube near its upper surface cast therewith, and provided with plugs *b b*, as set forth.

3. A steam-generator composed of a series or sections of generating tubes or flues, each of said tubes being adapted to be constantly supplied with water, in combination with communicating tubes arranged in such manner that the water entering the upper section of generating-tubes must traverse the entire number of tubes, and having a separate series of steam-and-water-circulating tubes running in opposite directions, in the manner set forth and described.

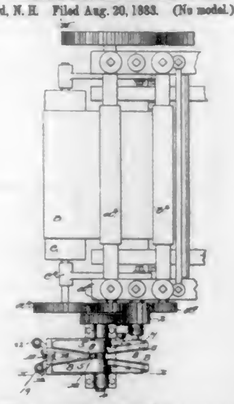


4. The combination, in a steam-generator, of two or more series or sections of tubes or flues with a steam-separating series, each of said series having communicating tubes connected to the upper portion of said tubes, and a steam-conveying pipe connecting the lower series to the upper, substantially as described.

5. The combination of a boiler composed of sections, consisting of the lower series of tubes, which are partially filled with water, and having a steam-space, and being connected with the upper series of steam-drums, which are adapted to steam alone, and with the intermediate horizontal partition arranged below said drums and running partially back to the rear of the boiler, and arranged in such manner as to protect the steam-tube drums from direct contact with the flame, and also form an outlet for the waste gases, smoke, &c., substantially as described.

293,223. DEVICE FOR GUIDING TONGUED AND GROOVED SHEATHING-PLANKS. TRUMAN B. BROWN, New York, N. Y. Filed Aug. 18, 1883. (No model.)

Brief.—A device for guiding tongued and grooved sheathing-planks, consisting of a circumferential grooved pulley placed between two parallel bars, which fits over the tongue of the plank to be driven. One of the parallel bars is provided with beveled spikes for securing it to the breast-piece.



293,223.

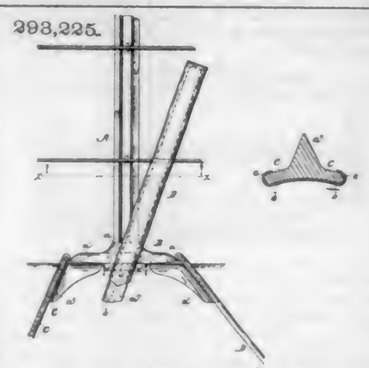
Claim.—1. The device or tool P, composed of the following parts, namely: the bar *i*, provided with prongs *s* and *s'*, formed on its outwardly-extending ends *k*, the bar *l*, welded or otherwise attached to said bar *i*, and the sheave or pulley *n*, pivoted or journaled between said bars *i* and *l*, and provided with the circumferential groove *n'*, all substantially as herein shown and described, and for the purpose set forth.

2. In combination with the bars *l i k* and pulley *n*, all constructed substantially as described, the prongs or spikes *s* and *s'*, the latter being beveled or inclined, as shown and described, for the purpose set forth.

293,224. MACHINE FOR LAP-SHAVING HOOPS. HENRY F. CAMPBELL, Concord, N. H. Filed Aug. 20, 1883. (No model.)

Claim.—1. The combination, substantially as shown and described, in a barrel-hoop machine, of rotary cutters, a table to support the hoop while being pointed, a block fast to the framing and supporting such table, and a V-shaped gage beneath said table, and adjustably held in said block, to make a variable V-shaped pocket between said block and one of the cutters, to bevel the hoop, as set forth.

2. In a lap-shaving machine, a block provided with a rest for one edge of the hoop to be beveled, a table to support the hoop while being pointed, and a cutter, combined with the pivoted and adjustable wedge-shaped gage 14, substantially as shown and described, and for the purpose specified.

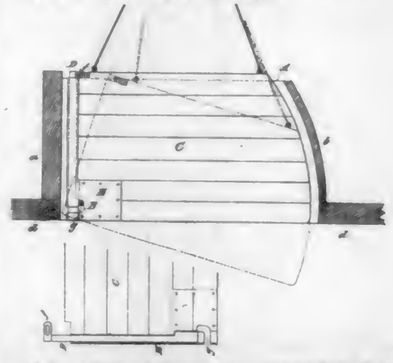


3. In a lap-shaving machine, a block provided with a rest for one edge of the hoop to be beveled, a table, and a cutter, combined with an adjustable gage to enable the pocket between the said rest and table to be made more or less tapering from edge to edge, substantially as described.

4. In a lap-shaving machine, the combination, substantially as shown and described, of a block provided with a rest for one edge of the hoop to be beveled, a table to support the hoop while being pointed, cutters, a pivoted and adjustable wedge-shaped gage, and guide-rollers to direct the stuff while being pointed and beveled, as set forth.

293,225. IRON OR STEEL FENCE-POST. ROBT. J. CARSON, Dixon, assignor of one-half to Edward Ratz, Belleville, Ill. Filed Aug. 14, 1883. (No model.)

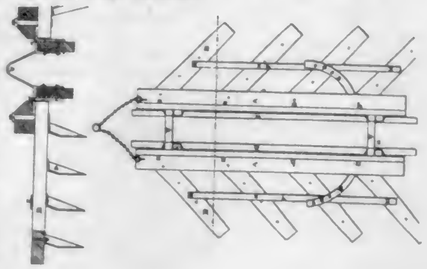
Claim.—1. The fence-post base-piece B, consisting of a central portion, *a*, adapted to support the post, and of two or more radial arms, *a' a'*, having depending and inclined portions *a'' a''*, with the flanges or ribs C C on their vertical or lateral edges, in combination with the pegs



293,225.

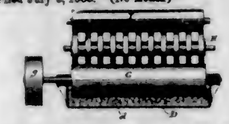
D D, having on their vertical or lateral edges the flanges *c c*, adapted to engage or clasp the flanges or ribs C C, substantially as shown and described, and for the purpose set forth.

2. The pegs D D, made curved or curvilinear between their vertical edges, and having on the said edges the flanges *c c*, in combination with the radial arms *a' a''*, curved inwardly on their outer faces, and provided with the flanges C C, substantially as and for the purposes specified.



293,226. CENTER-BOARD FOR VESSELS. ROBERT CRITER, New York, N. Y. Filed Nov. 2, 1883. (No model.)

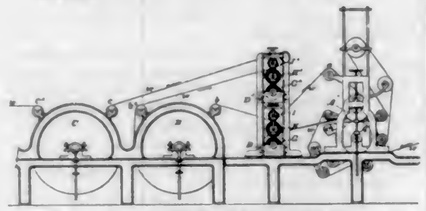
Claim.—1. The combination, with a center-board having its pivot-corner sheathed and provided with a right-angled slot extending inward and upward for receiving the pivotal pin, of a bolt adapted to slide in the sheathing and close the said right-angled slot, to retain the pivotal pin therein, as herein specified.



2. The center-board C, provided with the sheathing E, having the right-angled slot *g*, the bolt D, adapted to slide in the said sheathing and close the said slot, and the fixed pivotal pin B, in combination, as specified.

293,227. HARROW FOR CULTIVATING LISTED CORN. BYRON CLARK, Greenwood, Nebr., assignor of one-half to Obidiah Hull, same place. Filed July 7, 1883. (No model.)

Claim.—In combination with the runners C C, connected by arches U U, the harrow frames or wings A B, hinged to said runners, as shown, substantially as and for the purpose set forth.

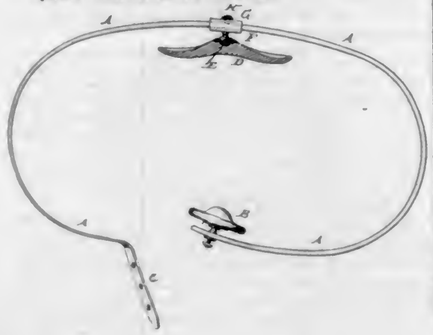


293,228. MANUFACTURE OF ORNAMENTAL PAPER. WINTHROP MURRAY CRANE, Dalton, Mass., assignor to Albert G. Goodall, New York, N. Y. Filed July 5, 1883. (No model.)

Claim.—1. The hereinbefore-described art, method, or process of surface-printing or coloring paper during the process of manufacture, which consists in applying the coloring material to either or both surfaces of the continuous web after the same has been consolidated and partially dried by passing through the press-rolls of the machine, as set forth.

2. The new article of manufacture hereinbefore described, which consists of a paper surface printed or colored after the web has been compressed and a portion of its moisture expelled by passing through the press-rolls of the paper-machine in the process of manufacture.

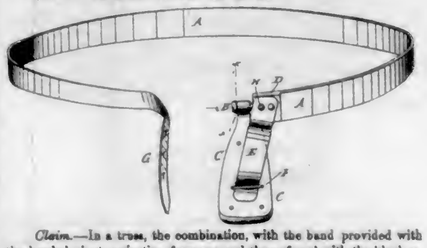
293,229. MACHINERY FOR MANUFACTURING ORNAMENTAL PAPER. WINTHROP MURRAY CRANE, Dalton, Mass. Filed July 5, 1883. (No model.)



Claim.—1. In a paper-making machine, the combination, substantially as hereinbefore set forth, of the press-rollers, the drying-cylinders, and the color-printing roller revolving in contact with the paper web between the press-rollers and the drying-cylinders.

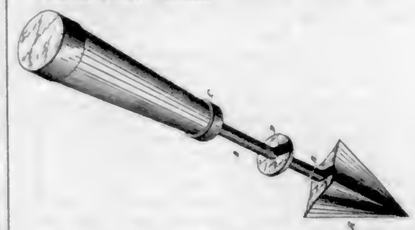
2. In a paper-making machine, the combination, substantially as hereinbefore set forth, of the press-rollers, two or more drying-cylinders, and two color-printing rollers, one of the latter revolving in contact with the paper web at a point between the press-rollers and the drying-cylinders, and the other in like manner at a point between two drying-cylinders.

3. In a paper-making machine, the combination, substantially as hereinbefore set forth, of the press-rollers, the color-roller, the printing-roller, the jockey-roller, and mechanism, substantially such as described, whereby the periphery of the printing-roller is caused to move at the same rate of speed as the periphery of the press-rollers.



4. In a paper-making machine, the combination, substantially as hereinbefore set forth, of the press-rollers, the drying-cylinders, the printing-roller, the divided color-roller, and the reservoir of coloring material divided into compartments corresponding to the divisions of said color-roller.

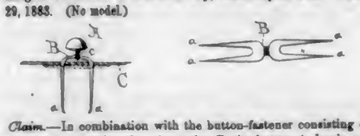
293,230. TRUSS. ORLANDO G. DARLING and HENRY A. SCHULE, Brooklyn, N. Y. Filed Feb. 24, 1883. (No model.)



Claim.—A truss consisting of the spring A, the convex pad B at the front and connecting by its stem the two ends of the spring, and the concave rear pad, D, ball-jointed to an adjustable sleeve on the spring, as shown and described.

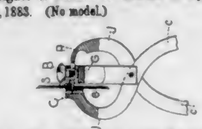
293,231. TRUSS. ORLANDO G. DARLING and HENRY A. SCHULE, Brooklyn, N. Y. Filed Mar. 16, 1883. (No model.)

Claim.—In a truss, the combination, with the band provided with the headed pivot projecting from one end thereof, and with the block or shoulder arranged at one side of said end, of the pad hung upon the said pivot, and the flat spring secured to the block or shoulder, and projecting through a keeper of the pad and bearing against the latter, essentially as shown and described, and for the purpose set forth.



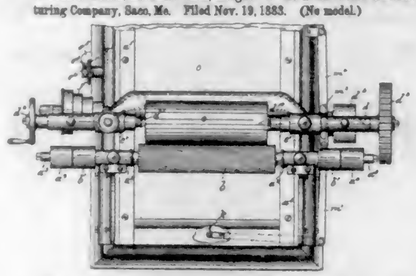
293,232. BUNG-EXTRACTOR. GEORGE M. DOBSON, Antigo, Wis. Filed Dec. 26, 1883. (No model.)

Claim.—1. The combination, with the shank of a bung-extractor, of a collar interposed between the blade and the handle-supporting shoulder, adapted to arrest the downward movement of the instrument, whereby a claw-iron may be readily interposed between said collar and the shoulder of the extractor in extracting the bung, substantially as and for the purpose specified.



2. In bung-extractors, the rigid collar D, in combination with the knife A, the shank B, and the shoulder C, substantially as and for the purpose specified.

293,233. BUTTON-FASTENER. CHARLES H. EGGLESTON, Marshall, assignor of one-half to Edward O. Ely, Grand Rapids, Mich. Filed June 29, 1883. (No model.)



Claim.—In combination with the button-fastener consisting of the prongs *a a* and the reduced neck portion B, the button A, having a suitable eye permanently secured upon such fastener, all substantially as shown and described.

293,234. BUTTON-SETTING INSTRUMENT. CHARLES H. EGGLESTON, Marshall, assignor of one-half to Edward O. Ely, Grand Rapids, Mich. Filed Nov. 9, 1883. (No model.)

Claim.—In a button-setting instrument, the guide G, provided with the slot *i*, and groove *t*, placed between and in combination with the jaws J and J', the groove *t* and the slot *i* being so placed with reference to each other that the groove will receive the staple and the slot *i* the eye of the button, substantially as described.

293,235. MACHINE FOR REDUCING WOOD TO PULP AND FIBER. G. FRANK EVANS, Mechanic Falls, assignor to the Evans Fiber Manufacturing Company, Saco, Me. Filed Nov. 19, 1883. (No model.)

Claim.—1. In a machine to reduce wood for the production of fiber, the revolving cutting-cylinder *b*, having pulleys at each end, combined with the two independent loose pulleys to receive the driving-belts, and with supports for the said cylinder and loose pulleys, substantially as and for the purpose described.

2. The carriage *c*, its uprights, the center-point and chuck to hold the block of wood to be reduced, and the base provided with guides to receive the said carriage, combined with the rotating cutting-cylinder, and with means to rotate the said block and move the carriage longitudinally, substantially as described.

3. The carriage, its uprights, and the center-point, chuck, spindle *d*, and gear d^3, combined with the pinion d^5, shaft d^6, and driving-pulley d^8, substantially as described.

4. The carriage, its uprights, and the center-point, chuck, spindle *d*, and gear d^3, combined with the pinion d^4, shaft d^6, and loose pulley d^9 and clutch, substantially as described.

5. The base *a*, cutting-cylinder, means to rotate it, the separable nuts, and the carriage to support the block of wood, combined with the shaft *f*, its worms, the worm-gears, and the shafts f^4 f^5, and with means to rotate the shaft and the said block of wood, substantially as described.

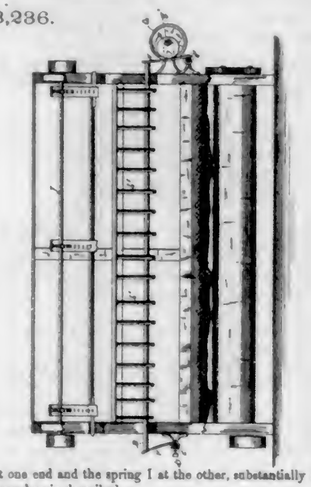
6. The base *a*, the slide-bars *g g'*, the carriage fitted into ways of the base, the threaded shafts f^4 f^5, worm-gears f^2 f^3, worm-shaft *f*, and means to rotate it, combined with means, substantially as described, to move the slide-bars to close them upon or release them from the said threaded shafts when it is desired to move or stop the said carriage, as set forth.

7. The base *a*, the slide-bars, the toggle-lever, and means to straighten the said toggle-lever or to break its joint, combined with the carriage and its attached threaded shafts, to operate substantially as set forth.

8. In a machine for reducing wood to shavings for the production of pulp, a rotating cutting-cylinder provided with blades shaped substantially as described, to cut from a block short shavings, combined with means, substantially as described, to rotate the block of wood more slowly than the said cutting-cylinder.

9. The carriage, center-point, chuck, and spindle, and means to rotate it, and a block held by the said point and chuck, and the base *a*, combined with a rotating cutting-cylinder provided with blades having their cutting-edges subdivided or shaped to remove short shavings from the periphery of the rotating block, substantially as and for the purpose set forth.

10. The cutting-cylinder and carriage and block supported thereon, and means to rotate the said cutting-cylinder and block, combined with feeding mechanism for moving the said carriage and block toward the cutting-cylinder, and mechanism automatically operated by the carriage, whereby its feeding mechanism is disengaged and the rotation of the block stopped, substantially as described.

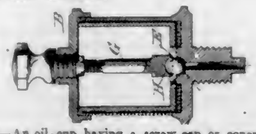


11. The cutting-cylinder and carriage and block, and its actuating pulley and clutch, combined with the separable nuts and threaded shafts, and the stopping device, whereby the said nuts are separated and the clutch simultaneously disengaged, substantially as described.

12. The cutting-cylinder and the carriage and block and gears, pulley, and clutch to rotate it, combined with the clutch and shipper and carriage-feeding mechanism, and the arm A, connected with the said shipper and with a portion of the carriage-feeding mechanism, and the rod *i*, connected with the carriage and co-operating with the arm A, as described, whereby the forward movement of the carriage and rotation of the block are simultaneously stopped, substantially as described.

293,236. MACHINE FOR TREATING MIDDLINGS. JAMES JOHNS FAULKNER and ELIZA TAYLOR FAULKNER, McMinnville, Tenn. Filed May 18, 1883. (No model.)

Claim.—1. In a middlings-purifier, the sieve C, having a lateral incline, and provided with the central supporting-bar, B, parallel bars *b b*, and cross-bars *b' b'*, in combination with the knocker H and eccentric *g'* at one end and the spring I at the other, substantially as and for the purpose herein described.



293,236.

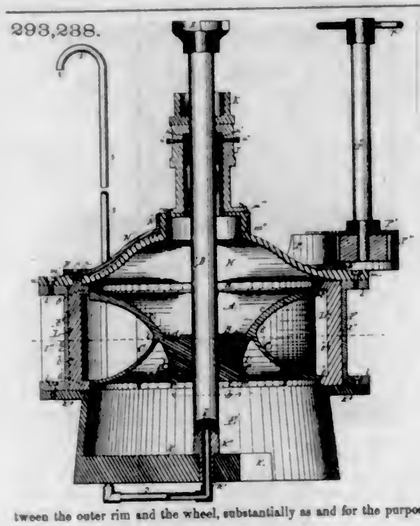
2. The sieve C, having a lateral inclination, in combination with the supporting-bar B, parallel bars *b b*, cross-bars *b' b'*, knocker H, and spring I, all constructed to operate substantially as and for the purpose set forth.

3. The knocker H, in combination with the shaker, the rocker-shaft H', set-screw *h'*, and eccentric *g'*, all constructed to operate substantially as and for the purpose set forth.

293,237. OIL-CUP. ROBERT A. FISHER, San Francisco, Cal. Filed June 23, 1883. (No model.)

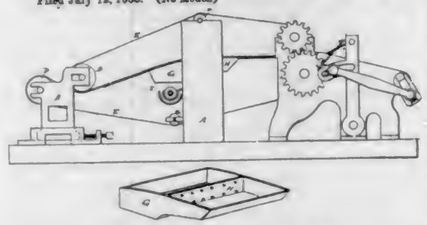
Claim.—An oil-cup having a screw cap or cover, a screw-stem passed through said cover, two hemispherical chambers, one of which is formed in the bottom of the cup in an axial line with the oil-passage and the other within the end of the screw-stem, and a ball-valve placed in and between said hemispherical chambers, and adapted to be operated by motion imparted to the machinery to which the oil-cup is attached, substantially as described.

293,238. WATER-WHEEL. THEODORE M. FLENNIKEN, Rockford, Ill., and THOMAS W. GRAHAM, Dubuque, Iowa; William McGregor Administrator of Theodore M. Flenniken, deceased. Filed Jan. 16, 1882. (Model.)



Claim.—1. The combination, in a two-rimmed water-wheel having its upper plate curved inward and downward, meeting the periphery of the hub in the plane of the lower face of the wheel, of buckets connecting the rims at their peripheries in vertical lines, their upper edges connecting the under curved face of the upper plate in a curved spiral line in easy curves terminating in the periphery of the hub in the lower plane of the wheel on the side of the hub opposite the connection of the bucket with the rims at their peripheries, substantially as and for the purpose hereinbefore set forth.

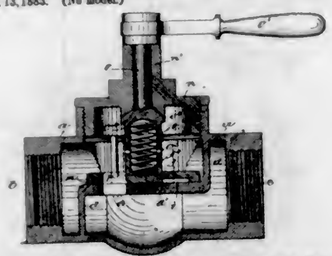
2. The herein-described water-wheel, consisting of an upper plate having its under surface concave on radial planes, buckets joining the lower and upper outer rims of the wheel in vertical lines, having their upper edges connected with the under curved surface of the upper plate in smooth, easy curves in a descending spiral line terminating in the lower plane of the wheel on the side of the hub opposite to the bucket-connection with the outer rim, from which connection they curve downward and outward, their lower edges producing the lower outer rim, and their lower ends terminating in the plane of the lower face of the wheel, substantially as and for the purpose hereinbefore set forth.



3. The combination, with the herein-described two-rimmed water-wheel, consisting of the upper plate with curved under surface, the buckets connected to the upper rim and descending in spiral lines and terminating in the lower plane of the wheel on the side of the hub opposite to the bucket-connection with the upper rim, of an outer rim having induction-openings, and a gate-ring provided with induction-openings to correspond with the openings in the outer rim, and fitted to oscillate between the outer rim and the wheel, substantially as and for the purpose set forth.

4. The combination, with the step-support of the wheel, of a tube-connection with the axial center of the step, to conduct a lubricant to the bearing-surface of the support, as and for the purpose hereinbefore set forth.

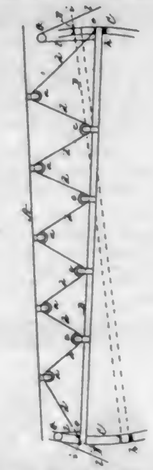
293,238.



293,239. PLAITING-MACHINE. JOHN B. FOLEY, New Haven, Conn. Filed July 12, 1883. (No model.)

Claim.—In a plaiting-machine, the boiler G and steamer H, connected together, with communicating passages between them, arranged between the rolls over which the endless apron carrying the goods passes, the steam from the steamer coming into direct and immediate contact with the apron, and the boiler adapted to impart heat to and dry or partially dry the steamed goods as they pass through the machine.

293,240. VALVE. J. MORTIMER GOLDSMITH, Boston, Mass. Filed Aug. 13, 1883. (No model.)

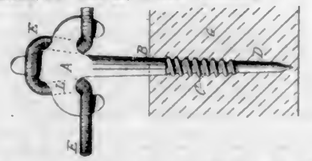


Claim.—1. In a register-valve, the combination, with the ported seat, of the valve proper, having corresponding ports, openings, and pockets or recesses in the wearing-face of the valve between the said port-openings, substantially as and for the purpose set forth.

2. The ported valve-seat and valve having corresponding ports, and having its periphery notched adjacent to the said ports, substantially as and for the purpose described.

3. The valve-seat and valve having a recessed hub combined with the valve-stem, having a shoulder and recessed hood, and a spring inclosed in the said hub and hood, which are engaged with one another, substantially as described.

293,241. CASH AND PARCEL CARRIER. CHARLES GRANT, Jr., Boston, Mass. Filed Jan. 7, 1884. (No model.)



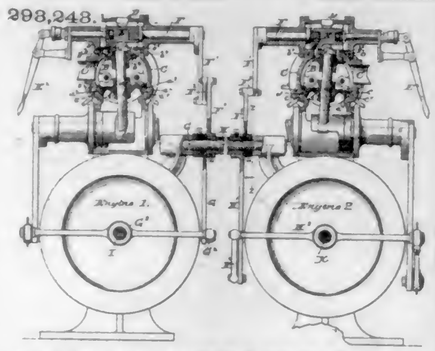
Claim.—1. In combination, a flexible supporting wire, cord, band, or chain, *d*, two series of pulleys or guide-rolls, *a c*, arranged substantially as described, and a track, B, of a form in cross-section adapted thereto, for the purpose set forth.

2. An inverted-T-shaped track having a series of pulleys or guide-rolls secured thereto, a series of pulleys or guide-rolls secured to or depending from the ceiling of an apartment, a flexible supporting cord, wire, chain, or band, and suitable track-inclining and locking devices, combined and arranged as specified.

3. A track having a central hollow or tubular portion, *b*, and a horizontal wire, cord, or band, *w*, extending loosely through it, in combination with suitable locking and track-inclining devices, substantially as described.

293,242. INSULATOR FOR ELECTRIC WIRES. ALBERT W. HALE, Plainfield, N.J. Filed May 17, 1883. (No model.)

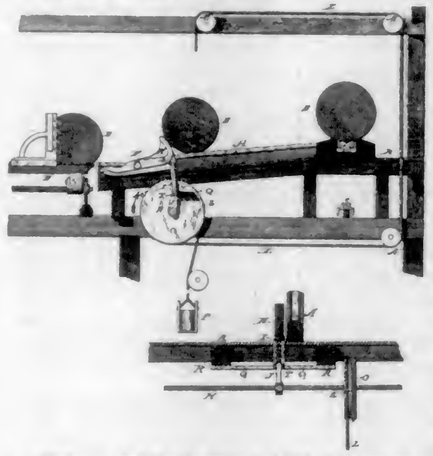
Claim.—1. As a new article of manufacture, metallic insulators for electric wires, combining in a single piece a bearing for the wire and a means of attachment to the support, insulated and made insulating by a complete covering of glaze, substantially as and for the purposes set forth.



2. As a new article of manufacture, metallic insulators for electric wires, protected from atmospheric influences, and also insulated from both the wire and the support for such insulators by a complete covering of glaze.

293,243. DIRECT-ACTING DUPLEX PUMPING-ENGINE. ROBERT W. HAMILTON, Hartford, Conn., assignor of two-thirds to Marshall T. Davidson, Brooklyn, N. Y. Filed Sept. 8, 1883. (No model.)

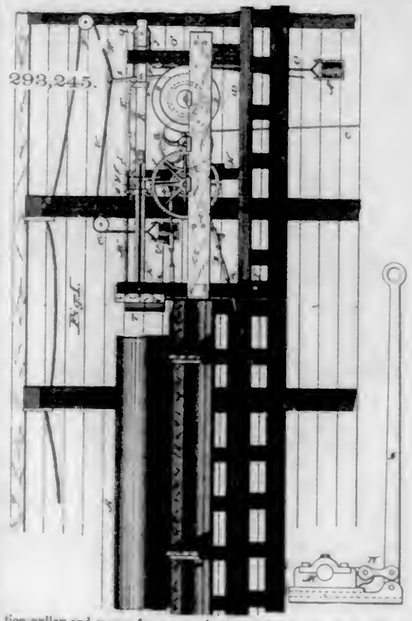
Claim.—1. In a duplex engine, the combination, substantially as before set forth, of a supplemental valve for governing the supply of steam to the induction-valve of the chest-cylinder of one engine and the piston-rod of the other engine



2. In a duplex engine, the combination, substantially as before set forth, of the piston-rod of one engine and a supplemental valve for governing the supply of steam to the induction-valve of the chest-cylinder of the other engine, said supplemental valve being shiftable by hand at pleasure from a position in which it opens and closes the ports to the in-

293,243.

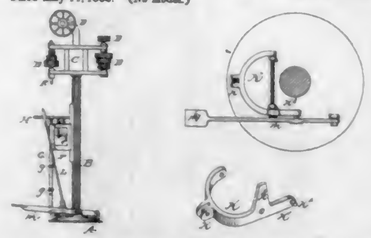
duction-valve alternately to a position in which said ports remain constantly uncovered, and vice versa.



293,244. LOG-LOADER. JAMES P. HANSON, Oshkosh, Wis. Filed Dec. 3, 1883. (No model.)

Claim.—1. In devices for stopping and holding logs preparatory to being sawed, the combination of a series of two or more log-stops, E, pivoted centrally below the upper surface of the logways, shaft H, extending beneath said several log-stops, and provided with arms J, rigidly attached thereto, links I, communicating between said arms and said stops, and means for communicating motion to said shaft, whereby said stops are thrown up as said shaft is turned in one direction, and drawn down as it is turned in the opposite direction, substantially as set forth.

2. In devices for stopping logs, the combination, with the shaft H, provided with series of arms J, connected to the several log-stops, of pulley O and rope L, one end of said rope being arranged upon said pulley, and provided with a weight, and the other end extending over supporting-pulleys above the log-deck, whereby said pulley O and shaft H may be turned in one direction by said weight, and in the other direction by the operator, as set forth.

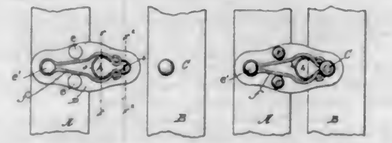


293,245.

tion-pulley and means for communicating motion therefrom to the bull-chain, a movable pulley communicating through bars and levers with a movable buffer, against which the approaching log is adapted to be brought in contact and moved in one direction, and weights suspended from ropes adapted through their connecting medium to bring said friction-pulleys in contact and move said buffer when relieved from the log in the opposite direction, thereby starting the bull-chain, substantially as and for the purpose specified.

3. In a log-jacking machine, the combination of standards A A, buffer T, bar R, rod M‴, bar L′, said bar L′ adapted to move on bar R, retaining-plates *a a*, cord O, as attached to bar L, and adapted to operate pulley Q in bar R, and pass beneath bar R, over pulley B, in post O′, said rope being provided at its lower end with weight N, lever S, provided with rope V, from the end of which is suspended a weight, U, said bar L′ being provided with brackets E′ and F′, for the reception of rod M‴, arm T′, adapted to be brought in contact with lever S, pin Y, adapted to communicate motion to the brake H′, brake H′, adapted to check the motion of the friction-pulley G, link W, movable journal-box M, shaft E, band-pulley D, friction-pulleys F and G, shaft H, gears I and J, shaft K, sprocket-gear L, and bull-chain B, said shafts, pulleys, and gears being adapted to communicate motion from said friction-pulley G to the endless chain, all substantially as and for the purpose specified.

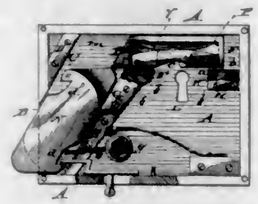
293,246. DRILLING-MACHINE. LEWIS HERRICK, New Haven, Conn. Filed May 11, 1883. (No model.)



Claim.—1. In a drill-press, the curved lever K, connected at the middle of its curvature with the table-bearing rod, fulcrumed as described, and provided with a long arm, *k*′, and an upright arm, *k*², said long arm connected with a treadle, and said upright arm adapted to carry a hand-lever, substantially as and for the purposes described.

2. The combination, with the curved lever K, having a long arm, *k*′, provided with a pin, *k*², of the pedal-lever M, pivoted in rear of said curved lever, and provided with a longitudinal slot, *m*, adapted to fit over the aforesaid pin, as and for the purposes described.

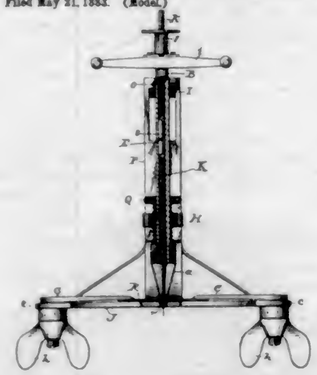
3. The combination, with the work-table and the elevating mechanism, of the rod G, composed of two sections held together by collars and set-screws, and the screw I, provided with nuts, as described, whereby said table may be adjusted, for the purposes set forth.



293,247. FASTENING-CLASP. LUCIAN HILL, North Brookfield, Mass., assignor to Theodore C. Bates, same place. Filed Dec. 13, 1883. (No model.)

Claim.—1. The herein-described plate, provided with a slot having a contracted extension, and having a flange, 3, extended more or less about the large part of the said slot, combined with one or more spring jaws or arms, the front ends of which are adapted to extend partially across the said slot, and to yield laterally to co-operate with the headed stud, substantially as and for the purpose set forth.

2. The plate D, slotted and provided with a flange, 4, about the small end of the slot, combined with one or more spring jaws or arms extended partially across the slot in the said plate between the said flange 4 and the larger part A of the said slot, and with a headed stud adapted to rest at its under side upon the flange 4, beyond the free end of the said arm, as and for the purpose described.



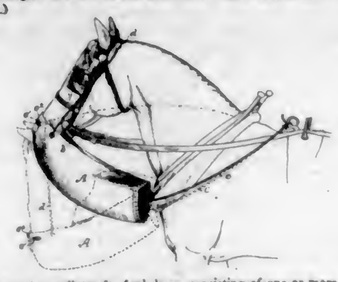
293,248. COMBINED LOCK AND LATCH. ANDERSON D. HOLLAND, Newport, Ark. Filed Jan. 4, 1883. (Model.)

Claim.—1. In a door-lock, the oblique reciprocating bolt, having its opposite ends beveled, whereby the said bolt will rise automatically in closing the door, in combination with the knob-shank and arm engaging the notches of the bolt, substantially as specified.

2. The door-lock herein described, consisting of the case having the communicating oblique and horizontal slideways, the oblique reciprocating bolt, having its ends beveled, and the horizontal locking-slide over the key-hole, the knob-shaft, and its arm engaging a notch or bearing of the oblique bolt, all combined and adapted to operate substantially as specified.

293,249. JEWELING-MACHINE. ERVIN HOUGHOUR, Shelbyville, Ill. Filed May 21, 1883. (Model.)

Claim.—1. In a machine for jeweling watches, the combination, with a hollow spindle journaled in a suitable frame over a face-plate provided with a central hole, of an expansible tool secured to the lower end of the hollow spindle, a spreader passing through said spindle, and means for forcing the spreader downward to spread the jaws of the tool, substantially as shown and described.



2. In a machine for jeweling watches, the combination, with the face-plate J, provided with a central hole, *r*, and frame P, secured to said face-plate, of the hollow spindle B, provided with handle *i*, hollow nut 1, threaded spreader K, and an expansible tool, substantially as shown and described.

3. In a machine for jeweling watches, the combination, with the face-plate J, provided with a central hole, *r*, and frame P, secured to said face-plate, of the hollow spindle B, provided with handle *i*, hollow nut Q, and threaded bracket H, substantially as described, and for the purpose set forth.

4. In a machine for jeweling watches, the combination, with the frame P, provided with the bracket H and bracket I, of the hollow spindle B, the hollow screw-nut Q, and the spring O, substantially as shown and described.

5. In a machine for jeweling watches, the combination, with the face-plate J, having a central hole, *r*, and frame P, secured to the face-plate, of the clamps C, hollow spindle B, handle *i*, hollow nut 1, threaded spreader K, hollow nut Q, and threaded bracket H, substantially as shown and described.

293,250. FEED-BAG FOR HORSES. GEORGE W. HORNE, New York, N. Y., assignor to A. A. Knudson, same place. Filed May 9, 1883. (No model.)

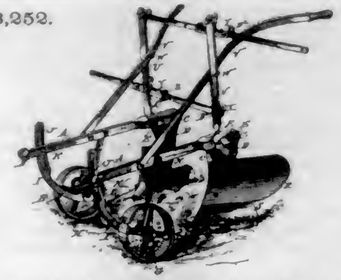
Claim.—A ventilator for feed-bags, consisting of one or more upright tubes secured to the front portion of the bag and opening into the inside thereof, substantially as hereinbefore set forth.

293,251. WHEEL. GEORGE W. HOWELL, Covington, Ky. Filed June 26, 1883. (No model.)

Claim.—1. The combination, in a wheel-hub, of the disks A A′, the flanged thimbles *e* and *f*, connected with the disks and having internal screw-threads, and the shaft or sleeve F, having right and left exterior threads, and engaging the threads of the thimbles to simultaneously adjust both the disks, substantially as and for the purpose described.

2. The combination, in a wheel-hub, of the disks A A′, each having a many-sided orifice, the interiorly-threaded flanged thimbles *e* and *f*, having exterior surfaces fitting in the orifices of the disks, and the shaft or sleeve F, having right and left screw-threads engaging the threads of the thimbles to simultaneously adjust both disks, substantially as described.

3. The combination, in a wheel-hub, of the disks A A′, the interiorly-threaded thimbles connected with the disks, and the shaft or sleeve F, having right and left threads engaging the threads of the thimbles to simultaneously adjust both the disks, substantially as described.



4. In combination with the disks A A′, having the slotted spoke-holes *a* and screw-threaded hub, the spokes C, having neck *c*, and connected to the rim D and disks A A′, substantially as herein set forth.

5. The combination, with the disks A A′, the threaded thimbles, and the threaded shaft or sleeve, of the T-shaped rim H and the spokes C, having their outer ends secured in the lateral flanges of the rim, substantially as shown and described

293,252. PLOW. CONRAD HUEHN, Rochester, N. Y. Filed June 30, 1883. (No model.)

Claim.—1. The combination of the beam, having the bifurcated

293,252.

rear end, with the standard, formed of a single plate, bent or doubled so as to form a pair of wings, connected by the curved front edge, and having their upper edges brought together so as to form a flange, fitted in the bifurcated rear end of the beam, and shoulders abutting against the under side of the latter, substantially as set forth.

2. The combination of the beams A A, having bifurcated rear ends, vertically-adjustable wheels or casters at the front ends of said beams, uprights U at the rear ends of said beams, handles V, secured to said beams and uprights, which latter are thereby braced, braces connecting the said uprights, adjustable near their upper and lower ends, and adapted to permit the beams to move vertically independently of each other, and the standards secured in the forked rear ends of the beams, as set forth.

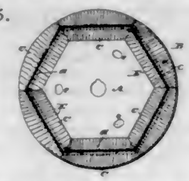
293,253. GATE-LATCH. WESLEY HULL, Fort Wayne, Ind. Filed Jan. 17, 1883. (Model.)

Claim.—In a pendent gate-latch, the case having a chamber with interior bearings and open bottom for the reception of the latch, in combination with two diverging arms, each of which curves out an equal distance from the center of the upper end of the vertical portion of the latch in such a manner that the head of each arm will rest in the opposite side of the chamber on its respective bearing, upon which the latch is suspended, and the horizontal arms of the bar which project out beyond the case at each side, substantially in the manner and for the purpose specified.

293,254. THREAD CUTTER AND HOLDER. EDWIN JERAULD, Jr., Bristol, R. I. Filed Sept. 10, 1883. (No model.)

Claim.—1. The combination, with the presser-foot bar and mounted thereon, of the thread-cutter and the spring-plunger provided with a head, and serving as a thread-holder for compressing thread between one side of said head and a coincident surface, substantially as described.

2. The combination of the spring-plunger, serving with an abutting-surface as a thread-holder, and the thread-cutter, serving also as a guide for said plunger, substantially as described.



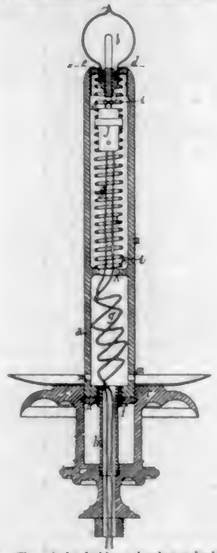
3. The combination of the thread-cutter and the thread-holder having the thread-compressing spring, and provided with means for adjusting the power of said spring, substantially as described, whereby said holder can be adjusted to compress a coarse thread no tighter than a fine one, and to hold both equally well during the use of the cutter, as set forth.

293,255. PULLEY. CLAY KEMBLE, Philadelphia, Pa. Filed Nov. 8, 1883. (No model.)

Claim.—1. A pulley having the grain running radially, and a peripheral portion formed of segmental pieces of wood, each having the grain exposed at the periphery, substantially as and for the purpose set forth.

2. A pulley having separate heads with collars on the inner faces thereof, sections or segments fitted between the heads around the collars thereof, and clamping bolts and nuts, said bolts being passed through

293,255.



the heads parallel with the supporting-shaft, substantially as and for the purpose set forth.

3. A pulley having separate heads, the outer faces whereof are depressed or countersunk, and clamping bolts and nuts, the heads of said bolts and nuts occupying positions in the spaces formed by said depressions, substantially as and for the purpose set forth.

4. Separate heads with depressions on their outer faces and collars and tongues on their inner faces, a peripheral portion formed of segments or sections of wood with grooved sides, and clamping-bolts passed through the separate heads, and provided with nuts, the parts being combined and operating as described, forming an improvement in pulleys.

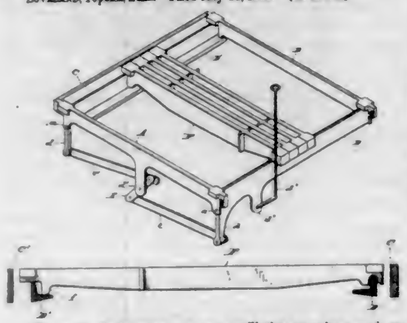
293,256. HOLDER FOR INCANDESCENT ELECTRIC LAMPS. JEAN LANGUEREAU, Paris, France. Filed July 23, 1883. (No model.)

Claim.—1. The tubular holder *a*, having at its lower end a threaded portion, *f*, in combination with the socket *c*, having a removable plate, *n*, and a central pipe, *h*, for receiving said portion *f*, all arranged substantially as and for the purposes specified.

2. The tubular support *a* and inclosed spiral spring *i* and piece *j*, in combination with an incandescent lamp, *b*, suitable means for fastening the latter upon the holder *a*, and suitable means for connecting the same to the conductor, the piece *j* being located below the upper end of the spiral spring, so as to permit the upper portion of spring to exert an upward tension on the lamp, as and for the purposes herein specified.

3. The tubular support *a*, having an internal flange, *k*, dividing the space into two parts, one for the reception of the spring *i* and the other for the reception of an extra length of conducting-wires *g*, in combination with said spring and wires, and with an incandescent lamp, *b*, arranged upon the holder *a*, all substantially as and for the purposes herein specified.

4. The tubular support *a*, mounted upon a socket, *c*, and carrying an incandescent electric lamp, *b*, said tubular support being provided at its base with holes *m*, adapted to allow the conducting-wires to be led from the exterior into and up through the hollow space of the support to the lamp *b*, substantially as herein specified.

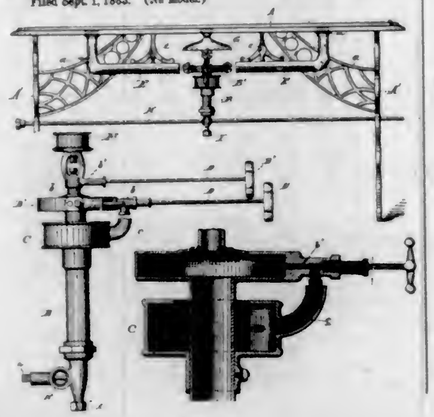


293,257. CARTRIDGE-CASE. WILHELM LORENZ, Carlsruhe, Baden, Germany. Filed May 21, 1883. (No model.) Patented in Germany Mar. 19, 1882, No. 19,677, and Aug. 24, 1882; in France May 27, 1882, No. 149,236; in Belgium July 1, 1882, No. 58,359; in England July 3, 1882, No. 3,137, and in Austria-Hungary Oct. 12, 1882.

293,257.

Claim.—The compound cartridge-case described, having an inner shell, A, with its closed rear and flange, as usual, but with a body of less thickness than is required to fill the cartridge-chamber of the gun, in combination with an external removable shell, B, in the form of a plain cylinder, adapted for joint operation relatively to each other and to a breech-loading gun, substantially as herein specified.

293,258. FURNACE FIRE-GRATE AND FRAME. HORACE W. LOVELAND, Topeka, Kans. Filed May 21, 1883. (No model.)



Claim.—1. In furnace grate-bars, oscillating cross-bars, each provided with an upright and a horizontal leg, and so arranged that the respective horizontal legs extend toward each other, and provided with suitable connecting mechanism, so that the two cross-bars will oscillate simultaneously and the respective upright legs move in opposite directions, substantially as and for the purpose set forth.

2. Furnace grate-bars provided at one end with a notch adapted to engage the upright leg of the oscillating cross-bar, and the other end of the grate-bar provided underneath with a flat surface and a lug, the former adapted to slide on the contiguous cross-bar, and the latter adapted to engage the horizontal leg of the said cross-bar, so as to be actuated vertically thereby, substantially as described, and for the purpose set forth.

3. In furnace grate-bars, oscillating cross-bars, each provided with an upright and a horizontal leg, and connected by suitable mechanism, so that the cross-bars will oscillate simultaneously, but in opposite directions, in combination with grate-bars provided on the under side with a notch at one end and a flat surface and a lug at the other end, and so arranged that alternate grate-bars will engage with their notched ends opposite cross-bars, so that when the said cross-bars are oscillated contiguous grate-bars will move endwise in opposite directions, and will be actuated vertically at opposite ends, substantially as described, and for the purpose specified.

4. The combination, with furnace grate-bars, substantially as described, of the cross-bars D and D', provided with the actuating mechanism E, *e*, and *e'*, and the lever d^3.

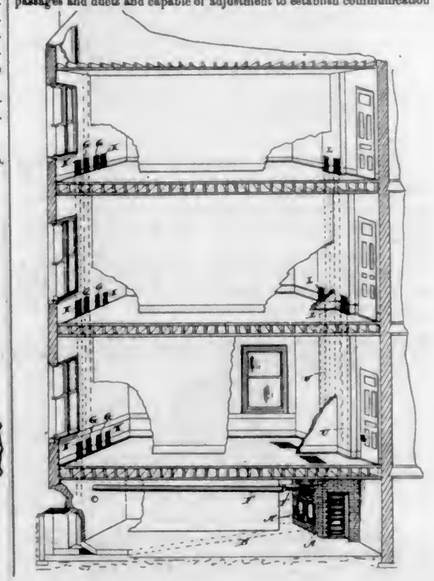
293,259. VAPOR-STOVE. FORDYCE ALLEN LYMAN, Cleveland, Ohio. Filed Sept. 1, 1883. (No model.)

Claim.—1. The combination, with an oil stove or stand and commingling-tubes secured thereto, and provided with burners, of the generator situated between the free ends of the commingling-tube, and a supply-pipe for supplying oil to the generator.

2. The combination, with an oil stove or stand, the bent commingling-tubes secured to the stand, and burners secured to the commingling-tubes, of a generator situated between the commingling-tubes, and separate and independent therefrom, and a burner situated above the generating-chamber, substantially as set forth.

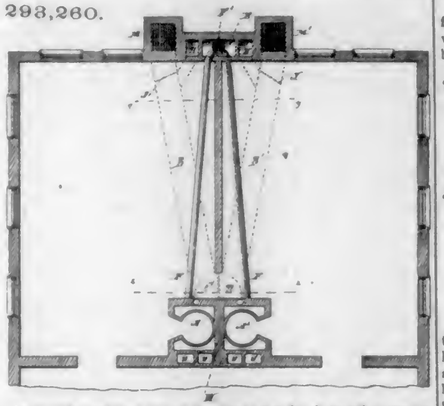
3. The combination, with an oil stove or stand, the bent commingling-tubes secured thereto and provided with burners, of the generator situated between the free ends of the commingling-tubes, and valves for closing the orifices in the generator and the supply-pipe.

4. The combination, with the generating-chamber, provided with a jet-orifice and a valve for regulating the flow of vapor therefrom, of a commingling-chamber constructed substantially as described, surrounding the supply-pipe, and provided with an upwardly-projecting spout, *c*, which latter terminates below the jet-orifice, whereby the gas is projected directly into the commingling-chamber, without the intervention of a series of passages, substantially as set forth.



5. The combination, with a vaporizing-chamber provided with a boss, the latter being provided with a bore, *d*, a short bore situated alongside of the bore, and provided with a jet-plug, and a valve-opening situated at right angles to the bore *d*, and communicating with the said bore, and the short bore containing the jet-plug, of the valve D, constructed as described, and adapted to shut off communication between the vaporizing-chamber and the jet-plug, substantially as set forth.

6. The combination, with the neck *c*, integral with the part C, of the boss *b'*, integral with the generating-chamber B', and provided with a suitable valve mechanism, and adapted, by means of the short route thus provided, for the passage of heated gases from the generating-chamber to the commingling-chamber with so little loss of heat that no auxiliary heating device is required, substantially as and for the purpose set forth.

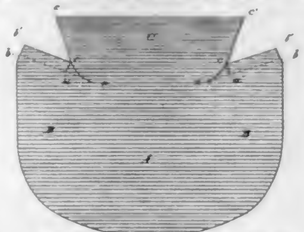


293,260. APPARATUS FOR HEATING AND VENTILATING BUILDINGS. JAMES H. MANNY, Chicago, Ill., assignor to the Richardson & Boynton Company, of New York. Filed July 23, 1881. (No model.)

Claim.—1. The two furnace-chambers A A', for containing furnaces, and provided with a valve, V, for opening and closing communication between the chambers, in combination with ducts arranged to supply cold air either to both or to one of the said chambers, whereby the furnaces can be used together, each heating a separate part of a building, or either of the furnaces can be used alone for heating the whole building, substantially as and for the purposes specified.

2. The circulating-passages H, one connecting with each room, in combination with separate cold-air ducts B B', opening, respectively, into the passages, and valves J, arranged, respectively, at the junction of the passages and ducts and capable of adjustment to establish communication

293,260.

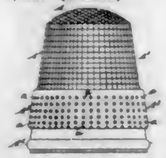


between the said passages and ducts and cause the air from the rooms to flow through the cold-air ducts, substantially as described.

3. The combination of the ventilating-registers G, the circulation-passages H, and valves J, controlling both the cold-air ducts and the passages H, all adapted to be operated simultaneously, substantially as and for the purposes specified.

4. A valve, V, and a valve, D, controlling the air-inlets to the furnace-chambers, said valves being connected together, so as to be simultaneously operated, in combination with two furnace-chambers, A A', and air-ducts B B', substantially as and for the purposes specified.

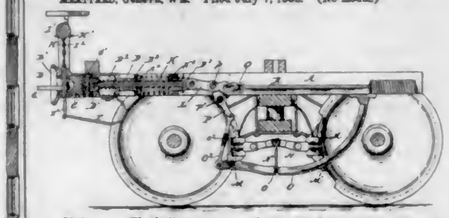
293,261. BLANK FOR ROAD-SCRAPERS. GEORGE D. MATCHAM, Pittsfield, Ohio. Filed Aug. 4, 1883. (No model.)



Brief.—The scraper-blank is formed with pieces on its sides to lap straight portions of the edges of the back, the seams at the lower and curved portions being protected, and the back supported by triangular pieces of the sides, formed by cutting the lines of the back and lines separating them from the main lapping pieces, and bent over such seams.

Claim.—1. In a blank for a road-scraper, the triangular pieces *a* *a'* *c*, integral with the respective sides B, and separated from the back C only by the slit *c a*, that has removed no metal, and adapted to be bent behind the part C, and to support it on the curved portion thereof, and adapted also to cover the crack on the curved parts between the sides and the back, substantially as described, and for the purpose specified.

2. In a blank for a road-scraper, the combination, with the back, as shown, of the sides provided with flaps for attaching the sides to the back, and with triangular pieces adapted to support the curved portion of the back, substantially as and for the purpose set forth.



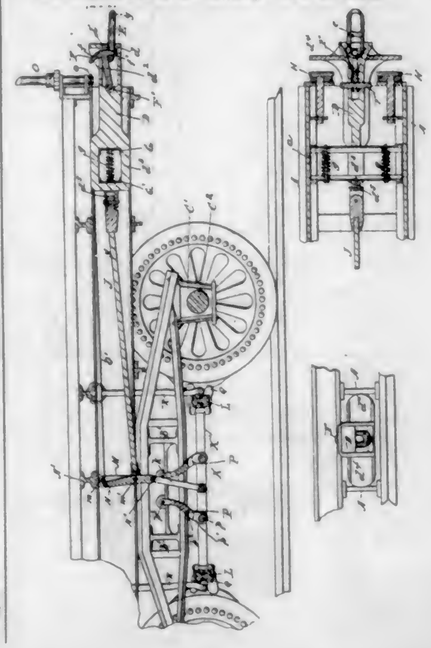
293,262. SEWING-THIMBLE. ELIZABETH F. MCCARTNEY, Omaha, Nebr. Filed Sept. 3, 1883. (No model.)

Claim.—1. The sewing-thimble described, having a raised portion, A^2, extended partially or entirely around, adapted to relieve the root of the finger-nail from pressure, as herein specified.

2. A thimble having a portion, A^2, both raised and furnished with fine perforations *a*, adapted to relieve the nail from pressure, and to ventilate the space, while completely protecting it from the needle, as herein specified.

293,263. COMBINED CAR BRAKE AND COUPLER. EDWARD B. MEATYARD, Geneva, Wis. Filed July 7, 1882. (No model.)

Claim.—1. The hollow open-mouthed buffer B, in combination with the coupler C, the pin C', rigidly affixed to the coupler, but arranged to have a limited backward and forward play in the buffer, and the pin C^2, arranged to have a vertical play in both coupler and buffer and a limited longitudinal play in the former only, and means for lowering and raising the pin C^2, substantially as and for the purpose described.



2. The buffer B, coupler C, upright pin C^2, horizontal pins E and E^2, guiding-rods E', and mechanism for lifting the pin E, all in combination, substantially as and for the purpose described.

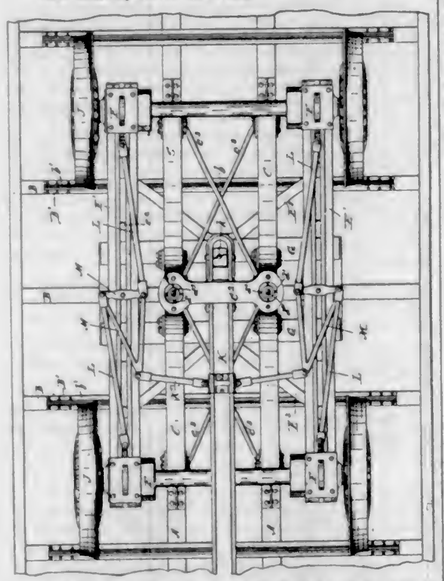
3. The buffer B, coupler C, upright pin C^2, horizontal pins E and E^2, guiding-rods E', bar H, shaped and arranged as described, spring F, arranged as described, and means for lifting the pin E, all in combination, substantially as and for the purpose described.

4. In a traction car-brake, the bifurcated toggle-arms N and N', connected with and arranged to operate two or more brake-bars, in combination with readily-yielding draw-bars, and mechanism for connecting the knuckle of the toggle-arms with the draw-bar, substantially as and for the purpose set forth.

5. The springs K and R', lever P, arranged as described, mechanism connecting the springs with each other and with one end of the lever, rod O^2, arranged substantially as described, bent lever O, connecting-rod N', toggle N, and brake-bars M, all in combination, substantially as and for the purposes described.

293,264. COMBINED CAR BRAKE AND COUPLER. EDWARD B. MEATYARD, Lake Geneva, Wis. Filed May 7, 1883. (No model.)

Claim.—1. A draw-bar, in combination with a brake-bar, a system of levers connecting the draw-bar to the brake-bar, and springs arranged in the usual gap at the rear end of the draw-bar, adapted and adjusted to maintain the said draw-bar in a normal position intermediate between the extremes of its range, and at the same time in this position to keep the brakes set up, and also adapted and adjusted to yield nearly the whole of their elastic range under a pull or thrust of traction due to the resistance of a single moving car, to thereby take off the brakes, substantially described.



2. The buffer provided with laterally-projecting wings, in combination with traction-springs, to keep slack between said wings and the end of the car, and auxiliary springs filling part of the slack to meet excessive buffing-shock as the traction-springs are compressed, and mechanism connecting the rear of the draw-bar with the brake.

3. The toggle K, arranged substantially as described, the hanger M, suspended above the knee of the toggle, so as to admit of oscillation lengthwise of the car, the bar N, vertically pivoted at the lower end of the hanger, extending a little way below the pivot, and having the part above the pivot equal in length to the hanger and bent slightly toward the inner end of the truck, the chain O^2, connecting the upper end of the bar with the hand-wheel, means for communicating the motion of the draw-bar to the lower end of the hanger, and means for communicating to the knee of the toggle the upward and downward motion of the lower end of the bar, all in combination, substantially as and for the purpose described.

4. The brake-bar L, in combination with two stiff connecting-bars, K', to which the brake-bar is readily fastened, and which converge near the center of the truck, and are there attached to an independent and substantially level support, whereby the brake-bar is held from rocking and the brake-shoes prevented from rubbing the wheels, substantially as and for the purposes set forth.

5. The two toggle-hangers P, the toggle K, and the connecting-bars K', all constructed and arranged substantially as and for the purpose described.

293,265. RAILWAY-CAR. EDWARD B. MEATYARD, Lake Geneva, Wis. Filed May 7, 1883. (No model.)

Claim.—1. In a railway-car, the longitudinal girder A, in combination with the transverse floor-joists B and the truss-bars B', the floor-joists B having their ends sprung down to a deflection within a safe limit of elasticity before being fastened to the ends of the truss-bars B', to prevent vibration of the joists while the car is moving empty, and when the car is loaded so as to take a portion of each joist's load directly to the top flange of the girder A by means of the stiffness of the joist, and the other portion of each joist's load down the truss-bar to the bottom flange of the girder A, substantially as described and shown.

2. In a railway-car, the V-shaped bolster C, rigidly secured to the main floor-beams at its ends, and pivotally suspended from the cross-beams in the middle, and composed of two parallel pairs of downwardly-convergent bars rigidly connected at their convergent ends, the bars of each pair being also connected by cross-braces, substantially as and for the purpose described.

3. The two-part channel or angle-arch bar E, in combination with the two-part angle truss-bar E', and vertical braces E^2, provided with heads at each end firmly clamped between the component parts of both the arch-bars and truss-bars, substantially as and for the purposes set forth.

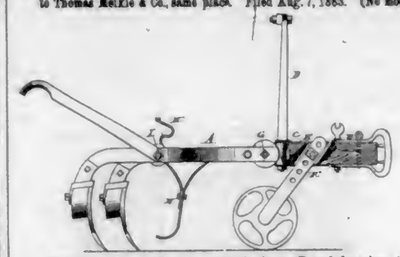
4. In a railway-car, the arch-bar E, the truss-bar E', the connecting-bar G', longitudinal girder A, V-shaped bolster C, and pivotal suspension-hanger D, in combination with I-beam transoms G, of the minimum depth, to permit the car-floor to be as low as possible, substantially as described.

5. In a railway-car, the arch-bars E and truss-bars E', constituting the truss spanning the distance between the two axle-boxes on each side of the truck, in combination with the transoms G, the brace-bars E^2, and the lateral brace-bars E^3, fastened to the transoms G at one end, and at the other to the brace-bars E^2 near the outer quarter of the bars E and E', substantially as and for the purposes set forth.

6. The combination of the arch-bars E, the truss-bars E', and the horn-plates F', all constructed and arranged substantially as and for the purpose described.

7. The vibration-springs H^2, in combination with the car-body and the truck cross-beams, whereby the car-body is tied down to the ends of the truck cross-beams, substantially as and for the purpose set forth.

8. The transverse floor-joists, in combination with the longitudinal floor-plank and the channel-beams O, fastened to the end of the joists, and also to the edges of the floor-plank, substantially as and for the purposes set forth.



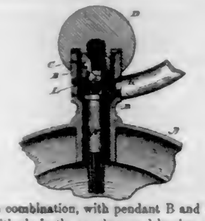
9. The axle-box, in combination with the rods L, the triangular bell-crank M, and the arms K', arranged and operating substantially as and for the purposes set forth.

10. In a railway-car, an angle-bar, P, in combination with a sheet-metal strip or strips bent or flanged at the edges to meet the sides of the angle-bar, and a U-shaped strip, R', inclosing and clamping together the angle-bar and edges of the sheet, substantially as and for the purposes set forth.

11. A car-axle, in combination with an independent tubular bearing of oval shape and hardened metal shrunk on the axle, substantially as and for the purposes set forth.

12. In combination with the running-board, the casting Q', bent at the ends to inclose the board, and having one of the bent ends prolonged to form a support, *q'*, for a hand-rail.

293,266. CULTIVATOR. THOMAS MEIKLE, Louisville, Ky., assignor to Thomas Meikle & Co., same place. Filed Aug. 7, 1883. (No model.)



Claim.—1. In combination with the beam B and drag-bar A of a cultivator, a coupling consisting of the central piece, C, pivoted to the rear end of the beam, and the side pieces, F F, attached to the front end of the drag-bar and pivoted to the piece C, said parts being constructed, respectively, and arranged to form a compound joint substantially as set forth.

2. In combination with the drag-bars and beams of a straddle-row cultivator, the arch-yoke D, having stems D', connecting the beams and turning in the beams to permit the fore and aft independent play of the plows, and said stems D' also forming pivots on which the drag-bars swing from side to side, substantially as set forth.

3. In combination with the vertically-swinging drag-bars of a cultivator, the swinging bifurcated spring-foot H H', the elastic arm H' of which is curved, substantially as shown, so as to perform the double function of supporting the spring-foot itself on the cross-bar K of the drag-bars, or of supporting the drag-bars on the spring-foot when the former are raised, so as to lift the shovels above the ground, substantially as set forth.

293,267. DEVICE FOR HOLDING THE STEM IN THE PENDANT OF STEM-WINDING WATCHES. ALEXANDER W. MILLER, Bellefontaine, Ohio. Filed Aug. 6, 1883. (Model.)

293,267.

Claim.—The combination, with pendant B and stem N, of the collar G, secured positively in the pendant, and having spring-tongue L, as and for the purpose set forth.

293,268. EAR-RING. FRANK W. MOORE, Waupun, Wis. Filed June 6, 1883. (No model.)

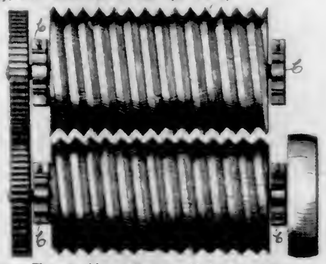
Claim.—1. In an ear-ring, the strap A, raised from the plate *x*, in combination with the bar *y*, for the purposes set forth.

2. The combination of the loop B and coil C, the bar *y*, bent at *b*, and strap A, raised from the plate *x*, as and for the purpose described.

3. In a spring-clasp for ear-rings, the combination of the bar *x*, having a coil, C, and tongue *c*, with the bar *y* through the strap A of the plate *x*, and the loop B, as and for the purpose set forth.

4. The combination, in a hinged and spring-clasped ear-ring, of the strap A on plate *x*, the bar *y*, having bend *b*, and loop B, secured to the plate by means of the strap, the flexible bar *z*, having coil C and tongue *c*, the loop and coil being united to form a hinge, substantially as set forth.

293,269. BOTTLE-STOPPING DEVICE. GEO. S. NORRIS, Baltimore, Md. Filed Nov. 9, 1883. (No model.)

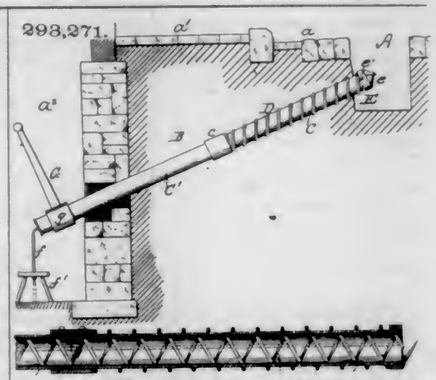


Claim.—1. A bottle-stopper cap consisting of a sheet-metal plate having two peripheral lugs, a disk, and an arm carrying said disk, stamped from said plate, substantially as and for the purpose described.

2. The combination of a bottle-stopper cap with a rubber plug having a central cavity, the floor of which cavity has a central projection resting against the end of the device forming a part of the stopper-cap, substantially as and for the purpose described

3. The combination of a bottle-stopper cap with a rubber plug having a central cavity and an opening, *d'*, in the top surface of said plug, leading into the side of said cavity, or eccentrically to said top, substantially as described.

293,270. CLAY-CRUSHING ROLLER. JAMES W. PENFIELD, Willoughby, Ohio. Filed Dec. 21, 1883. (No model.)



Claim.—Clay-crushing rollers provided each with a continuous spiral corrugation running from end to end of the roller, the corrugations having the same lead on each roller, either right or left handed, as preferred, substantially as set forth.

293,271. METHOD OF AND APPARATUS FOR LAYING BRANCH UNDERGROUND ELECTRICAL CONDUCTORS. WM. J. PHILIPS and GEO. L. KITSON, Philadelphia, Pa., assignors to said Philips. Filed Mar. 8, 1883. (No model.)

Brief.—For horizontal boring, a tube has a detachable drill-head, an exterior spiral, and an interior spiral of greater pitch, substantially the same diameter as the tube, and held from revolving with the tube.

293,271.

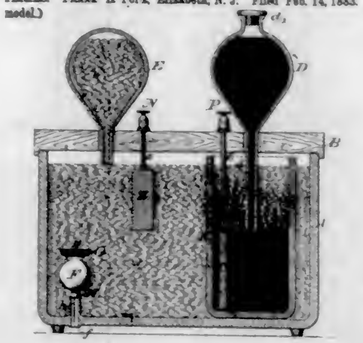
Claim.—1. The method herein described for laying branch or lateral conductors underground, which consists of first boring or drilling a passage-way underground to the main-line conductors, then withdrawing the core or internal appliances of the drilling-tool, then inserting the branch conductor through the drilling-tool, then coupling the branch conductor to the main-line conductor, and then withdrawing the drilling-tool, substantially as set forth.

2. The drilling or boring tool herein described, composed of a hollow tube carrying a cutter-head, an external spiral or thread, and a removable hollow spiral or helix of the same or nearly the same diameter as the hollow tube, substantially as described.

3. A drilling or boring tool composed of a hollow section carrying a removable cutter-head, an exterior feeding-spiral, and a removable hollow spiral of the same or nearly the same diameter as the hollow section, substantially as set forth.

4. A drilling or boring tool having an automatic feed arranged upon its exterior surface, and hollow internal appliances of the same diameter as the interior of the tube, for feeding the core or dirt cut by the drill through the latter, said appliances being designed and adapted to be removed from the drill, substantially as shown and described.

5. A hollow drilling or boring tool having a removable hollow spiral within, and of the same or nearly the same diameter as the interior of the tool, substantially as described.



6. A drilling or boring tool having an external thread or spiral and a removable hollow spiral of the same or nearly the same diameter as the bore of the tool, and having its coils of greater pitch than the external thread or spiral, for the purpose set forth.

7. A drilling or boring tool composed of one or more hollow sections carrying a removable cutter-head, an exterior feeding spiral or thread, an internal hollow spiral of the same or nearly the same diameter as the bore of the tool, and means for rotating said drill, substantially as described.

8. A drilling or boring tool composed of a rotating hollow section carrying a feeding-spiral and cutter-head, and an internal stationary spiral designed and adapted to be removable from said section, substantially as shown and described.

9. A drilling or boring tool composed of a rotating hollow section carrying a feeding-spiral, a removable cutter-head, and an internal stationary spiral, substantially as shown and described.

293,272. AUTOMATIC FEEDING APPARATUS FOR VOLTAIC BATTERIES. FRANK L. POPE, Elizabeth, N. J. Filed Feb. 14, 1883. (No model.)

Claim.—1. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel, a conduit whereby the solution may be withdrawn from the containing-vessel, a valve normally closing said conduit, and a float for automatically opening said valve when the specific gravity of the solution becomes abnormally great.

2. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel, a conduit whereby the solution or a portion thereof may be withdrawn from said containing-vessel, a valve normally closing said conduit, a float for opening said valve, and means, substantially such as described, for adjusting the specific gravity of said float, whereby the valve is automatically opened when the solution reaches a predetermined density.

3. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel within which the positive and negative elements of the battery are respectively immersed in solutions of normally unequal specific gravities, a conduit having its uppermost or inlet opening situated in the lower portion of the solution of least specific gravity, and a water-reservoir having its discharge-orifice situated at the normal level of the surface of the last-named solution, whereby the lower portion of said solution may be withdrawn when it becomes partially or wholly saturated, and automatically replaced by an equal volume of water.

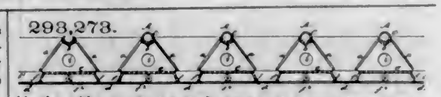
4. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel within which the positive and negative plates or elements are supported in different horizontal planes, a solution surrounding the lower plate having normally a greater specific gravity than the solution surrounding the upper plate, a conduit having its uppermost or inlet openings situated in a horizontal plane between the planes of the respective positive and negative plates, and a water-reservoir having its discharge-orifice situated at the normal level of the surface of the solution in the containing-vessel, whereby the lower portion of the uppermost solution may be withdrawn when it becomes partially or completely saturated, and automatically replaced by an equal volume of water.

5. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel, a positive plate or element placed in the upper part and a negative plate or element placed in the lower part of said vessel, a solution surrounding the negative plate having normally a greater specific gravity than the solution surrounding the positive plate, a conduit having its uppermost or inlet opening situated in a horizontal plane between the planes of the respective positive and negative plates, and a water-reservoir having its discharge-orifice at the normal level of the surface of the solution surrounding the positive element, whereby the lower portion of said solution may be automatically withdrawn when it becomes partially or completely saturated, and replaced by an equal volume of water.

6. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel, a positive plate or element placed in the upper part and a negative plate or element placed in the lower part of said vessel, a solution surrounding the negative plate having normally a greater specific gravity than the solution surrounding the positive plate, a water-reservoir having its discharge-orifice situated at the normal level of the surface of the solution surrounding the positive element, and a reservoir containing a supply of solution for exciting the negative plate, having its discharge-orifice in the immediate vicinity of said plate.

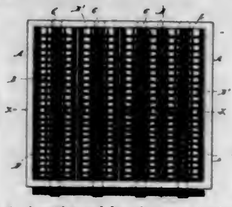
7. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel within which the positive and negative elements of the battery are respectively immersed in solutions of normally unequal specific gravities, a conduit having its uppermost or inlet opening situated in the lower portion of the solution of least specific gravity, a water-reservoir having its discharge-orifice situated at the normal level of the surface of the last-named solution, and a reservoir containing a supply of solution for exciting the negative plate, having its discharge-orifice in the immediate vicinity of said plate, whereby the specific gravities of the respective solutions may be automatically rendered practically constant during the continuous operation of the battery.

8. In a voltaic battery, the combination, substantially as hereinbefore set forth, of a containing-vessel, a positive plate or element placed in the upper part and a negative plate or element placed in the lower part of said vessel, a solution surrounding the negative plate having normally a greater specific gravity than the solution surrounding the positive plate, a conduit having its uppermost or inlet opening situated in a horizontal plane between the planes of the respective positive and negative plates, a water-reservoir having its discharge-orifice at the normal level of the surface of the solution surrounding the positive element, and a reservoir containing a supply of solution for exciting the negative plate, having its discharge-orifice in the immediate vicinity of said plate, whereby the specific gravities of the respective solutions may be rendered practically constant during the continuous operation of the battery.



293,273. FURNACE-GRATE. JOHN A. PRICE, Scranton, Pa. Filed May 17, 1883. (No model.)

Claim.—1. A furnace having hollow or grated grate-bars, in combination with means for introducing steam and air through said bars into the fire-bed, and with means for positively withdrawing ashes from the fire and discharging them into the ash-pit, substantially as described.



2. The combination of the grated fire-bars, means for supplying steam and air through the same to the fire, the stationary supporting plates between the fire-bars, and the intermediate movable plates, adapted, when operated, to scrape the ashes from the stationary plates and discharge them into the ash-pit, substantially as described.

3. The fire-bars having the grated inclined sides and the water-bars at the crown, substantially as described.

293,273.

293,274. FURNACE-GRATE. JOHN A. PRICE and DUNCAN WRIGHT, Scranton, Pa.; said Wright assignor to said Price. Filed Aug. 23, 1883. (No model.)

Claim.—1. A cutting and dumping grate having its fire-supporting arms or bars mounted upon shafts made tubular for the free circulation of air through them, whereby the sections are rendered light and strong and prevented from warping under the action of the heat, substantially as described.

2. In a cutting and dumping grate, the combination of the hollow supporting-shafts, open at both ends, and having the longitudinal groove, in combination with the independent fire-supporting arms or bars adapted to be slipped upon the tubular shaft, and provided with the projections or tongues for preventing their rotation independent of the shaft, substantially as described.

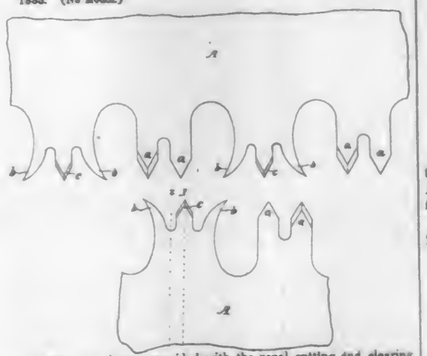
3. The fire-supporting bars or arms of the grate-sections, having the lateral projections or fingers, which serve to grate the space between the bars or arms, substantially as described.

4. In a cutting and dumping grate, the combination of the fire-supporting arms or bars and the hollow open shafts on which said bars or arms are separately mounted arranged in inclined position, substantially as described, for the purpose specified.

5. The combination of the hollow shafts and the fire-supporting arms or bars mounted thereon, having the lateral projections or fingers, which serve to space the arms from each other, and also to grate the space between the arms, substantially as described, for the purpose specified.

6. The combination of the hollow tubular shafts with the series of independent removable fire-supporting bars or arms mounted thereon, substantially as described.

293,275. URINAL. ALBERT B. PULLMAN, Chicago, Ill. Filed Mar. 2, 1883. (No model.)



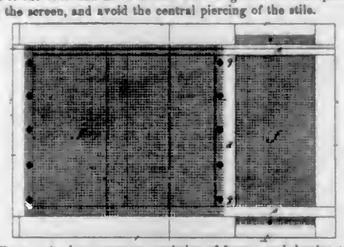
Claim.—1. A urinal comprising the basin A, provided with a downward extension, B, to connect with the waste-pipe at the floor, and with the high channeled back C, substantially as described, and for the purpose set forth.

2. In a urinal, the basin, A, provided with the extension B on its under side, and extended into a high channeled back, C, above, in combination with mechanism for detachably securing it in position, substantially as described.

3. The urinal comprising a basin, A, provided with the downward extension B, having its lower end adapted to enter an opening in the floor, and a high channeled back provided at its top with a socket, *n*, in combination with the casing H, having means for securing it to the wall, bolt I, and helical spring K, substantially as described.

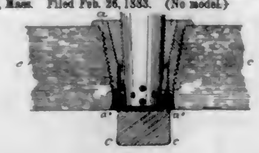
4. In a urinal, the basin A, having a high channeled back, C, and downward extension B, provided with the internal shoulder, *t*, in combination with the cover F, constructed and arranged to operate substantially as described.

293,276. SAW. JOHN H. RILEY, Indianapolis, Ind. Filed June 26, 1883. (No model.)



Claim.—1. A saw provided with the usual cutting and clearing teeth, and also with scoring-teeth, said scoring-teeth being filed alike on both sides, thus forming their points in the center of the teeth, and adapting them to score the bottom of the kerf in the middle before the regular cutting-teeth make the usual cut therein, substantially as set forth.

2. In a crescent-saw, scoring-teeth *c*, interposed between the reversely-set clearing-teeth, substantially as shown and specified.

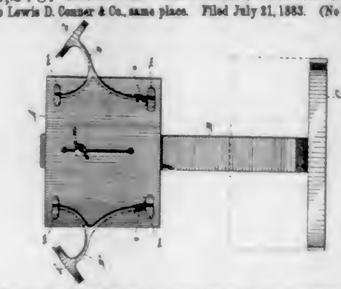


293,277. WINDOW-SCREEN. MORRIS ROBERTS, Philadelphia, Pa., assignor of one-half to George W. Hopkins, same place. Filed Sept. 8, 1883. (No model.)

Brief.—A window-screen consisting of two frames the stiles of which are grooved on opposite sides. The top and bottom pieces, *s c*, are secured to the stile and fitted to slide in said grooves when opening or closing the screen, and avoid the central piercing of the stile.

Claim.—An insect-screen consisting of frames each having top and bottom horizontal pieces, a side piece, a grooved stile, and additional horizontal pieces which are secured to the frame on the face opposite to said top and bottom pieces, substantially as and for the purpose set forth.

293,278. TAP-HOLE BUSHING AND PLUG. HENRY A. ROUTER, Boston, Mass. Filed Feb. 26, 1883. (No model.)



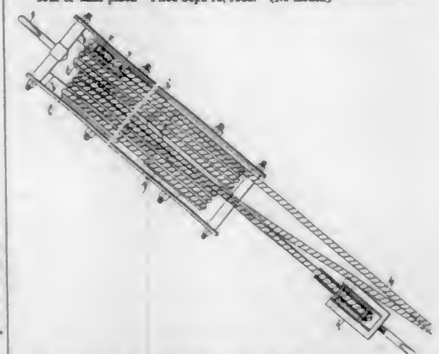
Claim.—1. The combination of a cask having a tap-hole of a frustum of conical or spheroidal form about half the length of the hole from the outer end of it, and of cylindrical form the remainder of the length of the hole to the inner end thereof, and a tap-hole stopper of a form corresponding to the form of the tap-hole, substantially as set forth.

2. A tap-hole stopper having the chamber c^3 and the transverse cut a^3, substantially as set forth.

3. A cask having a tap-hole provided with the short bevel a^4 at its inner end, substantially as described, for the purpose set forth.

293,279. BAG-HOLDER. CURTIS J. SAWYER, Cleveland, Ohio, assignor to Lewis D. Conner & Co., same place. Filed July 21, 1883. (No model.)

Claim.—In a bag-holder, the combination, with the support A, of the bifurcated arms D D', journaled in bearings secured to the support A, said arms being provided with jaws *d d'* and the coiled springs *e*, for forcing the arms away from each other, substantially as set forth.

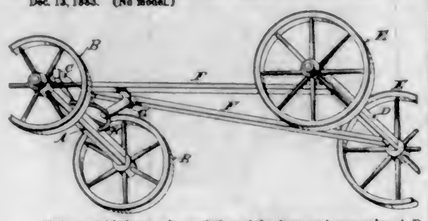


293,280. SELF-SHARPENING PENCIL AND ERASER COMBINED. HENRY R. SCAMMELL, St. Louis, Mo. Filed Jan. 11, 1883. (No model.)

Claim.—1. A self-sharpening pencil, consisting of an outer shell having an internal screw-thread and converging blades or sharpener-wings at one of its ends, an interior rotating tube having vertical slots, and a lead carrier or traveler having threaded wings projecting through said slots and engaging with the threads of the outer shell, substantially as herein set forth.

2. The combination of the rotating tube D, having collar or enlargement E, screw-threaded neck *e*, shell or cap I, and india-rubber eraser H, with the outer shell, C, and lead supporting and feeding devices, substantially as herein set forth.

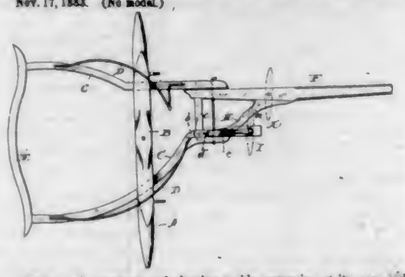
293,281. DIFFERENTIAL PULLEY. GEORGE SMITH, Jr., New York, N. Y., assignor of one-fourth to Leander H. Thorn and James R. Langdon, both of same place. Filed Sept. 18, 1883. (No model.)



Claim.—1. In a differential pulley of the character herein set forth, the upper and lower sheaves, grooved for the reception of the rope, each sheave being composed of two sections movable together, the sections in the two sheaves bearing the same relative proportions to each other, substantially as shown and described.

2. In a differential pulley, the combination, with the two grooved sheaves, proportioned as explained, and the fall, of the operating-rope wound over and under the larger sections of the two sheaves from outside to outside, under the fall, and over and under the smaller sections of the two sheaves from outside to outside, and spliced, substantially as shown and described.

3. In a differential pulley having the two grooved sheaves, proportioned as explained, the rope wound thereon, as explained, and the fall, and the spring-actuated rollers mounted upon the frame of the pulley-block, and serving to guide the hand portions of the rope, substantially as set forth.



4. In a differential pulley, the upper and lower sheaves, grooved for the reception of the rope, the axes of the two sheaves being inclined with respect to each other, substantially as shown and described.

293,282. BINDER-TRUCK. JOHN C. SMITH, Miamisburg, Ohio. Filed Dec. 13, 1883. (No model.)

Claim.—A binder-truck consisting of the front and rear axles, A D, wheels B E, bolster C, bounds F, the king-bolt uniting the bounds, bolster, and front axle, the pendent arm G, and semicircular staple H, the parts constructed and relatively arranged substantially in the manner and for the purpose specified.

293,283. DRAFT-EQUALIZER. JOS. W. STREE, Goshen, Ind. Filed Nov. 17, 1883. (No model.)

Claim.—A tongue or pole having a side extension at its rear end, consisting of the curved front bar, *a*, parallel bar *b*, the rear transverse bar, *c*, the straps *f f'*, and hammer-strap *e*, said straps being perforated to receive the connecting-bolt of a single-tree, substantially as described.

293,284. BICYCLE-BRACE. WILLIAM X. STEVENS, Washington, D. C. Filed Jan. 2, 1884. (No model.)

Claim.—1. The combination, with a brace and a hinge, of a spring or its equivalent, adapted to lift and support said brace, substantially as shown and described.

2. The combination, with a bicycle, of a brace hung thereto by a hinge, and a spring or its equivalent, adapted to raise and support said brace, as shown and described.

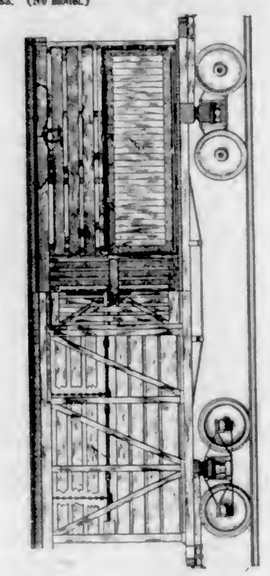
3. The combination, with a bicycle, a brace, and a spring, of a hinge having an inclined axis, substantially as and for the purpose specified.

4. The combination, with a bicycle and a brace, of a hinge, constructed substantially as described, whereby the foot of the brace in rising from the ground will be guided toward the wheel, as specified.

5. The combination, with a bicycle-brace, of a hinge and means for removably attaching the same to the step of a bicycle, substantially as and for the purpose specified.

6. The combination, with a bicycle having a step, of a brace, a hinge, and means for removably attaching the same to the step of the bicycle, substantially as and for the purpose specified.

7. The combination, with a bicycle having a fixed portion, upon which the rider's foot may rest, of a brace having an arm, substantially as described, whereby the rider's foot may rest upon said fixed portion while holding the brace down, as and for the purpose specified.



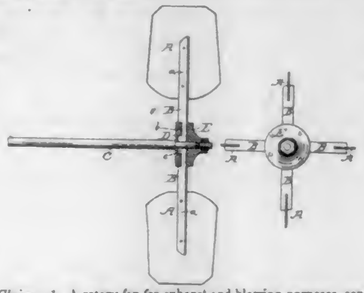
8. The combination, with a bicycle, of a brace and an arm on said brace, whereby the brace may be put down by the rider's foot, and whereby the said foot may rest upon both the bicycle-step and upon the said arm when the brace is down, as and for the purpose specified.

9. The combination, with a bicycle-brace, of a hinge therefor, fitted to engage the step of a bicycle, and a screw-bolt fitted for removably securing the hinge to the step, substantially as and for the purpose specified.

10. The combination, with a bicycle having a step, a brace having a hinge fitted to engage said step, and a screw-bolt therefor, of a washer countersunk to receive the bolt-head, and roughened to serve as a step, substantially as and for the purpose specified.

11. The combination, with a bicycle having a step, of a brace and means for securing the brace to the step, substantially as and for the purpose specified.

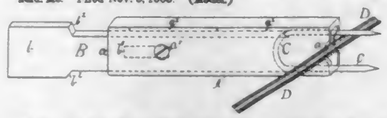
293,285. STOCK-CAR. LUTHER R. STILES, Chicago, Ill. Filed Nov. 24, 1883. (No model.)



Claim.—1. The combination of the several hinge-rods *f*, securely fastened to the side walls of the described stock-car, and the several sections A of the main portion of the upper deck, each provided with a series of eyes, *e*, adapting them not only to revolve on the hinge-rods, but to move back and forth lengthwise upon them and free the doorways when required, substantially as and for the purpose described.

2. The series of chains *c*, having their upper ends attached to the roof of the described car, and their lower ends provided with disks or plates *d*, adapted to support the inner edges and corners of the leaves A and B, substantially as described.

3. The stock-car described, provided with end leaves hinged to the walls thereof about midway between the roof and lower deck, having such lengths that when folded down upon their hinges against the walls sufficient space will be left at either end for the sections of the main portion of the upper deck to slide back against the end walls and free the doorways, substantially as described.

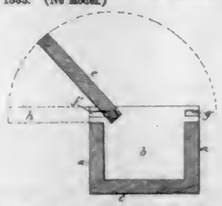


293,286. ROTARY FAN. CHARLES E. TUNELIUS, Chicago, Ill. Filed July 16, 1883. (No model.)

Claim.—1. A rotary fan for exhaust and blowing purposes, consisting of removable vanes provided with suitable shanks, and a sectional boss having a suitable formation corresponding to the extremity of said shanks, said vanes being removable by the separation of the sections of said boss.

2. The combination, with the vane having angle-iron ribs and a T-iron shank, recessed in the manner hereinbefore set forth, of a boss composed of two sections, one of which is mortised to receive the T-iron of said shank, and the other of which is a washer bearing against and confining said shank in position, the whole kept together by means of bolts or nuts.

293,287. FENCE-STAPLE DRIVER. JAMES D. VAN BIBBER, Springfield, Mo. Filed Nov. 5, 1883. (Model.)

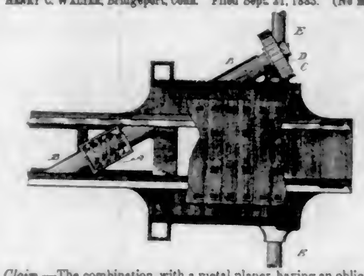


Claim.—1. In a fence-staple driver, the combination of a holder, A, having recesses *a' a'* at its forward end to straddle the fence-wire, and the shouldered driver B, having its driving end curved and recessed to fit the bow of the staple, the whole arranged so that the forward end of the driver will stop short of the fence-wire to be secured by the staple, in order not to injure the same, substantially as specified.

2. The combination, in a fence-staple driver, of the holder recessed on opposite sides at the forward end in a diagonal direction, and provided with a shouldered plunger curved and recessed at its forward end to fit the bow of the staple, and adapted to be operated substantially in the manner and for the purpose specified.

3. In a fence-staple driver, the combination of a holder, A, having recesses *a' a'* at its forward end to straddle the fence-wire, and provided with a slot on one side to receive an adjusting-screw, and the shouldered driver B, having its driving end recessed to fit the bow of the staple, and provided with an adjusting-screw working in said slot in the side of the holder, the whole so arranged and combined that the forward movement of the driver is limited by the shoulders and the backward movement limited by the adjusting-screw, substantially as specified.

293,288. BOX AND SIMILAR RECEPTACLE. WILHELM VON DARTEN, Bremerhaven, Germany, assignor to Carl Edelheim, Philadelphia, Pa. Filed Nov. 23, 1883. (No model.)



Claim.—1. A box and a cover therefor connected at the two ends by studs on one part entering open-ended slots in the other, said connecting devices being located, as described and shown, at or near the sides of the box, whereby the lid is rendered detachable and adapted to swing open without sliding the top backward in so doing.

2. A box and a detachable hinged cover therefor, the two connected by four studs on one part entering four open-ended grooves in the other, said parts constructed, substantially as described, to admit of the lid sliding edgewise to effect the engagement and disengagement of the studs.

3. A box and a detachable hinged lid therefor, one of said parts provided with flattened studs, and the other provided with grooves having one end open and the opposite end enlarged, to permit the rotation of the studs therein, whereby the accidental disengagement of the cover is prevented.

4. A box having the ends extended above the sides and provided with open-ended grooves at the front and rear sides, in combination with a lid having two pairs of studs to enter said grooves, as described and shown.

293,289. METAL-PLANING MACHINE. EDWARD P. WALTER and HENRY C. WALTER, Bridgeport, Conn. Filed Sept. 21, 1883. (No model.)

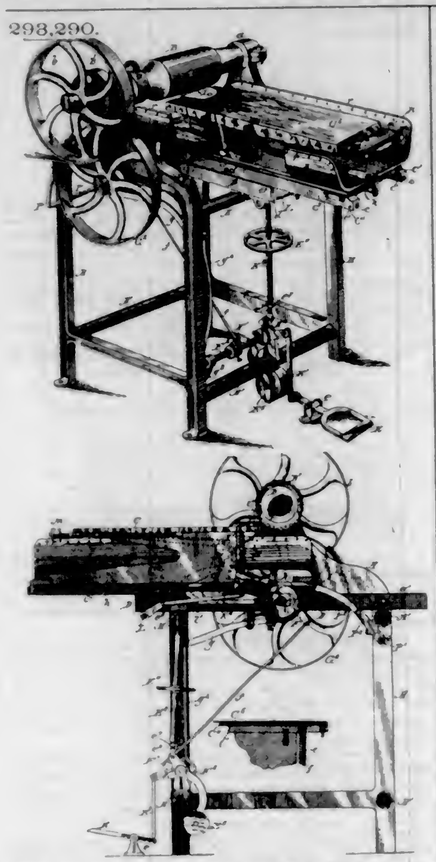
Claim.—The combination, with a metal planer, having an obliquely-arranged shaft provided with a spirally-toothed pinion meshing with a rack in the table and a spur-wheel on its outer extremity, of a transversely-arranged driving-shaft, having a spirally-toothed pinion meshing with said spur-wheel, substantially as shown and described.

293,290. IRONING-MACHINE. LEWIS H. WATSON, Chicago, Ill. Filed June 25, 1883. (No model.)

Claim.—1. In an ironing-machine, an iron and an ironing-table, in combination with mechanism, substantially as described, operating to move the table forward in contact with the iron, lower the table at the end of its forward movement, and return the table to the limit of its backward stroke without contact with the iron, substantially as set forth.

2. The combination of an ironing-table with mechanism, substantially as described, operating successively and automatically to move the table forward, lower the table at the end of its forward stroke, and return the table in its lowered position to the limit of its backward stroke, substantially as described.

3. The combination, substantially as herein described, of the iron and ironing-table with mechanism operating to reciprocate the table, an operating mechanism by which the table is brought up to and held against the iron during its forward stroke, and mechanism connected with and actuated by the table at the end of the forward stroke of the latter, and operating to lower the table-lifting mechanism, whereby the table shall be automatically lowered at the end of each forward stroke and returned in a lowered position, substantially as set forth.



4. In an ironing-machine, the ironing-table provided at one end with a clamp operating to hold down the shirt-bosom at the neck, and at its opposite end provided with an extensible gripping and stretching mechanism, substantially as described, whereby the shirt may be held at the tail portion thereof and outward from one end of the table, in order to stretch the shirt thereon, substantially as described.

5. An ironing-table provided with means at one end for holding the neck end of the shirt, in combination with a combined shirt bolder and stretcher at the opposite end, consisting of a clamp mounted substantially as described, whereby it may be extended out from the end of the table, and comprising a pair of jaws and a spring connected to the inner jaw, next to the table, to force the same against the face of the outer with a yielding spring-pressure, substantially as described.

6. As a means for stretching a shirt upon an ironing-table, the combination, with a table provided with means for holding the shirt at one end, and with supporting-guides, of a pair of slide-rods mounted in said guides, springs connected with said rods, substantially as described, to throw the rods out from the table, and a jaw rigidly connected with said rods, a movable jaw supported upon said rods, and springs of greater strength than the springs employed for projecting the rods connected with the movable jaw, substantially as set forth, and for the purposes specified.

7. An ironing-table provided with means for holding the neck end of a shirt, and provided with supporting-guides, in combination with means for stretching the bosom of the shirt upon the table, consisting of a pair of slide-rods mounted in said guides, springs connected with said rods, substantially as described, for projecting the same out from the table, a fixed jaw rigidly connected with said rods, and a sliding jaw and the stops supported on said rods, and springs located between the

293,290.

sliding jaw, the said springs being of greater force than the spring or springs acting on the slide-rods, substantially as described.

8. In an ironing-machine, the ironing-roller and the ironing-table provided with a seat in its top face, in combination with a vertically-movable clamping-plate for the neck portion of a shirt, constructed to fit in said seat, and means operating to automatically raise and lower the clamp, substantially as described.

9. In an ironing-machine, the combination, with a supporting-frame, a table normally mounted thereon, and provided with a clamp-seat recessed in the upper face of said table, a clamping-plate fitted to said seat, a spring connected to said clamping-plate and serving to draw the same into the seat, means for reciprocating the table, and devices, substantially as described, for raising the clamping-plate at the termination of the backward stroke of said table, substantially as described.

10. The combination, in an ironing-machine, of the reciprocating and vertically-movable table, with mechanism operating to propel the table forward, a mechanism, substantially as set forth, by which the table is raised and the forward-propelling mechanism is brought into action, mechanism operating to lower the table at the end of its forward stroke and throw the forward-propelling mechanism out of action, and a spring connected indirectly with the table, substantially as set forth, to cause the return movement of the same, as and for the purposes specified.

11. As a means for causing the forward movement of an ironing-table in an ironing-machine, a friction drive-pulley, a propelling-wheel, and a movable bearing, in combination with mechanism connected with a movable bearing by which the table and propelling-wheel are raised and the latter brought into frictional contact with the friction drive-pulley, and means, substantially as described, connecting the propelling-wheel with the table, whereby when the propelling-wheel is raised the table shall be forced forward, substantially as set forth.

12. The combination, in an ironing-machine, of the reciprocatory ironing-table with a rotary friction drive-pulley, a propelling-wheel, G^2, a movable bearing for the same, and mechanism connected with movable bearing for raising said wheel up to the friction drive-pulley, and means connecting the propelling-wheel with the table, by which the latter is advanced while the propelling-wheel and pulley are in frictional contact, substantially as described.

13. The ironing-table and mechanism for reciprocating the said table, in combination with a rotary spool, two cords or wires wound in reverse directions upon the spool and connected with the table, mechanism, substantially as described, for rotating the spool in opposite directions, and mechanism, substantially as described, for automatically throwing out of action the forward-propelling mechanism of the spool when the table arrives at the end of its forward stroke, as and for the purposes set forth.

14. The combination, in an ironing-machine, of the reciprocating ironing-table with a spool secured upon a rotary shaft, and having cords or wires wound thereon in reverse directions and connected with the table, frictional drive-gear, substantially as described, by which the shaft is rotated in one direction, and a spring attached to the shaft, substantially as set forth, by which the latter is rotated in a reverse direction, substantially as described.

15. In an ironing-machine, the combination of an ironing-table with a clamping-plate for the neck portion a shirt-bosom, a support for said clamping-plate, extending through and below the table, and a horizontal slide provided with an incline formed and located with relation to the support for the clamp substantially as described, whereby when said incline strikes the clamp-support both the latter and the clamp shall be raised, substantially as and for the purpose set forth.

16. The combination, in an ironing-machine, of the ironing-table, means for reciprocating the same, with the slide K', provided with an incline, a rock-shaft having a suitable operating-handle, and provided with an arm, *l*, a link connecting the slide and arm *l*, and a neck-clamp mechanism, substantially as described, carried by the table, substantially as and for the purposes set forth.

17. The table, neck-clamp mechanism, consisting of a clamp-plate, I, a vertically-movable rod supporting the clamp-plate, a spring connecting the table and rod I', substantially as described, and a pivoted lever, I^3, provided with a notch, in which a pin on the rod is received, said members being combined for operation and carried by the ironing-table, substantially as described.

18. The ironing-table and mechanism for actuating the same, and the spring-seated jaws, in combination with an incline and mechanism connecting said jaws with the incline, substantially as and for the purpose set forth.

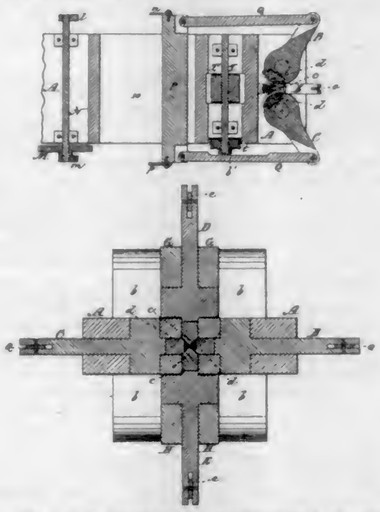
19. The supporting-frame, the ironing-table and means for actuating said table, and the clamp having a spring-seated jaw, in combination with the slide provided with an incline, the bell-crank, and rod connecting said bell-crank and jaw, substantially as described.

20. The supporting-frame, the ironing-table, and means for reciprocating the same, in combination with the slide-rods M, the fixed and movable jaws on the ends of said rods, the bell-crank pivoted to the table and connected with the movable jaw, and means for actuating said bell-crank and the spring m^3, substantially as described.

21. The ironing-table, its supporting-frame, and means for reciprocating said table, in combination with the treadle and devices connecting said treadle with the table, and means, substantially as described, connecting the driving mechanism and the treadle-connections, whereby the downward movement of the treadle will raise the table and the table be allowed to drop at the end of its forward movement, as and for the purpose specified.

22. The frame, the table, and means for reciprocating the table, in combination with a treadle, the rock-shaft, the bell-crank fixed on said rock-shaft and connected with the treadle, the shaft E^2, and the screw supporting said shaft at one end of the frame, substantially as described.

23. The combination, with a reciprocating ironing-table and a frame supporting the same, of a jointed support for one end of said frame and means for supporting the other end, substantially as set forth, and a treadle connected with the jointed support, substantially as described, whereby the joint may be flexed to lower the frame and have its members brought on a dead-center, in order to extend the support to its highest limit, as and for the purpose specified.



293,291. STREET-CAR-CURTAIN FIXTURE. JOHN ALEXANDER WATT, Boston, assignor of one-fourth to Henry B. Sellon and James L. Whitaker, both of Somerville, Mass. Filed July 3, 1883. (No model.)

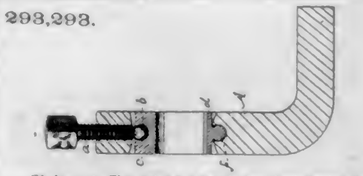
Claim.—1. The combination, with an open street-car or other open-sided covered vehicle, of curtains suspended at the sides of the vehicle, and an operating device for each curtain extended to one or both ends of the car, whereby an attendant at an end of the car can raise or lower said curtains, as set forth.

2. The combination, with an open street-car or like vehicle, of curtains suspended from the sides of the car, a substantially horizontal operating cord or cords extending over suitable supports from end to end of the car, and clew-lines secured to said cord or cords and to the lower portions of the curtains, whereby each curtain may be raised and lowered by an attendant at one end of the car, as set forth.

293,292. DRILL-MAKING MACHINE. EDWIN O. WILLIAMS, Taunton, Mass., assignor to himself and Byron L. Dwinell, same place. Filed June 22, 1883. (No model.)

Claim.—1. In a forging-machine, the combination of four rocking levers arranged in opposite pairs, and provided with convex and concave dies, respectively, said dies adapted to operate simultaneously upon the four opposite sides of a drill-blank or other piece of metal, and to extend entirely around the same, and means for operating said levers, the grooves in the blank being rolled as the blank is drawn in and forced out between the dies, substantially as and for the purpose set forth.

2. In a forging-machine, the combination of a pair of rocking levers provided with dies adapted to produce longitudinal grooves in two opposite sides of a rod or drill blank, with a pair of rocking levers provided with dies adapted to operate simultaneously with the grooving-dies upon the outside of the rod or drill blank between the edges of the grooves, means for diminishing the distance between the grooving-dies, and means for operating said levers, substantially in the manner and for the purpose set forth.

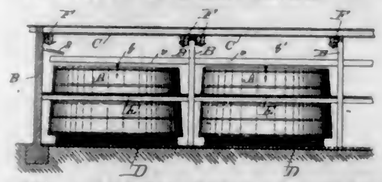


3. In a forging-machine, the combination, with a pair of rocking levers provided with dies, and adapted to operate upon two opposite sides of a rod or drill blank, of a pair of levers, D E, provided with dies, and pivoted to levers or carriers G H, and means, substantially as described, for operating said carriers to cause the dies of their levers D E to advance toward and recede from each other, substantially as and for the purpose set forth.

4. In a forging-machine, the combination, with the movable carriers G H and their rocking levers D E, provided with dies, of the cam T, placed between the carriers G H, the springs *r r*, shaft *q*, ratchet-wheel *t*, and the arm or pawl *u*, all constructed to operate substantially in the manner and for the purpose described.

5. In a forging-machine, the combination of the movable carriers G H, the rocking levers D E, pivoted thereto and provided with dies, the cam T, shaft *q*, pawl *u*, and the ratchet-wheel *t*, secured to the cam-shaft, and provided with one or more spaces, *a'*, whereby the intermittent rotation of the cam T is automatically arrested when the rod or blank has been rolled the required number of times, and the dies *c* have been separated to their greatest distance apart, all constructed to operate substantially in the manner and for the purpose set forth.

293,293. LATHE-DOG. JOHN WINSLOW, Jr., and ROSWELL ATKINS, Bristol, Conn. Filed May 12, 1883. (No model.)

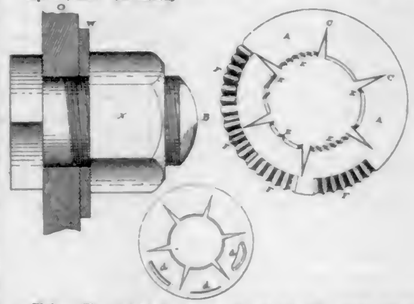


293,293.

Claim.—1. The lathe-dog herein described, having the rocking piece *c* permanently secured to the inner end of its set-screw and free to rock thereon, substantially as described, and for the purpose specified.

2. The combination of the lathe-dog, the set-screw *a*, the rocking piece *c*, mounted upon the inner end of said set-screw, so as to rock freely, and the rocking block *d*, permanently secured to the lathe-dog body at a point directly opposite the set screw and its rocking piece *c*, substantially as described, and for the purpose specified.

293,294. FERMENTING-ROOM IN DISTILLERIES. FREDERICK W. WOLF, Chicago, Ill. Filed July 12, 1883. (No model.)

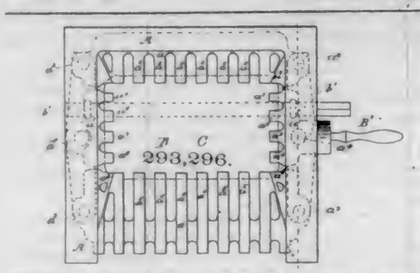


Claim.—1. In a distillery, a fermenting-room provided with a non-conducting floor built to surround the fermenting-vats over the supporting-floor, in combination with means for regulating the temperature of the upper chamber as circumstances shall require, substantially as described.

2. In a distillery, a fermenting-room having its ceiling and walls constructed wholly or in part of non-conducting materials, and provided with a non-conducting floor built to surround the fermenting-vats over the supporting-floor, and having pipes along the ceiling or walls, or both, to permit the circulation of cold or warm air through them, for the purpose of cooling or heating the atmosphere of the upper chamber as circumstances shall require, substantially as described.

3. In combination with the fermenting-vats A in a distillery, the walls B, ceiling C, and working-floor E, all formed wholly or in part of non-conducting materials, the floor D, supporting the vats A, and pipes F, lying along the said ceiling or walls, or both, substantially as described.

293,295. NUT-LOCK. FRANKLIN HOWELL AGNEW, Beaver, Pa. Filed Apr. 12, 1882. (No model.)

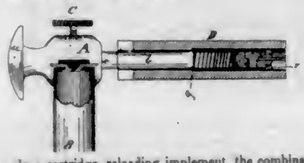


Claim.—The combination, with a nut and bolt, of a washer having a dished or concave inner portion, partial slits *c c*, a hole less, when the washer is flattened, than the diameter of the bolt, and with plane or roughened surfaces to come in contact with the bolt and nut, and with or without the cuts or indentations *d d*, all substantially as set forth.

293,296. STOVE-GRATE. EDGAR W. ANTHONY, Boston, Mass. Filed May 14, 1883. (No model.)

Claim.—1. A stove-grate having the parallel side bars, *a*, and the parallel end bars, *a'*, the end bars being pivoted to the frame of the grate, as described, and the side bars being pivoted to the end bars at a^2, the said bars having the fingers a^3 projecting inwardly therefrom, all substantially as and for the purposes described.

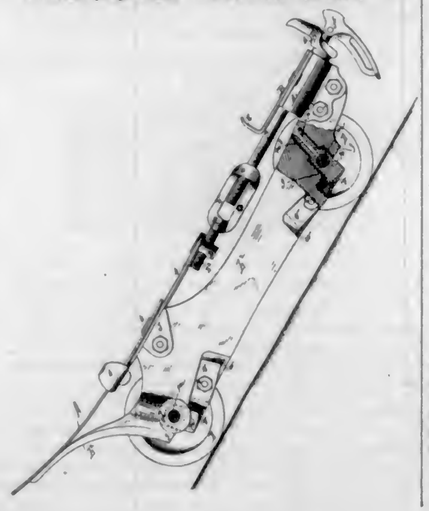
2. A stove or furnace provided with a rectangular or square grate,



293,296.

consisting of the fingered bars *a a'*, surrounding the opening B, adapted to be reciprocated as specified, and the grate C below said opening B, capable of being tipped toward the ash-pit door, and a clearing-space, D, between the upper surface and the lower surface of the upper grate, substantially as and for the purposes specified.

3. The combination, in a grate, of the fingered grate-bars *a a'*, pivoted to each other and to the grate-frame, as specified, surrounding the opening B, and adapted to be moved or reciprocated in relation to each other as indicated, with the grate C below said opening B, all substantially as and for the purposes described.



4. In a grate, the combination of the fingered bars *a a'*, pivoted to each other and to the grate-frame surrounding the opening B, the fingers of the back bar being more inclined than those of the front, and adapted to be moved or reciprocated in relation to each other as indicated, with the grate C, arranged below said opening B, all substantially as and for the purposes described.

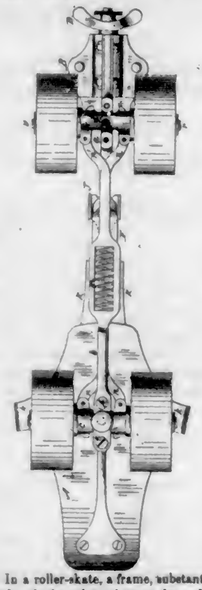
293,297. CARTRIDGE IMPLEMENT. JOHN H. BARLOW, New Haven, Conn. Filed Dec. 20, 1883. (No model.)

Claim.—In a cartridge-reloading implement, the combination of the body A, having a suitable recess upon one side for receiving and holding the head of the cartridge-shell B while seating a primer, also provided with the primer-seating screw C or its equivalent, and convex hand-piece *a*, with the piston *b*, provided with an extractor-pin, as shown, together with the movable rammer-sleeve D, all being arranged to operate substantially as and for the purpose set forth.

293,298. ROLLER-SKATE AND SKATE-FASTENING. EVERETT H. BARNEY, Springfield, Mass. Filed Dec. 5, 1883. (No model.)

Claim.—1. A roller-skate frame, substantially as described, having therein inclined cylindrical journal-bearings, one at each end, an axle-journal, substantially as described, for each of said bearings, having a journal-post fitting said bearings, and having on its side opposite to said post a flat-sided stud, and springs, substantially as described, secured to the frame, which bear upon the opposite sides of said stud under the journal, combined and operating substantially as set forth.

2. In a roller-skate, the frame *b'*, having the journal *d* pivoted and adapted to vibrate therein, and having portions 3 3 thereof extending in the front and rear of said journal to constitute axle-stops, substantially as set forth.



3. A roller-skate frame, substantially as described, having therein inclined cylindrical journal-bearings, one at each end, an axle-journal, substantially as described, for each of said bearings, having a journal-post fitting the latter, which post is provided with an oil-passage from its upper end to the interior of the journal, and having on its opposite side to said post a flat-sided stud, and springs, substantially as described, secured to the frame, which extend under the journal and bear against the opposite sides of said stud, combined and operating substantially as set forth.

4. A roller-skate frame, substantially as described, having an inclined cylindrical journal-bearing therein, a journal to receive and support that part of the axle between the rollers having a post thereon to fit said bearing, whose axial line intersects the longitudinal center line of the journal, and a flat-sided stud thereon opposite said post, and two springs secured on each side of the frame and bearing against the opposite sides of said stud, combined and operating substantially as set forth.

5. In a skate-fastening, the combination, with a non-rotating draw-bar, and with the sole-clamp pivot, of an adjusting-screw, substantially as described, connecting the said pivot and draw-bar, a heel-clamp secured to and having a sliding movement on the draw-bar, and a locking cam-lever pivoted to the latter in the rear of the heel-clamp, substantially as set forth.

6. The combination, with a non-rotating draw-bar, and with a locking cam-lever pivoted thereto, of a heel-clamp secured to said draw-bar by means substantially as described, but having a sliding movement thereon, substantially as set forth.

293,299. ROLLER-SKATE. EVERETT H. BARNEY, Springfield, Mass. Filed Dec. 5, 1883. (No model.)

Claim.—1. In a roller-skate, a frame, substantially as described, to support the fastening devices thereof, two axles and rollers therefor, two axle-cases pivoted to vibrate in said frame in a horizontal plane whose vibratory axes stand at an incline to each other, two connections pivoted to and uniting said axle-cases, and a spring to act through said connections upon both axle-cases simultaneously, combined and operating substantially as set forth.

2. In a roller-skate, the frame *a* and the strap *b*, each provided with a corresponding pivot-socket, the axle-case *c*, having pivots *d d* to

fit said sockets, and a suitable axle and rollers, combined and operating substantially as set forth.

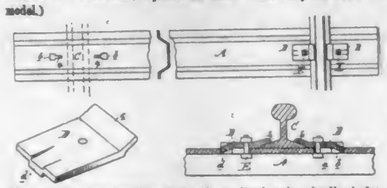
3. In a roller-skate, the frame *a* and the strap *b*, each provided with corresponding pivot-sockets, two axle-cases, *c*, each having pivots *d d'* to fit said sockets, the connections *n n'*, the spring *m*, and suitable axles and rollers, combined and operating substantially as set forth.

4. The lever J, having the lip *z* thereon, and the link F, having the hook *x*, combined and operating substantially as set forth.

293,300. VEGETABLE-CUTTER. ERNST HARTH, Stauchitz, and OTTO SPILLER, Döbeln, Germany. Filed Mar. 23, 1883. (No model.)

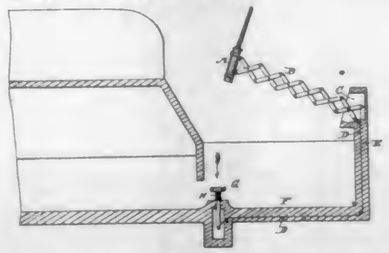
Claim.—1. In a vegetable-cutter, in combination with the table B, provided with a stationary knife, M, and sliding box K, a number of knives, *m*, attached side by side to a shaft, *g*, and the plate R, provided with slots or openings *r*, through which the ends of the knives *m* project, and in which the same are guided, the whole being arranged to operate substantially in the manner and for the purpose described.

2. In a vegetable-cutter, the sliding plate S, inserted between the table B and the sliding box K, in the manner and for the purpose described.



293,301. BUTTON OR STUD FASTENER. DUKE F. BAXTER, Rochester, N. Y., assignor of one-fourth to FRANCES A. BAXTER, same place. Filed Nov. 26, 1883. (No model.)

Claim.—1. A detachable stud consisting of a head having a threaded opening and a stem having a threaded body terminating at one end in a head and at the other in a tapering gimlet-point having one or more quick screw-threads, substantially as set forth.



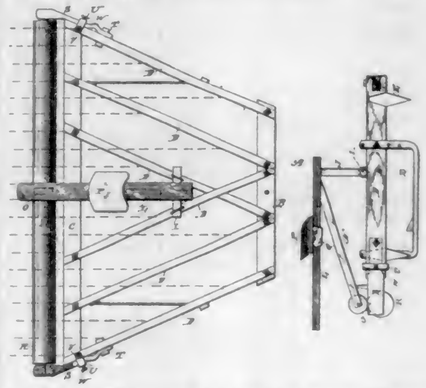
2. The combination of the button or stud and the attachment having a screw-stem and lateral arms at the outer ends, for the purpose set forth.

293,302. FASTENING RAILWAY-RAILS TO METALLIC TIES. GEORGE W. BLODGOOD, Wyandotte, Mich. Filed July 14, 1883. (No model.)

Claim.—The combination of the tie A, having longitudinal slot *a*, provided with the enlargement *b*, adapted to receive the head of a bolt, the clip D, having stop *d* and upturned end *c*, and the bolt E, substantially as and for the purpose specified.

293,303. WHIP-HOLDER. ST. GEORGE J. BOSWELL, Quebec, Quebec, Canada. Filed June 26, 1883. (No model.)

Claim.—1. A whip-socket fastened to one end of lazy-tongs, the other end of which is fastened to a vehicle, substantially as herein shown and described.



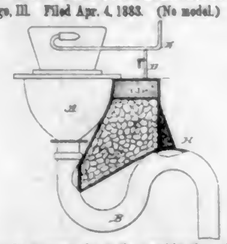
2. A whip-socket fastened to one end of lazy-tongs held to the bottom of a pocket in the dash-board of a vehicle, substantially as herein shown and described.

3. The combination, with a vehicle, of lazy-tongs held to the same, a whip-socket held to one end of the lazy-tongs, and devices connected with the opposite end of the tongs for the purpose of lengthening the tongs, substantially as herein shown and described.

4. The combination, with a vehicle, of lazy-tongs held to the same, a whip-socket held to one end of the tongs, the wire or chains D, connected with one lever of the end of the tongs held to the vehicle, and the pedal G with which the wire D is connected, substantially as herein shown and described.

5. The combination, with a vehicle, of lazy-tongs held to the same, a whip-socket, A, the wire or chain D, the pedal G, and the spring H, substantially as herein shown and described, and for the purpose set forth.

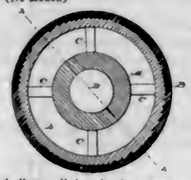
293,304. HARROW. WILLIAM E. BUDD, Chatham, N. J. Filed Oct. 5, 1883. (No model.)



Claim.—1. The combination of a harrow having a series of beams, D, which have recesses made in their sides where the teeth are to be applied to them, with the teeth provided with the shoulders F and studs or projections G, and the clamping-bolts H, whereby the teeth are made removable from one side of the harrow to the other, so that their cutting-edges can be reversed, substantially as specified.

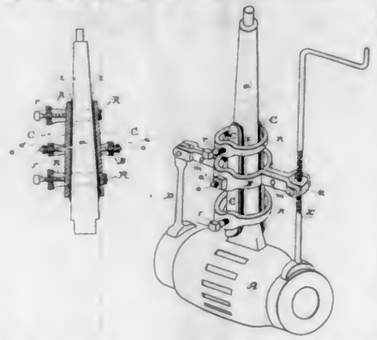
2. The combination, in a harrow, of the seat-lever L, the adjustable seat attached thereto, an arm or brace, N, the friction-roller O, and the roller R, which is attached to the rear end of the harrow by means of the adjustable levers S, substantially as shown.

3. The combination of the harrow, provided with the pivoted adjustable bearings S at its rear end, the bolts T, brackets U, set-screws W, roller R, the pivoted seat-frame L M J, and the roller O, substantially as described.



293,305. ATTACHMENT FOR WATER-CLOSETS. LUTHER H. BURNETT, Chicago, Ill. Filed Apr. 4, 1883. (No model.)

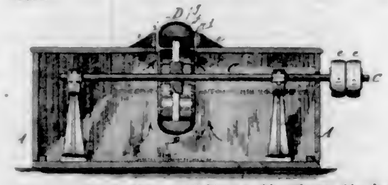
Claim.—1. In a water-closet, the combination of a chamber to receive a suitable chemical, and having a perforated bottom, and a pipe for conducting water to the chamber to dissolve the chemical, with a box which is filled with charcoal, through which the dissolved chemical flows into the waste-pipe, substantially as shown.



2. The combination of a chamber to receive a chemical, and having a perforated bottom, a pipe for conducting water into the chamber for the purpose of dissolving the chemical, and a chamber, F, for receiving powdered charcoal, and which is connected at its lower end with the waste-pipe, with a chamber, H, through which the gases are conducted from the waste-pipe into the chamber containing charcoal, substantially as shown and described.

293,306. ROLL FOR CRUSHING GRAIN. JOHN M'CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Apr. 25, 1883. (No model.)

Claim.—The hollow roll herein described, consisting of an externally-chilled cylinder, B, of strained metal, an inner hub, A, of less pure metal, connecting-arms C, and a wrought-iron or steel shaft, D, on which the aforesaid parts are cast, as herein set forth.

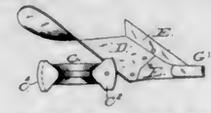


293,307. SPOKE-EXTRACTOR. ROBERT NELSON CADWELL, Shedd, Oreg. Filed Sept. 25, 1883. (No model.)

Claim.—1. In a spoke-extractor, the ring-lever B, the pivoted fulcrum-bar D, and screw-power E, in combination with the long jaws C, having trunnions *c*, upon which the ring-lever is pivoted, the nuts *c'*, and means for clamping said jaws on the spoke, substantially as herein described.

2. In a spoke-extractor, the ring-lever B, the pivoted fulcrum-bar D, and screw-power E, in combination with the long jaws C, having trunnions *c*, upon which said ring-lever is pivoted, and the means for clamping said jaws to the spoke, consisting of the rings R, secured above and below to one jaw, and the set-screws *r*, passing through said rings and impinging on the other jaw, substantially as herein described.

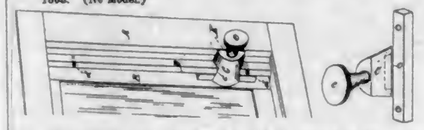
293,308. MACHINE FOR POLISHING LEATHER. ADOLPHE GERLAMENBERG, Paris, France. Filed Sept. 18, 1883. (No model.) Patented in France Mar. 22, 1882, No. 135,978, and in Belgium Apr. 20, 1882, No. 41,614.



Claim.—1. In a buffing or polishing machine, the combination of a polishing or buffing wheel provided with radial arms and a polishing-face, an inclosing-box having an induction air-opening at the bottom and an eduction air-opening at the top, and guards arranged at the sides of the top opening, which serve to direct the currents of air against the buffer, and also serve to guard the wheel against contact with the leather upon the table.

2. In a buffing or polishing machine, a buffing-wheel having radial arms and a polishing-face, in combination with a table or platform having an opening provided with guards at its sides for directing the air forced through the opening by the arms of the wheel, substantially as described.

3. A buffing-wheel having radial arms, and a face of oval cross-section composed of a layer of rubber and an outer covering of cloth, in combination with a box having an air-induction opening at its bottom and an eduction air-opening at its top, provided with guards at its sides for the purpose of directing the air-currents against the buffer and preventing it from heating, substantially as described.



293,309. PLOW. AUGUSTUS G. CHRISTMAN, Litiz, Pa. Filed May 12, 1883. (No model.)

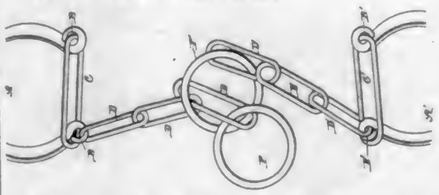
Claim.—1. In a plow, the combination, with the beam A and handles B, of an independent double and rearwardly-bifurcated standard, C, of the form shown, provided with beam-seats C' C^2, pad C^3, and ear C^4 for handles, landside-face C^5, recess-seat for landside C^6, nose-recess C^7, for reversible point G, and clamping-bolt C^8 and lug C^9, and in combination therewith the mold-board D, cutter E, share-wing F, reversible point G, and landside H, substantially as shown, and for the purpose set forth.

2. In combination with a double standard for a plow, as described, a reversible point, G, provided with a taper stem, and of varying section, as shown, a lug, G^2, and undercut portion G', adapted to combine with lug C^9 of recess C', and by bolt C^8 to be removably connected therewith, and by under-cut G' to lock both cutter E and share-wing F at their forward ends, as and for the purpose specified.

293,310. SASH-HOLDER. GEORGE P. CLEMENTS, New Milford, Pa., assignor of one-half to John C. McConnell, same place. Filed Oct. 31, 1883. (No model.)

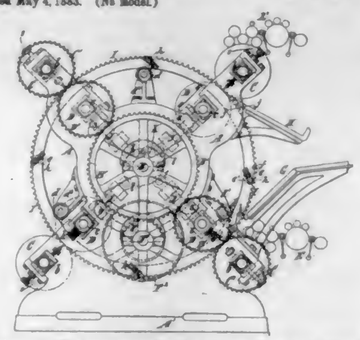
Claim.—In a sash-fastener, the slide C, secured to the window-sash, and having the slot *c* and set-screw E, in combination with the bead D, secured to the window-frame, substantially as and for the purpose shown and described.

293,311. SHADE-PULL. CHARLES W. CLARK, Philadelphia, Pa. Filed Nov. 15, 1883. (No model.)



Claim.—1. A shade-pull having a bar, end balls, and a suspension-cord, the latter having its ends fitted in the bar and secured by the balls, substantially as and for the purpose set forth.

2. In a shade-pull, a bar having its ends tubular and compressible, a suspension-cord having its ends fitted in the ends of the bar, and balls which are fitted on the ends of the bar and clamp the same on the cord, combined and operating substantially as and for the purpose set forth.



3. A shade-pull having a bar, a suspension-cord, and slide, said cord being stiffened and said slide tightening the stiffened cord, substantially as and for the purpose set forth.

293,312. HOPPLE FOR HORSES. JULIUS O. COTTLE and RUFUS IVIE, St. Jo, Tex. Filed Nov. 19, 1883. (No model.)

Claim.—A hopple composed of the two bent pieces A A', each one of which is provided with a long link, C C', a short chain, D D', and a ring, F F', substantially as shown.

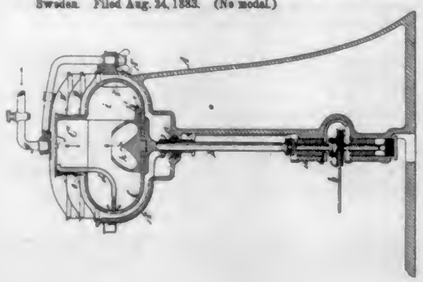
293,313. PRINTING-PRESS. CALVERT B. COTTRELL, Westerly, R. I. Filed May 4, 1883. (No model.)

Claim.—1. The combination, with a number of separate pairs of form and impression cylinders arranged in a circular series, of a rotary series of grippers for presenting the sheets successively to the several pairs of cylinders in the series, substantially as described.

2. The combination, with two or more pairs of form and impression cylinders arranged in a circular series, of a rotary annular gripper-carriage and attached grippers, for presenting sheets successively to the pairs of cylinders, substantially as described.

3. The combination, with two or more pairs of form and impression cylinders, of a center shaft, a gear-wheel thereon, gear-wheels on the several cylinders engaging with the wheel on said center shaft, and a rotary gripper-carriage and attached grippers, for presenting sheets successively to the pairs of cylinders, substantially as described.

4. The combination, with two or more pairs of form and impression cylinders, of a rotary gripper-carriage for presenting sheets successively to the pairs of cylinders, toothed rings comprised in said carriage, and gear-wheels upon the shafts of the cylinders engaging with said rings and operating the gripper-carriage, substantially as described.



5. The combination of the pairs of form and impression cylinders C D, arranged in a circular series, the center shaft, B, and its gear-wheel B', the wheels C' D', gearing the cylinders of each pair together, and with the wheel B', the toothed rings I, comprised in the gripper-carriage, and the wheels *g* on the shafts of the form-cylinders, engaging with and driving said rings, substantially as described.

6. The combination, with pairs of form and impression cylinders arranged in a circular series, of a rotary gripper-carriage for presenting sheets successively to the pairs of cylinders, and devices, substantially such as described, for relieving the impression-cylinders, to provide for double rolling or inking, substantially as set forth.

7. The combination, with pairs of form and impression cylinders arranged in a circular series, and a rotary gripper-carriage for presenting sheets successively to the pairs of cylinders, of a center shaft from which the cylinders derive motion, plungers or rods acting on the bearings of the impression-cylinders, and cams on said center shaft for controlling said plungers or rods to relieve the impression-cylinders for double rolling or inking, substantially as described.

8. The combination, with the center shaft, B, pairs of form and impression cylinders deriving motion therefrom, and a rotary gripper-carriage for presenting sheets successively to the pairs of cylinders, of the plungers J acting on the bearings of the impression-cylinders, and the cam K on said shaft B, composed of the plates or sections *m m*, one of which is circumferentially adjustable relatively to the other, substantially as described.

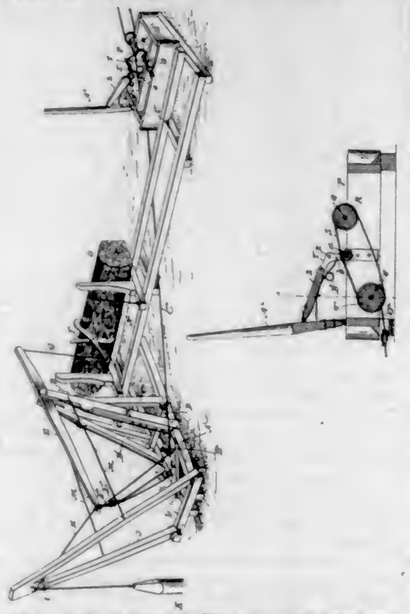
293,314. CENTRIFUGAL CREAMER. GUSTAF DE LAVAL, Stockholm, Sweden. Filed Aug. 24, 1883. (No model.)

Claim.—1. A rotary vessel, C, for a fluid-separator, provided with an upwardly-projecting throat, C', open at the top, and having a discharge orifice or notch, *j*, in its upper edge, substantially as and for the purpose described.

2. The combination, with the rotary vessel C, of the blade *i*, extending nearly but not quite to the side wall of the vessel, leaving an opening, *i'*, between the outer edge of the blade and the vessel, substantially as described, and as illustrated in the accompanying sheet of drawings.

293,315. MAGAZINE FIRE-ARM. WILLIAM H. ELLIOT, New York, N. Y. Filed Dec. 3, 1883. (No model.)

Claim.—1. The combination, in a magazine fire-arm, of the longitudinally-reciprocating strap *h*, pivotally connected at its rear end to the arm *d''* of the brace of the breech-block, and having at its forward end the handle *n*, with inwardly-projecting arms or edges, taking with the grooves or guides in the barrel above and independent of both the magazine-tube and the guard-strap, whereby the handle is supported and guided independently of said tube and guard-strap, and the rear end of said connecting-strap is guided by the breech-block, substantially as shown and described.



2. In a magazine fire-arm, the construction and combination of devices substantially as follows: a breech-block for closing the chamber, movable in a line with the barrel, actuated by a longitudinally-reciprocating handle, *n*, arranged forward of the receiver, through a suitable connection therewith, and having upon its forward end the inclined surfaces or cams *a* and *a'*, a bifurcated or slotted carrier pivoted at its rear end and provided with bar *s''*, upon which said surfaces act, whereby the carrier is depressed from its highest to its lowest position by the said inclined surfaces during the forward movement of the breech-block, substantially as specified.

3. In a magazine fire-arm, a breech-block movable in a line with the barrel, bearing the pivotally-connected brace, and having the eccentric bearing-surfaces *d'''*, for forcing the cartridge into the chamber, and *d'*, for starting the cartridge-shell out of the chamber, in combination with the receiver having the stationary shoulders *g''* and *m*, rigidly fastened thereto, whereby the cartridge is forced home in the chamber, and the shell is started out of the chamber by the alternate raising and lowering of the brace, substantially as shown and described.

4. In a magazine fire-arm, a breech-block provided with a brace for resisting the recoil of the charge, which brace abuts upon suitable recoil-shoulders that are formed eccentric to the axis of the brace and are supported by the receiver, and in combination therewith the two levers *d''* and *o*, both being pivoted to the brace and acted upon by the devices that give movement to the breech mechanism, to displace the brace from the recoil-shoulders, substantially as specified.

5. In a magazine fire-arm, a hammer having the curved projection *r'* extending forward from the face of the hammer under the rear end of the bolt, and the recess *r''* under said projection, in combination with the carrier *s* and brace *d*, the parts being arranged in such relation to each other that during the manipulation of the arm the rear end of the carrier occupies the recess *r''* when the arm is closed and the hammer down, the rear end of the brace occupies said recess when the arm is open, and the rear end of the receiver is kept all the time closed, substantially as shown and described.

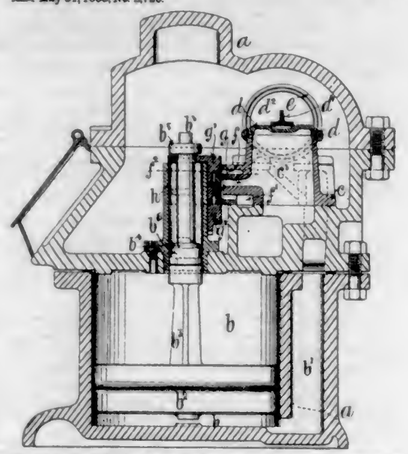
293,316. LOG-TURNER. WILLIAM FREY, Zoar Station, Ohio. Filed Dec. 12, 1883. (No model.)

Claim.—1. In a log-turner, the lifting-lever carrying a hook at one end, in combination with the rotary operating-shaft, a pulley and drum formed integral with each other and mounted loosely upon a bar, a loosely-fitting belt connecting the pulley and shaft, devices for increasing the tension of the belt, and means for connecting the drum with the power end of the lifting-lever, as set forth.

2. In a log-turner, the lifting-lever fulcrumed in suitable uprights and provided at one end with devices for raising the log, in combination with means for operating said lever, a pivoted frame having a jointed connection with the uprights, and a weighted line connecting the power end of the lever with the said frame, as set forth.

3. In a log-turner, the lifting-lever fulcrumed in uprights B, and provided at one end with devices for grasping the log, in combination with means for operating said lever, a pivoted frame working in the rear of the lever, and provided with jointed rods secured to uprights B, which permit the free forward movement of the frame, and a weighted line secured to the power end of the lever and passing through a pulley secured to the frame, as set forth.

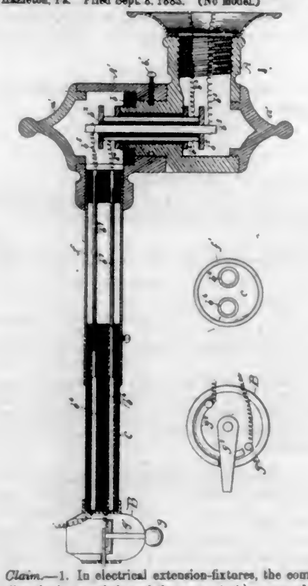
4. In a log-turner, the lifting-lever fulcrumed in suitable uprights and provided at one end with means for grasping the log, in combination with a rope connecting with the power end of the lever, a drum upon which said rope is wound, a rotary operating-shaft, a loosely-fitting belt connecting the shaft and drum, and devices for increasing the tension of the belt at will, as and for the purpose set forth.



5. In a log-turner, the lifting-lever fulcrumed in suitable uprights and provided at one end with devices for grasping the log, in combination with a rope connecting with the power end of the lever, a drum upon which the rope is wound, a rotary operating-shaft, a loose belt connecting the shaft and drum, and a hand-lever provided with an arm carrying a pulley arranged to increase the tension of the belt at will, as set forth.

6. In a log-turner, the combination, with the rotary operating-shaft, of a bar arranged parallel with the same, a pulley and drum formed integral and mounted upon the bar, a loose belt connecting the shaft with the pulley, and a hand-lever provided with an arm carrying a pulley arranged to increase the tension at will, as set forth.

7. In a log-turner, the combination, with the rotary operating-shaft, of a bar arranged parallel with the same, a pulley and drum formed integral and mounted upon the bar, a loose belt connecting the rotary shaft and pulley, a hand-lever, A^2, provided with an arm, Z, a hanger, Y, secured to the arm and carrying a pulley, *a*, a cross-bar, X, supporting the hanger, and a brace-rod connecting the hanger and arm, as set forth.



8. In a log-turner, the uprights B, provided with suitable brace-bars, and a lifting-lever fulcrumed between the uprights, a hook, F, attached to one end of the lever, a weighted line secured to the other end, a rope, C^3, pulleys G^2 D^2 E^2, a drum upon which the rope is wound, and means for operating the drum, as set forth.

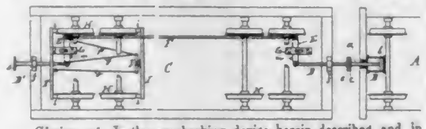
293,317. FLUID-METER. HERBERT FROST, Manchester, County of Lancaster, England. Filed Dec. 7, 1883. (No model.) Patented in England May 31, 1883, No. 2,720.

Claim.—In a fluid-meter or water-motor, the block or casting *c*, with its ports c' c^2 c^3 and f f' f^2, combined with the supplementary cylinders e e' and pistons d^2 d^3, respectively, with the valve-covers *d* and *g*, for controlling the ingress and egress of fluid to and from the main cylinder *b*, substantially in the manner and for the purposes described.

293,318. ELECTRICAL EXTENSION-BRACKET. J. EDWIN GILES, Hazleton, Pa. Filed Sept. 8, 1883. (No model.)

Claim.—1. In electrical extension-fixtures, the combination of the swiveling device consisting of the parts A A', arranged to rotate, and secured together as shown, with the tube *f*, carrying conductors *b'*, and

bar c, of insulating material, having tubes b^2, extending longitudinally therethrough, and sliding in said tube f, all substantially as described.



2. In electrical extension-fixtures, the combination of the swiveling device consisting of the parts A A', each having cap a', with tube b^2, pin b^2, passing through said tube and insulated therefrom, and electric conductors connected with said tube and pin, substantially as shown and described.

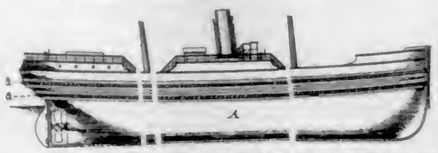
3. The combination of the swiveling device, tube f, carrying conductors b^1, and bar c, having tubes b^2, extending therethrough, all as described, with tube b^2, pin b^2, and conductors b^1 b^2, all substantially as shown and set forth.

4. In electrical brackets, the combination, with a joint or swiveling device maintaining electrical communication, of a tube secured thereto inclosing conductors, and an extension-bar of non-conducting material carrying tubes for continuing electrical contact in extension-arms, substantially as described.

5. In electrical extension devices, the combination of two naked bars secured as shown, with a bar or tube containing two metal tubes for receiving said naked bars, substantially as shown and described.

293,319. CAR-BRAKE. JOHN M. GRACE, Chicago, Ill., assignor of one-half to Francis R. Murphy, same place. Filed Mar. 27, 1883. (No model.)

Claim.—1. In the car-braking device herein described, and in combination with push-bars D D' and connecting-bar F, vibrating beams E E', having trunnions h, and mortise-plates G, having slots g and shoulder-studs m, all substantially as and for the purpose set forth.



2. The combination, with steam-actuated piston b, of push-bars D D', vibrating beams E E', provided with trunnions h, connecting-rod F, and mortise-plate G, provided with slots g and stud m, the parts arranged and operating substantially as described and shown.

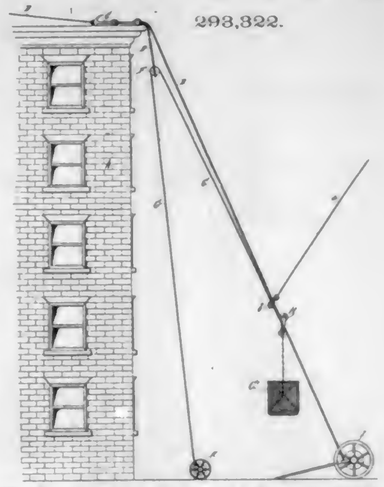
3. The vibrating beams E E', provided with trunnions h, and connected by bar F, in combination with brake-beams I I' and mortise-plate G, said plate provided with slot g and stud m, and the beams E' and I being suitably connected, the several parts being operated by steam-actuated piston b and push-rods D D', as described and shown.

293,320. INSECTICIDE. ISABELLA S. GRAVES, Fishkill-on-the-Hudson, N. Y. Filed Oct. 10, 1883. (No specimens.)

Claim.—The compound herein described for protecting plants and seeds from insects and other vermin, consisting of oleate of potash, nitrate of potash, and alum, with water in proportions substantially as herein set forth.

293,321. FENDER FOR SHIPS. JOHANN HEINRICH GRELL, Sr., Hamburg, Germany. Filed Sept. 26, 1883. (No model.)

Claim.—1. The combination, with the hull of a vessel, of one or more ropes extending longitudinally around the sides and ends of the same, parallel angle-irons, which are attached to the hull at each side of the rope or ropes, and transverse straps that extend across the ropes and serve to retain them between the angle-irons, substantially as and for the purpose set forth.



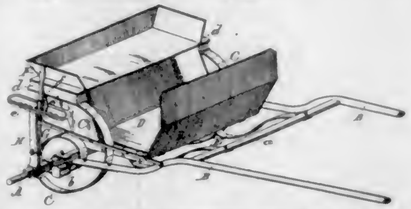
2. The combination, with the hull of a vessel, having one or more pairs of parallel angle-irons extending longitudinally around the hull, of ropes retained by said angle-irons and transverse straps, and of a vertical fender-rope applied to angle-irons of the stem-post of the bow, substantially as set forth.

293,322. FIRE-ESCAPE. WILLIAM N. GRENWOLD, New York, N. Y. Filed Oct. 29, 1883. (No model.)

Brief.—The hoisting-rope to which the carriage is secured runs through a pendant-block near the top of the building. The carriage runs upon a main line the upper end of which is anchored to the roof and the other end drawn taut by a windlass on a truck.

Claim.—1. In a fire-escape of the character herein set forth, the combination, with the anchor, of the main line or cable, the pendant carrying the block for the hoisting-line, and the backing-line, all connected

293,322.



with said anchor, and arranged to operate substantially as and for the purposes set forth.

2. In a fire-escape of the character herein set forth, the combination of the anchor, the main line, backing-line, pendant having the block, the hoisting-line running through said block, and the cage arranged to travel on the main line, substantially as shown and described.

3. The herein-described fire-escape, consisting of the main line, anchor, backing-line, pendant with the block, hoisting-line running through said block, folding cage arranged to travel upon the main line, and reels for the lines, all combined and arranged substantially as shown and described.

4. In a fire-escape, the combination of the main line, anchor, pendant, hoisting-line, cage, and the shifting-line a, with its runner b, applied upon the main line, substantially as explained.

293,323. TWO-WHEELED VEHICLE. GEORGE E. GUERNE, Santa Rosa, Cal. Filed June 22, 1883. (No model.)

Claim.—1. In a two-wheeled vehicle, the axle, body, and intervening springs supporting the body, and shafts hinged to the axle, in combination with the axle-arm H, having rack e, the spring-lever F, and the rod G, connecting the lever F and shaft, substantially as herein described.

2. In a two-wheeled vehicle, the axle A and shaft B, hinged thereto, in combination with the axle-arm H, having rack e, and guard e', the lever F, having spring f, and the rod G, substantially as herein described.

3. In a two-wheeled vehicle, the axle, body, intervening springs supporting the body upon the axle, and the spring-straps connecting the front of the body with the cross-bar of the shafts, in combination with the axle-arm having the rack, the spring-lever, and the rod connecting the lever and shaft, substantially as set forth.

293,324. THEATER APPLIANCE. WILLIAM HANLON, New York, N. Y. Filed Sept. 22, 1883. (No model.)

Claim.—1. As a theatrical appliance, the figure of an animal or fowl, provided with two heads arranged to point in opposite directions, one of which corresponds to the natural head, and the other of which projects rearward from the hind quarters or tail of said animal or fowl, in combination with a support or figure of a man, or woman, or animal, so formed as to have two faces, two pairs of arms and legs, and two body-fronts, the said double-faced figure being supported upon the back of the animal or fowl, and between the two heads thereof, substantially as and for the purpose specified.

293,324.

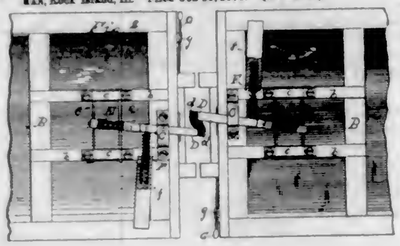
2. The combination of the figure of a horse, A, head-mask B, body F F', masks I, two pairs of arms, H, and legs K, secured to body F F', substantially as and for the purpose specified.

3. The combination of the figure of a horse, A, head-mask B, body F F', masks I, double hat J, and two pairs of arms, H, and legs K, secured to body F F', substantially as and for the purpose specified.

4. The combination of the figure of a horse, A, head-mask B, body F F', masks I, double hat J, coat G, having four arms, and four legs, K, secured to body F F', substantially as and for the purpose specified.

5. The combination of the figure of a horse, A, head-mask B, a body, F F', masks I, two pairs of arms, H, and two pairs of legs, K, and bands D, substantially as and for the purpose specified.

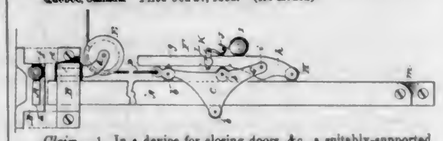
6. The combination of the figure of a horse, A, head-mask B, a body, F F', masks I, two pairs of arms, H, and two pairs of legs, K, and bands E, substantially as and for the purpose specified.



7. A detachable mask of the head of a horse or other figure, having its neck part so formed as to fit the hind quarters or tail of said figure, substantially as set forth.

8. A detachable mask of the head of a horse or other figure, having its neck part so formed as to fit the hind quarters or tail of same, and means to hide the juncture of the mask with the body, substantially as set forth.

9. The combination of a head or mask of an animal or fowl, having its neck part formed to fit the hind quarters or tail of said animal, with the double figure or clothes of a man facing in opposite directions, substantially as shown, and a support for said figure or clothes, whereby it or they are carried upon the back of said animal between its real and imitation head, substantially as and for the purpose specified.



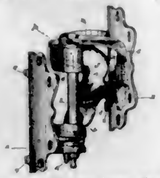
10. The combination of a head or mask of an animal or fowl, having its neck part formed to fit the hind quarters or tail of said animal, with the double figure or clothes of a man facing in opposite directions, substantially as shown, a pair of reins in each pair of hands of said figure, and adapted to connect with the real and imitation head of the animal, and a support for said figure or clothes, whereby it or they are carried upon the back of said animal between its real and imitation head, substantially as and for the purpose specified.

293,325. CAR-COUPLING. CHARLES A. HANSGEN and JAMES R. COLEMAN, Rock Island, Ill. Filed Oct. 19, 1883. (No model.)

Claim.—In car-couplers, the vertically-elongated heads rounded off on sides opposite to each other and having their clasping portions turned in reverse direction, said heads formed with the lips and attached at top and bottom to the bands at the end of the draw-bar, in combination with said draw-bar, the springs E and F, bars e e', and the lever G, all substantially as set forth and shown.

293,326. DOOR-CLOSING DEVICE. W. ANTROBUS HOLWELL, Quebec, Quebec, Canada. Filed Oct. 27, 1883. (No model.)

Claim.—1. In a device for closing doors, &c., a suitably-supported shaft or bar, in combination with a carrier traveling on said shaft and connecting with the door, and a weighted lever pivoted to said carrier, as and for the purposes set forth.



2. In a device for closing doors, &c., a suitably-supported bar or shaft provided with a beveled or chamfered recess, m, in combination with a carrier traveling on said shaft and connecting with the door, and a weighted lever pivoted to said carrier and provided with a roller, H, as and for the purposes set forth.

3. In a device for closing doors, &c., a suitably-supported bar or shaft provided with a beveled or chamfered recess, m, in combination with a carrier traveling on said shaft, and provided with rollers b, a cord or chain connecting said carrier to the door, a lever pivoted to the carrier and provided at one end with a roller, H, and an adjustable weight, as and for the purposes set forth..

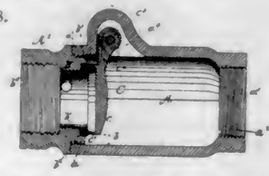
4. In a device for closing doors, &c., a bar or shaft fitted at its upper end in a block, B, and provided with a beveled or chamfered recess, m, in combination with a carrier encompassing and traveling on said shaft, a cord connected to the carrier and leading through requisite pulleys to the door, a lever pivoted to the extension G of the carrier and provided at one end with a roller, H, and an adjustable weight connected to the lever, as and for the purpose set forth.

5. In a device for closing doors, &c., a suitably-supported bar or shaft, in combination with a carrier traveling on the same and connecting with the door, a lever pivoted at i to the carrier, a sliding sleeve arranged to be adjusted on said lever by means of suitable binding-screws, and a weight connected to the sleeve, as and for the purpose set forth.

293,327. AUTOMATIC GATE-HINGE. WESLEY HULL, Fort Wayne, Ind. Filed Mar. 26, 1883. (Model.)

Claim.—1. In an automatic gate-hinge, the leaf B and right-angled plate P, with open lower surface, having on its under outer corner a downward-projecting stay, with lower end curved inward and upward to retain the closing device in position, in combination with said stay, and the end of the closing device shaped to enter the orifice formed by said stay and allow the free operation of the closing device therein and upon the under surface of said plate, substantially as and for the purpose specified.

2. In an automatic gate-hinge, the leaf A, with drum O, having inclined upper surface, in combination with the long tapering end of the closing device and the projection U on the side of the inclined arm thereof, substantially as and for the purpose set forth and described.



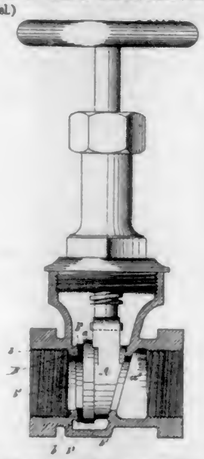
3. In an automatic gate-hinge, the curved horizontal arm of the closing device with notch V in its outer edge, in combination with rib R and projection E on leaf B, which enter said notch in the closing device and guide it in the act of opening and closing the gate, substantially as specified.

293,328. CHECK-VALVE. CHARLES JENKINS, Boston, MASS. Filed Feb. 17, 1883. (No model.)

Claim.—1. In a check-valve, the combination of the casing A, having the valve C hinged thereto, as described, with the removable section A', having the shoulder B integral therewith, and a valve-seat, b, of resilient or elastic packing, supported by said shoulder B, all substantially as and for the purposes described.

2. The combination, in a check-valve, of the section A', having the shoulder B, provided with the seat b, of Jenkins or other resilient pack-

298,328.

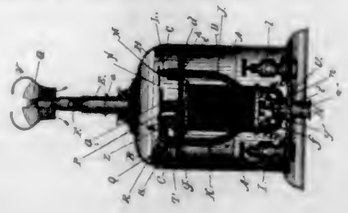


ing, screwed to the shell or casing A, with the said casing A, having a recess, a^4, formed in casting it, and a valve, C, having an arm, c^3, extending into said recess, and fastened therein by a screw-pivot, c^3, all substantially as and for the purposes described.

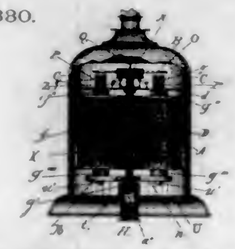
3. In a check-valve, the combination of the valve-casing A, supporting the hinged valve C, and having the screw-thread a', with the section A', having the resilient or elastic valve-seat b, and the screw-thread b^2, all substantially as and for the purposes described.

4. In a check-valve, the combination of the casing A, bearing or supporting the hinged valve C, and having the screw-thread a, with the section A', having a resilient or elastic valve-seat b, the screw-thread b^2, and the screw-thread b^4, all substantially as and for the purposes described.

5. In a check-valve, the combination of the casing A and the hinged valve C with the section A', having the shoulder B, supporting the resilient or elastic packing b, secured thereto by the screw-sleeve b', and also having the screw-thread b^4, all substantially as and for the purposes described.



298,329. VALVE. CHARLES JENKINS, Boston, MASS. Filed Feb. 17, 1883. (No model.)



Claim.—1. The combination, in a valve having the rest b, of the packing b', with the movable connection or coupling described, for holding and securing the packing to the rest, all substantially as and for the purposes set forth.

2. The combination, in a valve having the rest b, of the packing b' and the movable connection or coupling described, for holding and securing the packing to the rest, and the gate A, all substantially as and for the purposes described.

298,330. ELECTRO-MAGNETIC GAS-LIGHTER. EVANS H. JENKINS, Richmond, Ind. Filed Aug. 6, 1883. (No model.)

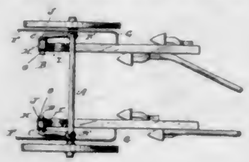
298,330.

Claim.—1. In an electro-magnetic gas-lighter, the combination, with an electro-magnet and a gas-inlet duct provided with a valve-seat, of a counterbalanced tilting lever mounted pivotally upon an adjustable fulcrum, an armature attached to said lever, and a conoidal valve, also attached to said lever and arranged to operate in conjunction with the valve-seat of the gas-inlet duct, substantially as and for the purposes described.

2. The combination, with an electro-magnet and a gas-inlet duct provided with a valve-seat, of a tilting lever carrying an armature, and a conoidal valve arranged to act in conjunction with the valve-seat and mounted pivotally upon an adjustable fulcrum, a counterbalance-weight attached to said lever, and a screw passing through the counter-weight and arranged to limit the decent of said weight, substantially as and for the purposes set forth.

3. The combination, with an electro-magnet, a main gas-inlet duct provided with a valve-seat, and an auxiliary gas-inlet duct provided with an adjustable discharge-opening, of a tilting lever mounted pivotally upon an adjustable fulcrum, an armature attached to said lever, a conoidal valve, also attached to said lever and arranged to act in conjunction with the valve-seat, and a counterbalance-weight mounted upon said lever and provided with an aperture for the reception of the upper end of the auxiliary gas-duct, substantially as and for the purposes set forth.

4. The combination, with the electro-magnet $f\,f$, the gas-inlet ducts H J, and the externally-beveled valve-seat formed at the upper extremity of the duct J, of the tilting lever N, mounted upon the adjustable fulcrum Z, the armature O, attached to said lever, the counterbalance-weight S, with its regulating-screw Q, and the conoidal valve L, secured movably to the lever by its stem M, and arranged to operate in conjunction with the said beveled valve-seat, substantially as set forth.



5. The combination, with the electro-magnet $f\,f$, the inlet-duct H, the branch duct J, provided at its upper extremity with the beveled valve-seat, and the auxiliary branch duct K, of the sub-cylinder D, provided with the inverted cover for the terminus of said duct, the adjusting-screw R, the tilting lever N, mounted upon an adjustable fulcrum secured to said sub-cylinder, the conoidal valve L, secured movably by its stem to said lever, the apertured counter-weight S, and the armature O, mounted upon said lever, substantially as described.

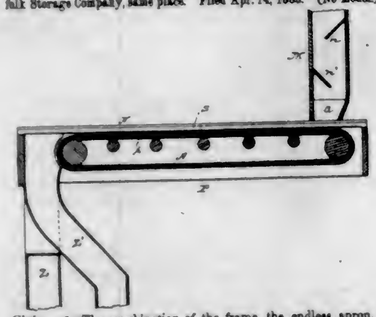
6. The combination, with the casing-sections A B, the sub-cylinder D, and the base-plate U, of the chamber g', the plate n, the magnet $f\,f$, the screw t, connecting the said chamber with the plate n, the screws n', connecting the plate n to the base of the magnet, and the screws g'', connecting the upper ends of the magnet to the plate d of sub-cylinder D, substantially as specified.

7. The combination, with the casing and the sub-cylinder, the counterbalanced lever carrying the armature and the conoidal valve, and the electro-magnet, of the base-plate n, the aperture chamber g', and the branches J K, opening from the apertures in said chamber, said branch J being provided with a valve-seat for the conoidal valve, and said branch K being provided with an adjustable valve, substantially as herein set forth.

298,331. TONGUELESS WHEEL-CULTIVATOR. THOS. B. JEWETT, Steubenville, Ohio. Filed Oct. 29, 1883. (No model.)

Brief.—The horizontal ends of the arch extend forward and then inward to form advanced bearings for the drag-bars. The spindle-plate has draft-rods to the front and arms to the rear for carrying the drag-bars when elevated. The drag-bars are connected to one end of the couplings, which may be interchanged to vary the distance apart of the drag-bars.

Claim.—1. In a cultivator, an arch or axle having its ends turned forward and then inward, for the purpose of having the front ends of the beams attached to them, substantially as shown.

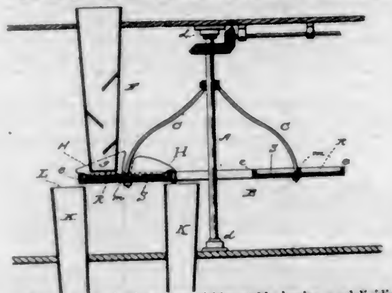


2. In a wheel-cultivator, the combination of the axle, having its ends turned forward and then inward, with the sleeves, which are applied to the ends, the sleeves being provided with means for limiting the movement of the beams, substantially as described.

3. The combination of an axle with the sleeves, having the vertical portion I provided with pin or bolt holes, made at or near one end of the sleeve, whereby, when the sleeves are reversed from one end of the axle to the other, the distance between the beams is increased or decreased, substantially as set forth.

4. In a wheel-cultivator, the combination of the axle, the draft-rods, the arms or braces, and the beams, whereby, when the beams are hung upon the arms or braces, the machine is locked rigidly in position, substantially as specified.

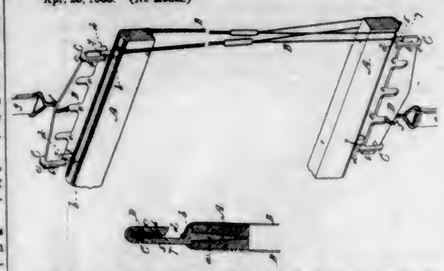
5. In a wheel-cultivator, the combination of an axle, having its ends turned forward and then inward, with the sleeves, provided with suitable means for regulating the vertical play of the beams, the draft-rods, the arms or braces which are formed with or secured to the draft-rods, and the cultivator-beams, substantially as shown and described.



298,332. DEVICE FOR CLEANING AND SEPARATING PEANUTS. JOSEE JOHNSON, Norfolk, Va., assignor, by mesne assignments, to the Norfolk Storage Company, same place. Filed Apr. 14, 1883. (No model.)

Claim.—1. The combination of the frame, the endless apron, the partitions dividing the belt into a series of compartments, the feed-chute, the deflectors in said chute to direct matter into a portion of the compartments and exclude it from the other, and separate discharge-chutes for said compartments, substantially as described.

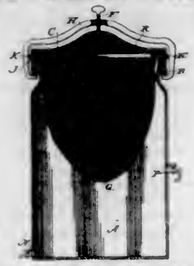
2. The combination of the frame provided with ways along its sides, the endless apron traveling in the ways of the frame, the longitudinal partitions dividing the apron into a series of compartments, the feed-chute provided with the deflectors to direct matter into a portion of said compartments and exclude it from the others, and the separate discharge-chutes to said compartments, substantially as described.



298,333. TABLE FOR ASSORTING BEANS, NUTS, FRUIT, &c. JOSEE JOHNSON, Norfolk, Va., assignor, by mesne assignments, to the Norfolk Storage Company, same place. Filed Apr. 14, 1883. (No model.)

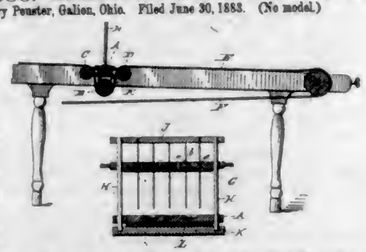
Claim.—1. A circular rotary picking-table having a subdividing-partition extending circularly around the table, and automatic discharging devices for the compartments, in combination with the chutes or receivers into which the discharge is made, substantially as specified.

2. A horizontal rotary picking-table having a subdividing-partition extending circularly around the table, and each compartment provided with an automatic discharging device, substantially as and for the purpose specified.



298,334. DEVICE FOR CONNECTING LOOM-HARNESSES WITH THEIR ACTUATING MECHANISM. JOHN P. KELLY, Saco, Me. Filed Apr. 28, 1883. (No model.)

Claim.—1. The combination, with the shaft of a heddle-frame, of a fastening or connecting device, C, consisting of a head, b, an open spring eye or loop, c, with a projection, 7, and having a space, d, between said projection and the head b, and a shank, a, adapted to be driven into the shaft until the head b lies flush with its surface, all constructed to operate substantially as and for the purpose described.

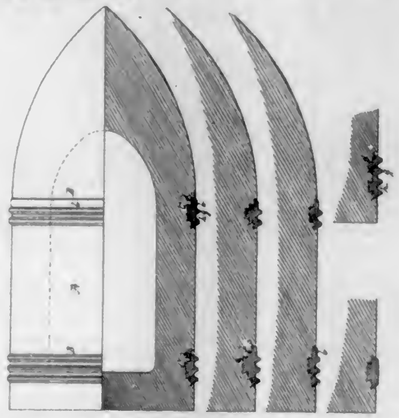


2. The combination, with the shaft A of a heddle-frame, of the draft-bar D, provided with a series of notches or apertures, e, and the spring fastening-eyes C, constructed as described, and adapted to receive the ends of said bar and secure them to the shaft A, substantially as set forth.

298,335. VACUUM-PRESS PERCOLATOR. CHAS. RICHARD KNAPP, San Francisco, Cal. Filed Mar. 2, 1883. (No model.)

Claim.—The combination of an elastic diaphragm, made of india-rubber or other suitable elastic material, separating the normal atmosphere from a vacuum created within a glass jar or other suitable air-tight vessel, in the interior upper part of which is suspended a porous conical bag, holding drug or other substance, so arranged as to be subject to the pressure of the diaphragm, transmitting atmospheric weight, for the purpose of separating volatile, gaseous, liquid, or soluble matter from solid or insoluble matter.

298,336. BRETZEL-MACHINE. WM. LAMPERT, Crestline, assignor to Henry Peuster, Galion, Ohio. Filed June 30, 1883. (No model.)



Claim.—1. In a machine for making bretzels or other like articles, the combination, with upper and lower dies, of endless apron having upper section, E, located substantially in the same horizontal plane with the lower die forward and rearward thereof, and means for conducting said apron-section beneath the lower die, substantially as set forth.

2. In a machine for making bretzels or other like articles, the combination, with the lower die and the endless apron, of a guide located below the lower die, beneath which the upper apron-section passes, and two guides respectively located to the front and rear of the lower die, over which said apron-section passes, substantially as set forth.

3. In a machine for making bretzels or other like articles, the combination, with upper and lower dies, and an endless apron whose upper section is located substantially in the same horizontal plane with the lower die forward and rearward thereof, of a guide located in vertical line below the lower die, beneath which said apron-section passes, and two guides respectively located to the front and rear of the lower die, over which said apron-section passes, substantially as set forth.

293,337. PROJECTILE. HENRY F. MANN, Pittsburg, Pa. Filed Dec. 20, 1883. (No model.)

Claim.—1. A projectile having a band-groove composed of a peripheral dovetail groove or grooves and a sub-goove of similar form made in the bottom thereof, substantially as and for the purposes specified.

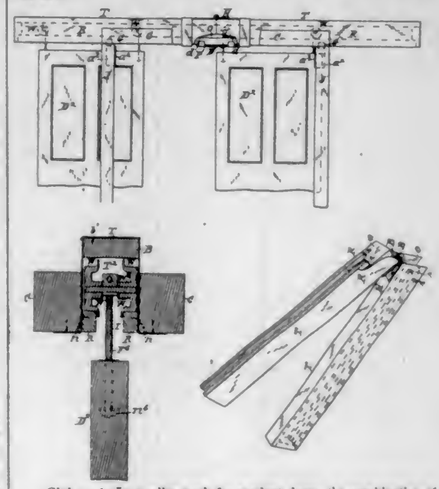
2. The combination, with a projectile having a peripheral dovetailed groove and a sub-groove of like form in the bottom of the main groove, of a soft-metal band, substantially as and for the purposes specified.

3. The combination, with a projectile having a dovetailed band-groove, of a soft-metal band having one or more ribs and groove and a leading ring which corresponds in external diameter with the internal diameter of the bore of the gun at the top of the lands, substantially as and for the purposes specified.

4. The combination, with a projectile having a dovetailed band-groove, of a soft-metal band having two or more ribs, interposed grooves which correspond with or are less than the windage given to the shell, and a leading part which corresponds in diameter with the diameter of the bore of the gun at the top of the lands, substantially as and for the purposes specified.

5. The combination, with a projectile having a band-groove composed of a peripheral dovetailed band-groove and a sub-groove of like form in the main groove, of a soft-metal band having one or more ribs and interposed grooves and a leading part whose diameter corresponds with the diameter of the bore at the top of the lands, substantially as and for the purposes specified.

293,338. MAGNET. CHARLES MATTHEWS MANY, Brooklyn, N. Y. Filed Aug. 17, 1883. (No model.)



Claim.—1. A magnet provided with notches or projections, in combination with an armature provided with corresponding projections or notches, respectively, for connecting together the said magnet and armature, substantially as and for the purpose herein set forth.

2. The combination, with a magnet, A, provided with whole or half dovetailed projections *a*, of an armature, B, having notches *b*, shaped to correspond to said projections, substantially as shown in Fig. 1, and above described.

293,339. ROLLER-TRACK MECHANISM FOR PENDENT SLIDING DOORS. EDWARD WILLIAM MARTIN, Lansingburg, N. Y., assignor to Henry Martin, same place. Filed May 16, 1883. (No model.)

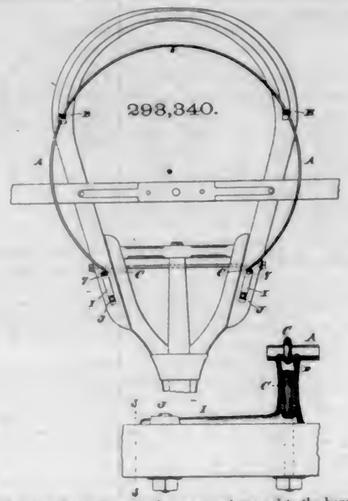
Brief.—The invention comprises a two-part track-inclosure having its adjacent inner ends connected at the top by a hinge and rails, arranged on its inner, lower, and opposite edges, and having a longitudinal opening between them, and also an opening below the hinged connection. A central top support of wood is attached to the interior of said inclosure, and adjustable slotted plates are constructed for the reception of short rails to make the track continuous past the hinge-joint. A pair of hinged plates, provided with stirrups to support the rails and a vertical set-screw at the bottom of same, is attached to door-opening jambs, to permit the door in certain cases to swing. A hook-shank constructed with an offset-arm is attached to the door, and has a hook-bearing to hook onto an axle of the roller, to serve the purpose of a hanger. A plate with corner tangs and screw-openings for attachment to the door, and a tubular opening through which passes a hook-shank, hold the hanger rigidly to the door.

Claim.—1. In a roller-track for pendent doors, the combination of the two-part track-inclosure T, the rails R R, arranged on the inner, lower, and opposite edges of said two-part track-inclosure, and the hinge-H, connecting the adjacent inner ends of the two-part inclosure for the track, as shown and described.

2. In a roller-track for pendent doors, the combination of the two-part track-inclosure T, the rails R R, attached on the inner, lower, and opposite edges of said inclosure, the longitudinal opening I between the rails, the hinge H, connecting the inner adjacent ends of the said track-inclosure at the top, and the opening O, made in said inclosure between the rail ends beneath the hinge, as and for the purposes herein set forth.

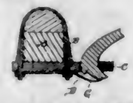
3. In a roller-track for pendent doors, the combination of the two-part sheet-metal track-inclosure T, the central top support, B, of wood, attached to the interior of said inclosure, the rails R R, attached to the inner, lower, and opposite edges of the sheet-metal track-inclosure, the opening I between the said rails, and the hinge H, connecting the inner adjacent ends of said inclosure, as shown and described.

4. In a roller-track for pendent doors, the combination of the two-part track-inclosure T, the rails R R, arranged on the inner, lower, and opposite edges of said track-inclosure, the hinge H, connecting the inner adjacent ends of the two-part inclosure, the opening O, made between the rail ends below the hinged connection, the adjustable plates P P, and the short rails N N, constructed to adjust in said plates, and the parts specified arranged to attach and operate as herein shown and described.



5. In combination with a roller-track for pendent doors, the hinge C, constructed with the plates a' a^2, the stirrup G, attached to the top of the plate a', and the set-screw K, in the bottom of the stirrup, as and for the purposes herein set forth.

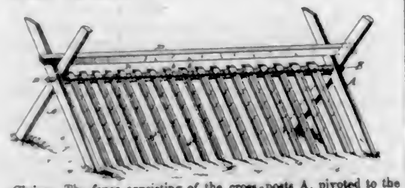
6. In a roller-track mechanism for suspended doors, the combination of the hook-shank F^4, adapted at its lower end to attach to the doors, and constructed with the offset-arm S^4, and the hook-bearing B^4, adapted to hook onto the roller-axle, and constructed with the opening b^4, and vertical groove l^4, for the passage of said hook-shank and offset-arm, as shown and described.



7. In a roller-track mechanism for suspended doors, the plate P^7, constructed with the corner-tangs h^7, and screw-openings for attachment to the top of the door, and the tubular opening O^7, for the passage of the hook-shank, as shown and described.

293,340. CIRCLE-IRON FOR WAGONS. JOHN MASSEY, Salem, Mo. Filed Oct. 15, 1883. (No model.)

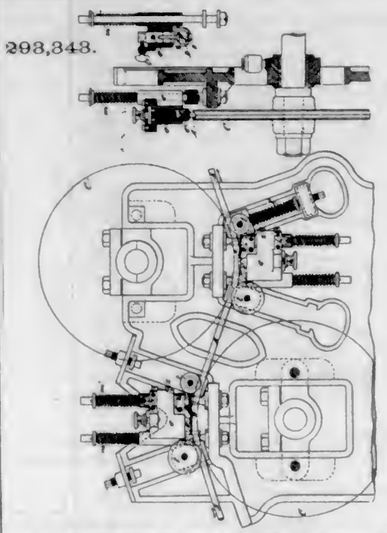
Claim.—In combination with a circle-iron for wagons, &c., made of one continuous piece of bent iron, the notched hollow vertical posts with horizontal projections resting upon and secured to the hounds, and the eyebolts in which fit the ends of the circle-iron, and which pass down through the hollow posts and through the hounds with nuts on their lower ends, substantially as and for the purpose set forth.



293,341. THILL-COUPLING. OSCAR C. MEHURIN, Newark, Ohio. Filed June 23, 1883. (No model.)

Claim.—The combination, in a thill-iron having on its rear end the downwardly-projecting hook or cam, and provided on its rear end or convex surface with a shoulder, of a draft-plate, C, having an opening through it just large enough to admit the thill-iron, and the spring G, which bears against the thill-iron, the parts being constructed and arranged to operate substantially as shown.

293,342. FENCE. JOHN WM. MEWBORN, Centerville, Tex. Filed Aug 30, 1882. (No model.)



Claim.—The fence consisting of the cross-posts A, pivoted to the stringer B, provided with a top rail, D, and having slats E, extending from the stringer to the ground, and secured to said stringer by the barbed wire *b* and staples *b'*, said slats being further provided with barbed wire *b'*, substantially as shown and described.

293,343. MACHINE FOR WORKING RATTAN. HEINRICH ADOLPH MEYER, Hamburg, Prussia, Germany. Filed May 12, 1883. (No model.) Patented in Germany June 6, 1882; in Belgium July 5, 1882, No. 58,390, and in Austria-Hungary Oct. 19, 1882.

Claim.—1. The combination of the rotary disk C, having a grooved periphery, the chuck D and its cutter *s*, the presser *e* and springs *m m'*, for impelling it toward said disk, the bolt *o*, whereby said chuck is pivoted in said presser, and the screw *i*, for swinging the chuck D on said bolt *o*, and thus effecting the lateral adjustment of the cutter *s* relatively to said grooved disk, substantially as herein described.

2. The combination, with the disk C, chuck D, cutter *s*, and presser *e*, all arranged and operating substantially as herein described, of the movable presser-foot *e'*, and the screw A, whereby it may be adjusted in the presser *e* relatively to the cutter *s*, as set forth.

293,348.

3. The combination of the disk C, chuck D, cutter *s*, presser *e*, springs *m m'*, movable presser-foot *e'*, rollers *t t*, for holding the rattan against said disk in rear of and in advance of the cutter *s*, and presser-foot *e'*, and springs P, all substantially as herein described.

293,344. PROCESS OF EXTRACTING GLYCERINE FROM FATTY MATTERS. EDMOND FRANÇOIS MICHAUD and ERNEST NICOLAS MICHAUD, Aubervilliers, France, assignors, by mesne assignments, to the Continental Glycerine Company, New York, N. Y. Filed Oct. 6, 1883. (No specimens.) Patented in France Oct. 4, 1882, No. 151,404; in England Oct. 27, 1882, No. 5,112; in Germany Nov. 2, 1882, No. 23,213; in Belgium Nov. 8, 1882, No. 59,512; in Russia Nov. 13, 1882, No. 8,159; in Italy Nov. 15, 1882, No. 14,804; in Austria-Hungary Feb. 19, 1883, No. 37,740; in Canada Mar. 31, 1883, No. 15,594, and in Spain May 29, 1883, No. 2,573.

Claim.—1. The process of extracting glycerine from fatty matters, which consists in placing the fatty matters, with water and a zinc preparation, and without other more powerful base, in a closed vessel and subjecting the same to heat and pressure until the separation is effected, substantially as set forth.

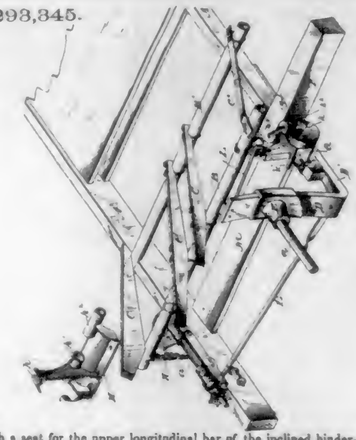
2. The process of extracting glycerine from fatty matters, which consists in placing the fatty matters, with water and a zinc preparation, and in the absence of calcareous or alkaline substances, in a closed vessel, subjecting the same to steam-pressure for a sufficient time, and seperating the water containing the glycerine from the resulting fatty acids, substantially as set forth.

3. The process of extracting glycerine from fatty matters, which consists in adding to said fatty matters water and a zinc preparation known as "zinc-powder," and consisting, principally, of finely-divided metallic zinc and zinc oxide, and subjecting the mixture to the action of heat, substantially as set forth.

293,345. HARVESTER. LEWIS MILLER, Akron, Ohio. Filed June 2, 1883. (No model.)

Claim.—1. The curved and angular drive-wheel axle-bracket connected by its horizontal arm with the forward platform-sill, in combination with a brace supporting its upper end and the axle block or sleeve adjustable on said bracket, substantially as described.

2. The curved angular axle-bracket having its horizontal arm rigidly connected with the platform-sill, in combination with a chair supporting the upper end of the inclined binder-frame, and a brace connecting said angular bracket and chair, substantially as and for the purpose described.

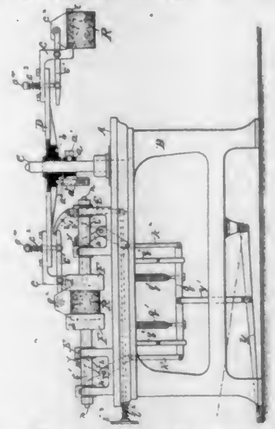


3. The combination, with the transverse grain-platform sills A and A', of the inclined binder-frame and the chairs supporting the upper end of said inclined frame, substantially as and for the purpose described.

4. The combination, with the forward platform-sill, of the chair G, forming a support for the upper end of the inclined binder-frame, and a tongue-socket, substantially as described.

5. The chair G, forming a combined binder-frame support and tongue-bracket, and provided with the shields or guards and bearings for the mechanism for adjusting the frame, substantially as described.

6. The combination, with the platform-sill, of the chair H, provided



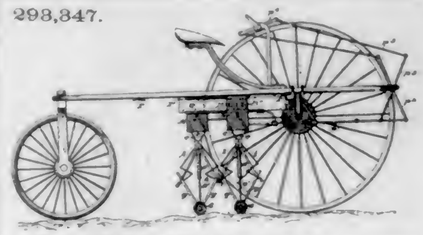
293,345.

with a seat for the upper longitudinal bar of the inclined binder-frame, and with bearings for the secondary or bevel-wheel shaft and counter-shaft, substantially as described.

7. The combination, with the platform sills or frame, of the chairs G and H, the inclined binder-frame secured to said sills and chairs, the angular axle-bracket D, and the braces L' and M, all substantially as described.

293,346. CAN-SOLDERING MACHINE. DAVID M. MONROE, Baltimore, Md. Filed Dec. 11, 1883. (No model.)

Claim.—1. The combination of a rotary conveyer, D, having attached thereto projecting arms *c* and clamping-knives c^2, and a gaging device provided with gages *d*, inside expanding-jaws, *e e*, and mechanism that will force the jaws *e e* apart, as set forth, and for the purpose as herein specified

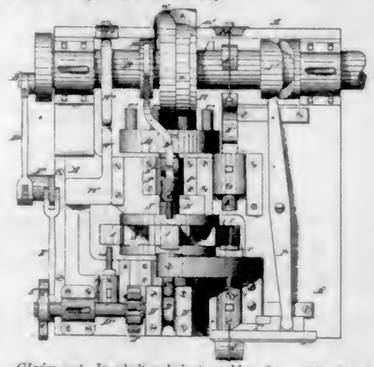


2. In a can-body-gaging device, the combination of two reciprocating heads, F F, provided with outside gages, *d*, inside expanding-jaws, *e e*, and mechanism to force the jaws *e e* apart, whereby each end of the can-body will be gaged at the same time.

3. The combination of the outside gages, *d*, inside expanding-jaws, *e e*, a reciprocating carrier or shaft, *t'*, attached thereto, and mechanism contained therein which will force apart the jaws *e e* when they cease to move in the direction of the can-body.

4. In a can-seaming machine, the combination of a conveyer having a vertical adjustment and a device to stop and hold the conveyer, whereby the conveyer may be adjusted vertically by the vertical adjustment of the stop and holder.

5. The combination of a reciprocating cross-head, *t*, adjustable gages *d*, expanding-jaws *e*, rod *n*, spring n^3, and shaft or carrier *t'*, operated as set forth.



293,347. PROPELLING VEHICLES. BALDWIN S. MOORE, Austin, Tex. Filed May 26, 1883. (No model.)

Claim.—1. The combination of the vehicle, the vertically-extensible propeller-frame connected thereto, so that the one may slide longitudinally upon the other, and arranged so that when elongated it will bear above against the vehicle and below upon the ground, and mechanism for causing the elongation and sliding movement of the said propeller-frame, these parts being combined and having the mode of operation substantially as hereinbefore set forth.

2. The combination, with the vehicle, the vertically-extensible propeller-frame carried by and sliding lengthwise on said vehicle, and the propeller-actuating mechanism, of reversing mechanism, substantially as described, whereby the direction of movement of the vehicle upon the propeller-frame at the time the latter is elongated or extended by its actuating mechanism can be reversed at will, substantially as and for the purposes hereinbefore set forth.

293,348. BOLT OR RIVET MACHINE. JAMES MORGAN, Pittsburg, Pa. Filed May 14, 1883. (No model.)

Claim.—1. In a bolt and rivet machine, the combination of feed-tube C, dies *s*, in any desired number, such dies being movable backward to partially sever the blank, and then forward to completely sever the blank, and a device, substantially as described, which gives such backward and forward movements to the dies and holds them in positions of rest thereafter against movement in either direction.

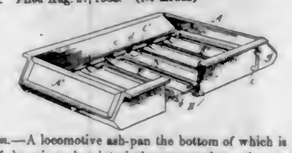
2. The die-carrying shaft S', in combination with wheel R, having pins projecting from its side face, and wheel R', having cams and grooves on its periphery engaging with the pins on wheel R, substantially as and for the purposes set forth.

3. The combination of a die-carrying shaft, a wheel secured thereon having pins projecting from its side face, and a wheel having on a part of its periphery-face a groove parallel with the plane of the wheel, and on the remaining part of such periphery having inclined cams and grooves, substantially as set forth.

4. The combination of die-carrying shaft S', wheel R, having pins projecting from its side face, driving-shaft B, and wheel R', the latter having on its periphery-face straight groove *a*, inclined grooves *a' a² a³ a⁴*, and inclined cams *c c' c²*, substantially as and for the purposes set forth.

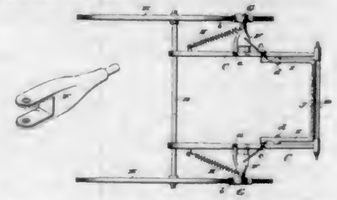
5. The combination of die-carrying shaft S', disk or wheel R, having four pins, r' r^2 r^3 r^4, on its side face set in circular order about the axis of the shaft, and wheel R', having on its periphery-face straight groove *a*, inclined grooves *a' a² a³ a⁴*, and inclined cams *c c' c²*, substantially as and for the purposes set forth.

6. The combination of feed-tube C, stop N, dies *s s*, heading mechanism K *i*, and mechanism, substantially as described, for moving the dies both backward and forward to sever the blank and carry the dies in succession from the feeding to the heading positions, and for holding the dies during the feeding and heading operations from movement either forward or backward, as set forth.



7. The wheel R', having straight groove *a*, inclined grooves *a'*, a^2, a^3, and a^4, and inclined cams *c* c^2, in combination with removable cam-piece *c'*, substantially as and for the purposes set forth.

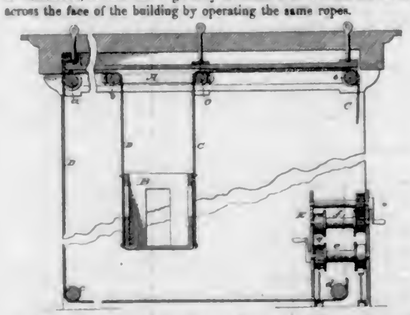
293,349. PAPER-HOLDER. MILLARD F. NEWBURY, Coxsackie, N. Y., assignor to Benjamin F. Eaton, same place. Filed Sept. 4, 1883. (No model.)



Claim.—The combination, with the paper-holder and the knife-stock, of a compound knife formed of the blade *o*, and the separate plates or strips *r*, having teeth at their ends, and the attaching-screws for holding the blade to the stock and clamping the strips *r*, substantially as set forth.

293,350. LOCOMOTIVE ASH-PAN. WILLIAM H. D. NEWTH, Detroit, Mich. Filed Aug. 27, 1883. (No model.)

Claim.—A locomotive ash-pan the bottom of which is formed with a series of dumping-slats interiorly connected together, and adapted to be opened and closed from the cab of the engine, each slat being provided with a flange, J, upon its upper face, substantially as and for the purposes set forth.

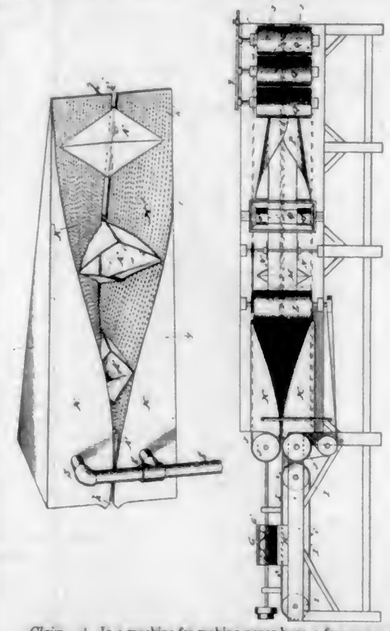


293,351. BRAKE FOR CHILDREN'S CARRIAGES. GEO. D. FAUL, Orange, assignor of one-half to Andrew R. Miller, East Orange, N. J. Filed May 8, 1883. (No model.)

Claim.—The combination, with the wheels and handle of a child's carriage, of brake-operating levers I I J, pivoted at *d d* to the side arms of the carriage-handle, brake-shoes, rods *c c*, and springs H H, substantially as set forth.

293,352. FIRE-ESCAPE. DENISON C. PIERCE, Chicago, Ill. Filed May 11, 1883. (No model.)

Brief.—The ropes are secured to the sides of the cage, passing up over pulleys on the carriage, and one passed in one direction, the other in the opposite direction over pulleys at the corners of the building down to windlasses, so that the cage may be raised and lowered and moved across the face of the building by operating the same ropes.



Claim.—1. The combination, in a fire-escape, of a cab suspended by cables or ropes at its two opposite sides, a traveling carriage carrying sheaves, over which said ropes pass, and two pulleys located one at each corner of the building in line with the traveling carriage, said ropes being led to winding-drums below, all arranged to operate substantially as described, whereby the cab, by means of said ropes, can be both elevated, lowered, and also moved laterally, as set forth.

2. In combination with the traveling carriage A, the cab B, with the ropes C D, sheaves *a b c d*, and winding-drums *e f*, all arranged to operate substantially as and for the purpose set forth.

3. The combination, in a fire-escape, of a traveling carriage, A, provided with the two sheaves *o o*, and the cab B, having the two ropes C D connected thereto, and passing up over sheaves in the traveling carriage, and from thence in opposite directions around the pulleys *a d* at the opposite corners of the building, and from thence to the two winding-drums, whereby the ropes which sustain the cab can be made to move the same both vertically and laterally, as herein shown and described.

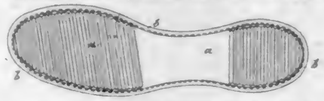
293,353. PAPER-BAG MACHINE. WILLIAM B. PURVIS, Philadelphia, Pa., assignor, by direct and mesne assignments of one-half to Louis E. Pfeiffer, same place. Filed Oct. 11, 1881. Renewed May 26, 1883. (No model.)

Brief.—The tube is formed, creased for the diamond-fold, and severed into bag-lengths in the usual way, and discharged upon idler-rolls H. Belts I', provided with projecting pins and running at right angles to the tube-forming mechanism, seize the blanks, and, with belts, J present them transversely to and carry them through "suction-former" K, where, by exhausting the air from the former, the plies of the blank are sucked apart to form the diamond-fold of the bag-bottom. The creases for the final folds are made by disks N, and the final folds made by folder P.

Claim.—1. In a machine for making paper bags, a former provided with means to create a suction and a longitudinal aperture through which the tubes are fed in close succession, side by side, for the purpose of forming the bottom of the bag, substantially as and for the purpose specified.

2. In a machine for making paper bags, a stationary former made hollow, with its operating surfaces provided with numerous small apertures, in combination with an exhaust-fan, and pipes connecting said fan with the interior of the former, substantially as and for the purpose specified.

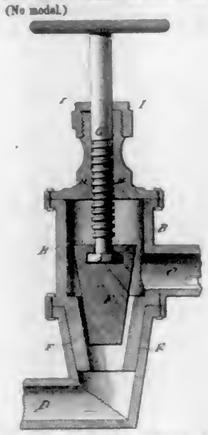
3. In a machine for making paper bags, a former having two suction-faces curved in opposite directions arranged to allow the tube-sections to pass between said faces, and side by side, as described and shown, and adapted to suck and draw the sides of said tube apart to form the bottom of the bag, substantially as and for the purpose specified.



4. In a paper-bag machine, the combination of the feeding-bands I', suction-former K, roller L, creasing-rollers N, support *n*, plate M, pasting-roller O^2, folder P, and drying-rolls Q, substantially as and for the purpose specified.

3.

5. In a paper-bag machine, the combination of leveling-roller B, creasing-roller C, pasting device D, folder E, drying-rolls F, and creasing and cutting roller G, with suction-former K, means, substantially as described, to feed the tube-section to said former, pipe S, exhaust-fan U, feeding-bands J, a pasting-roller, and a folder, P, for folding over the bottom to complete the bottom as formed in former K, substantially as and for the purpose specified.

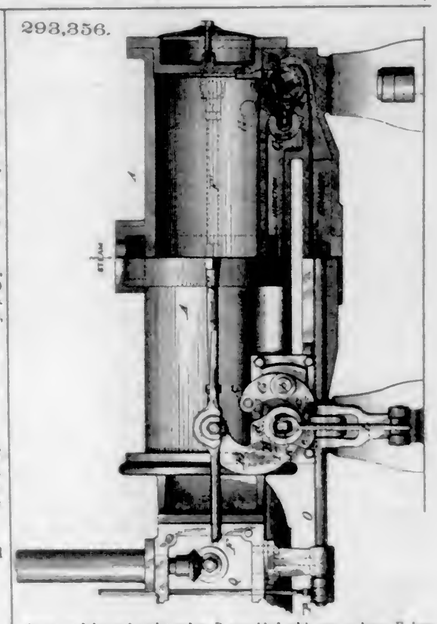


6. In a machine for making paper bags, a former provided with means to create a suction and a longitudinal aperture through said former, through which the tubes are fed in close succession for the purpose of forming the bottoms of the bags, in combination with two endless bands having their line of contact in line with the aperture in the former, and means, substantially as described, to press said bands together to feed the tubes through said former, substantially as set forth.

293,354. BOOT OR SHOE. HENRY EDWARD RANDALL, Northampton, County of Northampton, England. Filed Apr. 23, 1883. (No model.) Patented in England Dec. 1, 1882, No. 5,739; in France Apr. 13, 1883, No. 154,938; in Belgium Apr. 27, 1883, No. 61,240; in Canada Aug. 10, 1883, No. 17,439, and in Italy Sept. 30, 1883, XVII, 15,732, and XXXI, 345.

Claim.—In a lawn-tennis or other boot or shoe, an inner sole of leather, in combination with an outer sole, *a*, of rubber, made with a border or flange of lesser thickness than the main body of such outer sole, and united by a line of stitching through such flange to the leather sole, all as shown and described.

293,355. STOP-VALVE. ALBERT RAFFOLD, Titusville, Pa. Filed Dec. 26, 1882. (No model.)



Claim.—As an improved article of manufacture, a stop-cock valve especially adapted for corrosive substances, and comprising a valve-chamber, A, formed of lead or equivalent soft metal, and consisting of the walls B and the conical valve-seat E, formed integral with the walls B, and forming the bottom of the valve-chamber, the cap-piece H, the operating-stem G, the conical valve-plug F, corresponding to the seat E, and likewise formed of lead or an equivalent soft metal, whereby should particles become lodged between the plug and seat they will be compressed into the soft metal, and not prevent closing of the valve, and the discharge-pipe D, having a conical throat that encircles the soft-metal seat E and protects and strengthens the same from damage from the outside, substantially as set forth.

293,356. CUT-OFF-VALVE GEAR. EDWIN REYNOLDS, Milwaukee, Wis. Filed Oct. 12, 1883. (No model.)

Claim.—1. In a steam-engine, the combination of a steam inlet and outlet valve, a cut-off valve, a double-ended lever for operating the cut-off valve, and a swinging arm or lever connected with the eccentric-rod and provided with bearing-faces on opposite sides of its center of motion, to actuate the double-ended lever in opposite directions, one of said bearing-faces being adjustable relatively to the lever, substantially as explained, to vary the point at which the steam shall be cut off.

2. The combination, in a steam-engine, of a steam cylinder and

293,356.

piston, an inlet and outlet valve, B, provided with arm or lever E, having bearing-face or cam *d*, cam or ear *e*, adjustable in relation to cam *d*, substantially as set forth, cut-off valve C, and double-ended lever G, connected with the cut-off valve, substantially as and for the purpose explained.

3. In a steam-engine, the combination of a steam-cylinder, and at each end of said cylinder an inlet and outlet valve, B, provided with lever E, cam or bearing-face *d*, and adjustable cam *e*, cut-off valve C, provided with double-ended lever G, and a rod, F', connecting the two levers E at opposite ends of the cylinder, a rod, F, connected with the eccentric of the engine, and a regulator connected with the adjustable cam *e*, substantially as set forth, whereby said cam is automatically set to cut off the steam at any required point.

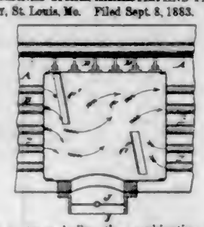
4. In a steam-engine, the combination of a cut-off valve, C, provided with a double-ended lever, G, an induction and eduction valve, B, provided with an operating-lever, E, having a rigid cam or bearing-face, *d*, and a movable cam or bearing-face, *e*, connected with said lever, and with a regulator or governor, D, substantially as explained, whereby the governor is caused to control the position of the adjustable cam or bearing-face.

5. In combination with cut-off valve C, having double-ended lever G, valve B, provided with lever E, having rigid cam or face *d*, stem *a*, and hub or sleeve I, provided with slots *g*, sleeve H, encircling hub I, and provided with slots *f*, sliding block J, having arms *j*, extended through slots *f g*, governor D, and intermediate connections, substantially as described and shown, between the block J and governor.

6. In combination with cylinder A, cut-off valve C, having double-ended lever G, valve B, provided with lever E, having face *d*, stem *a*, and hub I, provided with slots *g*, sleeve H, encircling hub I, and provided with slots *f*, and sliding block J, provided with arms *j*, said arms being extended through the slots *f g*, and serving to rotate sleeve H about sleeve or hub I when moved longitudinally of the hub, substantially as explained.

7. In combination with valves B C, constructed and arranged to operate as described, sleeve H, provided with ear or cam *e* and slots *f*, hub I within said sleeve, and provided with slots *g*, sliding block J, link K, connected with block J by a universal joint, yoke L, connecting-rod M, shaft O, crank-arms N P, governor D, and rod Q, all combined and operating substantially as set forth.

8. In combination with valves B C, and with a rotary sleeve adapted to control the movements of cut-off valve C, substantially as explained, a sliding block, J, adapted to rotate said sleeve, and connected with the rod Q of a governor, D, through the medium of link K, yoke L, rod M, shaft O, and arms N P, as shown and described.



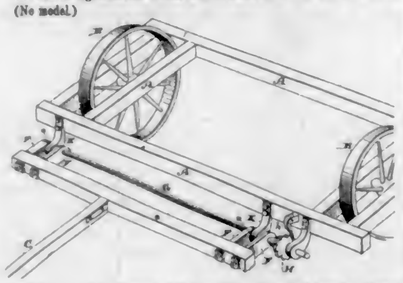
9. In a steam-engine, the combination of a steam inlet and outlet valve, a cut-off valve provided with an arm or lever, and a moving arm or body, substantially as shown, provided with two bearing-faces or cams

to act alternately upon the arm of the cut-off valve, one of said bearings being adjustable relatively to said moving body to vary the point at which the steam is cut off.

10. In a steam-engine, the combination of a steam inlet and outlet valve, a cut-off valve provided with an arm or lever, a moving block or lever, substantially as shown, provided with two bearing-faces to act alternately upon the arm of the cut-off valve, one of said bearing-faces being adjustable relatively to the other, a governor, and intermediate devices connecting the governor and the movable bearing-face, substantially as and for the purpose set forth.

11. In a steam-egine, the combination, substantially as shown, of a steam cylinder and piston, an inlet and outlet valve, B, provided with arm or lever E, having bearing-face or cam *d*, cam or ear *e*, adjustable in relation to cam *d*, substantially as set forth, and cut-off valve C, provided with an arm or lever, substantially as and for the purpose explained.

293,357. COMBINED SPARK-ARRESTER AND FLUE-SUPPORTER. JOSEPH C. RIDLEY, St. Louis, Mo. Filed Sept. 8, 1883. (No model.)



Claim.—1. In a steam-boiler, the combination, with a chamber, divided flues connected thereto, and a discharge at the bottom of the chamber, of a deflector depending from the top of the chamber at the end nearest to the fire-box, to throw the solid matter down to the discharge-pipe, as set forth.

2. In a steam-boiler, the combination, with a chamber, flues connected thereby, and a discharge at the bottom of the chamber, of the deflector projecting upward from the bottom of the chamber to throw the solid matter back into the discharge-pipe, as set forth.

3. In a steam-boiler, the combination, with a chamber, flues connected thereby, and a discharge at the bottom of the chamber, of the depending deflector at the end of the chamber nearest to the fire-box, and a deflector extending upwardly from the bottom of the chamber in advance of the discharge-pipe, as set forth.

293,358. HARVESTER. ALEXANDER ROBINSON, Benicia, assignor to the Benicia Agricultural Works, San Francisco, Cal. Filed July 20, 1883. (No model.)

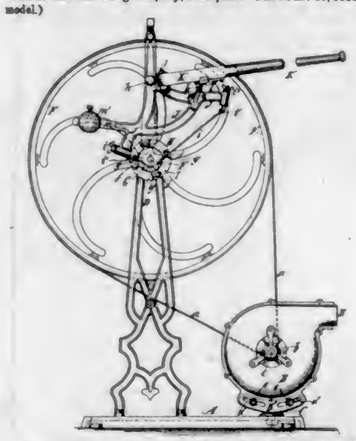
Claim.—1. In a harvester, the pole C and wheeled frame A, hinged thereto, to adapt it to be adjusted to an inclination, in combination with an intervening torsion-spring, forming the pivotal connection between said pole and frame, and having a tendency to return said frame from its inclination, substantially as herein described.

2. In a harvester, the pole C, having cross-bar *c*, and the wheeled frame A, in combination with the metal rod G, hinging the cross-bar and frame, and a means for twisting said rod by the movement of the frame to an inclination to form a torsion-spring, substantially as and for the purpose herein described.

3. In a harvester, the pole C, having cross-bar *c* and eyebolts F, and the wheeled frame A, having bars E, with eyes *e*, in combination with the metal rod G, passing through eyebolts F and bars E, and squared at one end in one of said eyebolts F, as described, the ratchet-wheel H on the other end of rod G, and the pawl *h* on the frame A, all arranged and operating substantially as and for the purpose herein described.

293,359. BOOT OR SHOE. GEORGE ROLLRAHS, Pittsburg, Pa. Filed Oct. 1, 1881. Renewed Sept. 21, 1883. (Model.)

293,359.



Claim.—1. The inside plate, C, in combination with the heel A and shank B, fastened together, as hereinbefore described.

2. The combination of the heel, shank, and plate C, with the quarter and vamp of a boot or shoe, the latter being held by compression between the former, substantially as described.

3. The combination of the heel and shank A B, and the inside plate, C, provided with longitudinal slots, clamping-screws, plates *a*, and buttons *b*, substantially as set forth.

293,360. DRIVING MECHANISM FOR FAN-BLOWERS. JOHN R. ROWLANDS, New York, N. Y., assignor, by mesne assignments, to the J. G. Hoffman Manufacturing Company, same place. Filed June 15, 1883. (No model.)

Claim.—1. The combination, with a driving wheel or pulley and its shaft, of a chain-wheel having a clutch-connection with said shaft which will permit the wheel to turn independently of the shaft in one direction only, a rocking frame and means for oscillating it, and a drive-chain carried by said rocking frame and gearing with said chain-wheel, substantially as specified.

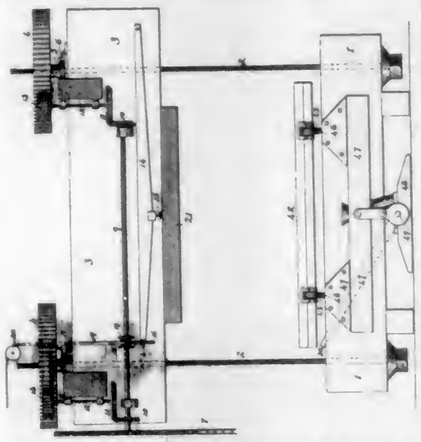
2. The combination, with a driving wheel or pulley and its shaft, of a chain-wheel having a clutch-connection with said shaft which will permit the wheel to turn independently of the shaft in one direction only, a rocking frame and means for oscillating it, and a drive-chain having one or both ends detachably connected with said frame and gearing with said chain-wheel, whereby provision is afforded for detaching the chain and rotating the wheel or pulley by a hand-crank, substantially as specified.

3. The combination, with a driving wheel or pulley and its shaft, of a ratchet-wheel secured to the shaft, a flange or wheel loosely fitting on said shaft, and carrying a number of pawls adapted to engage with the said ratchet-wheel by gravity only, and means for rotating said loose flange or wheel alternately in opposite directions, substantially as specified.

4. The combination of the wheel or pulley F, the shaft E, the ratchet-wheel G, fast on said shaft, the chain-wheel H, loose on said shaft, and carrying pawls *f*, the rocking frame J and its drive-chain *i*, and means for oscillating said rocking frame, all substantially as specified.

5. The combination of the wheel or pulley F, the shaft E, the chain-wheel H, having a clutch-connection with said shaft, the rocking frame J, provided with the arm *m* and carrying the drive-chain *i*, and the weight *m'*, all substantially as specified.

6. The combination, with a driving wheel or pulley and its shaft, of a chain-wheel having a clutch-connection with said shaft which will permit the wheel to turn independently of the shaft in one direction only, a rocking frame and a drive-chain connected therewith and engaging with said chain-wheel, an operating-lever fulcrumed at its inner end to said frame, and a bearing or bracket projecting from the frame, and upon which said operating-lever may be adjusted laterally, substantially as specified.



7. The combination, with the pulley F and its shaft E, of the pinion *o* on said shaft, and the crank L and its internal gear, L', mounted on a pivot independent of the shaft E, and gearing into the pinion *o*, substantially as specified.

293,361. COOLING-CASKET FOR PRESERVING THE BODIES OF CHILDREN. CHARLES M. RUTAN, Paterson, N. J. Filed Sept. 4, 1882. (No model.)

Claim.—In a cooler for corpses of children, a lid, *b*, having full-length glass *d*, in combination with a cooling-board, *g*, vertically adjustable upon supports *l* within the cooler, whereby the full length of the corpse can be exposed to view at a suitable distance below the glass, substantially as set forth.

293,362. CIDER-MILL. MARCUS P. SCHENCK, Fulton, N. Y. Filed July 5, 1883. (No model.)

Claim.—1. In a cider-press, the combination, with the bed 1, stationary screws 2, moving press-beams 3, and pinions 4, of a train of driving mechanism, 8 9 10 11 12 13, located between said moving beams, substantially as set forth.

2. In a cider-press, the combination, with the vertically-moving press-beams 3, of an adjustable lever, 14, pivoted at one end to said beams, and carrying at the other end a friction-wheel, 16, and a friction-wheel, 17, mounted on the main driving-shaft, and having flanges 18, for retaining a loose belt, 19, substantially as and for the purpose set forth.

3. In a cider-mill, a pomace-chute having a hinged trap-door and a sliding cut-off above said door, for measuring an equal quantity of material for each layer, as set forth.

4. In a cider-mill, a pomace-chute having a hinged trap-door provided with a marginal flange, in combination with a trough for catching the juice and delivering it into a suitable pipe or conveyer, as set forth.

5. In a cider-mill, the combination, with the pomace-chute 22, having hinged door 23, of a trough, 26, suspended by a spring, and adapted to hold said door in a closed position, and a suitable trigger for liberating it, as set forth.

6. In a cider-mill, the combination, with the chute 22, having trap-door 23, of a cut-off 29, operated by a crank through the medium of rack 30 and pinion 31, as set forth.

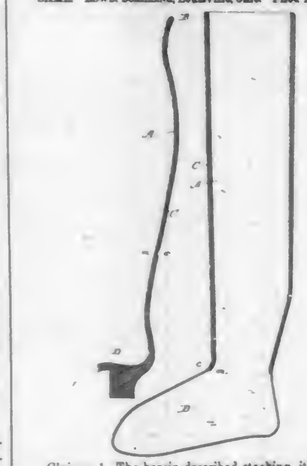
7. In a cider-mill, the combination, with a pomace-chute, of a flexible shield suspended from the ceiling by ropes passing over pulleys, and having a counterbalancing-weight, substantially as and for the purpose set forth.

8. In a cider-mill, a turn-table consisting of a frame supported and held centrally by suitable wear-irons, substantially as herein described, and having at its ends wheels running on a circular track or way, substantially as and for the purpose set forth.

9. The combination, with a turn-table supported at each end by suitable wheels, of a pair of corrugated wear-irons adapted to work together, as and for the purpose set forth.

10. The combination, with a turn-table supported at each end by suitable wheels, and having a central longitudinal trough, as described, of a pair of corrugated wear-irons adapted to work together, and having a central opening, as and for the purpose set forth.

11. In a cider-mill, the combination, with a wheeled press-board, of a turn-table having upright corner-pieces adapted to assist in laying up the cheeses evenly, as set forth.



12. In a cider-mill, the combination, with a turn-table carrying a track on the top thereof, of a wheeled press-board and a suitable latch for holding it in place on the turn-table, substantially as and for the purposes set forth.

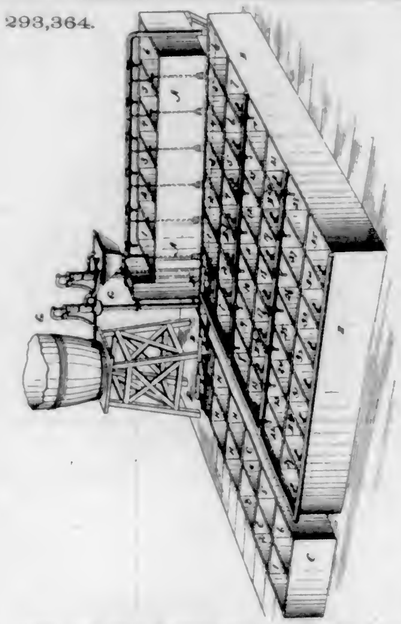
13. In a cider-mill, the combination, with a turn-table, of a wheeled press-board having a marginal flange and an opening in the front thereof for discharging juice into a suitable trough or receptacle, as set forth.

14. In a cider-mill, the combination, with a turn-table carrying tracks or ways, of a press-bed having similar tracks and a wheeled press-board, as set forth.

15. In a cider-press, the combination, with a wheeled press-board, of a track secured to and having its ends project beyond the press-bed, and connected to cross-beams operated by an eccentric-lever, whereby said ends are raised or lowered, substantially as and for the purposes set forth.

293,363. STOCKING AND THE ART OF MANUFACTURING THE SAME. EDWD. SCHILLING, Louisville, Ohio. Filed Apr. 7, 1883. (Model.)

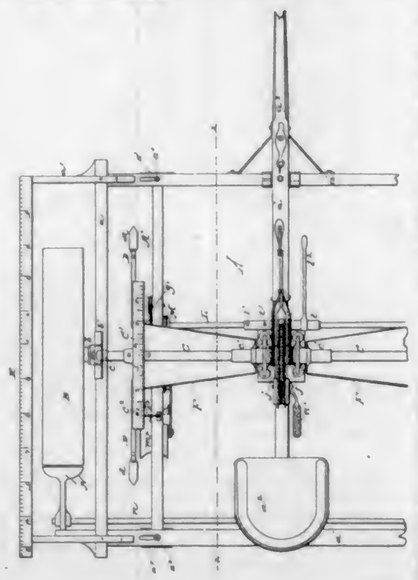
Claim.—1. The herein-described stocking, it having a double-ply continuous fabric for the leg above the foot portion or shoe portion, and a single-ply tubular knit fabric for the foot portion, adapted to be inserted into a shoe without increase of pressure therein or an unusual enlargement of the foot portion of the fabric, the whole being knitted with stitches running in a continuous series, substantially as set forth.



2. The herein-described stocking, it being made of a single-ply tubular knit fabric for the foot portion or shoe portion, and of a fabric which is double ply around the leg above the foot portion or shoe portion, said double-ply leg portion being open at both ends, the lower end communicating with the foot portion, and the upper open end having the inner thickness made integrally with the outer by a continuous series of stitches, substantially as set forth.

3. The herein-described method of manufacturing a stocking, it consisting in knitting a tubular fabric with both ends open, then turning one part thereof inside of the other to form a double-ply fabric around the leg, joining the two ends of the tubular part together, and continuing the stitches of that thickness of the leg which was last knit and forming the foot, all with one continuous knitting operation.

4. The herein-described method of manufacturing a stocking, it consisting in knitting a tubular fabric with both ends open, then turning one part thereof inside the other to form a double-ply fabric around the leg, then replacing a series of stitches or loops of one of the thicknesses upon the needles while a series of stitches or loops of the other thickness are still upon the needles, then by a knitting operation joining the two said series of stitches or loops together and knitting the foot portion, all with one continuous operation, substantially as set forth.



293,364. PROCESS OF TANNING HIDES. LOUIS SCHRADEL, Chicago, Ill. Filed June 23, 1883. (No model.)

293,364.

Claim.—The process of tanning hides consisting in, first, treating the hides in fresh water and in the hide-mill; second, placing the hides in the lime-vats until the coarser hair is taken off; third, washing the hides; fourth, placing the hides in a bed made of human excrement or fowl-manure; fifth, washing the hides clean; sixth, soaking them in water until the fine hair is taken off; seventh, placing the hides in a coloring-mill; eighth, then placing them in handling-vats; ninth, placing the hides in the layer-vats, substantially as described.

293,365. CORN-PLANTER. BENJAMIN SCOTT, Bloomington, Ill. Filed May 29, 1883. (No model.)

Claim.—1. In a corn-planter, the circular flanged dropping-disks C', provided with a series of radiating spokes, D, for engaging the ground and revolving said disks, substantially as herein shown and described.

2. In a corn-planter, the combination of the dropping-disks C', having adjustable spokes D for engaging the ground, and the vertically-adjustable supporting-wheels, substantially as and for the purpose herein shown and described.

3. In a corn-planter, the combination, with the revolving flanged dropping disk or disks C', of the interior flanged disk or disks E, having a series of holes through its flange or flanges arranged in a series of divisions at equal distances apart, substantially as and for the purpose herein shown and described.

4. In a corn-planter, the combination, with the revolving flanged disk or disks C', of the interior flanged disk or disks E, having a series of oblique holes through its flange or flanges arranged in a series of divisions of holes at equal distances apart, substantially as and for the purpose herein shown and described.

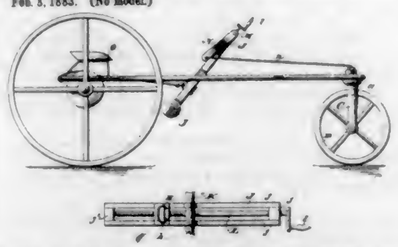
5. In a corn-planter, the combination, with the revolving flanged disk C', of the interior flanged disk, E, having a series of holes through its flange arranged in a series of divisions at equal distances apart, and the series of holes in each division varying in size uniformly in advance of the larger ones, substantially as and for the purpose herein shown and described.

6. In a corn-planter, the circular recessed flanged disk E, having a series of holes through its flange arranged in a series of divisions at equal distances apart, and the series of holes in each division varying in size uniformly in advance of the larger ones, in combination with an interior adjustable band, e^2, having a series of single holes through it for each division of holes in disk E, and of the same size as the largest hole in each division, substantially as and for the purpose herein shown and described.

7. In a corn-planter, the combination of the disk E and a semicircular or troughed shaped inclined and tapering hopper, F, having its enlarged end communicating with said disk, substantially as and for the purpose herein shown and described.

8. In a corn-planter, the combination of the disk E and a semicircular or troughed shaped inclined and tapering hopper, F, having its enlarged end communicating with said disk, and provided with an offset or rabbet, f^3, which fits outside of and one-half around the disk, substantially as and for the purpose herein shown and described.

9. In a corn-planter, the combination, with the disk E, of the inclined and tapering hopper, having a hammer, H, pivoted therein, with its larger end extending inside of said disk, and having a beveled shoulder, A, inclining toward said hopper, substantially as and for the purpose herein shown and described.



10. In a corn-planter, the combination of the flanged dropping-disks C' E and hoppers F, arranged on opposite sides of the central beam, *a*, and adapted to be adjusted toward and from each other, substantially as and for the purpose herein shown and described.

11. In a corn-planter, the combination of the shaft C, carrying the dropping mechanism, journaled in boxes *c c*, castings *b' b'*, having vertical slots for the reception of said boxes, hollow tube *c'*, castings 2, having vertical tubes c^3, bent or curved guide-rods I, toothed bar K, gear-wheel J, and lever 4, for operating said gear in raising and lowering the dropping mechanism, substantially as herein shown and described.

12. In a corn-planter, the gear-wheel J, having hexagonal hube *j' j'*, in combination with the lever H, having forked arms with hexagonal openings through them, by which they are adapted to be sprung on said hubs, substantially as and for the purpose herein shown and described.

13. In a corn-planter, the combination of the laterally-adjustable beams A' A', sectional shaft L, journaled in said beam and adjustably coupled together, and carrying the operating-lever l^2, gear-wheels m^2, and pulleys M, and mechanism for connecting said gear-wheels and pulleys with the cutters and covering-wheels, substantially as and for the purpose herein shown and described.

293,366. VELOCIPEDE. SAML. NORMAN SILVER, Auburn, Me. Filed Feb. 3, 1883. (No model.)

Claim.—1. In a velocipede having two or more wheels, the combination, with a driving shaft or axle, of the single operating-lever, con-

sisting of rigidly-connected parallel bars pivoted on a rock-shaft, and having treadles and handles at its respective ends, a block connected with said shaft or axle, arranged and adapted to slide between said bars, and means, as described, for adjusting said block, substantially as set forth.

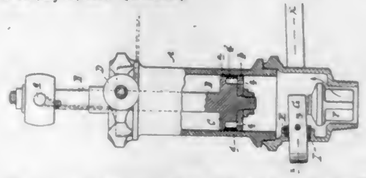
2. In a velocipede, the combination, with the frame thereof, its supporting-wheels, and a driving shaft or axle, of the operating-lever pivoted on a rock-shaft, and consisting of two parallel bars, the adjustable block arranged within said bars, a screw passing through said block and rock-shaft, and connections, as described, between said block and shaft, for revolving the latter, substantially as set forth.

3. In a velocipede, the combination, with the frame thereof, the driving-axle, and a rock-shaft having bearings on said frame, of a lever fulcrumed between its ends on said rock-shaft, consisting of parallel rods, and having treadles at its lower end and handles at its upper end, the adjustable block fitted between said rods, and the screw working in said block and the upper cross-piece of the lever, whereby the block is adjusted, substantially as set forth.

4. The combination, with the axle, of a drum loosely mounted thereon, and provided with spring mechanism and a pawl-and-ratchet device, a lever provided with an adjustable block, and a strap or band wound upon said drum and connected to said block by a rigid connecting-rod, substantially as set forth.

5. The combination, with the frame, provided with elongated bearings to receive the fulcra of operating-levers, of levers provided with adjustable blocks suitably connected to the axle, substantially as set forth.

6. The combination, with the axle and loosely-mounted drum, of the operating-lever fulcrumed between its ends, and having an adjustable block arranged between the bars of the lever, said block being connected with the axle by a strap or band and said lever being provided with treadles and handles, whereby the machine may be operated both by the hands and feet of the rider, thus obtaining a rowing movement, substantially as set forth.



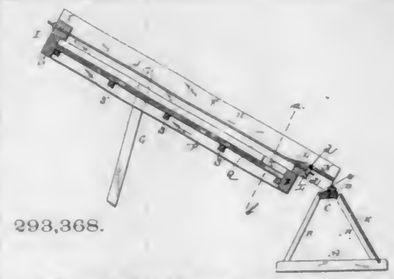
7. The combination, with the axle, of a drum loosely mounted thereon, and provided with spring and pawl-and-ratchet mechanism, an operating-lever, or lever having adjustable blocks connected with said drum by straps or bands, and having treadles and depending handles, the latter being connected with the guide-wheel of the machine by suitable rods, substantially as set forth.

8. The combination, with the axle, of an operating lever or levers provided both with handles and treadles and a band or strap, and spring mechanism between said axle and lever, to obtain both a pulling and pushing action to revolve the axle, substantially as set forth.

9. The combination, with the main axle, of the separate operating-levers having two adjustable blocks fitted thereto, and upon screw-threaded rods, provided at their inner ends with beveled gears adapted to mesh with an intermediate beveled gear secured upon the pivotal shaft, and the straps wound upon the drums upon the said axle, and their ends secured, respectively, to the forward blocks, and the rigid connecting-bars secured to the rear blocks, substantially as set forth.

10. The combination, with the axle and separate operating-levers, of connections between said axle and levers, whereby both a pulling and pushing action upon the axle is obtained, and a crank-rod arranged adjacent to the rider's seat and connected intermediately with the lever and axle connections, for adjusting the said connections to vary the power and speed of the machine, substantially as set forth.

293,367. DAMPER-REGULATOR. GEORGE W. SMITH, Milford, Mich. Filed July 14, 1883. (No model.)

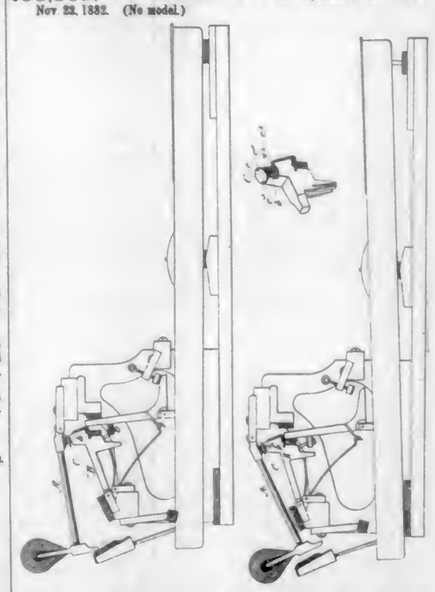


Claim.—1. In combination with the cylinder A and valve F, the lever G, pivotally secured at a point between the valve and the long arm of the lever, substantially as and for the purposes specified.

2. The combination of the cylinder A, provided with the stuffing-box E, valve F, and lever G, provided with the elastic packing I, substantially as described.

3. The combination of the cylinder A, piston B C, expanding packing-rings *d*, stuffing-box E, valve F, lever G, and packing I, when constructed, arranged, and operating substantially in the manner and for the purposes set forth.

293,368. SCREEN FOR SCREENING POTATOES. ORSON J. SMITH, Farmer City, Ill. Filed Dec. 3, 1883. (No model.)

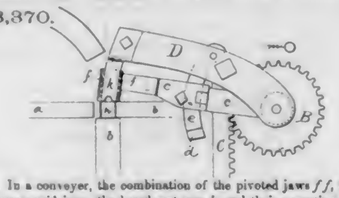


Claim.—1. In a potato-screen, the combination of the side pieces, H, end pieces, I L, and screw-threaded rods J, the pieces L being provided with the shoulders *d*, substantially as shown.

2. The combination of the upper screen, legs to support it at one end, and a trestle at the other, with the lower screen having its surface inclined toward one side, and provided with the opening T through one side near its lower end, whereby potatoes of different sizes are deposited at the front and rear of the trestle, substantially as described.

3. The combination of the upper screen, the legs G, the trestle provided with means upon its top to keep the end of the upper screen in place, and the lower screen, P, removably attached to the upper one, and having its surface inclined toward one side, and provided with the opening T through one side, substantially set forth.

293,369. PIANO-ACTION. FRANCIS ST. AMANT, Boston, Mass. Filed Nov. 22, 1882. (No model.)



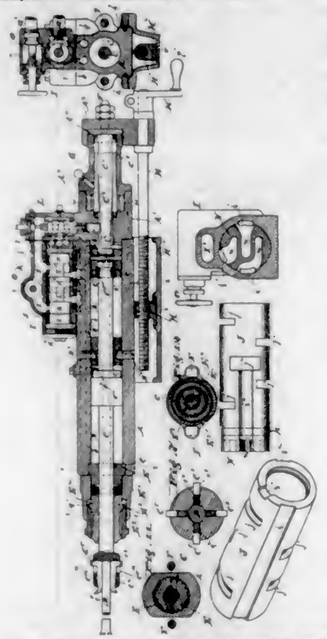
Claim.—1. The combination, in a piano-forte action, of the hammer-stem, the hammer-elevator B, and the interposed adjustable regulating device C, made of metal, and having the regularly rounded or curved head *c* and the threaded shank *c'*, all substantially as described.

2. The combination of a hammer-stem, the hammer-elevator B, and the curved or rounded metallic bumper C, arranged between the hammer-stem and the hammer-elevator and fastened to one of them, and adapted to contact with a rounded or curved leather or cloth covered bumper or projection upon the other, all substantially as and for the purposes described.

293,370. CONVEYER FOR NUT-MACHINES. MORTIMER D. STEDMAN, Unionville, Conn., assignor to Charles C. Dunham, same place. Filed May 12, 1883. (No model.)

Claim.—1. The combination of the conveyer-arm D, having knock-out *k*, said arm being rigidly secured to its driving-shaft, the arm *c*, carrying holding-jaws and loosely mounted on the same driving-shaft, and mechanism for oscillating the shaft upon which said arms are mounted, substantially as described, and for the purpose specified.

293,370.



2. In a conveyer, the combination of the pivoted jaws *f f*, the table between said jaws, the knock-out arm *k*, and their operating mechanism, substantially as described, and for the purpose specified.

3. The combination of the conveyer, the holding-jaws, the knock-out, and mechanism for swinging the conveyer back and forth from and to the hammering-dies, substantially as described, and for the purpose specified.

4. The combination of the conveyer-arm D, having knock-out *k*, the arm *c*, bearing holding-jaws and loosely mounted upon the driving-shaft, and devices for limiting the extent of the swinging movement of the arm *c*, substantially as described, and for the purpose specified.

293,371. STEAM ROCK-DRILL. AMOS STEVENS and ARTHUR L. STEVENS, Philadelphia, Pa. Filed June 27, 1883. (No model.)

Claim.—1. The combination of a cylinder, piston-rod C, having piston C', split bushing E, head E', split gland E^2, ring E^3, and a chuck made solid on the end of said piston-rod, substantially as and for the purpose specified.

2. The combination of a cylinder, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, split bushing E, head E', split gland E^2, ring E^3, a chuck made solid on the end of said piston-rod, and mechanism to give said piston-rod a partial revolution upon its upstroke, substantially as and for the purpose specified.

3. The combination of a cylinder, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, split bushing E, head E', split gland E^2, ring E^3, a chuck made solid on the end of said piston-rod, cam-extension C^3 C', having feather C^4, cylinder G, having oblique slots *g*, ratchet-wheel G', and one or more pawls, *g'*, substantially as and for the purpose specified.

4. The combination of a cylinder, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, split bushing E, head E', split gland E^2, ring E^3, a chuck made solid on the end of said piston-rod, cam-extension C^3 C', having feather C^4, cylinder G, having oblique slots *g*, ratchet-wheel G', one or more pawls, *g'*, parts A' A^2, and cap A^3, and bolts F F, substantially as and for the purpose specified.

5. The combination of a cylinder, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, split bushing E, head E', split gland E^2, ring E^3, a chuck made solid on the end of said piston-rod, cam-extension C^3 C', having feather C^4, cylinder G, having oblique slots *g*, ratchet-wheel G', one or more pawls, *g'*, parts A' A^2, and cap A^3, packing A^4, and bolts F F, substantially as and for the purpose specified.

6. The combination of cylinder A, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, bisected ring *c'*, and means to secure said piston C^2 on the piston-rod, substantially as and for the purpose specified.

7. The combination of cylinder A, having steam-ports *b*, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, bisected ring *c'*, and means to secure said piston C^2 on the piston-rod, the said pistons having a portion of their length reduced in diameter, as at *c*, substantially as and for the purpose specified.

8. A cylinder, in combination with a piston-rod having a solid piston and chuck formed upon it, a split bushing to fit the end of the cylinder and encircle the piston-rod, a head to hold said split bushing together and in place, and means to make a steam-tight joint, substantially as and for the purpose specified.

9. The combination of cylinder A, having steam-ports *b*, the lower of which enters the lower chamber, B, of the cylinder a short distance above its bottom, to enable the piston to cushion on live or exhaust steam, ring-piece B', piston-rod C, having solid piston C', loose piston C^2, bisected ring *c'*, and means to secure said piston C^2 on the piston-rod, the said pistons having a portion of their length reduced in diameter, as at *c*, substantially as and for the purpose specified.

10. In a rock-drill, a piston-rod extended to form cam-extension C^3 C', in combination with a piston steam-valve to admit steam to the cylinders above and below the pistons, and an auxiliary valve mechanism controlled by said cam-extension to control or govern the time of admittance of steam to each end of said piston steam-valve to cause it to reciprocate, substantially as and for the purpose specified.

11. In a rock-drill, the piston-rod extended to form cam-extension C^3 C', in combination with a piston steam-valve to admit steam to the cylinders above and below the pistons, an auxiliary valve mechanism controlled by said cam-extension to control or govern the time of admittance of steam to each of said piston steam-valves, to cause it to reciprocate, and mechanism, substantially as set forth, to vary the stroke of the piston-rod, substantially as and for the purpose specified.

12. In a rock-drill, a piston-rod provided with the cam-extension C^3 C', projecting from the rear end of the cylinder and inclosed in a separate case, in combination with said cylinder-case, valve mechanism actuated by said cam-extension to control the admittance of steam to the cylinder above and below the piston, and means, substantially as set forth, controlled by the reciprocations of said cam-extension, to impart an intermittent rotary motion to said piston-rod, substantially as and for the purpose specified.

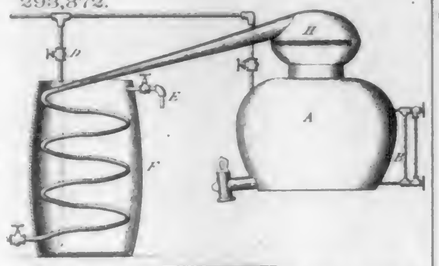
13. In a rock-drill, the cam-extension C^3 C', in combination with valve mechanism I and L, when constructed as shown, substantially as and for the purpose specified.

14. In a rock-drill, the cam-extension C^3 C', in combination with valve M, having screw M^2, ports *l l' l²*, valve K, ports *j j' j² n n' i i' i²*, nut M^4, and means to screw said screw M^2 more or less into the said nut M^4, substantially as and for the purpose specified.

15. In a rock-drill, the cam-extension C^3 C', in combination with valve M, ports *l l' l²*, valve K, ports *j j' j² n n' i i' i²*, packing *k' k'*, to receive the concussion of the valve K in its reciprocations, substantially as and for the purpose specified.

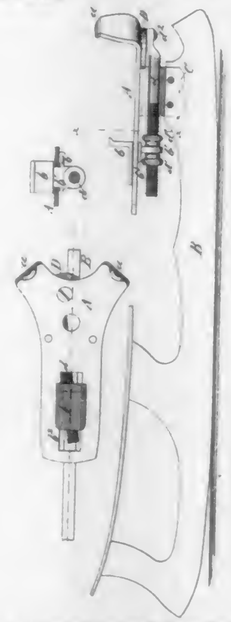
16. In a rock-drill, the cam-extension C^3 C', in combination with valve M, ports *l l' l²*, valve K, ports *j j' j² n n' i i' i²*, passage-way I, and steam-valve O in said passage-way, to admit steam from the steam-main simultaneously to both valves K and M, substantially as and for the purpose specified.

17. The combination of cylinder A, piston-rod C, a rear cylinder-head, and split bushing E with head E' and longitudinal binding-bolts F F, substantially as and for the purpose specified.



18. The combination of cylinder A, piston C, a rear cylinder-head, and split bushing E with head E', a packing-gland, E^2, and longitudinal binding-bolts F F, substantially as and for the purpose specified.

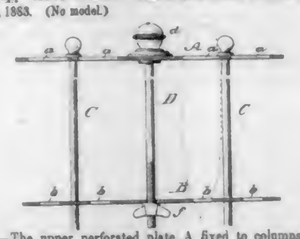
19. The combination of cylinder A, piston-rod C, a rear cylinder-head, and split bushing E with head E', a split packing-gland, E^2, ring E^3, and longitudinal binding-bolts F F, substantially as and for the purpose specified.



293,372. HAIR-DRESSING AND WASH FOR SILKS, LACES, EMBROIDERY, AND WOOLEN GOODS. HENRY P. STULTZ, Santa Fé, N. Mex. Filed Nov. 20, 1883. (No specimens.)

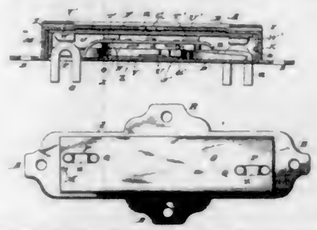
Claim.—The herein-described double-distilled and concentrated soap-root, to be used for hair and skin wash and for washing silks, laces, embroidery, and woolen goods.

293,372.



293,373. SKATE. WILLIAM A. SUTTON, New York, N. Y. Filed Feb. 28, 1883. (No model.)

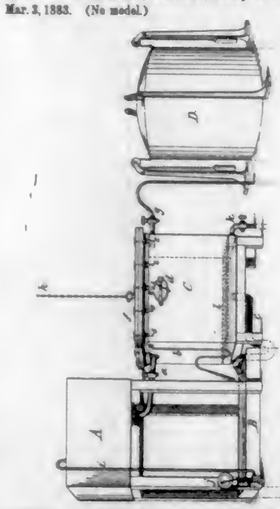
Claim.—1. As an improvement in skates, the lever D, having a disk pivoted at its center to the rear part of the heel-plate on one side of the longitudinal axis of said heel-plate, in combination with the connecting-rod *d*, the rear end of which is pivoted to the disk of the lever D between the central pivot of said lever and the outer edge of said disk, and threaded at the front end, which engages the shank *b'* of the front clamp, *b*, and the adjusting screw nuts *d' d''*, substantially as described.



2. The combination of the centrally-pivoted lever D, the connecting-rod *d*, the front clamp, *b*, the adjusting screw-nuts *d' d''*, the heel-plate A, and the fixed clamps *a a*, substantially as described.

293,374. CIGAR-STAND. CHAS. N. SWIFT, New York, N. Y. Filed June 13, 1883. (No model.)

Claim.—The upper perforated plate, A, fixed to columns C, that form the legs of the stand, in combination with the lower perforated plate, B, screw-rod D, and nut *f*, arranged substantially as and for the purposes set forth.

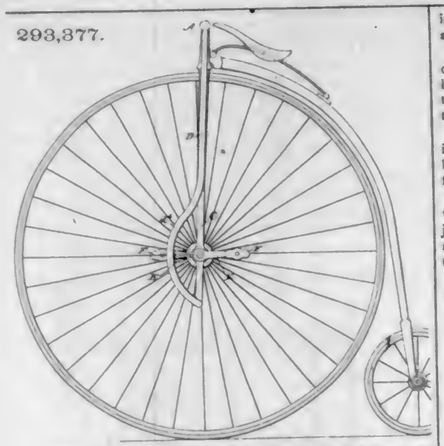


293,375. LOCK. ELISHA P. TREFFERS, Alliance, Ohio. Filed Apr. 11, 1883. (Model.)

Claim.—1. In a lock, the combination, with the casing and the case secured therein, the latter having an oblong slot at each end, the said slots being parallel with the length of the case, of the described pivoted and independent lock-bolts provided with shoulders, and the described pivoted locking-tumblers provided with shoulders which engage those of the said lock-bolts to lock the lock-bolts in their locked adjustment, substantially as set forth.

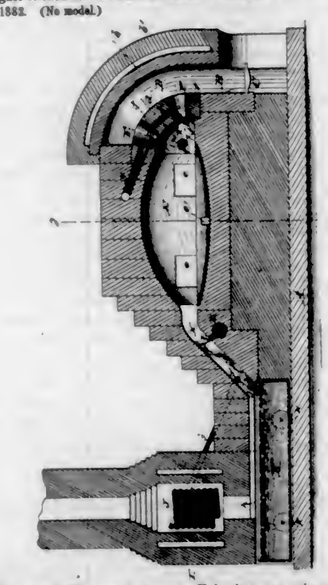
2. In a lock, the combination, with the casing and the case secured therein, the latter having an oblong slot at each end, of independent pivoted lock-bolts provided with shoulders and respectively extending across said slots, independent pivoted locking-tumblers associated with each of said bolts, and an elastic ejector adapted to prevent the bolts from passing the slots, to automatically admit of the bolts engaging with the staples, and to automatically eject the staples from the lock, substantially as set forth.

293,376. PROCESS OF AND APPARATUS FOR BLEACHING. JACOB BATHER THOMPSON, New-Cross, County of Kent, England. Filed Mar. 3, 1883. (No model.)



Claim.—1. An apparatus for bleaching linen and cotton or other vegetable fibers or fabrics, composed of the tanks A and B for the bleaching-liquor, the bleaching-vessel C, the gas-holder D, the pipe *a*, connecting vessels A and C, the pipe *g*, connecting vessel C and holder D, discharge-pipes *b c* from the vessel C, and a pump, *j*, for transferring the liquid from vessel B to vessel A, substantially as shown and described.

2. The herein-described process for bleaching vegetable fiber, threads, and fabrics, the same consisting in first boiling them in a solution of cyanide of potassium, or sodium, then subjecting them to alternate baths of a solution of chloride of lime and of carbonic-acid gas in a closed vessel, and lastly passing them through a solution of triethylrosaniline and oxalic acid, with suitable washings, all substantially as described.



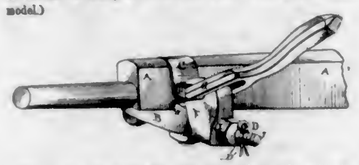
293,377. BICYCLE. RICHARD COMINGS THOMPSON, Brixton, and WILLIAM SPENCE, Surbiton, County of Surrey, England. Filed Dec. 4, 1883. (No model.)

293,377.

Claim.—The combination, with the steering-fork of a bicycle, of extensions or arms attached rigidly to the lower extremities of the said fork or formed in one therewith and passing beyond and clear of the paths described by the cranks and pedals and rising at either side of the steering-fork at such a distance therefrom as to admit the rider's legs between them and the fork, and of handles attached to the upper ends of said arms or extensions, substantially as shown and described, for the purpose specified.

293,378. ORE-FURNACE. GEORGE B. N. TOWER, New York, N. Y., assignor of one-half to Edward L. Lambie, Washington, D. C. Filed Feb. 14, 1882. (No model.)

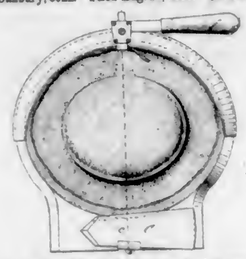
Claim.—1. The tapering tuyeres F, having connecting openings through them, arranged in a spiral manner, and discharging therein obliquely to their axes, in combination with the bridge-wall of a furnace having air-spaces surrounding said tuyeres for admitting air thereto, substantially as and for the purpose specified.



2. The combination, with a smelting-chamber and fire-place, B, of a series of intermediate tuyeres, constructed as described, to convey the gases and air toward a common center in said chamber, and having openings for admitting air therein, said openings being arranged through the tuyeres obliquely to their axes, the bridge-wall through which said tuyeres pass having air-spaces *f* surrounding said tuyeres, and wall *b'*, having air-space *b* and connecting-flues *f'*, and supply-pipe *g'*, substantially as and for the purpose specified.

3. The combination, with the discharge-flue H of the smelting-chamber E, of the water-pipe L, arranged through the furnace-walls below said flue, and having discharge-pipes *l*, for admitting jets of water to said flue against its upper inclined wall, substantially as and for the purpose specified.

4. The combination, with the inclined discharge-flue H of the smelting-chamber E, of the water-pipe L, and jet-pipes *l*, and steam-pipe *j*, having jet-pipe *j'*, all arranged to discharge water and steam into said flue, substantially in the manner and for the purpose specified.



5. The combination, with the smelting-chamber E, flue H, stack I, vessel K, for containing water, and coiled pipe J, of the pipe *j*, having jet-pipe *j'*, for supplying the steam to the interior or neck of said flue, and water-pipe L, and jet-pipe *l*, for discharging water therein, substantially as described.

293,379. THILL-COUPLING. OSCAR TOWER, Wilson, N. Y., assignor of one-half to Henry M. Davis, same place. Filed Aug. 22, 1883. (No model.)

Claim.—In a thill-coupling, the combination of the axle, clip, block B, having the tapering portion I, screw-threaded portion J, and hole D', with the coupling F, nut E, and pin D, the parts being combined and arranged to operate substantially as shown.

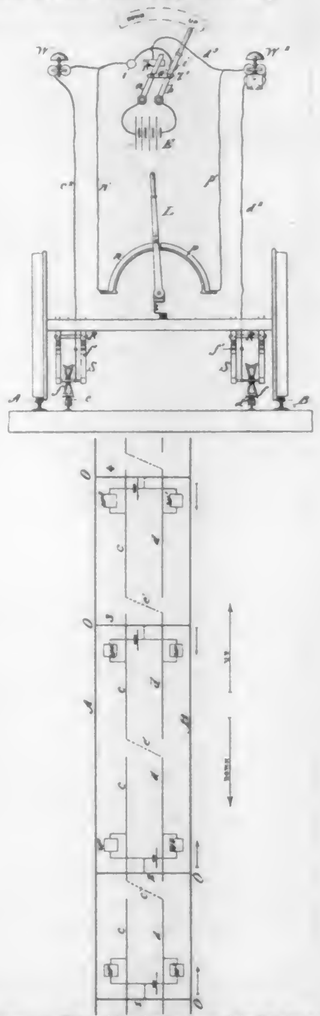
293,380. APPARATUS FOR TRIMMING HAT-BODIES. EDMUND TWEEDY, Danbury, Conn. Filed Aug. 28, 1883. (No model.)

Claim.—1. A curled-hat-rim-trimming device consisting of a hat-supporting bed-piece provided with suitable means of securing a hat thereto, and which holding devices are not part of the hat-shaping mechanism, and with a pattern or guide rest for the trimming-tool, in combination with the latter, substantially as herein described.

2. A curled-hat-rim-trimming device consisting of a hat-supporting bed-piece provided with suitable means for securing a hat thereto, and with a pattern or guide rest for the trimming-tool, and having an adjustable bed-plate, in combination with a trimming-tool, substantially as herein described.

3. In combination with a curled-hat-rim-trimming device consisting of a hat-supporting bed-piece provided with suitable means for securing a hat thereto, and with a pattern or guide rest for the trimming-tool, a trimming-tool formed with a projecting finger or flange arranged to enter the curl of a hat-brim and support its extreme upper edge during the operation of trimming the edge of the curl, substantially in the manner and for the purpose described.

4. In combination with a curled-hat-rim-trimming device consisting of a hat-supporting bed-piece provided with suitable means for securing a hat thereto, and with a pattern or guide rest for the trimming-tool, a curl smoothing and supporting tool for use in conjunction with the pattern or guide rest, substantially in the manner and for the purpose described.

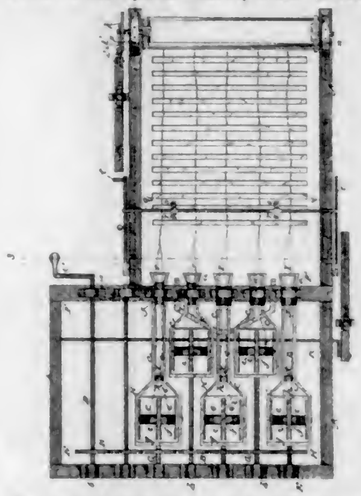


5. In combination with a curled-hat-rim-trimming device consisting of a hat-supporting bed-piece provided with suitable means for securing a hat thereto, with a pattern or guide rest for the trimming-tool, and with a trimming-tool of suitable construction, a curl smoothing and supporting device for use in conjunction with the pattern or guide rest and the trimming-tool, substantially in the manner and for the purpose described.

6. A curled-hat-rim-trimming device consisting of a hat-supporting bed-piece and suitable wedge-shaped adjusting-pieces, means for securing the hat to the bed-piece, and a pattern or guide rest for the trimming-tool, substantially as described.

7. The process of trimming the curled edges of hats, which consists in securing the hat upon a plate or bed having a pattern or guide rest, and then moving a cutting-tool around the hat and in contact with the said pattern or guide rest.

293,381. ELECTRIC RAILWAY-SIGNAL. JAMES C. UPHAM, North Sydney, and JOHN P. ROGERS, Elmsdale, Nova Scotia, Canada. Filed MAR. 12, 1883. Renewed Dec. 8, 1883. (No model.)



Brief.—The battery on engine entering section before advance engine has passed off thereof sends current through its own alarm W^2, (danger ahead,) and through advance engine's alarm W', (danger behind,) return-circuit being made through rails of track. In case of approaching (meeting) engines both batteries are thrown into circuit sounding W^2 (with redoubled force) on both engines. Commutators T and L (L the reversing-lever of engine) prevent opposition and consequent neutralization of batteries, however engines are moving.

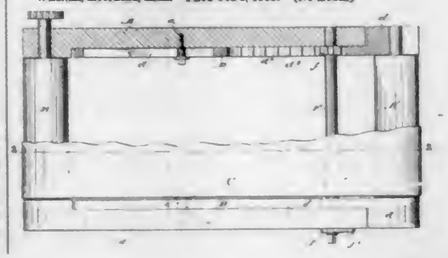
Claim.—1. The paddle-wheel contacts *f*, having sharp edges, in combination with the supporting-frames S, hinged at *f'*, and insulated from the upper frames, R, as shown and described.

2. The combination on locomotives with the instruments W' W^2, and circuit-closers *f*, of the lever L, connected to the axle, segments *n p*, and connections *n' p'*, substantially as described, for bringing these instruments in direct connection with the axle, as set forth.

293,382. MACHINE FOR MAKING WIRE-AND-SLAT FENCES. WILLIAM VAN HORN, Piqua, Ohio. Filed July 13, 1883. (No model.)

Claim.—1. A fence-machine having a spool-frame having forwardly-extending wire-guarding arms, and a wire-twisting head formed integrally out of a single piece of metal, and a hollow shaft or sleeve connected with said arms for the purpose of guiding the wires to the twister-head, substantially as set forth.

2. In a fence-machine, a combined spool-frame and twister-head, consisting of a spool-holder having a rear cross-piece and side arms, said side arms being extended inwardly and forwardly to form wire-guarding arms, and having their outer ends perforated to receive the wires and formed into a twister-head, substantially as set forth.

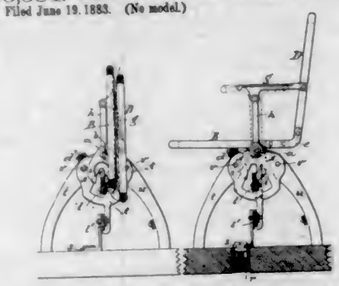


3. In a fence-machine, a combined spool-frame and twister-head, consisting of a spool-holder having a rear cross-piece and side arms, said side arms being extended inwardly and forwardly to form wire-guarding arms, and having their outer ends perforated to receive the wires and formed into a twister-head, and provided with a hollow shaft or tube for guiding the wires to the twister-head and forming a bearing for the wire-guarding arms and twister-head, substantially as set forth.

4. The spool-frame H, having vertically-extending rear cross-bar, *g*, side bars and wire-guarding arms, *c*, formed integrally, and a front cross-bar, *h*, having a rearwardly-extending arm, *i*, for supporting the spool-spindle during the removal of a spool, substantially as set forth.

5. The slat-spacer herein described, consisting of the arms *o*, hinged or pivoted at their rear ends to the main frame of the machine, and having a suitable handle at their front end, a cross-bar having a downwardly-extending rigid pin, and a removable and adjustable lug for the purpose of adjusting or changing the spacing of the slats, as desired.

6. The reel herein described, consisting of an end piece or frame, *y*, having a short shaft or journal, *f'*, extending outwardly therefrom, and a notch, *b b'*, in its upper edge, an end block, *v*, having a shaft or journal, *e'*, extending outwardly therefrom, and having ears *w*, longitudinal arms *u*, hinged at one end between the ears *w*, supported at their opposite ends within the block *y* by pins *x*, and a key, *z*, having hinge-connection at one end with the end block, *v*, its opposite end engaging the notch *b'*, substantially as and for the purpose set forth.



293,383. ENDLESS CARRIER FOR HARVESTERS. JOHNSTON WAGNER, Moorhead, Minn. Filed Oct. 3, 1883. (No model.)

Claim.—1. In an endless carrier, the combination, with the side pieces of the frame, of a drum or roller journaled in said side pieces, two adjustable plates, each provided with inner and outer inclosed slots, the outer slots each having a rack on one side, pins or bolts fixed to said side pieces and arranged in the said inner slots, a drum or roller journaled in the outer ends of said plates, a shaft journaled in said side pieces, two pinions fixed to said shaft and arranged in said outer slots in engagement with racks, and means for securing said plates in position after adjustment, substantially as hereinbefore set forth.

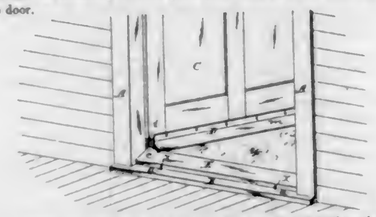
2. The combination, with the recessed side pieces, A A, of the drum or roller B, the plates D D, provided with bearing-blocks *d*, inner slots, *d'*, and outer slots, d^3, the latter having racks d^2, the drum or roller B', the pins *a a*, the shaft F, the pinions *f f*, the ratchet-wheel *f'*, and the pawl f^3, substantially as hereinbefore set forth.

293,384. FOLDING SEAT. JOHN E. WAKEFIELD, Worcester, MASS. Filed June 19, 1883. (No model.)

Claim.—1. The combination, with the pivoted seat, of a back, hinges connecting the seat and back, supporting-frames, radius-bars pivoted to the frames, mechanism, substantially as described, to limit the movement of such radius-bars, and links connecting the radius-bars to the back, substantially as set forth.

2. In combination with the supporting-frames, the seat B, pivots upon which such seat is swung, a back, D, hinges connecting the back and seat, radius-bars *h* upon the seat-pivots, links *g*, connecting the upper ends of the radius-bars with the back, forked lower ends upon the radius-bars, and means, substantially as described, to limit the swinging movement of such radius-bars, substantially as set forth.

3. The metallic seat-frames having projecting rests *d*, in combination with the seat B, the pivots upon which the seat is swung, the radius-bars A, pivoted upon the frames, mechanism, substantially as described, to limit the movement of the radius-bars, the back D, hinges connecting the same to the seat, and links connecting the upper ends of the radius-bars with the back, substantially as seth forth.



4. The combination, with movable seats, of the split foot-pieces connected therewith, the socket having external and internal screw-threads, and whereby it may be screwed into the floor, and a screw within the socket to confine the split foot-pieces, substantially as set forth.

5. The combination, with the seat, of a split foot-piece united at the upper end of the frame of the seat, and a metal socket and screw within the same, for confining the split foot-piece, substantially as set forth.

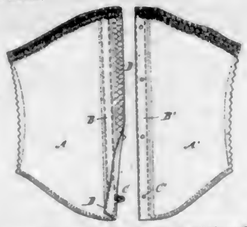
6. A screw for movable seats, formed of a metal socket fastened into the floor, and a screw within such socket, for the purpose and as set forth.

293,385. WEATHER-STRIP. DAVID WARNOCK, Olathe, Kans. Filed Aug. 23, 1883. (No model.)

Brief.—A weather-strip consisting of an L-shaped metal plate hinged to the sill by staples, and having a lip turned up at one corner, which is struck by a plate secured to the door, the sill-plate being forced up under an outwardly-inclined guard-plate secured to the outer face of the door.

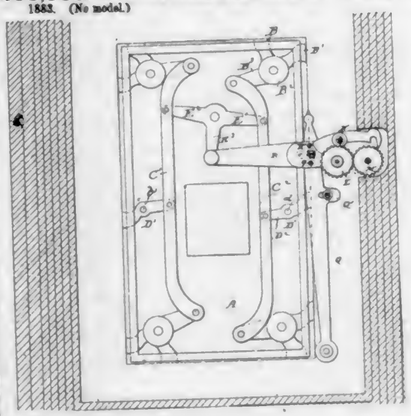
Claim.—A weather-strip for doors, consisting of an L-shaped plate, E, provided with a corner lip, *e*, with recesses *x*, and secured by staples to the sill of the door, in combination with a corner-plate, *i*, arranged upon the door to bear against the inner side of the lip *e*, and a plate D, provided with an inclined flange, *m*, and connected to the door, substantially as set forth.

293,386. CLOAK. SIGMUND WETZLER, Hoboken, N. J. Filed Nov. 4, 1882. (No model.)



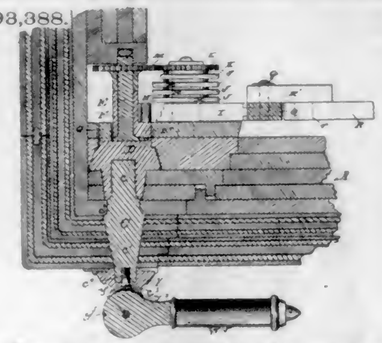
Claim.—1. The combination, with a garment, of a receptacle into which the garment may be packed, and which is so attached to the garment that its mouth will be presented upward when the garment is worn, so that it may be used as a pocket, substantially as specified.

2. The combination, with a garment, of a receptacle adapted to receive it, having the inner side of the garment secured to the receptacle on the interior of the latter only and within its mouth, the receptacle being otherwise unconnected with the garment, and the edges of the receptacle being left free from the garment, so that they may be drawn over the garment when it is packed, substantially as specified.



3. A circular, cloak, or other outer garment having permanently connected thereto a receptacle or device constructed substantially as described, whereby it may be used as a pocket when the garment is upon the wearer, and also as a receptacle or traveling-bag for carrying the cloak and other articles when the garment is not in use.

293,387. ATTACHMENT FOR DRESSES. ELLA WHAPLES, Jackson, Mich., assignor of one-half to Lewis Shannon, same place. Filed Aug. 8, 1883. (No model.)



Claim.—An attachment to dress-fronts, consisting of the parts A A', provided with the busk-steels B B', and adapted to be used substantially as and for the purposes described.

293,388. SAFE-LOCK. JAMES WHITE, Canton, Ohio. Filed May 23, 1883. (No model.)

293,388.

Claim.—1. In a safe, the combination of the bolts secured to the inner face of the door, the arbor passing through the stationary front wall of the safe at right angles to the door when the latter is closed, the permutation devices supported stationarily upon the front stationary wall of the safe, and arranged, substantially as set forth, to be operated by the arbor, means, constructed and operating substantially as described, which connect the bolts with the arbor, and devices, substantially as described, which throw the bolts out of engagement with the arbor.

2. The combination of the arbor provided with the loose collar and projecting pin, and means for preventing the complete rotation of the collar and pin around the arbor, the bolts, the arm I, means which engage said arm with the bolts, and the permutation devices arranged, substantially as set forth, to throw the arm I into and out of engagement with the loose pin on the arbor, substantially as set forth.

3. In a safe, the combination of the bolts secured to the inside of the door, the arbor passing through the front stationary wall of the safe at right angles to the door when the latter is closed, the swinging lever or bar pivoted to the said stationary wall, a catch which automatically connects said lever with the bolts when the door is shut, the permutation devices interposed between the said swinging lever and the arbor, and means, substantially as described, operated by said permutation devices, for intermittently connecting the arbor with the swinging lever, substantially as set forth.

4. The combination of the arbor passing through the front stationary wall of the safe at right angles to the door when the latter is closed, the spur-wheel on the inner end thereof, the tumblers J, the cam K, spur-wheel L, arm I, adapted to be raised and lowered by the cam and tumblers and to be engaged with the arbor, the bolts secured to the inner side of the door, and devices supported upon the stationary wall of the safe, which connect the arbor with the bolt, substantially as set forth.

5. In a safe, the combination of an arbor situated in the front stationary wall, and having its inner end journaled in a fixed bearing independent of the bearing for the outer end, the bolts secured to the inside of the door at one side of the arbor, and the devices which connect the arbor with the bolts, substantially as and for the purposes set forth.

6. The combination of the arbor having upon the inner side of the safe an inwardly-projecting spindle, a bearing for the inner end of said spindle having a socket, and a loosely-mounted button situated in said socket at the inner end of said spindle, substantially as and for the purposes set forth.

7. The combination of the arbor carrying the crank-pin G, the sleeve F, carried by and loosely supported on the arbor, the crank-pin H, carried by said sleeve, the permutation devices operated by the arbor, the bolts on the inside of the door, and the means which intermittently connect the bolts with the arbor, substantially as set forth.

8. In a safe, the combination of the arbor, the permutation devices connected with and operated by the arbor, the bolts, the lever which connects the bolts with the arbor, a laterally-expanded wheel mounted loosely on the axis of the arbor, and a second wheel secured rigidly to the arbor, and provided with a crank-pin adapted to be detachably connected with the aforesaid lever which operates the bolts, substantially as set forth.

9. The combination, with the outer part of the arbor, which tapers outwardly, and is provided with a shoulder adapted to bear against the plates of the wall, of the wheel or intermediate portion secured to the outer part by a screw-thread, and the inwardly-projecting spindle mounted at its inner end in the wall of the safe, substantially as set forth.

10. In a safe, the combination of an arbor having the outer portion, C, formed with a conical part, c', the shouldered part c^3, and the threaded portion c, and the wheel D, having the outwardly-projecting conical part and the inner inverted conical part, and united to the part C by a screw-thread, and provided with the eccentric pin G, substantially as and for the purposes set forth.

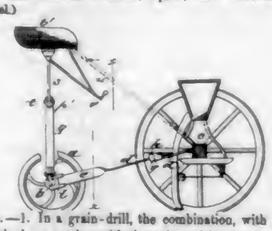
11. In a safe, the combination of an arbor having the part C, formed with an outwardly-narrowing portion, whereby it is prevented from being drawn outward, and an inwardly-narrowing portion, whereby it is prevented from being driven inward, a bar or arm for connecting the arbor with the bolts, a crank-pin which connects the arbor with said bar, and a wheel or support for said pin, secured to the said part C of the arbor, and of greater diameter, substantially as set forth.

12. In a safe, the combination of the arbor, the permutation devices connected with and operated by the arbor, the bolts adapted to be operated by the arbor, a laterally-swinging lever, and a vertically-swinging arm pivoted to said lever, and adapted, substantially as set forth, to be engaged with and disengaged from the aforesaid swinging lever, as described.

13. The combination of the bolts, the sliding bar carried by the door for operating the bolts, a bar which travels to and fro and is attached to the wall of the safe, a pin adapted to detachably connect the two aforesaid bars together, and means, substantially as described, for connecting the arbor to the bar which is attached to the wall of the safe, and which moves to and fro, substantially as set forth.

14. The combination of the bolts, the lever Q, the lever I, pivoted thereto, the arbor, means, substantially as described, for intermittently engaging the arbor with the lever I, and means, substantially as described, for throwing the lever out of engagement with the arbor when the door is shut, as set forth.

15. The combination of the arbor, the bolts, the lever Q, means, substantially as set forth, for detachably connecting said lever with the bolts, and means, substantially as set forth, for intermittently engaging said lever with the arbor, as described.



16. The combination of the bolts, the lever Q, arranged to swing in planes transverse to the arbor, means, substantially such as described, for detachably connecting the bolts to said lever, and means, substantially such as described, for intermittently connecting the lever with the arbor, as set forth.

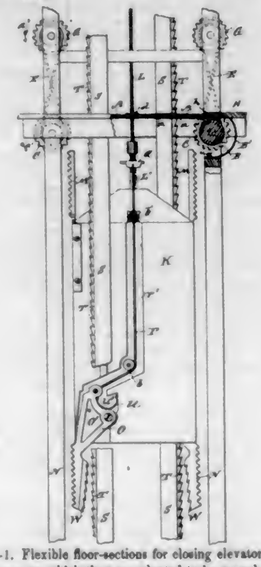
17. The combination of the arbor, the bolts, a laterally-swinging lever, a bar or arm connected to said swinging lever, variable permutation devices interposed between said bar or arm and the arbor, and operated by the rotation of the latter, and means, substantially such as described, for detachably connecting the bolts with the laterally-swinging lever, and thereby connecting them directly with the arbor which moves the permutation devices, as described.

18. The combination of the laterally-swinging lever Q, the bolts, the draw-bar which operates the bolts, the pin r, carried by the swinging lever and adapted to engage with said draw-bar, the arbor, and means, arranged and operating substantially as described, for intermittently connecting said swinging lever with the arbor, substantially as set forth.

19. The combination of the arbor, the bolts, means, constructed and arranged substantially as set forth, for detachably connecting the arbor with the bolts, a series of tumblers constructed to alternately hold said connecting means out of engagement with the arbor, and means for permitting the engagement thereof with the arbor, a cam which throws said connecting means out of engagement with the arbor, and devices for transmitting power from the arbor to said cam.

293,389. ROLLER ATTACHMENT TO GRAIN-DRILLS. JAMES M. WEIKART and WILLIAM F. BUDEK, Topeka, Kans. Filed Aug. 17, 1883. (No model.)

Claim.—1. In a grain-drill, the combination, with each pair of rolls, of a rod, d, connecting with the axle, and having two branches, e e, fitted at the ends with separable bearings which receive the outer ends of the roll-axle, as shown and described.



2. The frame-sections and roller-axles, connected by knuckle-joints, sustaining the load and the wear independently of the joint-pin, and having shoulders a', that limit the lateral vibration, substantially as described.

3. The combination, with the seat-frame, of the axles b, sleeves n, and role-joints p, having seats o, whereby said frame may be supported, as described.

4. The independent pairs of rollers a, connected to the drill-axle by an extensible and vibrating connecting-rod, d, made in two parts, one having a socket and the other being inserted in said socket and fastened with a pin, substantially as described.

5. A roller attachment for grain-drills, consisting of independent pairs of rollers connected to the axle of the grain-drill by independent connecting-rods, said rods having an extensible and vibrating joint, and being connected to the axle by a T-head and eyebolts, substantially as described.

293,390. COMBINED AUTOMATIC FLOOR AND SAFETY-CLUTCH FOR ELEVATORS. THOMAS H. WOOD, Philadelphia, Pa. Filed July 16, 1883. (No model.)

Claim.—1. Flexible floor-sections for closing elevator-shafts, combined with drums on which they are adapted to be wound, racks on the elevator-car, and cog-wheels connected with the drums, substantially as herein shown and described, and for the purpose set forth.

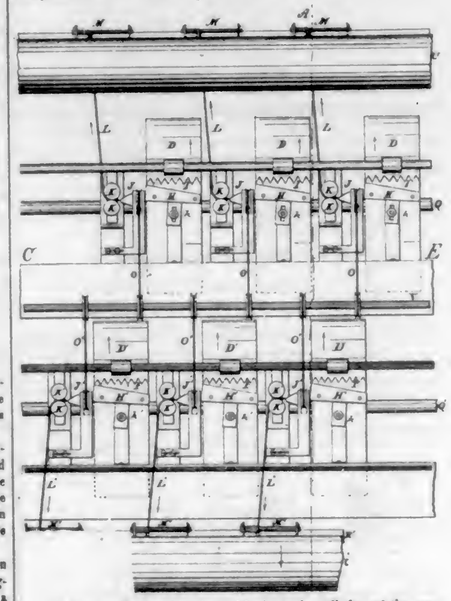
2. The combination, with flexible floor-sections for closing elevator-shafts, of drums on which the sections are wound, cog-wheels on the said drums, cog-wheels journaled in the frame of the elevator-shaft above the drums, pulleys connected with the upper cog-wheels, pulleys on the shafts, ropes or belts passing over the said pulleys, and racks secured on the car, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the flexible floor-sections A, secured on the drums B, of the cog-wheels C on the ends of the drums, the cog-wheels G, journaled in the elevator-frame above the shafts, and in a plane parallel with the plane of the cog-wheels C, the belts E, the belt-pulleys F, connected with the cog-wheels G, the pulleys D on the drum B, the racks M, projecting from the top of the car, and adapted to engage with the cog-wheels C, and the racks N, projecting from the bottom of the car, and adapted to engage with the cog-wheels G, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with an elevator-car, flexible floor-sections adapted to be wound on drums, and racks arranged in the shaft, of angle-levers pivoted to the lower sides of the car, and provided with racks on opposite sides, ropes attached to said levers and connected with the cable for raising the car, and a pinion arranged above the floor and connected with the floor-drums, substantially as herein shown and described.

5. The combination, with an elevator-car, flexible floor-sections adapted to be wound on drums, and racks arranged in the shaft, of the angle-levers O, provided with the racks N W, the ropes P, secured to the upper ends of the levers and connected to the car-operating cable, the pinion G, and the belt E, connecting the pinion with the floor-drums, substantially as herein shown and described.

6. The combination, with the car K, of the racks W, secured to levers O, pivoted to the side of the car, the springs U, the ropes P, the cable L, the elongated hook L', and the elongated eye E, substantially as herein shown and described, and for the purpose set forth.



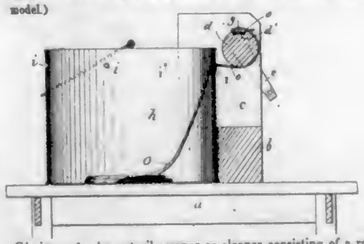
7. Flexible floor-sections for closing an elevator-shaft, combined with drums to which the said floor-sections are attached, and racks projecting from the top and bottom of the car for revolving the said drums, which bottom racks are attached to pivoted angle-levers, and are made integral with racks adapted to engage with vertical ratchet-bars secured on the side of the elevator-shaft, substantially as herein shown and described, and for the purpose set forth.

8. The combination, with the flexible sections A, of the drums B, the cog-wheels C G, the belt-pulleys D F, the belts E and car K, the upwardly-projecting racks M, the downwardly-projecting racks N, made integral or connected with racks W, and attached to the pivoted angle-levers O, the springs U, the ropes P, attached to the levers O and to the elevator-cable, and the vertical ratchet-bars T, substantially as herein shown and described, and for the purpose set forth.

9. The combination, with the drums B and means for rotating the drums by the movement of elevator, of the flexible floor-sections A, provided at their outer edges with the check-lugs d, for limiting the winding of said sections on the drums, substantially as herein shown and described.

293,391. CARDING AND SPINNING MACHINERY FOR THE MANUFACTURE OF ASBESTUS YARN, &c. WILLIAM WOOD, Philadelphia, Pa. Filed Mar. 16, 1882. (No model.)

Brief.—Sectional doffers and combs deposit the material in adjustable receiving-shells which deliver the fiber to twisting-tubes and delivery-rollers.

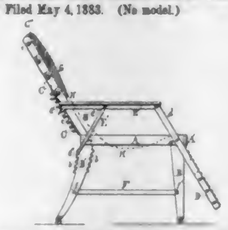


Claim.—1. The combination, with the main cylinder, of the sectional doffer-cylinders, the doffing-combs, receiving-shells, twisting-tubes, delivery-rollers, bobbin-winding rollers, and means for operating said parts, substantially as described.

2. The combination, with the main cylinder, of the doffer-cylinder, twisting-tube and delivery-rollers, doffing-comb, receiving-shell, and means for operating said parts, substantially as described.

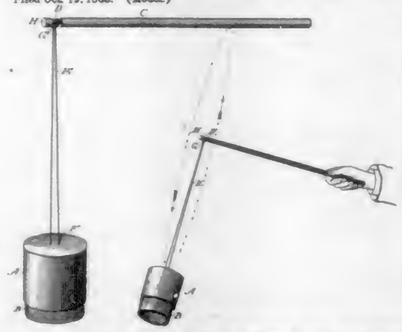
3. The combination, with the doffing-cylinder and doffing-knife, of the receiving-shell, and means for supporting and adjusting said shell, the twisting-tube, drawing-rolls, and means for operating said parts, substantially as and for the purpose set forth.

293,392. MACHINE FOR SCRAPING AND CLEANING INTESTINES. ANDREW M. WOODS, Shiloh, S. C. Filed June 16, 1883. (No model.)



Claim.—1. An entrail scraper or cleaner consisting of a rotating drawing-roller fitted with a suitable clamping device for grasping an end of the entrails, and a contiguous die-plate, through the apertures of which the entrails are drawn by the revolution of the roller, substantially as shown and described.

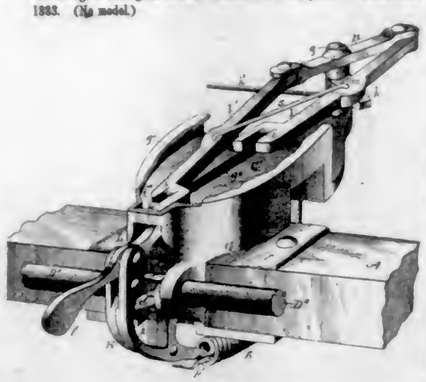
2. The combination, with the frame a b c, supporting the rotating



roller *d*, fitted with a clamping device, of the pail *h*, having die-apertures *i* formed therethrough, for the passage and cleaning of the entrails, substantially as shown and described.

293,393. RECLINING AND FOLDING CHAIR. FRANKLIN E. YOUNG, Canton, Ohio. Filed May 4, 1883. (No model.)

Claim.—The combination of the supporting-frame, the legs B', provided with notches, as shown, the standards *d*, arms E, pivoted brace E', having cross-rod *e'''*, engaging with the notches in legs B', the back G, having notches *c*, rod *e*, secured to the arms, and engaging said notches, and flexible seat H, whereby the inclination of the back and the elevation of the arms are simultaneously adjusted, as described.



293,394. ADVERTISING-TOY. ROBERT ALBRECHT, Oneida, N. Y. Filed Oct. 19, 1883. (Model.)

Claim.—1. In combination with a string hung movably on a rosined handle, as shown, a resonant shell connected to the free end of said string, and adapted to be distended or contracted to produce different sounds, substantially as set forth and shown.

2. The combination of the cylinders A and B, the handle C, having a groove, D, coated with resin, and the string attachment E, fastened to the cylinder A and looped over the handle C, substantially as specified and shown.

293,395. CORN-PLANTER CHECK-ROWER. ABRAHAM ANDERSON, Galesburg, Ill., assignor to G. D. Colton & Co., same place. Filed Oct. 20, 1883. (No model.)

Claim.—1. In a check-rower, in combination with the oscillating bar H, connected by suitable mechanism with the planter seed-slides, and the arms I I', hinged or journaled one to each end of the bar H, the link J, hinged to said arms, and adapted to swing one of them in a curved path in its return movement to pass the other, which moves in a straight or nearly straight path in its direct movement, substantially as and for the purpose specified.

2. In a check-rower, in combination with the oscillating bar H and the arms I I', hinged or journaled one to each end of said bar, and connected by a link, J, a pawl adapted to move in a straight line in contact with the arms I I' alternately, substantially as and for the purpose specified.

3. In a check-rower, in combination with the oscillating bar H, arms I I', hinged or journaled to said bar and connected by a link, J, the pawl L, and plate G', having a slot, *g''*, in which the pawl reciprocates and upon which the arms I I' slide, substantially as and for the purpose specified.

4. In a check-rower, in combination with the oscillating bar H, arms I I', hinged or journaled to said bar, connected by a link, J, and having each a fork, *i*, in its end, the pawl L, adapted to move in a straight path and to engage with a fork, *i*, in the arms I I' alternately, substantially as and for the purpose specified.

5. In a check-rower, in combination with the oscillating bar H, arms I I', hinged or journaled thereto, connected by a link, J, and provided with forks *i* at their ends, the pawl L, adapted to move in a straight path, with its part *l'''* in the slot *g''* in the plate G', and its part *l'* in position to act on the arms I I' alternately, substantially as and for the purpose specified.

6. In a check-rower, in combination with the oscillating bar H, arms I I', hinged or journaled thereto and connected by a link, J, the weighted pawl L, hinged to the rocking plate K, which is oscillated by connection with the fork-carrying shaft D, substantially as and for the purpose specified.

7. In a check-rower, in combination with the oscillating bar H, arms I I', hinged or journaled thereto and connected by a link, J, the weighted pawl L, hinged to the plate K, which is loosely seated on the divided shaft D, and has a recess, *k*, adapted to receive the arms *d' d'''*, one on each end of the divided shaft, and to be actuated by one of said arms while the other remains stationary, substantially as and for the purpose specified.

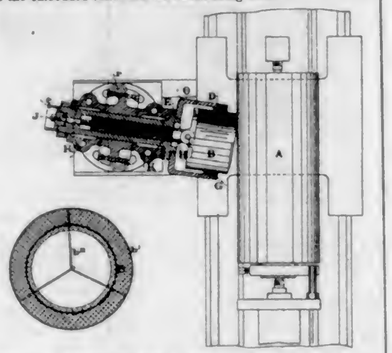
8. In combination, the oscillating bar H, with arms I I' hinged thereto, and connected by a link, J, pawl L, and rocking plate K, loosely mounted on the ends of the shafts D' D'', and provided with a recess, *k*, which receives the arms *d' d''* of said shafts, and the spring E, connected directly to the plate K, substantially as and for the purpose specified.

9. In combination, the two-part shaft D' D'', having arms *d' d''*, respectively, plate K, loosely seated on said shafts, and provided with a recess, *k*, pawl L, arms I I', connected by link J, and oscillating bar H, substantially as and for the purpose specified.

10. In combination, the two-part shaft D' D'', having arms *d' d''*, respectively, plate K, loosely seated on the adjacent ends of said shafts, and provided with a recess, *k*, spring E, connected with the plate K, pawl L, arms I I', links J, and oscillating bar H, substantially as and for the purpose specified.

293,396. NAPKIN RING AND HOLDER. GUS A. BAEN, Austin, Tex. Filed Dec. 13, 1883. (No model.)

Claim.—A combined napkin ring and holder, consisting of the two sections A and B, hinged together, and provided with a catch for fastening them, and a sliding clasp-piece, C, substantially as and for the purpose described.

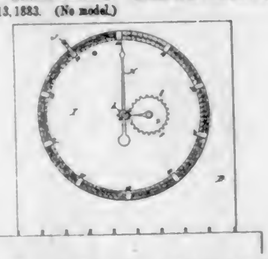


293,397. BORING-TOOL. GEO. W. BAKER, Wilmington, Del. Filed June 23, 1883. (No model.)

Claim.—The combination of the adjustable sleeve *a*, having the forward end of its axial bore enlarged, and provided with diametrically-arranged notches *e e*, the cutter *m*, and the stem *g*, having the enlargement *k*, to fit within the enlargement of the sleeve-bore, and provided with a transverse slot, *l*, to receive the cutter *m*, the wings of which fit over the notches *e*, and provided at its opposite end with a thread to receive the lock-nut *z*, substantially as specified.

293,398. ABRADING-TOOL. WILLIAM PARK BARCLAY, Chicago, Ill. Filed June 4, 1883. (No model.)

Brief.—One or more wire-gauze or perforated metal rings are embedded in a ring-grinder; also, a surrounding like ring is heated and shrunk into the abrading-ring. Wings of like material are connected by interlocking thin wires to each other at the center and by alternate wires to the embedded tubes and the surrounding tube.



Claim.—1. An abrading-tube, B, surrounded by a cylindrical wire-gauze tube, *b''*, or thin sheet-metal tube perforated with holes, the said metal tube being of a material capable of being worn away with the particles composing the body of the abrading-tube when the same is rotated, substantially as described and shown.

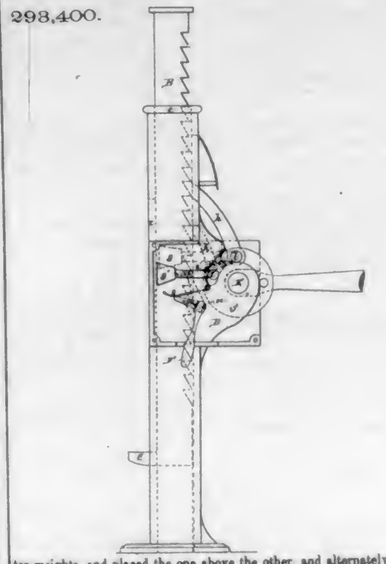
2. An abrading-tube, B, having one or more concentric wire-gauze tubes, *b'*, embedded in the body of the abrading-tube B, the said tubes also having radial arms *b'''*, that assist to strengthen the abrading-tube, substantially as shown and described.

3. An abrading-tube, B, with one or more recesses, *b*, at one end, in combination with thrust-plate I, spindle H, thrust-screw J, spindle E, collar *e*, and hollow cylinder D, substantially as shown and described.

4. The double pillar K and slide-plate L, in combination with spindle E, pulley F, cylinder D, nut G, and abrading-tube B, substantially as shown and described.

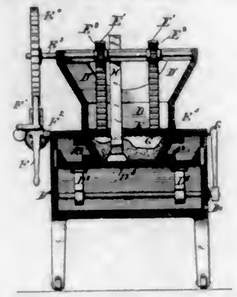
293,399. ADDING-MACHINE. ALBERT KING BARMORE, Benton, Tex. Filed Sept. 13, 1883. (No model.)

Claim.—1. The combination, with a toothed wheel fixed on a shaft to rotate in a frame, of a dial having indices corresponding to the number of teeth in said wheel mounted to revolve upon said shaft, and means for securing said dial to said frame, substantially as described, whereby the shaft of the toothed wheel may revolve in said dial when the latter is fixed, or the dial may be loosened to revolve on said shaft.



2. The combination, with the toothed wheel A, the shaft *a*, secured thereon and journaled in the frame B, the index or pointer H, secured on said shaft, the arm C, journaled on said shaft, the pawl *c* on said arm, adapted to engage the teeth of wheel A, the lever E, the connecting-rod D, and the digital levers G, each pivoted near its center to engage lever E, of the graduated dial I, concentric with shaft *a*, and the clamp *j*, as and for the purpose specified.

293,400. LIFTING-JACK. JOSIAH BARRETT, Allegheny, Pa. Filed Dec. 14, 1883. (No model.)



Claim.—1. In a lifting-jack, the pawls *h h'*, provided with counter-weights, and placed the one above the other, and alternately acting in raising or lowering the lifting-bar, substantially as described.

2. In a lifting-jack, the lever E, with the disks *f f''*, in combination with the pawls *h h'*, weighted levers *g g'*, springs *s s*, crank *m*, and lever F, arranged substantially as shown and described.

298,400.

293,401. SAND MOLDING-MACHINE. WILLIAM N. BARROWS, Philadelphia, Pa. Filed Nov. 7, 1883. (No model.)

Claim.—1. In a machine for making green-sand molds, the combination of a flask, having sides converging toward the parting of the mold, with a sand-supplying vessel and plunger, and a mechanism for depressing the same, and bearing forms corresponding to the shape of the patterns, for the purpose of distributing and regulating the pressure in the sand in the flask, substantially as and for the purpose set forth.

2. In combination with a flask having sides converging toward the parting thereof, a false cope adapted to measure the quantity of sand to be compressed into the flask, and a plunger fitting in said false cope, and an actuating mechanism arranged to displace the sand from the said false cope into the flask and compact the sand therein, substantially as and for the purpose set forth.

3. In a machine for making sand molds for casting metals, the combination of a pattern, a flask having sides converging toward the parting thereof, and a sand-supplying vessel having a plunger fitting therein, provided with forms adapted to compact the sand equally against the pattern, with a gate-former fitting through said plunger, substantially as and for the purpose set forth.
